# Media subsystem admin and user guide

## 1.1 The media subsystem

### 1.1.1 Introduction

3

### 1.1.2 Building support for a media device

- 1.1.2.1 Configuring the Linux Kernel
- 1.1.2.2 Building and installing a new Kernel
- 1.1.2.3 Building just the new media drivers and core

8

### 1.1.3 Infrared remote control support in video4linux drivers

10

- 1.1.3.1 Basics
- 1.1.3.2 How it works

10

### 1.1.4 Digital TV

11

- 1.1.4.1 Using the Digital TV Framework
- 1.1.4.2 Digital TV Conditional Access Interface
- 1.1.4.3 FAQ
- 1.1.4.4 References

23

### 1.1.5 Cards List

26

- 1.1.5.1 USB drivers
- 1.1.5.2 PCI drivers
- 1.1.5.3 Platform drivers
- 1.1.5.4 Radio drivers
- 1.1.5.5 I²C drivers
- 1.1.5.6 Firewire driver
- 1.1.5.7 Test drivers

86

### 1.1.6 Video4Linux (V4L) driver-specific documentation

99

- 1.1.6.1 The bttv driver
- 1.1.6.2 The cafe_ccic driver
- 1.1.6.3 The cpia2 driver
- 1.1.6.4 The cx88 driver
- 1.1.6.5 The VPBE V4L2 driver design
- 1.1.6.6 The Samsung S5P/Exynos4 FIMC driver
- 1.1.6.7 i.MX Video Capture Driver
- 1.1.6.8 i.MX7 Video Capture Driver
- 1.1.6.9 Intel Image Processing Unit 3 (IPU3) Imaging Unit (ImgU) driver
- 1.1.6.10 The ivtv driver
- 1.1.6.11 Vaio Picturebook Motion Eye Camera Driver
- 1.1.6.12 OMAP 3 Image Signal Processor (ISP) driver
- 1.1.6.13 OMAP4 ISS Driver
- 1.1.6.14 Philips webcams (pwc driver)
- 1.1.6.15 Qualcomm Camera Subsystem driver

177
2 Media subsystem kernel internal API 233

2.1 Media Subsystem Profile .......................... 233
  2.1.1 Overview .................................... 233
    2.1.1.1 Media maintainers ....................... 234
  2.1.2 Submit Checklist Addendum .................... 234
    2.1.2.1 Style Cleanup Patches ................... 235
    2.1.2.2 Coding Style Addendum .................. 235
  2.1.3 Key Cycle Dates ................................ 236
  2.1.4 Review Cadence ................................ 236

2.2 Video4Linux devices .......................... 236
  2.2.1 Introduction ................................ 236
  2.2.2 Structure of a V4L driver .................... 237
  2.2.3 Structure of the V4L2 framework ............... 237
  2.2.4 Video device’s internal representation .......... 237
    2.2.4.1 ioctl’s and locking ....................... 239
    2.2.4.2 Video device registration ................ 240
    2.2.4.3 video device debugging .................... 241
    2.2.4.4 Video device cleanup ....................... 242
    2.2.4.5 helper functions ........................... 242
    2.2.4.6 video_device functions and data structures ........ 243
  2.2.5 V4L2 device instance ....................... 252
    2.2.5.1 v4l2_device functions and data structures .......... 254
  2.2.6 V4L2 File handlers .......................... 262
    2.2.6.1 V4L2_fh functions and data structures .......... 264
  2.2.7 V4L2 sub-devices ............................ 266
    2.2.7.1 Subdev registration ....................... 268
    2.2.7.2 Calling subdev operations .................. 270
  2.2.8 V4L2 sub-device userspace API ................. 271
  2.2.9 Read-only sub-device userspace API ............ 272
  2.2.10 I2C sub-device drivers ..................... 272
  2.2.11 V4L2 sub-device functions and data structures .... 274
  2.2.12 V4L2 events ............................... 292
2.3.2.3 Digital TV Frontend functions and types .......................... 453
2.3.3 Digital TV Demux kABI .................................................. 466
  2.3.3.1 Digital TV Demux .................................................. 466
  2.3.3.2 Demux Callback API .............................................. 467
  2.3.3.3 Digital TV Demux device registration functions and data structures 467
  2.3.3.4 High-level Digital TV demux interface ............................. 470
  2.3.3.5 Driver-internal low-level hardware specific driver demux interface 475
2.3.4 Digital TV Conditional Access kABI .................................. 483
2.3.5 Digital TV Network kABI ................................................ 485

2.4 Remote Controller devices .............................................. 486
  2.4.1 Remote Controller core .............................................. 486
    2.4.1.1 Remote controller data structures and functions ............. 487

2.5 Media Controller devices .............................................. 493
  2.5.1 Media Controller .................................................... 493
    2.5.1.1 Abstract media device model ................................ 493
    2.5.1.2 Media device .................................................. 494
    2.5.1.3 Entities ....................................................... 494
    2.5.1.4 Interfaces ..................................................... 494
    2.5.1.5 Pads ........................................................... 494
    2.5.1.6 Links ........................................................... 495
    2.5.1.7 Graph traversal ............................................... 495
    2.5.1.8 Use count and power handling ................................ 496
    2.5.1.9 Links setup ................................................... 496
    2.5.1.10 Pipelines and media streams ................................ 496
    2.5.1.11 Link validation .............................................. 497
    2.5.1.12 Media Controller Device Allocator API ........................ 497
    2.5.1.13 API Definitions .............................................. 498

2.6 CEC Kernel Support ....................................................... 531
  2.6.1 The CEC Protocol .................................................... 531
  2.6.2 CEC Adapter Interface .............................................. 531
  2.6.3 Implementing the Low-Level CEC Adapter ......................... 532
  2.6.4 Implementing the interrupt handler ................................ 535
  2.6.5 Optional: Implementing Error Injection Support ................. 535
  2.6.6 Implementing the High-Level CEC Adapter ....................... 536
  2.6.7 CEC framework functions ......................................... 536
  2.6.8 CEC Pin framework ................................................ 537
  2.6.9 CEC Notifier framework ........................................... 539

2.7 Pixel data transmitter and receiver drivers .......................... 541
  2.7.1 Bus types ............................................................ 541
    2.7.1.1 MIPI CSI-2 .................................................. 541
    2.7.1.2 Parallel ....................................................... 541
  2.7.2 Transmitter drivers ................................................ 541
    2.7.2.1 Media bus pixel code ........................................ 541
    2.7.2.2 Link frequency .............................................. 541
    2.7.2.3 .s_stream() callback ....................................... 541
  2.7.3 CSI-2 transmitter drivers ......................................... 542
    2.7.3.1 Pixel rate .................................................... 542
    2.7.3.2 LP-11 and LP-111 modes .................................... 542
    2.7.3.3 Stopping the transmitter .................................... 543

2.8 Writing camera sensor drivers ....................................... 543
  2.8.1 CSI-2 and parallel (BT.601 and BT.656) busses .................. 543
2.8.2 Handling clocks .................................................. 543
  2.8.2.1 ACPI ......................................................... 543
  2.8.2.2 Devicetree .................................................. 543
2.8.3 Frame size ...................................................... 544
  2.8.3.1 Freely configurable camera sensor drivers .......... 544
  2.8.3.2 Register list based drivers ...................................... 544
2.8.4 Frame interval configuration .................................. 544
  2.8.4.1 Raw camerasensors ......................................... 544
  2.8.4.2 USB cameras etc. devices ................................. 545
2.8.5 Power management .............................................. 545
  2.8.5.1 Control framework ......................................... 545
2.9 Media driver-specific documentation ......................... 545
  2.9.1 Video4Linux (V4L) drivers .................................... 545
    2.9.1.1 The bttv driver ........................................... 545
    2.9.1.2 The cpia2 driver ......................................... 548
    2.9.1.3 The cx2341x driver ...................................... 549
    2.9.1.4 The cx88 driver ........................................... 619
    2.9.1.5 The VPBE V4L2 driver design ............................ 621
    2.9.1.6 The Samsung S5P/EXYNOS4 FIMC driver ............ 622
    2.9.1.7 The pvrusb2 driver ...................................... 622
    2.9.1.8 PXA-Camera Host Driver ................................ 626
    2.9.1.9 The Radiotrack radio driver ............................. 629
    2.9.1.10 The saa7134 driver ..................................... 631
    2.9.1.11 Cropping and Scaling algorithm, used in the sh_mobile_ceu_camera
driver .............................................................. 633
    2.9.1.12 Tuner drivers ............................................. 635
    2.9.1.13 The Virtual Media Controller Driver (vimc) .... 638
    2.9.1.14 The Zoran driver ........................................ 640
    2.9.1.15 MIPI CCS camera sensor driver ...................... 650
    2.9.1.16 CCS PLL calculator ..................................... 651
2.9.2 Digital TV drivers .............................................. 656
  2.9.2.1 Idea behind the dvb-usb-framework .................... 656
  2.9.2.2 Frontend drivers ......................................... 662
  2.9.2.3 vidtv: Virtual Digital TV driver ....................... 676
  2.9.2.4 Contributors ............................................... 707

3 Linux Media Infrastructure userspace API ......................... 711
  3.1 Introduction ................................................... 711
  3.2 Part I - Video for Linux API .................................. 713
    3.2.1 Common API Elements ....................................... 713
      3.2.1.1 Opening and Closing Devices ......................... 713
      3.2.1.2 Querying Capabilities ................................ 716
      3.2.1.3 Application Priority ................................ 717
      3.2.1.4 Video Inputs and Outputs ............................ 717
      3.2.1.5 Audio Inputs and Outputs ............................ 718
      3.2.1.6 Tuners and Modulators ............................... 720
      3.2.1.7 Video Standards ....................................... 721
      3.2.1.8 Digital Video (DV) Timings .......................... 724
      3.2.1.9 User Controls .......................................... 724
      3.2.1.10 Extended Controls API .............................. 731
      3.2.1.11 Camera Control Reference ......................... 733
3.2.4.6 Raw VBI Data Interface ................................................. 1019
3.2.4.7 Sliced VBI Data Interface ........................................... 1024
3.2.4.8 Radio Interface ...................................................... 1031
3.2.4.9 RDS Interface ....................................................... 1032
3.2.4.10 Software Defined Radio Interface (SDR) ......................... 1034
3.2.4.11 Touch Devices ...................................................... 1035
3.2.4.12 Event Interface ..................................................... 1036
3.2.4.13 Sub-device Interface .............................................. 1036
3.2.4.14 Metadata Interface ................................................. 1055
3.2.5 Libv4l Userspace Library ........................................... 1056
3.2.5.1 Introduction ........................................................ 1056
3.2.6 Changes .............................................................. 1058
3.2.6.1 Differences between V4L and V4L2 ............................... 1058
3.2.6.2 Changes of the V4L2 API .......................................... 1067
3.2.7 Function Reference .................................................... 1086
3.2.7.1 V4L2 close() ....................................................... 1086
3.2.7.2 V4L2 ioctl() ........................................................ 1087
3.2.7.3 ioctl VIDIOC_CREATE_BUFS .................................. 1088
3.2.7.4 ioctl VIDIOC_CROP CAP ......................................... 1091
3.2.7.5 ioctl VIDIOC_DBG_G CHIP INFO .................................. 1093
3.2.7.6 ioctl VIDIOC_DBG_G REGISTER, VIDIOC_DBG_S REGISTER ... 1095
3.2.7.7 ioctl VIDIOC_DECODER_CMD, VIDIOC_TRY_DECODER_CMD ... 1097
3.2.7.8 ioctl VIDIOC_DQEVENT ........................................... 1100
3.2.7.9 ioctl VIDIOC_DV_TIMINGS_CAP, VIDIOC_SUBDEV_DV_TIMINGS_CAP ... 1105
3.2.7.10 ioctl VIDIOC_ENCODER_CMD, VIDIOC_TRY_ENCODER_CMD ... 1107
3.2.7.11 ioctl VIDIOC_ENUMAUDIO ....................................... 1110
3.2.7.12 ioctl VIDIOC_ENUMAUDOUT ..................................... 1111
3.2.7.13 ioctl VIDIOC_ENUM_DV_TIMINGS, VIDIOC_SUBDEV_ENUM_DV_TIMINGS ... 1112
3.2.7.14 ioctl VIDIOCENUM_DV_TIMINGS .................................. 1113
3.2.7.15 ioctl VIDIOC_ENUM_FMT ......................................... 1118
3.2.7.16 ioctl VIDIOC_ENUM_FRAME INTERVALS ........................ 1121
3.2.7.17 ioctl VIDIOC_ENUM_FREQ_BANDS ................................ 1123
3.2.7.18 ioctl VIDIOC_ENUMINPUT ........................................ 1126
3.2.7.19 ioctl VIDIOC_ENUMOUTPUT ..................................... 1129
3.2.7.20 ioctl VIDIOC_ENUMSTD, VIDIOC_SUBDEV_ENUMSTD ............ 1131
3.2.7.21 ioctl VIDIOC_EXPBUF ........................................... 1136
3.2.7.22 ioctl VIDIOC_G_AUDIO, VIDIOC_S_AUDIO ....................... 1138
3.2.7.23 ioctl VIDIOC_G_AUDOUT, VIDIOC_S_AUDOUT .................. 1140
3.2.7.24 ioctl VIDIOC_G_CROP, VIDIOC_S_CROP ........................ 1141
3.2.7.25 ioctl VIDIOC_G_CTRL, VIDIOC_S_CTRL ........................ 1143
3.2.7.26 ioctl VIDIOC_G_DV_TIMINGS, VIDIOC_S_DV_TIMINGS .......... 1144
3.2.7.27 ioctl VIDIOC_G_EDID, VIDIOC_S_EDID, VIDIOC_SUBDEV_G_EDID, VIDIOC_SUBDEV_S_EDID ... 1149
3.2.7.28 ioctl VIDIOC_G_ENC_INDEX ..................................... 1151
3.2.7.29 ioctl VIDIOC_G_EXT_CTRL, VIDIOC_S_EXT_CTRL, VIDIOC_TRY_EXT_CTRL ... 1153
3.2.7.30 ioctl VIDIOC_G_FBUF, VIDIOC_S_FBUF ........................ 1159
3.2.7.31 ioctl VIDIOC_G_FMT, VIDIOC_S_FMT, VIDIOC_TRY_FMT ....... 1165
3.2.7.32 ioctl VIDIOC_G_FREQUENCY, VIDIOC_S_FREQUENCY .......... 1168
3.2.7.33 ioctl VIDIOC_G_INPUT, VIDIOC_S_INPUT ...................... 1169
3.2.7.34 ioctl VIDIOC_G_JPEGCOMP, VIDIOC_S_JPEGCOMP ................. 1170
3.2.7.35 ioctl VIDIOC_G_MODULATOR, VIDIOC_S_MODULATOR .......... 1172
3.2.7.36 ioctl VIDIOC_G_OUTPUT, VIDIOC_S_OUTPUT .................. 1175
3.2.7.37 ioctl VIDIOC_G_PARM, VIDIOC_S_PARM ........................ 1176
3.2.7.38 ioctl VIDIOC_G_PRIORITY, VIDIOC_S_PRIORITY .............. 1180
3.2.7.39 ioctl VIDIOC_G_SELECTION, VIDIOC_S_SELECTION ........... 1181
3.2.7.40 ioctl VIDIOC_G_SLICED_VBI_CAP ............................... 1184
3.2.7.41 ioctl VIDIOC_G_STD, VIDIOC_S_STD, VIDIOC_SUBDEV_G_STD,
              VIDIOC_SUBDEV_S_STD ........................................... 1186
3.2.7.42 ioctl VIDIOC_G_TUNER, VIDIOC_S_TUNER ..................... 1187
3.2.7.43 ioctl VIDIOC_LOG_STATUS ........................................ 1194
3.2.7.44 ioctl VIDIOC_OVERLAY ........................................... 1195
3.2.7.45 ioctl VIDIOC_PREPARE_BUF ..................................... 1196
3.2.7.46 ioctl VIDIOC_QBUF, VIDIOC_DQBUF ............................. 1197
3.2.7.47 ioctl VIDIOC_QUERYBUF ......................................... 1199
3.2.7.48 ioctl VIDIOC_QUERYCAP .......................................... 1200
3.2.7.49 ioctl VIDIOC_QUERYCTRL, VIDIOC_QUERY_EXT_CTRL and VID-
              IOC_QUERYMENU .................................................... 1205
3.2.7.50 ioctl VIDIOC_QUERY_DV_TIMINGS ................................ 1213
3.2.7.51 ioctl VIDIOC_QUERYSTD, VIDIOC_SUBDEV_QUERYSTD ........... 1214
3.2.7.52 ioctl VIDIOC_REQBUFS ............................................ 1215
3.2.7.53 ioctl VIDIOC_S_HW_FREQ_SEEK .................................. 1218
3.2.7.54 ioctl VIDIOC_STREAMON, VIDIOC_STREAMOFF .................. 1220
3.2.7.55 ioctl VIDIOC_SUBDEV_ENUM_FRAME_INTERVAL .................... 1222
3.2.7.56 ioctl VIDIOC_SUBDEV_ENUM_FRAME_SIZE ........................ 1223
3.2.7.57 ioctl VIDIOC_SUBDEV_ENUM_MBUS_CODE ........................ 1225
3.2.7.58 ioctl VIDIOC_SUBDEV_G_CROP, VIDIOC_SUBDEV_S_CROP .......... 1227
3.2.7.59 ioctl VIDIOC_SUBDEV_G_FMT, VIDIOC_SUBDEV_S_FMT .......... 1228
3.2.7.60 ioctl VIDIOC_SUBDEV_G_FRAME_INTERVAL, VIDIOC_SUBDEV_S_FRAME_INTERVAL, VIDIOC_SUBDEV_S_SELECTION .................................................... 1230
3.2.7.61 ioctl VIDIOC_SUBDEV_G_SELECTION, VIDIOC_SUBDEV_S_SELECTION .................................................... 1232
3.2.7.62 ioctl VIDIOC_SUBDEV_QUERYCAP ................................ 1234
3.2.7.63 ioctl VIDIOC_SUBSCRIBE_EVENT, VIDIOC_UNSUBSCRIBE_EVENT 1235
3.2.7.64 V4L2 mmap() ....................................................... 1237
3.2.7.65 V4L2 munmap() .................................................... 1239
3.2.7.66 V4L2 open() ....................................................... 1240
3.2.7.67 V4L2 poll() ....................................................... 1241
3.2.7.68 V4L2 read() ....................................................... 1243
3.2.7.69 V4L2 select() .................................................... 1244
3.2.7.70 V4L2 write() ..................................................... 1246
3.2.8 Common definitions for V4L2 and V4L2 subdev interfaces ........ 1247
3.2.8.1 Common selection definitions ..................................... 1247
3.2.8.2 Video For Linux Two Header File ................................. 1248
3.2.9 videodev2.h ............................................................. 1248
3.2.10 Video Capture Example ............................................. 1304
3.2.10.1 file: media/v4l/capture.c ...................................... 1304
3.2.11 Video Grabber example using libv4l ............................... 1316
3.2.11.1 file: media/v4l/v4l2grab.c ...................................... 1316
3.2.12 References ............................................................. 1319
3.2.12.1 CEAL 608-E ......................................................... 1319
3.3 Part II - Digital TV API

3.3.1 Introduction

3.3.1.1 What you need to know
3.3.1.2 History
3.3.1.3 Overview
3.3.1.4 Linux Digital TV Devices
3.3.1.5 API include files

3.3.2 Digital TV Frontend API

3.3.2.1 Querying frontend information
3.3.2.2 Querying frontend status and statistics ........................................ 1335
3.3.2.3 Property types ........................................................................... 1335
3.3.2.4 Frontend Function Calls ............................................................. 1372
3.3.3 Digital TV Demux Device ................................................................. 1383
  3.3.3.1 Demux Data Types .................................................................... 1384
  3.3.3.2 Demux Function Calls ............................................................... 1388
3.3.4 Digital TV CA Device ...................................................................... 1407
  3.3.4.1 CA Data Types .......................................................................... 1407
  3.3.4.2 CA Function Calls ..................................................................... 1410
  3.3.4.3 The High level CI API ............................................................... 1417
3.3.5 Digital TV Network API .................................................................. 1419
  3.3.5.1 Digital TV net Function Calls .................................................... 1420
3.3.6 Digital TV Deprecated APIs ............................................................ 1423
  3.3.6.1 Digital TV Frontend legacy API (a. k. a. DVBv3) ........................ 1423
3.3.7 Examples ....................................................................................... 1433
3.3.8 Digital TV uAPI header files ............................................................ 1433
  3.3.8.1 Digital TV uAPI headers ............................................................ 1433
3.3.9 Revision and Copyright ................................................................. 1464
3.3.10 Revision History .......................................................................... 1465
3.4 Part III - Remote Controller API ......................................................... 1465
  3.4.1 Introduction ................................................................................. 1465
  3.4.2 Remote Controller’s sysfs nodes ................................................... 1466
    3.4.2.1 /sys/class/rc/ ....................................................................... 1466
    3.4.2.2 /sys/class/rc/rcN/ ................................................................. 1466
    3.4.2.3 /sys/class/rc/rcN/protocols .................................................. 1466
    3.4.2.4 /sys/class/rc/rcN/filter ......................................................... 1466
    3.4.2.5 /sys/class/rc/rcN/filter_mask ................................................ 1467
    3.4.2.6 /sys/class/rc/rcN/wakeup_protocols ..................................... 1467
    3.4.2.7 /sys/class/rc/rcN/wakeup_filter ............................................ 1467
    3.4.2.8 /sys/class/rc/rcN/wakeup_filter_mask ................................... 1467
  3.4.3 Remote Controller Protocols and Scancodes ................................ 1468
    3.4.3.1 rc-5 (RC_PROTO_RC5) ............................................................ 1468
    3.4.3.2 rc-5-sz (RC_PROTO_RC5_SZ) .................................................. 1468
    3.4.3.3 rc-5x-20 (RC_PROTO_RC5X_20) .......................................... 1469
    3.4.3.4 jvc (RC_PROTO_JVC) .............................................................. 1469
    3.4.3.5 sony-12 (RC_PROTO_SONY12) ............................................. 1469
    3.4.3.6 sony-15 (RC_PROTO_SONY15) .............................................. 1469
    3.4.3.7 sony-20 (RC_PROTO_SONY20) .............................................. 1470
    3.4.3.8 nec (RC_PROTO_NEC) ............................................................ 1470
    3.4.3.9 nec-x (RC_PROTO_NECX) ...................................................... 1470
    3.4.3.10 nec-32 (RC_PROTO_NEC32) ................................................ 1470
    3.4.3.11 sanyo (RC_PROTO_SANYO) ................................................ 1471
    3.4.3.12 mcir2-kbd (RC_PROTO_MCIR2_KBD) .................................. 1471
    3.4.3.13 mcir2-mse (RC_PROTO_MCIR2_MSE) .................................. 1471
    3.4.3.14 rc-6-0 (RC_PROTO_RC6_0) ................................................... 1471

This section contains usage information about media subsystem and its supported drivers. Please see:

Documentation/userspace-api/media/index.rst
- for the userspace APIs used on media devices.

Documentation/driver-api/media/index.rst
- for driver development information and Kernel APIs used by media devices;

### 1.1 The media subsystem

#### 1.1.1 Introduction

The media subsystem consists on Linux support for several different types of devices:

- Audio and video grabbers;
- PC and Laptop Cameras;
- Complex cameras found on Embedded hardware;
- Analog and digital TV;
- HDMI Customer Electronics Control (CEC);
- Multi-touch input devices;
- Remote Controllers;
- Media encoders and decoders.

Due to the diversity of devices, the subsystem provides several different APIs:

- Remote Controller API;
- HDMI CEC API;
- Video4Linux API;
- Media controller API;
- Video4Linux Request API (experimental);
- Digital TV API (also known as DVB API).
1.1.2 Building support for a media device

The first step is to download the Kernel’s source code, either via a distribution-specific source file or via the Kernel’s main git tree\(^1\).

Please notice, however, that, if:

- you’re a braveheart and want to experiment with new stuff;
- if you want to report a bug;
- if you’re developing new patches

you should use the main media development tree master branch:

https://git.linuxtv.org/media_tree.git/

In this case, you may find some useful information at the LinuxTv wiki pages:

1.1.2.1 Configuring the Linux Kernel

You can access a menu of Kernel building options with:

```
$ make menuconfig
```

Then, select all desired options and exit it, saving the configuration.

The changed configuration will be at the .config file. It would look like:

```
...
# CONFIG_RC_CORE is not set
# CONFIG_CEC_CORE is not set
CONFIG_MEDIA_SUPPORT=m
CONFIG_MEDIA_SUPPORT_FILTER=y
...
```

The media subsystem is controlled by those menu configuration options:

```
Device Drivers --->
  <M> Remote Controller support --->
    [ ] HDMI CEC RC integration
    [ ] Enable CEC error injection support
    [*] HDMI CEC drivers --->
  <*> Multimedia support --->
```

The Remote Controller support option enables the core support for remote controllers\(^2\).

The HDMI CEC RC integration option enables integration of HDMI CEC with Linux, allowing to receive data via HDMI CEC as if it were produced by a remote controller directly connected to the machine.

---
\(^1\) The upstream Linux Kernel development tree is located at https://git.kernel.org/pub/scm/linux/kernel/git/torvalds/linux.git/
\(^2\) Remote Controller support should also be enabled if you want to use some TV card drivers that may depend on the remote controller core support.
The HDMI CEC drivers option allow selecting platform and USB drivers that receives and/or
transmits CEC codes via HDMI interfaces\(^3\).

The last option (Multimedia support) enables support for cameras, audio/video grabbers and
TV.

The media subsystem support can either be built together with the main Kernel or as a module.
For most use cases, it is preferred to have it built as modules.

**Note:** Instead of using a menu, the Kernel provides a script with allows enabling configuration
options directly. To enable media support and remote controller support using Kernel modules,
you could use:

```
$ scripts/config -m RC_CORE
$ scripts/config -m MEDIA_SUPPORT
```

### Media dependencies

It should be noticed that enabling the above from a clean config is usually not enough. The
media subsystem depends on several other Linux core support in order to work.

For example, most media devices use a serial communication bus in order to talk with some
peripherals. Such bus is called \(^2\)C (Inter-Integrated Circuit). In order to be able to build
support for such hardware, the \(^2\)C bus support should be enabled, either via menu or with:

```
./scripts/config -m I2C
```

Another example: the remote controller core requires support for input devices, with can be
enabled with:

```
./scripts/config -m INPUT
```

Other core functionality may also be needed (like PCI and/or USB support), depending on the
specific driver(s) you would like to enable.

### Enabling Remote Controller Support

The remote controller menu allows selecting drivers for specific devices. It’s menu looks like this:

```
--- Remote Controller support
<*> Compile Remote Controller keymap modules
[*] LIRC user interface
[*] Support for eBPF programs attached to lirc devices
[*] Remote controller decoders --->
[*] Remote Controller devices --->
```

---

\(^3\) Please notice that the DRM subsystem also have drivers for GPUs that use the media HDMI CEC support.
Those GPU-specific drivers are selected via the Graphics support menu, under Device Drivers.
When a GPU driver supports HDMI CEC, it will automatically enable the CEC core support at the media subsystem.
The Compile Remote Controller keymap modules option creates key maps for several popular remote controllers.

The LIRC user interface option adds enhanced functionality when using the lirc program, by enabling an API that allows userspace to receive raw data from remote controllers.

The Support for eBPF programs attached to lirc devices option allows the usage of special programs (called eBPF) that would allow applications to add extra remote controller decoding functionality to the Linux Kernel.

The Remote controller decoders option allows selecting the protocols that will be recognized by the Linux Kernel. Except if you want to disable some specific decoder, it is suggested to keep all sub-options enabled.

The Remote Controller devices allows you to select the drivers that would be needed to support your device.

The same configuration can also be set via the script/config script. So, for instance, in order to support the ITE remote controller driver (found on Intel NUCs and on some ASUS x86 desktops), you could do:

```
$ scripts/config -e INPUT
$ scripts/config -e ACPI
$ scripts/config -e MODULES
$ scripts/config -m RC_CORE
$ scripts/config -e RC_DEVICES
$ scripts/config -e RC_DECODERS
$ scripts/config -m IR_RC5_DECODER
$ scripts/config -m IR_ITE_CIR
```

### Enabling HDMI CEC Support

The HDMI CEC support is set automatically when a driver requires it. So, all you need to do is to enable support either for a graphics card that needs it or by one of the existing HDMI drivers.

The HDMI-specific drivers are available at the HDMI CEC drivers menu:

```
--- HDMI CEC drivers
< > ChromeOS EC CEC driver
< > Amlogic Meson A0 CEC driver
< > Amlogic Meson G12A A0 CEC driver
< > Generic GPIO-based CEC driver
< > Samsung SSP CEC driver
< > STMicroelectronics STiH4xx HDMI CEC driver
< > STMicroelectronics STM32 HDMI CEC driver
< > Tegra HDMI CEC driver
< > SECO Boards HDMI CEC driver
[ ] SECO Boards IR RC5 support
< > Pulse Eight HDMI CEC
< > RainShadow Tech HDMI CEC
```

---

4 The above contents is just an example. The actual options for HDMI devices depends on the system’s architecture and may vary on new Kernels.
Enabling Media Support

The Media menu has a lot more options than the remote controller menu. Once selected, you should see the following options:

```plaintext
--- Media support
[ ] Filter media drivers
[*] Autoselect ancillary drivers
  Media device types --->
  Media core support --->
  Video4Linux options --->
  Media controller options --->
  Digital TV options --->
  HDMI CEC options --->
  Media drivers --->
  Media ancillary drivers --->
```

Except if you know exactly what you’re doing, or if you want to build a driver for a SoC platform, it is strongly recommended to keep the Autoselect ancillary drivers option turned on, as it will auto-select the needed I²C ancillary drivers.

There are now two ways to select media device drivers, as described below.

Filter media drivers menu

This menu is meant to easy setup for PC and Laptop hardware. It works by letting the user to specify what kind of media drivers are desired, with those options:

```plaintext
[ ] Cameras and video grabbers
[ ] Analog TV
[ ] Digital TV
[ ] AM/FM radio receivers/transmitters
[ ] Software defined radio
[ ] Platform-specific devices
[ ] Test drivers
```

So, if you want to add support to a camera or video grabber only, select just the first option. Multiple options are allowed.

Once the options on this menu are selected, the building system will auto-select the needed core drivers in order to support the selected functionality.

**Note:** Most TV cards are hybrid: they support both Analog TV and Digital TV.

If you have an hybrid card, you may need to enable both Analog TV and Digital TV at the menu.

When using this option, the defaults for the media support core functionality are usually good enough to provide the basic functionality for the driver. Yet, you could manually enable some desired extra (optional) functionality using the settings under each of the following Media support sub-menus:

1.1. The media subsystem
Once you select the desired filters, the drivers that matches the filtering criteria will be available at the Media support->Media drivers sub-menu.

**Media Core Support menu without filtering**

If you disable the Filter media drivers menu, all drivers available for your system whose dependencies are met should be shown at the Media drivers menu.

Please notice, however, that you should first ensure that the Media Core Support menu has all the core functionality your drivers would need, as otherwise the corresponding device drivers won’t be shown.

**Example**

In order to enable modular support for one of the boards listed on *this table*, with modular media core modules, the .config file should contain those lines:

```
CONFIG_MODULES=y
CONFIG_USB=y
CONFIG_I2C=y
CONFIG_INPUT=y
CONFIG_RC_CORE=m
CONFIG_MEDIA_SUPPORT=m
CONFIG_MEDIA_SUPPORT_FILTER=y
CONFIG_MEDIA_ANALOG_TV_SUPPORT=y
CONFIG_MEDIA_DIGITAL_TV_SUPPORT=y
CONFIG_MEDIA_USB_SUPPORT=y
CONFIG_VIDEO_CX231XX=y
CONFIG_VIDEO_CX231XX_DVB=y
```

### 1.1.2.2 Building and installing a new Kernel

Once the .config file has everything needed, all it takes to build is to run the make command:

```
$ make
```

And then install the new Kernel and its modules:

```
$ sudo make modules_install
$ sudo make install
```
1.1.2.3 Building just the new media drivers and core

Running a new development Kernel from the development tree is usually risky, because it may have experimental changes that may have bugs. So, there are some ways to build just the new drivers, using alternative trees.

There is the Linux Kernel backports project, with contains newer drivers meant to be compiled against stable Kernels.

The LinuxTV developers, with are responsible for maintaining the media subsystem also maintains a backport tree, with just the media drivers daily updated from the newest kernel. Such tree is available at: https://git.linuxtv.org/media_build.git/

It should be noticed that, while it should be relatively safe to use the media_build tree for testing purposes, there are not warranties that it would work (or even build) on a random Kernel. This tree is maintained using a “best-efforts” principle, as time permits us to fix issues there.

If you notice anything wrong on it, feel free to submit patches at the Linux media subsystem’s mailing list: media@vger.kernel.org. Please add [PATCH media-build] at the e-mail’s subject if you submit a new patch for the media-build.

Before using it, you should run:

```
$ ./build
```

**Note:**

1) you may need to run it twice if the media-build tree gets updated;
2) you may need to do a make distclean if you had built it in the past for a different Kernel version than the one you’re currently using;
3) by default, it will use the same config options for media as the ones defined on the Kernel you’re running.

In order to select different drivers or different config options, use:

```
$ make menuconfig
```

Then, you can build and install the new drivers:

```
$ make && sudo make install
```

This will override the previous media drivers that your Kernel were using.
1.1.3 Infrared remote control support in video4linux drivers

Authors: Gerd Hoffmann, Mauro Carvalho Chehab

1.1.3.1 Basics

Most analog and digital TV boards support remote controllers. Several of them have a micro-
processor that receives the IR carriers, convert into pulse/space sequences and then to scan
codes, returning such codes to userspace (“scan code mode”). Other boards return just the
pulse/space sequences (“raw mode”).

The support for remote controller in scan code mode is provided by the standard Linux input
layer. The support for raw mode is provided via LIRC.

In order to check the support and test it, it is suggested to download the v4l-utils. It provides
two tools to handle remote controllers:

- ir-keytable: provides a way to query the remote controller, list the protocols it supports,
  enable in-kernel support for IR decoder or switch the protocol and to test the reception of
  scan codes;
- ir-ctl: provide tools to handle remote controllers that support raw mode via LIRC interface.

Usually, the remote controller module is auto-loaded when the TV card is detected. However,
for a few devices, you need to manually load the ir-kbd-i2c module.

1.1.3.2 How it works

The modules register the remote as keyboard within the linux input layer, i.e. you’ll see the
keys of the remote as normal key strokes (if CONFIG_INPUT_KEYBOARD is enabled).

Using the event devices (CONFIG_INPUT_EVDEV) it is possible for applications to access the
remote via /dev/input/event<n> devices. The udev/systemd will automatically create the de-
vices. If you install the v4l-utils, it may also automatically load a different keytable than the
default one. Please see v4l-utils ir-keytable.1 man page for details.

The ir-keytable tool is nice for trouble shooting, i.e. to check whenever the input device is
really present, which of the devices it is, check whenever pressing keys on the remote actually
generates events and the like. You can also use any other input utility that changes the keymaps,
like the input kbd utility.

Using with lircd

The latest versions of the lircd daemon supports reading events from the linux input layer (via
event device). It also supports receiving IR codes in lirc mode.
Using without lircd

Xorg recognizes several IR keycodes that have its numerical value lower than 247. With the advent of Wayland, the input driver got updated too, and should now accept all keycodes. Yet, you may want to just reassign the keycodes to something that your favorite media application likes.

This can be done by setting v4l-utils to load your own keytable in runtime. Please read ir-keytable.1 man page for details.

1.1.4 Digital TV

1.1.4.1 Using the Digital TV Framework

Introduction

One significant difference between Digital TV and Analogue TV that the unwary (like myself) should consider is that, although the component structure of DVB-T cards are substantially similar to Analogue TV cards, they function in substantially different ways.

The purpose of an Analogue TV is to receive and display an Analogue Television signal. An Analogue TV signal (otherwise known as composite video) is an analogue encoding of a sequence of image frames (25 frames per second in Europe) rasterised using an interlacing technique. Interlacing takes two fields to represent one frame. Therefore, an Analogue TV card for a PC has the following purpose:

- Tune the receiver to receive a broadcast signal
- Demodulate the broadcast signal
- Demultiplex the analogue video signal and analogue audio signal.

Note: some countries employ a digital audio signal embedded within the modulated composite analogue signal - using NICAM signaling.)

- Digitize the analogue video signal and make the resulting datastream available to the data bus.

The digital datastream from an Analogue TV card is generated by circuitry on the card and is often presented uncompressed. For a PAL TV signal encoded at a resolution of 768x576 24-bit color pixels over 25 frames per second - a fair amount of data is generated and must be processed by the PC before it can be displayed on the video monitor screen. Some Analogue TV cards for PCs have onboard MPEG2 encoders which permit the raw digital data stream to be presented to the PC in an encoded and compressed form - similar to the form that is used in Digital TV.

The purpose of a simple budget digital TV card (DVB-T,C or S) is to simply:

- Tune the receiver to receive a broadcast signal. * Extract the encoded digital datastream from the broadcast signal.
- Make the encoded digital datastream (MPEG2) available to the data bus.

1.1. The media subsystem
The significant difference between the two is that the tuner on the analogue TV card spits out an Analogue signal, whereas the tuner on the digital TV card spits out a compressed encoded digital datastream. As the signal is already digitised, it is trivial to pass this datastream to the PC databus with minimal additional processing and then extract the digital video and audio datastreams passing them to the appropriate software or hardware for decoding and viewing.

**Getting the card going**

The Device Driver API for DVB under Linux will the following device nodes via the devfs filesystem:

- /dev/dvb/adapter0/demux0
- /dev/dvb/adapter0/dvr0
- /dev/dvb/adapter0/frontend0

The /dev/dvb/adapter0/dvr0 device node is used to read the MPEG2 Data Stream and the /dev/dvb/adapter0/frontend0 device node is used to tune the frontend tuner module. The /dev/dvb/adapter0/demux0 is used to control what programs will be received.

Depending on the card’s feature set, the Device Driver API could also expose other device nodes:

- /dev/dvb/adapter0/ca0
- /dev/dvb/adapter0/audio0
- /dev/dvb/adapter0/net0
- /dev/dvb/adapter0/osd0
- /dev/dvb/adapter0/video0

The /dev/dvb/adapter0/ca0 is used to decode encrypted channels. The other device nodes are found only on devices that use the av7110 driver, with is now obsoleted, together with the extra API whose such devices use.

**Receiving a digital TV channel**

This section attempts to explain how it works and how this affects the configuration of a Digital TV card.

On this example, we’re considering tuning into DVB-T channels in Australia, at the Melbourne region.

The frequencies broadcast by Mount Dandenong transmitters are, currently:

Table 1. Transponder Frequencies Mount Dandenong, Vic, Aus.
The digital TV Scan utilities (like dvbv5-scan) have use a set of compiled-in defaults for various countries and regions. Those are currently provided as a separate package, called dtv-scan-tables. It’s git tree is located at LinuxTV.org:

https://git.linuxtv.org/dtv-scan-tables.git/

If none of the tables there suit, you can specify a data file on the command line which contains the transponder frequencies. Here is a sample file for the above channel transponders, in the old “channel” format:

```
# Data file for DVB scan program
#
# C Frequency SymbolRate FEC QAM
# S Frequency Polarisation SymbolRate FEC
# T Frequency Bandwidth FEC FEC2 QAM Mode Guard Hier

T 1775000000 7MHz AUTO AUTO QAM64 8k 1/16 NONE
T 1845000000 7MHz AUTO AUTO QAM64 8k 1/8 NONE
T 1916250000 7MHz AUTO AUTO QAM64 8k 1/16 NONE
T 2195000000 7MHz AUTO AUTO QAM64 8k 1/16 NONE
T 2265000000 7MHz AUTO AUTO QAM64 8k 1/16 NONE
T 5576250000 7MHz AUTO AUTO QPSK 8k 1/16 NONE
```

Nowadays, we prefer to use a newer format, with is more verbose and easier to understand. With the new format, the “Seven” channel transponder’s data is represented by:

```
[Seven]
DELIVERY_SYSTEM = DVBT
FREQUENCY = 1775000000
BANDWIDTH_HZ = 7000000
CODE_RATE_HP = AUTO
CODE_RATE_LP = AUTO
MODULATION = QAM/64
TRANSMISSION_MODE = 8K
GUARD_INTERVAL = 1/16
HIERARCHY = NONE
INVERSION = AUTO
```

For an updated version of the complete table, please see:

https://git.linuxtv.org/dtv-scan-tables.git/tree/dvb-t/au-Melbourne

When the Digital TV scanning utility runs, it will output a file containing the information for all the audio and video programs that exists into each channel’s transponders which the card’s frontend can lock onto. (i.e. any whose signal is strong enough at your antenna).

Here’s the output of the dvbv5 tools from a channel scan took from Melbourne:

1.1. The media subsystem
1.1.4.2 Digital TV Conditional Access Interface

**Note:** This documentation is outdated.

This document describes the usage of the high level CI API as in accordance to the Linux DVB API. This is not a documentation for the existing low level CI API.

**Note:** For the Twinhan/Twinhan clones, the dst_ca module handles the CI hardware handling. This module is loaded automatically if a CI (Common Interface, that holds the CAM (Conditional Access Module) is detected.

**ca_zap**

A userspace application, like ca_zap is required to handle encrypted MPEG-TS streams. The ca_zap userland application is in charge of sending the descrambling related information to the Conditional Access Module (CAM).

This application requires the following to function properly as of now.

a) Tune to a valid channel, with szap.
   
   eg: $ szap -c channels.conf -r "TMC" -x

b) A channels.conf containing a valid PMT PID
   

   here 278 is a valid PMT PID. the rest of the values are the same ones that szap uses.

c) After running a szap, you have to run ca_zap, for the descrambler to function,
   
   eg: $ ca_zap channels.conf "TMC"

d) Hopefully enjoy your favourite subscribed channel as you do with a FTA card.

**Note:** Currently ca_zap, and dst_test, both are meant for demonstration purposes only, they can become full fledged applications if necessary.

**Cards that fall in this category**

At present the cards that fall in this category are the Twinhan and its clones, these cards are available as VVMER, Tomato, Hercules, Orange and so on.
CI modules that are supported

The CI module support is largely dependent upon the firmware on the cards. Some cards do support almost all of the available CI modules. There is nothing much that can be done in order to make additional CI modules working with these cards.

Modules that have been tested by this driver at present are

1. Irdeto 1 and 2 from SCM
2. Viaccess from SCM
3. Dragoncam

1.1.4.3 FAQ

Note:

1. With Digital TV, a single physical channel may have different contents inside it. The specs call each one as a service. This is what a TV user would call “channel”. So, in order to avoid confusion, we’re calling transponders as the physical channel on this FAQ, and services for the logical channel.

2. The LinuxTV community maintains some Wiki pages with contain a lot of information related to the media subsystem. If you don’t find an answer for your needs here, it is likely that you’ll be able to get something useful there. It is hosted at:

https://www.linuxtv.org/wiki/

Some very frequently asked questions about Linux Digital TV support

1. The signal seems to die a few seconds after tuning.

   It’s not a bug, it’s a feature. Because the frontends have significant power requirements (and hence get very hot), they are powered down if they are unused (i.e. if the frontend device is closed). The dvb-core module parameter `dvb_shutdown_timeout` allow you to change the timeout (default 5 seconds). Setting the timeout to 0 disables the timeout feature.

2. How can I watch TV?

   Together with the Linux Kernel, the Digital TV developers support some simple utilities which are mainly intended for testing and to demonstrate how the DVB API works. This is called DVB v5 tools and are grouped together with the v4l-utils git repository:

   https://git.linuxtv.org/v4l-utils.git/

   You can find more information at the LinuxTV wiki:

   https://www.linuxtv.org/wiki/index.php/DVBv5_Tools

   The first step is to get a list of services that are transmitted.

   This is done by using several existing tools. You can use for example the `dvbv5-scan` tool. You can find more information about it at:
There are some other applications like w_scan\(^1\) that do a blind scan, trying hard to find all possible channels, but those consumes a large amount of time to run.

Also, some applications like kaffeine have their own code to scan for services. So, you don’t need to use an external application to obtain such list.

Most of such tools need a file containing a list of channel transponders available on your area. So, LinuxTV developers maintain tables of Digital TV channel transponders, receiving patches from the community to keep them updated.

This list is hosted at:

```
https://git.linuxtv.org/dtv-scan-tables.git
```

And packaged on several distributions.

Kaffeine has some blind scan support for some terrestrial standards. It also relies on DTV scan tables, although it contains a copy of it internally (and, if requested by the user, it will download newer versions of it).

If you are lucky you can just use one of the supplied channel transponders. If not, you may need to seek for such info at the Internet and create a new file. There are several sites with contains physical channel lists. For cable and satellite, usually knowing how to tune into a single channel is enough for the scanning tool to identify the other channels. On some places, this could also work for terrestrial transmissions.

Once you have a transponders list, you need to generate a services list with a tool like dvbv5-scan.

Almost all modern Digital TV cards don’t have built-in hardware MPEG-decoders. So, it is up to the application to get a MPEG-TS stream provided by the board, split it into audio, video and other data and decode.

### 3. Which Digital TV applications exist?

Several media player applications are capable of tuning into digital TV channels, including Kaffeine, Vlc, mplayer and MythTV.

Kaffeine aims to be very user-friendly, and it is maintained by one of the Kernel driver developers.

A comprehensive list of those and other apps can be found at:

```
https://www.linuxtv.org/wiki/index.php/TV_Related_Software
```

Some of the most popular ones are linked below:

- **KDE media player**, focused on Digital TV support

```
https://kde.org/applications/multimedia/org.kde.kaffeine
```

- **Klaus Schmidinger's Video Disk Recorder**

```
https://www.linuxtv.org/vdrwiki/index.php/Main_Page
```

- Digital TV and other media-related applications and Kernel drivers. The v4l-utils package there contains several swiss knife tools for using with Digital TV.

Xine

MythTV - analog TV and digital TV PVR

DVB sniffer program to monitor, analyze, debug, dump or view dvb/mpeg/dsm-cc/mhp stream information (TS, PES, SECTION)

Can’t get a signal tuned correctly

That could be due to a lot of problems. On my personal experience, usually TV cards need stronger signals than TV sets, and are more sensitive to noise. So, perhaps you just need a better antenna or cabling. Yet, it could also be some hardware or driver issue.

For example, if you are using a Technotrend/Hauppauge DVB-C card without analog module, you might have to use module parameter adac=-1 (dvb-ttpci.o).

Please see the FAQ page at linuxtv.org, as it could contain some valuable information:

https://www.linuxtv.org/wiki/index.php/FAQ_%26_Troubleshooting

If that doesn’t work, check at the linux-media ML archives, to see if someone else had a similar problem with your hardware and/or digital TV service provider:

https://lore.kernel.org/linux-media/

If none of this works, you can try sending an e-mail to the linux-media ML and see if someone else could shed some light. The e-mail is linux-media AT vger.kernel.org.

The dvb_net device doesn’t give me any packets at all

Run tcpdump on the dvb0_0 interface. This sets the interface into promiscuous mode so it accepts any packets from the PID you have configured with the dvbnet utility. Check if there are any packets with the IP addr and MAC addr you have configured with ifconfig or with ip addr.

If tcpdump doesn’t give you any output, check the statistics which ifconfig or netstat -ni outputs. (Note: If the MAC address is wrong, dvb_net won’t get any input; thus you have to run tcpdump before checking the statistics.) If there are no packets at all then maybe the PID is wrong. If there are error packets, then either the PID is wrong or the stream does not conform to the MPE standard (EN 301 192, http://www.etsi.org/). You can use e.g. dvbsnoop for debugging.

The dvb_net device doesn’t give me any multicast packets
Check your routes if they include the multicast address range. Additionally make sure that “source validation by reversed path lookup” is disabled:

```
$ echo 0 > /proc/sys/net/ipv4/conf/dvb0/rp_filter
```

7. What are all those modules that need to be loaded?

In order to make it more flexible and support different hardware combinations, the media subsystem is written on a modular way.

So, besides the Digital TV hardware module for the main chipset, it also needs to load a frontend driver, plus the Digital TV core. If the board also has remote controller, it will also need the remote controller core and the remote controller tables. The same happens if the board has support for analog TV: the core support for video4linux need to be loaded.

The actual module names are Linux-kernel version specific, as, from time to time, things change, in order to make the media support more flexible.

### 1.1.4.4 References

The main development site and GIT repository for Digital TV drivers is [https://linuxtv.org](https://linuxtv.org).

The DVB mailing list linux-dvb is hosted at vger. Please see [http://vger.kernel.org/vger-lists.html#linux-media](http://vger.kernel.org/vger-lists.html#linux-media) for details.

There are also some other old lists hosted at: [https://linuxtv.org/lists.php](https://linuxtv.org/lists.php). If you’re interested on that for historic reasons, please check the archive at [https://linuxtv.org/pipermail/linux-dvb/](https://linuxtv.org/pipermail/linux-dvb/).

The media subsystem Wiki is hosted at [https://linuxtv.org/wiki/](https://linuxtv.org/wiki/). There, you’ll find lots of information, from both development and usage of media boards. Please check it before asking newbie questions on the mailing list or IRC channels.

The API documentation is documented at the Kernel tree. You can find it in both html and pdf formats, together with other useful documentation at:

- [https://linuxtv.org/docs.php](https://linuxtv.org/docs.php).

You may also find useful material at [https://linuxtv.org/downloads/](https://linuxtv.org/downloads/).

In order to get the needed firmware for some drivers to work, there’s a script at the kernel tree, at scripts/get_dvb_firmware.

### 1.1.5 Cards List

The media subsystem provide support for lots of PCI and USB drivers, plus platform-specific drivers. It also contains several ancillary I²C drivers.

The platform-specific drivers are usually present on embedded systems, or are supported by the main board. Usually, setting them is done via OpenFirmware or ACPI.

The PCI and USB drivers, however, are independent of the system’s board, and may be added/removed by the user.

You may also take a look at [https://linuxtv.org/wiki/index.php/Hardware_Device_Information](https://linuxtv.org/wiki/index.php/Hardware_Device_Information) for more details about supported cards.
1.1.5.1 USB drivers

The USB boards are identified by an identification called USB ID.

The `lsusb` command allows identifying the USB IDs:

```
$ lsusb
...
Bus 001 Device 015: ID 046d:082d Logitech, Inc. HD Pro Webcam C920
Bus 001 Device 074: ID 2040:b131 Hauppauge
Bus 001 Device 075: ID 2013:024f PCTV Systems nanoStick T2 290e
...
```

Newer camera devices use a standard way to expose themselves as such, via USB Video Class. Those cameras are automatically supported by the `uvc-driver`.

Older cameras and TV USB devices uses USB Vendor Classes: each vendor defines its own way to access the device. This section contains card lists for such vendor-class devices.

While this is not as common as on PCI, sometimes the same USB ID is used by different products. So, several media drivers allow passing a `card=` parameter, in order to setup a card number that would match the correct settings for an specific product type.

The current supported USB cards (not including staging drivers) are listed below

1 some of the drivers have sub-drivers, not shown at this table. In particular, gspca driver has lots of sub-drivers, for cameras not supported by the USB Video Class (UVC) driver, as shown at [gspca card list](#).

1.1. The media subsystem 61
1.1.5.2 PCI drivers

The PCI boards are identified by an identification called PCI ID. The PCI ID is actually composed by two parts:

- Vendor ID and device ID;
- Subsystem ID and Subsystem device ID;

The `lspci -nn` command allows identifying the vendor/device PCI IDs:

```
$ lspci -nn
... 
00:0a.0 Multimedia controller [0480]: Philips Semiconductors SAA7131/SAA7133/SAA7135
  Video Broadcast Decoder [1131:7133] (rev d1)
00:0b.0 Multimedia controller [0480]: Brooktree Corporation Bt878 Audio Capture
  [109e:0878] (rev 11)
01:00.0 Multimedia video controller [0400]: Conexant Systems, Inc. CX23887/8 PCIe
  Broadcast Audio and Video Decoder with 3D Comb [14f1:8880] (rev 0f)
02:01.0 Multimedia video controller [0400]: Internext Compression Inc iTVC15
  (CX23415) Video Decoder [4444:0803] (rev 01)
02:02.0 Multimedia video controller [0400]: Conexant Systems, Inc. CX23418 Single-
  Chip MPEG-2 Encoder with Integrated Analog Video/Broadcast Audio Decoder [14f1:5b7a]
02:03.0 Multimedia video controller [0400]: Brooktree Corporation Bt878 Video Capture
  [109e:036e] (rev 11)
... 
```

The subsystem IDs can be obtained using `lspci -vn`

```
$ lspci -vn
... 
00:0a.0 0480: 1131:7133 (rev d1)
  Subsystem: 1461:f01d
  Flags: bus master, medium devsel, latency 32, IRQ 209
  Memory at e2002000 (32-bit, non-prefetchable) [size=2K]
  Capabilities: [40] Power Management version 2
... 
```

At the above example, the first card uses the saa7134 driver, and has a vendor/device PCI ID equal to 1131:7133 and a PCI subsystem ID equal to 1461:f01d (see Saa7134 card list).

Unfortunately, sometimes the same PCI subsystem ID is used by different products. So, several media drivers allow passing a `card=` parameter, in order to setup a card number that would match the correct settings for an specific board.

The current supported PCI/PCIe cards (not including staging drivers) are listed below.

**CX18 cards list**

Those cards are supported by cx18 driver:

- Hauppauge HVR-1600 (ESMT memory)
- Hauppauge HVR-1600 (Samsung memory)
- Compro VideoMate H900
- Yuan MPC718 MiniPCI DVB-T/Analog
- Conexant Raptor PAL/SECAM
- Toshiba Qosmio DVB-T/Analog
- Leadtek WinFast PVR2100
- Leadtek WinFast DVR3100
- GoTView PCI DVD3 Hybrid
- Hauppauge HVR-1600 (s5h1411/tda18271)

1.1.5.3 Platform drivers

There are several drivers that are focused on providing support for functionality that are already included at the main board, and don’t use neither USB nor PCI bus. Those drivers are called platform drivers, and are very popular on embedded devices. The current supported of platform drivers (not including staging drivers) are listed below

<table>
<thead>
<tr>

The \( \text{I}^{2}\text{C} \) bus is a three-wires bus used internally at the media cards for communication between different chips. While the bus is not visible to the Linux Kernel, drivers need to send and receive commands via the bus. The Linux Kernel driver abstraction has support to implement different drivers for each component inside an \( \text{I}^{2}\text{C} \) bus, as if the bus were visible to the main system board.

One of the problems with \( \text{I}^{2}\text{C} \) devices is that sometimes the same device may work with different \( \text{I}^{2}\text{C} \) hardware. This is common, for example, on devices that comes with a tuner for North America market, and another one for Europe. Some drivers have a `tuner=` modprobe parameter to allow using a different tuner number in order to address such issue.

The current supported of \( \text{I}^{2}\text{C} \) drivers (not including staging drivers) are listed below.

**Frontend drivers**

**Note:**

1) There is no guarantee that every frontend driver works out of the box with every card, because of different wiring.

2) The demodulator chips can be used with a variety of tuner.PLL chips, and not all combinations are supported. Often the demodulator and tuner.PLL chip are inside a metal box for shielding, and the whole metal box has its own part number.

<td>Virtual Video Test Driver</td>
</tr>
</tbody>
</table>
1.1.6 Video4Linux (V4L) driver-specific documentation

1.1.6.1 The bttv driver

Release notes for bttv

You’ll need at least these config options for bttv:

```bash
./scripts/config -e PCI
./scripts/config -m I2C
./scripts/config -m INPUT
./scripts/config -m MEDIA_SUPPORT
./scripts/config -e MEDIA_PCI_SUPPORT
./scripts/config -e MEDIA_ANALOG_TV_SUPPORT
./scripts/config -e MEDIA_DIGITAL_TV_SUPPORT
./scripts/config -e MEDIA_RADIO_SUPPORT
./scripts/config -e RC_CORE
./scripts/config -m VIDEO_BT848
```

If your board has digital TV, you’ll also need:

```bash
./scripts/config -m DVB_BT8XX
```

In this case, please see Documentation/admin-guide/media/bt8xx.rst for additional notes.

Make bttv work with your card

If you have bttv compiled and installed, just booting the Kernel should be enough for it to try probing it. However, depending on the model, the Kernel may require additional information about the hardware, as the device may not be able to provide such info directly to the Kernel.

If it doesn’t bttv likely could not autodetect your card and needs some insmod options. The most important insmod option for bttv is “card=n” to select the correct card type. If you get video but no sound you’ve very likely specified the wrong (or no) card type. A list of supported cards is in Documentation/admin-guide/media/bttv-cardlist.rst.

If bttv takes very long to load (happens sometimes with the cheap cards which have no tuner), try adding this to your modules configuration file (usually, it is either `/etc/modules.conf` or some file at `/etc/modules-load.d/`, but the actual place depends on your distribution):

```bash
options i2c-algo-bit bit_test=1
```

Some cards may require an extra firmware file to work. For example, for the WinTV/PVR you need one firmware file from its driver CD, called: `hcwamc.rbf`. It is inside a self-extracting zip file called `pvr45xxx.exe`. Just placing it at the `/etc/firmware` directory should be enough for it to be autoloaded during the driver’s probing mode (e. g. when the Kernel boots or when the driver is manually loaded via `modprobe` command).

If your card isn’t listed in Documentation/admin-guide/media/bttv-cardlist.rst or if you have trouble making audio work, please read `Still doesn’t work?`.

---

1.1. The media subsystem
Autodetecting cards

bttv uses the PCI Subsystem ID to autodetect the card type. lspci lists the Subsystem ID in the second line, looks like this:

```
00:0a.0 Multimedia video controller: Brooktree Corporation Bt878 (rev 02)
    Subsystem: Hauppauge computer works Inc. WinTV/GO
    Flags: bus master, medium devsel, latency 32, IRQ 5
    Memory at e2000000 (32-bit, prefetchable) [size=4K]
```

only bt878-based cards can have a subsystem ID (which does not mean that every card really has one). bt848 cards can’t have a Subsystem ID and therefore can’t be autodetected. There is a list with the ID’s at Documentation/admin-guide/media/bttv-cardlist.rst (in case you are interested or want to mail patches with updates).

Still doesn’t work?

I do NOT have a lab with 30+ different grabber boards and a PAL/NTSC/SECAM test signal generator at home, so I often can’t reproduce your problems. This makes debugging very difficult for me.

If you have some knowledge and spare time, please try to fix this yourself (patches very welcome of course...) You know: The linux slogan is “Do it yourself”.

There is a mailing list at http://vger.kernel.org/vger-lists.html#linux-media

If you have trouble with some specific TV card, try to ask there instead of mailing me directly. The chance that someone with the same card listens there is much higher...

For problems with sound: There are a lot of different systems used for TV sound all over the world. And there are also different chips which decode the audio signal. Reports about sound problems (“stereo doesn’t work”) are pretty useless unless you include some details about your hardware and the TV sound scheme used in your country (or at least the country you are living in).

Modprobe options

**Note:** The following argument list can be outdated, as we might add more options if ever needed. In case of doubt, please check with `modinfo <module>`.

This command prints various information about a kernel module, among them a complete and up-to-date list of insmod options.

bttv

The bt848/878 (grabber chip) driver

insmod args:

```
card=n  card type, see CARDLIST for a list.
tuner=n  tuner type, see CARDLIST for a list.
radio=0/1 card supports radio
```
###_pll=0/1/2 pll settings

0: don't use PLL  
1: 28 MHz crystal installed  
2: 35 MHz crystal installed

### triton1=0/1 for Triton1 (+others) compatibility

### vsfx=0/1 yet another chipset bug compatibility bit
see README.quirks for details on these two.

### bigendian=n Set the endianness of the gfx framebuffer.  
Default is native endian.

### fieldnr=0/1 Count fields.  
Some TV descrambling software needs this, for others it only generates  
50 useless IRQs/sec.  default is 0 (off).

### autoload=0/1  
a autoload helper modules (tuner, audio).  
default is 1 (on).

### bttv_verbose=0/1/2 verbose level (at insmod time, while  
looking at the hardware).  default is 1.

### bttv_debug=0/1  
debug messages (for capture).  
default is 0 (off).

### irq_debug=0/1  
irq handler debug messages.  
default is 0 (off).

### gbuffers=2-32  
number of capture buffers for mmap'ed capture.  
default is 4.

### gbufsize= size of capture buffers.  default and  
maximum value is 0x208000 (~2MB)

### no_overlay=0 Enable overlay on broken hardware.  There  
some chipsets (SIS for example) which  
are known to have problems with the PCI DMA  
push used by bttv.  bttv will disable overlay  
by default on this hardware to avoid crashes.  
With this insmod option you can override this.

### no_overlay=1 Disable overlay.  It should be used by broken  
hardware that doesn't support PCI2PCI direct  
transfers.

### automute=0/1 Automatically mutes the sound if there is  
no TV signal, on by default.  You might try  
to disable this if you have bad input signal  
quality which leading to unwanted sound  
dropouts.

### chroma_agc=0/1  
AGC of chroma signal, off by default.

### adc_crush=0/1  
Luminance ADC crush, on by default.

### i2c_udelay=  
Allow reduce I2C speed.  Default is 5 usecs  
(meaning 66,67 Kbps).  The default is the  
maximum supported speed by kernel bitbang  
algorithm.  You may use lower numbers, if I2C  
messages are lost (16 is known to work on  
all supported cards).

### bttv_gpio=0/1  
gpiomask=  
audiomask=  
audiomux=  
See Sound-FAQ for a detailed description.

---

### 1.1. The media subsystem
(for multiple boards).

**tuner** The tuner driver. You need this unless you want to use only with a camera or the board doesn't provide analog TV tuning.

**insmod args:**

- `debug=1`: print some debug info to the syslog
- `type=n`: type of the tuner chip. `n` as follows: see CARDLIST for a complete list.
- `pal=[bdgil]`: select PAL variant (used for some tuners only, important for the audio carrier).

**tvaudio** Provide a single driver for all simple i2c audio control chips (tda/tea*).

**insmod args:**

- `tda8425 = 1`: enable/disable the support for the various chips.
- `tda9840 = 1`: The tea6300 can't be autodetected and is therefore off by default, if you have this one on your card (STB uses these)
- `tda9855 = 1`: you have to enable it explicitly.
- `tda9873 = 1`: The tea6300 can't be autodetected and is therefore off by default, if you have this one on your card (STB uses these)
- `tda9874a = 1`: you have to enable it explicitly.
- `tea6300 = 0`: The two tda985x chips use the same i2c address and can't be distinguished from each other, you might have to disable the wrong one.
- `tea6420 = 1`: The two tda985x chips use the same i2c address and can't be distinguished from each other, you might have to disable the wrong one.
- `debug = 1`: print debug messages

**msp3400** The driver for the msp34xx sound processor chips. If you have a stereo card, you probably want to insmod this one.

**insmod args:**

- `debug=1/2`: print some debug info to the syslog, 2 is more verbose.
- `simple=1`: Use the ”short programming” method. Newer msp34xx versions support this. You need this for dbx stereo. Default is on if supported by the chip.
- `once=1`: Don't check the TV-stations Audio mode every few seconds, but only once after channel switches.
- `amsound=1`: Audio carrier is AM/NICAM at 6.5 Mhz. This should improve things for french people, the carrier autoscan seems to work with FM only...
If the box freezes hard with bttv

It might be a bttv driver bug. It also might be bad hardware. It also might be something else ...

Just mailing me “bttv freezes” isn’t going to help much. This README has a few hints how you can help to pin down the problem.

bttv bugs

If some version works and another doesn’t it is likely to be a driver bug. It is very helpful if you can tell where exactly it broke (i.e. the last working and the first broken version).

With a hard freeze you probably doesn’t find anything in the logfiles. The only way to capture any kernel messages is to hook up a serial console and let some terminal application log the messages. /me uses screen. See Documentation/admin-guide/serial-console.rst for details on setting up a serial console.

Read Documentation/admin-guide/bug-hunting.rst to learn how to get any useful information out of a register+stack dump printed by the kernel on protection faults (so-called “kernel oops”).

If you run into some kind of deadlock, you can try to dump a call trace for each process using sysrq-t (see Documentation/admin-guide/sysrq.rst). This way it is possible to figure where exactly some process in “D” state is stuck.

I’ve seen reports that bttv 0.7.x crashes whereas 0.8.x works rock solid for some people. Thus probably a small buglet left somewhere in bttv 0.7.x. I have no idea where exactly, it works stable for me and a lot of other people. But in case you have problems with the 0.7.x versions you can give 0.8.x a try ...

hardware bugs

Some hardware can’t deal with PCI-PCI transfers (i.e. grabber => vga). Sometimes problems show up with bttv just because of the high load on the PCI bus. The bt848/878 chips have a few workarounds for known incompatibilities, see README.quirks.

Some folks report that increasing the pci latency helps too, althrought I’m not sure whenever this really fixes the problems or only makes it less likely to happen. Both bttv and btaudio have a insmod option to set the PCI latency of the device.

Some mainboard have problems to deal correctly with multiple devices doing DMA at the same time. bttv + ide seems to cause this sometimes, if this is the case you likely see freezes only with video and hard disk access at the same time. Updating the IDE driver to get the latest and greatest workarounds for hardware bugs might fix these problems.
other

If you use some binary-only yunk (like nvidia module) try to reproduce the problem without.

IRQ sharing is known to cause problems in some cases. It works just fine in theory and many configurations. Nevertheless it might be worth a try to shuffle around the PCI cards to give bttv another IRQ or make it share the IRQ with some other piece of hardware. IRQ sharing with VGA cards seems to cause trouble sometimes. I've also seen funny effects with bttv sharing the IRQ with the ACPI bridge (and apci-enabled kernel).

Bttv quirks

Below is what the bt878 data book says about the PCI bug compatibility modes of the bt878 chip.

The triton1 insmod option sets the EN_TBFX bit in the control register. The vsfx insmod option does the same for EN_VSFX bit. If you have stability problems you can try if one of these options makes your box work solid.

drivers/pci/quirks.c knows about these issues, this way these bits are enabled automagically for known-buggy chipsets (look at the kernel messages, bttv tells you).

Normal PCI Mode

The PCI REQ signal is the logical-or of the incoming function requests. The inter-nal GNT[0:1] signals are gated asynchronously with GNT and demultiplexed by the audio request signal. Thus the arbiter defaults to the video function at power-up and parks there during no requests for bus access. This is desirable since the video will request the bus more often. However, the audio will have highest bus access priority. Thus the audio will have first access to the bus even when issuing a request after the video request but before the PCI external arbiter has granted access to the Bt879. Neither function can preempt the other once on the bus. The duration to empty the entire video PCIFIFO onto the PCI bus is very short compared to the bus access latency the audio PCI FIFO can tolerate.

430FX Compatibility Mode

When using the 430FX PCI, the following rules will ensure compatibility:

1. Deassert REQ at the same time as asserting FRAME.
2. Do not reassert REQ to request another bus transaction until after finishing the previous transaction.

Since the individual bus masters do not have direct control of REQ, a simple logical-or of video and audio requests would violate the rules. Thus, both the arbiter and the initiator contain 430FX compatibility mode logic. To enable 430FX mode, set the EN_TBFX bit as indicated in Device Control Register on page 104.

When EN_TBFX is enabled, the arbiter ensures that the two compatibility rules are satisfied. Before GNT is asserted by the PCI arbiter, this internal arbiter may still logical-or the two requests. However, once the GNT is issued, this arbiter must lock in its decision and now route only the granted request to the REQ pin. The arbiter decision lock happens regardless of the
state of FRAME because it does not know when FRAME will be asserted (typically - each initiator will assert FRAME on the cycle following GNT). When FRAME is asserted, it is the initiator's responsibility to remove its request at the same time. It is the arbiters responsibility to allow this request to flow through to REQ and not allow the other request to hold REQ asserted. The decision lock may be removed at the end of the transaction: for example, when the bus is idle (FRAME and IRDY). The arbiter decision may then continue asynchronously until GNT is again asserted.

Interfacing with Non-PCI 2.1 Compliant Core Logic

A small percentage of core logic devices may start a bus transaction during the same cycle that GNT is de-asserted. This is non PCI 2.1 compliant. To ensure compatibility when using PCs with these PCI controllers, the EN_VSFX bit must be enabled (refer to Device Control Register on page 104). When in this mode, the arbiter does not pass GNT to the internal functions unless REQ is asserted. This prevents a bus transaction from starting the same cycle as GNT is de-asserted. This also has the side effect of not being able to take advantage of bus parking, thus lowering arbitration performance. The Bt879 drivers must query for these non-compliant devices, and set the EN_VSFX bit only if required.

Other elements of the tvcards array

If you are trying to make a new card work you might find it useful to know what the other elements in the tvcards array are good for:

<table>
<thead>
<tr>
<th>Element</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>video_inputs</td>
<td># of video inputs the card has</td>
</tr>
<tr>
<td>audio_inputs</td>
<td>historical cruft, not used any more.</td>
</tr>
<tr>
<td>tuner</td>
<td>which input is the tuner</td>
</tr>
<tr>
<td>svhs</td>
<td>which input is svhs (all others are labeled composite)</td>
</tr>
<tr>
<td>muxsel</td>
<td>video mux, input-&gt;registervalue mapping</td>
</tr>
<tr>
<td>pll</td>
<td>same as pll= insmod option</td>
</tr>
<tr>
<td>tuner_type</td>
<td>same as tuner= insmod option</td>
</tr>
<tr>
<td>*_modulename</td>
<td>hint whenever some card needs this or that audio module loaded to work properly.</td>
</tr>
<tr>
<td>has_radio</td>
<td>whenever this TV card has a radio tuner.</td>
</tr>
<tr>
<td>no_msp34xx</td>
<td>&quot;1&quot; disables loading of msp3400.o module</td>
</tr>
<tr>
<td>no_tda9875</td>
<td>&quot;1&quot; disables loading of tda9875.o module</td>
</tr>
<tr>
<td>needs_tvaudio</td>
<td>set to &quot;1&quot; to load tvaudio.o module</td>
</tr>
</tbody>
</table>

If some config item is specified both from the tvcards array and as insmod option, the insmod option takes precedence.

Cards

Note: For a more updated list, please check https://linuxtv.org/wiki/index.php/Hardware_Device_Information
Supported cards: Bt848/Bt848a/Bt849/Bt878/Bt879 cards

All cards with Bt848/Bt848a/Bt849/Bt878/Bt879 and normal Composite/S-VHS inputs are supported. Teletext and Intercast support (PAL only) for ALL cards via VBI sample decoding in software.

Some cards with additional multiplexing of inputs or other additional fancy chips are only partially supported (unless specifications by the card manufacturer are given). When a card is listed here it isn’t necessarily fully supported.

All other cards only differ by additional components as tuners, sound decoders, EEPROMs, teletext decoders ...

MATRIX Vision

MV-Delta - Bt848A - 4 Composite inputs, 1 S-VHS input (shared with 4th composite) - EEPROM
http://www.matrix-vision.de/

This card has no tuner but supports all 4 composite (1 shared with an S-VHS input) of the Bt848A. Very nice card if you only have satellite TV but several tuners connected to the card via composite.

Many thanks to Matrix-Vision for giving us 2 cards for free which made Bt848a/Bt849 single crystal operation support possible!!!

Miro/Pinnacle PCTV

- Bt848 some (all??) come with 2 crystals for PAL/SECAM and NTSC
- PAL, SECAM or NTSC TV tuner (Philips or TEMIC)
- MSP34xx sound decoder on add on board decoder is supported but AFAIK does not yet work (other sound MUX setting in GPIO port needed??? somebody who fixed this???)
- 1 tuner, 1 composite and 1 S-VHS input
- tuner type is autodetected

Many thanks for the free card which made first NTSC support possible back in 1997!

Hauppauge Win/TV pci

There are many different versions of the Hauppauge cards with different tuners (TV+Radio ...), teletext decoders. Note that even cards with same model numbers have (depending on the revision) different chips on it.

- Bt848 (and others but always in 2 crystal operation???) newer cards have a Bt878
- PAL, SECAM, NTSC or tuner with or without Radio support

E.g.:
- PAL:
- TDA5737: VHF, hyperband and UHF mixer/oscillator for TV and VCR 3-band tuners
- TSA5522: 1.4 GHz I2C-bus controlled synthesizer, I2C 0xc2-0xc3

• NTSC:
  - TDA5731: VHF, hyperband and UHF mixer/oscillator for TV and VCR 3-band tuners
  - TSA5518: no datasheet available on Philips site

• Philips SAA5246 or SAA5284 (or no) Teletext decoder chip with buffer RAM (e.g. Winbond W24257AS-35: 32Kx8 CMOS static RAM) SAA5246 (I2C 0x22) is supported

• 256 bytes EEPROM: Microchip 24LC02B or Philips 8582E2Y with configuration information I2C address 0xa0 (24LC02B also responds to 0xa2-0xaf)

• 1 tuner, 1 composite and (depending on model) 1 S-VHS input
• 14052B: mux for selection of sound source
• sound decoder: TDA9800, MSP34xx (stereo cards)

Askey CPH-Series

Developed by TelSignal(?), OEMed by many vendors (Typhoon, Anubis, Dynalink)

• Card series: - CPH01x: BT848 capture only - CPH03x: BT848 - CPH05x: BT878 with FM - CPH06x: BT878 (w/o FM) - CPH07x: BT878 capture only
• TV standards: - CPH0x0: NTSC-M/M - CPH0x1: PAL-B/G - CPH0x2: PAL-I/I - CPH0x3: PAL-D/K - CPH0x4: SECAM-L/L - CPH0x5: SECAM-B/G - CPH0x6: SECAM-D/K - CPH0x7: PAL-N/N - CPH0x8: PAL-B/H - CPH0x9: PAL-M/M

• CPH03x was often sold as “TV capturer”.

Identifying:

1) 878 cards can be identified by PCI Subsystem-ID: - 144f:3000 = CPH06x - 144F:3002 = CPH05x w/ FM - 144F:3005 = CPH06x_LC (w/o remote control)

2) The cards have a sticker with “CPH”-model on the back.

3) These cards have a number printed on the PCB just above the tuner metal box: - “80-CP20000300-x” = CPH03X - “80-CP2000500-x” = CPH05X - “80-CP2000600-x” = CPH06X / CPH06x_LC

Askey sells these cards as “Magic TVView series”, Brand “MagicXpress”. Other OEM often call these “Tvview”, “TVView99” or else.
Lifeview Flyvideo Series:

The naming of these series differs in time and space.

Identifying:

1) Some models can be identified by PCI subsystem ID:
   - 1852:1852 = Flyvideo 98 FM
   - 1851:1850 = Flyvideo 98
   - 1851:1851 = Flyvideo 98 EZ (capture only)

2) There is a print on the PCB:
   - LR25 = Flyvideo (Zoran ZR36120, SAA7110A)
   - LR26 Rev.N = Flyvideo II (Bt848)
   - LR26 Rev.O = Flyvideo II (Bt878)
   - LR37 Rev.C = Flyvideo EZ (Capture only, ZR36120 + SAA7110)
   - LR38 Rev.A1 = Flyvideo II EZ (Bt848 capture only)
   - LR50 Rev.Q = Flyvideo 98 (w/EEPROM and PCI subsystem ID)
   - LR50 Rev.W = Flyvideo 98 (no EEPROM)
   - LR51 Rev.E = Flyvideo 98 EZ (capture only)
   - LR90 = Flyvideo 2000 (Bt878)
   - LR90 Flyvideo 2000S (Bt878) w/Stereo TV (Package incl. LR91 daughterboard)
   - LR91 = Stereo daughter card for LR90
   - LR97 = Flyvideo DVBS
   - LR99 Rev.E = Low profile card for OEM integration (only internal audio!) bt878
   - LR136 = Flyvideo 2100/3100 (Low profile, SAA7130/SAA7134)
   - LR137 = Flyvideo DV2000/DV3000 (SAA7130/SAA7134 + IEEE1394)
   - LR138 Rev.C = Flyvideo 2000 (SAA7130)
   - LR138 Flyvideo 3000 (SAA7134) w/Stereo TV
     - These exist in variations w/FM and w/Remote sometimes denoted by suffixes “FM” and “R”.

3) You have a laptop (miniPCI card):
   - Product = FlyTV Platinum Mini
   - Model/Chip = LR212/saa7135
   - Lifeview.com.tw states (Feb. 2002): “The FlyVideo2000 and FlyVideo2000s product name have renamed to FlyVideo98.” Their Bt8x8 cards are listed as discontinued.
   - Flyvideo 2000S was probably sold as Flyvideo 3000 in some countries(Europe?). The new Flyvideo 2000/3000 are SAA7130/SAA7134 based.
“Flyvideo II” had been the name for the 848 cards, nowadays (in Germany) this name is re-used for LR50 Rev.W.

The Lifeview website mentioned Flyvideo III at some time, but such a card has not yet been seen (perhaps it was the german name for LR90 [stereo]). These cards are sold by many OEMs too.

FlyVideo A2 (Elta 8680)= LR90 Rev.F (w/Remote, w/o FM, stereo TV by tda9821) {Germany}
Lifeview 3000 (Elta 8681) as sold by Plus(April 2002), Germany = LR138 w/ saa7134

**lifeway config coding on gpio pins 0-9**

- LR50 rev. Q (“PARTS: 7031505116), Tuner wurde als Nr. 5 erkannt, Eingänge SVideo, TV, Composite, Audio, Remote:
  - CP9..1=100001001 (1: 0-Ohm-Widerstand gegen GND unbestückt; 0: bestückt)

**Typhoon TV card series:**

These can be CPH, Flyvideo, Pixelview or KNC1 series.

Typhoon is the brand of Anubis.

Model 50680 got re-used, some model no. had different contents over time.

Models:

- 50680 “TV Tuner PCI Pal BG”(old,red package)= can be CPH03x(bt848) or CPH06x(bt878)
- 50680 “TV Tuner Pal BG” (blue package)= Pixelview PV-BT878P+ (Rev 9B)
- 50681 “TV Tuner PCI Pal I” (variant of 50680)
- 50682 “TVView TV/FM Tuner Pal BG” = Flyvideo 98FM (LR50 Rev.Q)

**Note:** The package has a picture of CPH05x (which would be a real TView)

- 50683 “TV Tuner PCI SECAM” (variant of 50680)
- 50684 “TV Tuner Pal BG” = Pixelview 878TV(Rev.3D)
- 50686 “TV Tuner” = KNC1 TV Station
- 50687 “TV Tuner stereo” = KNC1 TV Station pro
- 50688 “TV Tuner RDS” (black package) = KNC1 TV Station RDS
- 50689 TV SAT DVB-S CARD CI PCI (SAA7146AH, SU1278?) = “KNC1 TV Station DVB-S”
- 50692 “TV/FM Tuner” (small PCB)
- 50694 TV TUNER CARD RDS (PHILIPS CHIPSET SAA7134HL)
- 50696 TV TUNER STEREO (PHILIPS CHIPSET SAA7134HL, MK3ME Tuner)

1.1. The media subsystem
• 50804 PC-SAT TV/Audio Karte = Techni-PC-Sat (ZORAN 36120PQC, Tuner: Alps)
• 50866 TVIEW SAT RECEIVER+ADR
• 50868 “TV/FM Tuner Pal I” (variant of 50682)
• 50999 “TV/FM Tuner Secam” (variant of 50682)

**Guillemot**

Models:

- Maxi-TV PCI (ZR36120)
- Maxi TV Video 2 = LR50 Rev.Q (FI1216MF, PAL BG+SECAM)
- Maxi TV Video 3 = CPH064 (PAL BG + SECAM)

**Mentor**

Mentor TV card (“55-878TV-U1”) = Pixelview 878TV(Rev.3F) (w/FM w/Remote)

**Prolink**

- TV cards:
  - PixelView Play TV pro - (Model: PV-BT878P+ REV 8E)
  - PixelView Play TV pro - (Model: PV-BT878P+ REV 9D)
  - PixelView Play TV pro - (Model: PV-BT878P+ REV 4C / 8D / 10A )
  - PixelView Play TV - (Model: PV-BT848P+)
  - 878TV - (Model: PV-BT878TV)
- Multimedia TV packages (card + software pack):
  - PixelView Play TV Theater - (Model: PV-M4200) = PixelView Play TV pro + Software
  - PixelView Play TV PAK - (Model: PV-BT878P+ REV 4E)
  - PixelView Play TV/VCR - (Model: PV-M3200 REV 4C / 8D / 10A )
  - PixelView Studio PAK - (Model: M2200 REV 4C / 8D / 10A )
  - PixelView PowerStudio PAK - (Model: PV-M3600 REV 4E)
  - PixelView DigitalVCR PAK - (Model: PV-M2400 REV 4C / 8D / 10A )
  - PixelView PlayTV PAK II (TV/FM card + usb camera) PV-M3800
  - PixelView PlayTV XP PV-M4700,PV-M4700(w/FM)
  - PixelView PlayTV DVR PV-M4600 package contents:PixelView PlayTV pro, windvr & videoMail s/w
- Further Cards:
  - PV-BT878P+rev.9B (Play TV Pro, opt. w/FM w/NICAM)
- PV-BT878P+rev.2F
- PV-BT878P Rev.1D (bt878, capture only)
- XCapture PV-CX881P (cx23881)
- PlayTV HD PV-CX881PL+, PV-CX881PL+(w/FM) (cx23881)
- DTV3000 PV-DTV3000P+ DVB-S CI = Twinhan VP-1030
- DTV2000 DVB-S = Twinhan VP-1020

• Video Conferencing:
  - PixelView Meeting PAK - (Model: PV-BT878P)
  - PixelView Meeting PAK Lite - (Model: PV-BT878P)
  - PixelView Meeting PAK plus - (Model: PV-BT878P+rev 4C/8D/10A)
  - PixelView Capture - (Model: PV-BT848P)
  - PixelView PlayTV USB pro
  - Model No. PV-NT1004+, PV-NT1004+ (w/FM) = NT1004 USB decoder chip + SAA7113 video decoder chip

Dynalink

These are CPH series.

Phoebemicro

• TV Master = CPH030 or CPH060
• TV Master FM = CPH050

Genius/Kye

• Video Wonder/Genius Internet Video Kit = LR37 Rev.C
• Video Wonder Pro II (848 or 878) = LR26

Tekram

• VideoCap C205 (Bt848)
• VideoCap C210 (zr36120 +Philips)
• CaptureTV M200 (ISA)
• CaptureTV M205 (Bt848)

1.1. The media subsystem
Lucky Star

- Image World Conference TV = LR50 Rev. Q

Leadtek

- WinView 601 (Bt848)
- WinView 610 (Zoran)
- WinFast2000
- WinFast2000 XP

Support for the Leadtek WinView 601 TV/FM

Author of this section: Jon Tombs <jon@gte.esi.us.es>

This card is basically the same as all the rest (Bt484A, Philips tuner), the main difference is that they have attached a programmable attenuator to 3 GPIO lines in order to give some volume control. They have also stuck an infra-red remote control decoded on the board, I will add support for this when I get time (it simple generates an interrupt for each key press, with the key code is placed in the GPIO port).

I don’t yet have any application to test the radio support. The tuner frequency setting should work but it is possible that the audio multiplexer is wrong. If it doesn’t work, send me email.

- No Thanks to Leadtek they refused to answer any questions about their hardware. The driver was written by visual inspection of the card. If you use this driver, send an email insult to them, and tell them you won’t continue buying their hardware unless they support Linux.
- Little thanks to Princeton Technology Corp (http://www.princeton.com.tw) who make the audio attenuator. Their publicly available data-sheet available on their web site doesn’t include the chip programming information! Hidden on their server are the full data-sheets, but don’t ask how I found it.

To use the driver I use the following options, the tuner and pll settings might be different in your country. You can force it via modprobe parameters. For example:

```
modprobe bttv tuner=1 pll=28 radio=1 card=17
```

Sets tuner type 1 (Philips PAL I), PLL with a 28 MHz crystal, enables FM radio and selects bttv card ID 17 (Leadtek WinView 601).
KNC One

- TV-Station
- TV-Station SE (+Software Bundle)
- TV-Station pro (+TV stereo)
- TV-Station FM (+Radio)
- TV-Station RDS (+RDS)
- TV Station SAT (analog satellite)
- TV-Station DVB-S

**Note:** newer Cards have saa7134, but model name stayed the same?

Provideo

- PV951 or PV-951, now named PV-951T (also are sold as: Boeder TV-FM Video Capture Card, Titanmedia Supervision TV-2400, Provideo PV951 TF, 3DeMon PV951, MediaForte TV-Vision PV951, Yoko PV951, Vivanco Tuner Card PCI Art.-Nr.: 68404)

  - Surveillance Series:
    - PV-141
    - PV-143
    - PV-147
    - PV-148 (capture only)
    - PV-150
    - PV-151
  - TV-FM Tuner Series:
    - PV-951TDV (tv tuner + 1394)
    - PV-951T/TF
    - PV-951PT/TF
    - PV-956T/TF Low Profile
    - PV-911

1.1.6.2 The cafe_ccic driver

Author: Jonathan Corbet <corbet@lwn.net>

Introduction

“cafe_ccic” is a driver for the Marvell 88ALP01 “cafe” CMOS camera controller. This is the controller found in first-generation OLPC systems, and this driver was written with support from the OLPC project.

Current status: the core driver works. It can generate data in YUV422, RGB565, and RGB444 formats. (Anybody looking at the code will see RGB32 as well, but that is a debugging aid which will be removed shortly). VGA and QVGA modes work; CIF is there but the colors remain funky. Only the OV7670 sensor is known to work with this controller at this time.

To try it out: either of these commands will work:
The “xawtv” utility also works; gqcam does not, for unknown reasons.

**Load time options**

There are a few load-time options, most of which can be changed after loading via sysfs as well:

- **alloc_bufs_at_load**: Normally, the driver will not allocate any DMA buffers until the time comes to transfer data. If this option is set, then worst-case-sized buffers will be allocated at module load time. This option nails down the memory for the life of the module, but perhaps decreases the chances of an allocation failure later on.

- **dma_buf_size**: The size of DMA buffers to allocate. Note that this option is only consulted for load-time allocation; when buffers are allocated at run time, they will be sized appropriately for the current camera settings.

- **n_dma_bufs**: The controller can cycle through either two or three DMA buffers. Normally, the driver tries to use three buffers; on faster systems, however, it will work well with only two.

- **min_buffers**: The minimum number of streaming I/O buffers that the driver will consent to work with. Default is one, but, on slower systems, better behavior with mplayer can be achieved by setting to a higher value (like six).

- **max_buffers**: The maximum number of streaming I/O buffers; default is ten. That number was carefully picked out of a hat and should not be assumed to actually mean much of anything.

- **flip**: If this boolean parameter is set, the sensor will be instructed to invert the video image. Whether it makes sense is determined by how your particular camera is mounted.

### 1.1.6.3 The cpia2 driver

Authors: Peter Pregler <Peter_Pregler@email.com>, Scott J. Bertin <scottbertin@yahoo.com>, and Jarl Totland <Jarl.Totland@bdc.no> for the original cpia driver, which this one was modelled from.

**Introduction**

This is a driver for STMicroelectronics’s CPiA2 (second generation Colour Processor Interface ASIC) based cameras. This camera outputs an MJPEG stream at up to vga size. It implements the Video4Linux interface as much as possible. Since the V4L interface does not support compressed formats, only an mjepg enabled application can be used with the camera. We have modified the gqcam application to view this stream.

The driver is implemented as two kernel modules. The cpia2 module contains the camera functions and the V4L interface. The cpia2_usb module contains usb specific functions. The main reason for this was the size of the module was getting out of hand, so I separated them. It is not likely that there will be a parallel port version.
Features

- Supports cameras with the Vision stv6410 (CIF) and stv6500 (VGA) cmos sensors. I only have the vga sensor, so can’t test the other.
- Image formats: VGA, QVGA, CIF, QCIF, and a number of sizes in between. VGA and QVGA are the native image sizes for the VGA camera. CIF is done in the coprocessor by scaling QVGA. All other sizes are done by clipping.
- Palette: YCrCb, compressed with MJPEG.
- Some compression parameters are settable.
- Sensor framerate is adjustable (up to 30 fps CIF, 15 fps VGA).
- Adjust brightness, color, contrast while streaming.
- Flicker control settable for 50 or 60 Hz mains frequency.

Making and installing the stv672 driver modules

Requirements

Video4Linux must be either compiled into the kernel or available as a module. Video4Linux2 is automatically detected and made available at compile time.

Setup

Use `modprobe cpia2` to load and `modprobe -r cpia2` to unload. This may be done automatically by your distribution.

Driver options

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>video_nr</td>
<td>video device to register (0=/dev/video0, etc) range -1 to 64. default is -1 (first available) If you have more than 1 camera, this MUST be -1.</td>
</tr>
<tr>
<td>buffer_size</td>
<td>Size for each frame buffer in bytes (default 68k)</td>
</tr>
<tr>
<td>num_buffers</td>
<td>Number of frame buffers (1-32, default 3)</td>
</tr>
<tr>
<td>alternate</td>
<td>USB Alternate (2-7, default 7)</td>
</tr>
<tr>
<td>flicker_freq</td>
<td>Frequency for flicker reduction(50 or 60, default 60)</td>
</tr>
<tr>
<td>flicker_mode</td>
<td>0 to disable, or 1 to enable flicker reduction. (default 0). This is only effective if the camera uses a stv0672 coprocessor.</td>
</tr>
</tbody>
</table>
Setting the options

If you are using modules, edit /etc/modules.conf and add an options line like this:

```
options cpia2 num_buffers=3 buffer_size=65535
```

If the driver is compiled into the kernel, at boot time specify them like this:

```
cpia2.num_buffers=3 cpia2.buffer_size=65535
```

What buffer size should I use?

The maximum image size depends on the alternate you choose, and the frame rate achieved by the camera. If the compression engine is able to keep up with the frame rate, the maximum image size is given by the table below.

The compression engine starts out at maximum compression, and will increase image quality until it is close to the size in the table. As long as the compression engine can keep up with the frame rate, after a short time the images will all be about the size in the table, regardless of resolution.

At low alternate settings, the compression engine may not be able to compress the image enough and will reduce the frame rate by producing larger images.

The default of 68k should be good for most users. This will handle any alternate at frame rates down to 15fps. For lower frame rates, it may be necessary to increase the buffer size to avoid having frames dropped due to insufficient space.

<table>
<thead>
<tr>
<th>Alternate</th>
<th>bytes/ms</th>
<th>15fps</th>
<th>30fps</th>
</tr>
</thead>
<tbody>
<tr>
<td>2</td>
<td>128</td>
<td>8533</td>

<td>12800</td>
</tr>
<tr>
<td>4</td>
<td>640</td>
<td>42667</td>
<td>21333</td>
</tr>
<tr>
<td>5</td>
<td>768</td>
<td>51200</td>
<td>25600</td>
</tr>
<tr>
<td>6</td>
<td>896</td>
<td>59733</td>
<td>29867</td>
</tr>
<tr>
<td>7</td>
<td>1023</td>
<td>68200</td>
<td>34100</td>
</tr>
</tbody>
</table>

Table: Image size(bytes)

How many buffers should I use?

For normal streaming, 3 should give the best results. With only 2, it is possible for the camera to finish sending one image just after a program has started reading the other. If this happens, the driver must drop a frame. The exception to this is if you have a heavily loaded machine. In this case use 2 buffers. You are probably not reading at the full frame rate. If the camera can send multiple images before a read finishes, it could overwrite the third buffer before the read finishes, leading to a corrupt image. Single and double buffering have extra checks to avoid overwriting.
Using the camera

We are providing a modified gqcam application to view the output. In order to avoid confusion, here it is called mview. There is also the qx5view program which can also control the lights on the qx5 microscope. MJPEG Tools (http://mjpeg.sourceforge.net) can also be used to record from the camera.

1.1.6.4 The cx88 driver

Author: Gerd Hoffmann

This is a v4l2 device driver for the cx2388x chip.

Current status

video

• Works.
• Overlay isn’t supported.

audio

• Works. The TV standard detection is made by the driver, as the hardware has bugs to auto-detect.
• audio data dma (i.e. recording without loopback cable to the sound card) is supported via cx88-alsa.

vbi

• Works.

How to add support for new cards

The driver needs some config info for the TV cards. This stuff is in cx88-cards.c. If the driver doesn’t work well you likely need a new entry for your card in that file. Check the kernel log (using dmesg) to see whenever the driver knows your card or not. There is a line like this one:

```
cx8800[0]: subsystem: 0070:3400, board: Hauppauge WinTV \ 34xxx models [card=1,autodetected]
```

If your card is listed as “board: UNKNOWN/GENERIC” it is unknown to the driver. What to do then?

1) Try upgrading to the latest snapshot, maybe it has been added meanwhile.

2) You can try to create a new entry yourself, have a look at cx88-cards.c. If that worked, mail me your changes as unified diff (“diff -u”).

3) Or you can mail me the config information. We need at least the following information to add the card:

• the PCI Subsystem ID (“0070:3400” from the line above, “lspci -v” output is fine too).
1.1.6.5 The VPBE V4L2 driver design

Functional partitioning

Consists of the following:

1. V4L2 display driver

   Implements creation of video2 and video3 device nodes and provides v4l2 device interface to manage VID0 and VID1 layers.

2. Display controller

   Loads up VENC, OSD and external encoders such as ths8200. It provides a set of API calls to V4L2 drivers to set the output/standards in the VENC or external sub devices. It also provides a device object to access the services from OSD subdevice using sub device ops. The connection of external encoders to VENC LCD controller port is done at init time based on default output and standard selection or at run time when application change the output through V4L2 IOCTLs.

   When connected to an external encoder, vpbe controller is also responsible for setting up the interface between VENC and external encoders based on board specific settings (specified in board-xxx-evm.c). This allows interfacing external encoders such as ths8200. The setup_if_config() is implemented for this as well as configure_venc() (part of the next patch) API to set timings in VENC for a specific display resolution. As of this patch series, the interconnection and enabling and setting of the external encoders is not present, and would be a part of the next patch series.

3. VENC subdevice module

   Responsible for setting outputs provided through internal DACs and also setting timings at LCD controller port when external encoders are connected at the port or LCD panel timings required. When external encoder/LCD panel is connected, the timings for a specific standard/preset is retrieved from the board specific table and the values are used to set the timings in venc using non-standard timing mode.

   Support LCD Panel displays using the VENC. For example to support a Logic PD display, it requires setting up the LCD controller port with a set of timings for the resolution supported and setting the dot clock. So we could add the available outputs as a board specific entry (i.e add the “LogicPD” output name to board-xxx-evm.c). A table of timings for various LCDs supported can be maintained in the board specific setup file to support various LCD displays. As of this patch a basic driver is present, and this support for external encoders and displays forms a part of the next patch series.

4. OSD module

   OSD module implements all OSD layer management and hardware specific features. The VPBE module interacts with the OSD for enabling and disabling appropriate features of the OSD.
Current status

A fully functional working version of the V4L2 driver is available. This driver has been tested with NTSC and PAL standards and buffer streaming.

1.1.6.6 The Samsung S5P/Exynos4 FIMC driver

Copyright © 2012 - 2013 Samsung Electronics Co., Ltd.

The FIMC (Fully Interactive Mobile Camera) device available in Samsung SoC Application Processors is an integrated camera host interface, color space converter, image resizer and rotator. It’s also capable of capturing data from LCD controller (FIMD) through the SoC internal writeback data path. There are multiple FIMC instances in the SoCs (up to 4), having slightly different capabilities, like pixel alignment constraints, rotator availability, LCD writeback support, etc. The driver is located at drivers/media/platform/exynos4-is directory.

Supported SoCs

S5PC100 (mem-to-mem only), S5PV210, Exynos4210

Supported features

- camera parallel interface capture (ITU-R.BT601/565);
- camera serial interface capture (MIPI-CSI2);
- memory-to-memory processing (color space conversion, scaling, mirror and rotation);
- dynamic pipeline re-configuration at runtime (re-attachment of any FIMC instance to any parallel video input or any MIPI-CSI front-end);
- runtime PM and system wide suspend/resume

Not currently supported

- LCD writeback input
- per frame clock gating (mem-to-mem)

User space interfaces

Media device interface

The driver supports Media Controller API as defined at Part IV - Media Controller API. The media device driver name is “Samsung S5P FIMC”.

The purpose of this interface is to allow changing assignment of FIMC instances to the SoC peripheral camera input at runtime and optionally to control internal connections of the MIPI-CSIS device(s) to the FIMC entities.
The media device interface allows to configure the SoC for capturing image data from the sensor through more than one FIMC instance (e.g. for simultaneous viewfinder and still capture setup).

Reconfiguration is done by enabling/disabling media links created by the driver during initialization. The internal device topology can be easily discovered through media entity and links enumeration.

**Memory-to-memory video node**

V4L2 memory-to-memory interface at /dev/video? device node. This is standalone video device, it has no media pads. However please note the mem-to-mem and capture video node operation on same FIMC instance is not allowed. The driver detects such cases but the applications should prevent them to avoid an undefined behaviour.

**Capture video node**

The driver supports V4L2 Video Capture Interface as defined at Interfaces.

At the capture and mem-to-mem video nodes only the multi-planar API is supported. For more details see: Single- and multi-planar APIs.

**Camera capture subdevs**

Each FIMC instance exports a sub-device node (/dev/v4l-subdev?), a sub-device node is also created per each available and enabled at the platform level MIPI-CSI receiver device (currently up to two).

**sysfs**

In order to enable more precise camera pipeline control through the sub-device API the driver creates a sysfs entry associated with “s5p-fimc-md” platform device. The entry path is: /sys/platform/devices/s5p-fimc-md/subdev_conf_mode.

In typical use case there could be a following capture pipeline configuration: sensor subdev -> mipi-csi subdev -> fimc subdev -> video node

When we configure these devices through sub-device API at user space, the configuration flow must be from left to right, and the video node is configured as last one.

When we don’t use sub-device user space API the whole configuration of all devices belonging to the pipeline is done at the video node driver. The sysfs entry allows to instruct the capture node driver not to configure the sub-devices (format, crop), to avoid resetting the subdevs’ configuration when the last configuration steps at the video node is performed.

For full sub-device control support (subdevs configured at user space before starting streaming):

```
# echo "sub-dev" > /sys/platform/devices/s5p-fimc-md/subdev_conf_mode
```

For V4L2 video node control only (subdevs configured internally by the host driver):
This is a default option.

5. Device mapping to video and subdev device nodes

There are associated two video device nodes with each device instance in hardware - video capture and mem-to-mem and additionally a subdev node for more precise FIMC capture subsystem control. In addition a separate v4l2 sub-device node is created per each MIPI-CSIS device.

How to find out which /dev/video? or /dev/v4l-subdev? is assigned to which device?
You can either grep through the kernel log to find relevant information, i.e.

```
# dmesg | grep -i fimc
```

(note that udev, if present, might still have rearranged the video nodes),
or retrieve the information from /dev/media? with help of the media-ctl tool:

```
# media-ctl -p
```

7. Build

If the driver is built as a loadable kernel module (CONFIG_VIDEO_SAMSUNG_S5P_FIMC=m) two modules are created (in addition to the core v4l2 modules): s5p-fimc.ko and optional s5p-csis.ko (MIPI-CSI receiver subdev).

1.1.6.7 i.MX Video Capture Driver

Introduction

The Freescale i.MX5/6 contains an Image Processing Unit (IPU), which handles the flow of image frames to and from capture devices and display devices.

For image capture, the IPU contains the following internal subunits:

- Image DMA Controller (IDMAC)
- Camera Serial Interface (CSI)
- Image Converter (IC)
- Sensor Multi-FIFO Controller (SMFC)
- Image Rotator (IRT)
- Video De-Interlacing or Combining Block (VDIC)

The IDMAC is the DMA controller for transfer of image frames to and from memory. Various dedicated DMA channels exist for both video capture and display paths. During transfer, the IDMAC is also capable of vertical image flip, 8x8 block transfer (see IRT description), pixel component re-ordering (for example UYVY to YUYV) within the same colorspace, and packed
planar conversion. The IDMAC can also perform a simple de-interlacing by interweaving even and odd lines during transfer (without motion compensation which requires the VDIC).

The CSI is the backend capture unit that interfaces directly with camera sensors over Parallel, BT.656/1120, and MIPI CSI-2 buses.

The IC handles color-space conversion, resizing (downscaling and upscaling), horizontal flip, and 90/270 degree rotation operations.

There are three independent “tasks” within the IC that can carry out conversions concurrently: pre-process encoding, pre-process viewfinder, and post-processing. Within each task, conversions are split into three sections: downsizing section, main section (upsizing, flip, colorspace conversion, and graphics plane combining), and rotation section.

The IPU time-shares the IC task operations. The time-slice granularity is one burst of eight pixels in the downsizing section, one image line in the main processing section, one image frame in the rotation section.

The SMFC is composed of four independent FIFOs that each can transfer captured frames from sensors directly to memory concurrently via four IDMAC channels.

The IRT carries out 90 and 270 degree image rotation operations. The rotation operation is carried out on 8x8 pixel blocks at a time. This operation is supported by the IDMAC which handles the 8x8 block transfer along with block reordering, in coordination with vertical flip.

The VDIC handles the conversion of interlaced video to progressive, with support for different motion compensation modes (low, medium, and high motion). The deinterlaced output frames from the VDIC can be sent to the IC pre-process viewfinder task for further conversions. The VDIC also contains a Combiner that combines two image planes, with alpha blending and color keying.

In addition to the IPU internal subunits, there are also two units outside the IPU that are also involved in video capture on i.MX:

- MIPI CSI-2 Receiver for camera sensors with the MIPI CSI-2 bus interface. This is a Synopsys DesignWare core.
- Two video multiplexers for selecting among multiple sensor inputs to send to a CSI.

For more info, refer to the latest versions of the i.MX5/6 reference manuals¹ and².

**Features**

Some of the features of this driver include:

- Many different pipelines can be configured via media controller API, that correspond to the hardware video capture pipelines supported in the i.MX.
- Supports parallel, BT.565, and MIPI CSI-2 interfaces.
- Concurrent independent streams, by configuring pipelines to multiple video capture interfaces using independent entities.
- Scaling, color-space conversion, horizontal and vertical flip, and image rotation via IC task subdevs.

• Many pixel formats supported (RGB, packed and planar YUV, partial planar YUV).

• The VDIC subdev supports motion compensated de-interlacing, with three motion compensation modes: low, medium, and high motion. Pipelines are defined that allow sending frames to the VDIC subdev directly from the CSI. There is also support in the future for sending frames to the VDIC from memory buffers via a output/mem2mem devices.

• Includes a Frame Interval Monitor (FIM) that can correct vertical sync problems with the ADV718x video decoders.

Topology

The following shows the media topologies for the i.MX6Q SabreSD and i.MX6Q SabreAuto. Refer to these diagrams in the entity descriptions in the next section.

The i.MX5/6 topologies can differ upstream from the IPUv3 CSI video multiplexers, but the internal IPUv3 topology downstream from there is common to all i.MX5/6 platforms. For example, the SabreSD, with the MIPI CSI-2 OV5640 sensor, requires the i.MX6 MIPI CSI-2 receiver. But the SabreAuto has only the ADV7180 decoder on a parallel bt.656 bus, and therefore does not require the MIPI CSI-2 receiver, so it is missing in its graph.

Entities

imx6-mipi-csi2

This is the MIPI CSI-2 receiver entity. It has one sink pad to receive the MIPI CSI-2 stream (usually from a MIPI CSI-2 camera sensor). It has four source pads, corresponding to the four MIPI CSI-2 demuxed virtual channel outputs. Multiple source pads can be enabled to independently stream from multiple virtual channels.

This entity actually consists of two sub-blocks. One is the MIPI CSI-2 core. This is a Synopsys Designware MIPI CSI-2 core. The other sub-block is a “CSI-2 to IPU gasket”. The gasket acts as a demultiplexer of the four virtual channels streams, providing four separate parallel buses containing each virtual channel that are routed to CSIs or video multiplexers as described below.

On i.MX6 solo/dual-lite, all four virtual channel buses are routed to two video multiplexers. Both CSI0 and CSI1 can receive any virtual channel, as selected by the video multiplexers.

On i.MX6 Quad, virtual channel 0 is routed to IPU1-CSI0 (after selected by a video mux), virtual channels 1 and 2 are hard-wired to IPU1-CSI1 and IPU2-CSI0, respectively, and virtual channel 3 is routed to IPU2-CSI1 (again selected by a video mux).

ipuX_csiY_mux

These are the video multiplexers. They have two or more sink pads to select from either camera sensors with a parallel interface, or from MIPI CSI-2 virtual channels from imx6-mipi-csi2 entity. They have a single source pad that routes to a CSI (ipuX_csiY entities).

On i.MX6 solo/dual-lite, there are two video mux entities. One sits in front of IPU1-CSI0 to select between a parallel sensor and any of the four MIPI CSI-2 virtual channels (a total of five sink pads). The other mux sits in front of IPU1-CSI1, and again has five sink pads to select between a parallel sensor and any of the four MIPI CSI-2 virtual channels.
Fig. 1: Media pipeline graph on i.MX6Q SabreSD
Fig. 2: Media pipeline graph on i.MX6Q SabreAuto
On i.MX6 Quad, there are two video mux entities. One sits in front of IPU1-CSI0 to select between a parallel sensor and MIPI CSI-2 virtual channel 0 (two sink pads). The other mux sits in front of IPU2-CSI1 to select between a parallel sensor and MIPI CSI-2 virtual channel 3 (two sink pads).

**ipuX_csiY**

These are the CSI entities. They have a single sink pad receiving from either a video mux or from a MIPI CSI-2 virtual channel as described above.

This entity has two source pads. The first source pad can link directly to the ipuX_vdic entity or the ipuX_ic_prp entity, using hardware links that require no IDMAC memory buffer transfer. When the direct source pad is routed to the ipuX_ic_prp entity, frames from the CSI can be processed by one or both of the IC pre-processing tasks.

When the direct source pad is routed to the ipuX_vdic entity, the VDIC will carry out motion-compensated de-interlace using “high motion” mode (see description of ipuX_vdic entity).

The second source pad sends video frames directly to memory buffers via the SMFC and an IDMAC channel, bypassing IC pre-processing. This source pad is routed to a capture device node, with a node name of the format “ipuX_csiY capture”.

Note that since the IDMAC source pad makes use of an IDMAC channel, pixel reordering within the same colorspace can be carried out by the IDMAC channel. For example, if the CSI sink pad is receiving in UYVY order, the capture device linked to the IDMAC source pad can capture in YUYV order. Also, if the CSI sink pad is receiving a packed YUV format, the capture device can capture a planar YUV format such as YUV420.

The IDMAC channel at the IDMAC source pad also supports simple interweave without motion compensation, which is activated if the source pad’s field type is sequential top-bottom or bottom-top, and the requested capture interface field type is set to interlaced (t-b, b-t, or unqualified interlaced). The capture interface will enforce the same field order as the source pad field order (interlaced-bt if source pad is seq-bt, interlaced-tb if source pad is seq-tb).

For events produced by ipuX_csiY, see ref:imx_api_ipuX_csiY.

**Cropping in ipuX_csiY**

The CSI supports cropping the incoming raw sensor frames. This is implemented in the ipuX_csiY entities at the sink pad, using the crop selection subdev API.

The CSI also supports fixed divide-by-two downscaling independently in width and height. This is implemented in the ipuX_csiY entities at the sink pad, using the compose selection subdev API.

The output rectangle at the ipuX_csiY source pad is the same as the compose rectangle at the sink pad. So the source pad rectangle cannot be negotiated, it must be set using the compose selection API at sink pad (if /2 downscale is desired, otherwise source pad rectangle is equal to incoming rectangle).

To give an example of crop and /2 downscale, this will crop a 1280x960 input frame to 640x480, and then /2 downscale in both dimensions to 320x240 (assumes ipu1_csi0 is linked to ipu1_csi0_mux):

1.1. The media subsystem

145
Frame Skipping in ipuX_csiY

The CSI supports frame rate decimation, via frame skipping. Frame rate decimation is specified by setting the frame intervals at sink and source pads. The ipuX_csiY entity then applies the best frame skip setting to the CSI to achieve the desired frame rate at the source pad.

The following example reduces an assumed incoming 60 Hz frame rate by half at the IDMAC output source pad:

```
media-ctl -V "'ipu1_csi0':0[fmt:UYVY2X8/640x480@1/60]"
media-ctl -V "'ipu1_csi0':2[fmt:UYVY2X8/640x480@1/30]"
```

Frame Interval Monitor in ipuX_csiY

See ref:`imx_api_FIM`

ipuX_vdic

The VDIC carries out motion compensated de-interlacing, with three motion compensation modes: low, medium, and high motion. The mode is specified with the menu control `V4L2_CID_DEINTERLACING_MODE`. The VDIC has two sink pads and a single source pad.

The direct sink pad receives from an ipuX_csiY direct pad. With this link the VDIC can only operate in high motion mode.

When the IDMAC sink pad is activated, it receives from an output or mem2mem device node. With this pipeline, the VDIC can also operate in low and medium modes, because these modes require receiving frames from memory buffers. Note that an output or mem2mem device is not implemented yet, so this sink pad currently has no links.

The source pad routes to the IC pre-processing entity ipuX_ic_prp.

ipuX_ic_prp

This is the IC pre-processing entity. It acts as a router, routing data from its sink pad to one or both of its source pads.

This entity has a single sink pad. The sink pad can receive from the ipuX_csiY direct pad, or from ipuX_vdic.

This entity has two source pads. One source pad routes to the pre-process encode task entity (ipuX_ic_prpenc), the other to the pre-process viewfinder task entity (ipuX_ic_prpvf). Both source pads can be activated at the same time if the sink pad is receiving from ipuX_csiY. Only the source pad to the pre-process viewfinder task entity can be activated if the sink pad is receiving from ipuX_vdic (frames from the VDIC can only be processed by the pre-process viewfinder task).
**ipuX_ic_prpenc**

This is the IC pre-processing encode entity. It has a single sink pad from ipuX_ic_prp, and a single source pad. The source pad is routed to a capture device node, with a node name of the format “ipuX_ic_prpenc capture”.

This entity performs the IC pre-process encode task operations: color-space conversion, resizing (downscaling and upscaling), horizontal and vertical flip, and 90/270 degree rotation. Flip and rotation are provided via standard V4L2 controls.

Like the ipuX_csiY IDMAC source, this entity also supports simple de-interlace without motion compensation, and pixel reordering.

**ipuX_ic_prpvf**

This is the IC pre-processing viewfinder entity. It has a single sink pad from ipuX_ic_prp, and a single source pad. The source pad is routed to a capture device node, with a node name of the format “ipuX_ic_prpvf capture”.

This entity is identical in operation to ipuX_ic_prpenc, with the same resizing and CSC operations and flip/rotation controls. It will receive and process de-interlaced frames from the ipuX_vdic if ipuX_ic_prp is receiving from ipuX_vdic.

Like the ipuX_csiY IDMAC source, this entity supports simple interweaving without motion compensation. However, note that if the ipuX_vdic is included in the pipeline (ipuX_ic_prp is receiving from ipuX_vdic), it’s not possible to use interweave in ipuX_ic_prpvf, since the ipuX_vdic has already carried out de-interlacing (with motion compensation) and therefore the field type output from ipuX_vdic can only be none (progressive).

**Capture Pipelines**

The following describe the various use-cases supported by the pipelines.

The links shown do not include the backend sensor, video mux, or mipi csi-2 receiver links. This depends on the type of sensor interface (parallel or mipi csi-2). So these pipelines begin with:

sensor -> ipuX_csiY_mux -> ...

for parallel sensors, or:

sensor -> imx6-mipi-csi2 -> (ipuX_csiY_mux) -> ...

for mipi csi-2 sensors. The imx6-mipi-csi2 receiver may need to route to the video mux (ipuX_csiY_mux) before sending to the CSI, depending on the mipi csi-2 virtual channel, hence ipuX_csiY_mux is shown in parenthesis.
Unprocessed Video Capture:

Send frames directly from sensor to camera device interface node, with no conversions, via ipu_X_csi_Y IDMAC source pad:

-> ipu_X_csi_Y:2 -> ipu_X_csi_Y capture

IC Direct Conversions:

This pipeline uses the preprocess encode entity to route frames directly from the CSI to the IC, to carry out scaling up to 1024x1024 resolution, CSC, flipping, and image rotation:

Motion Compensated De-interlace:

This pipeline routes frames from the CSI direct pad to the VDIC entity to support motion-compensated de-interlacing (high motion mode only), scaling up to 1024x1024, CSC, flip, and rotation:

Usage Notes

To aid in configuration and for backward compatibility with V4L2 applications that access controls only from video device nodes, the capture device interfaces inherit controls from the active entities in the current pipeline, so controls can be accessed either directly from the subdev or from the active capture device interface. For example, the FIM controls are available either from the ipu_X_csi_Y subdevs or from the active capture device.

The following are specific usage notes for the Sabre* reference boards:

i.MX6Q SabreLite with OV5642 and OV5640

This platform requires the OmniVision OV5642 module with a parallel camera interface, and the OV5640 module with a MIPI CSI-2 interface. Both modules are available from Boundary Devices:

- https://boundarydevices.com/product/nit6x_5mp
- https://boundarydevices.com/product/nit6x_5mp_mipi

Note that if only one camera module is available, the other sensor node can be disabled in the device tree.

The OV5642 module is connected to the parallel bus input on the i.MX internal video mux to IPU1 CSI0. It’s i2c bus connects to i2c bus 2.

The MIPI CSI-2 OV5640 module is connected to the i.MX internal MIPI CSI-2 receiver, and the four virtual channel outputs from the receiver are routed as follows: vc0 to the IPU1 CSI0 mux, vc1 directly to IPU1 CSI1, vc2 directly to IPU2 CSI0, and vc3 to the IPU2 CSI1 mux. The
OV5640 is also connected to I2C bus 2 on the SabreLite, therefore the OV5642 and OV5640 must not share the same I2C slave address.

The following basic example configures unprocessed video capture pipelines for both sensors. The OV5642 is routed to ipu1_csi0, and the OV5640, transmitting on MIPI CSI-2 virtual channel 1 (which is imx6-mipi-csi2 pad 2), is routed to ipu1_csi1. Both sensors are configured to output 640x480, and the OV5640 outputs YUY2X8, the OV5640 UYVY2X8:

```bash
# Setup links for OV5642
media-ctl -l "'ov5642 1-0042':0 -> 'ipu1_csi0_mux':1[1]"
media-ctl -l "'ipu1_csi0_mux':2 -> 'ipu1_csi0':0[1]"
media-ctl -l "'ipu1_csi0':2 -> 'ipu1_csi0 capture':0[1]"
# Setup links for OV5640
media-ctl -l "'ov5640 1-0040':0 -> 'imx6-mipi-csi2':0[1]"
media-ctl -l "'imx6-mipi-csi2':2 -> 'ipu1_csi1':0[1]"
media-ctl -l "'ipu1_csi1':2 -> 'ipu1_csi1 capture':0[1]"
# Configure pads for OV5642 pipeline
media-ctl -V "'ov5642 1-0042':0 [fmt:YUYV2X8/640x480 field:none]"
media-ctl -V "'ipu1_csi0_mux':2 [fmt:YUYV2X8/640x480 field:none]"
media-ctl -V "'ipu1_csi0':2 [fmt:AYUV32/640x480 field:none]"
# Configure pads for OV5640 pipeline
media-ctl -V "'ov5640 1-0040':0 [fmt:UYVY2X8/640x480 field:none]"
media-ctl -V "'imx6-mipi-csi2':2 [fmt:UYVY2X8/640x480 field:none]"
media-ctl -V "'ipu1_csi1':2 [fmt:AYUV32/640x480 field:none]"
```

Streaming can then begin independently on the capture device nodes “ipu1_csi0 capture” and “ipu1_csi1 capture”. The v4l2-ctl tool can be used to select any supported YUV pixel format on the capture device nodes, including planar.

### i.MX6Q SabreAuto with ADV7180 decoder

On the i.MX6Q SabreAuto, an on-board ADV7180 SD decoder is connected to the parallel bus input on the internal video mux to IPU1 CSI0.

The following example configures a pipeline to capture from the ADV7180 video decoder, assuming NTSC 720x480 input signals, using simple interweave (unconverted and without motion compensation). The adv7180 must output sequential or alternating fields (field type ‘seq-bt’ for NTSC, or ‘alternate’):

```bash
# Setup links
media-ctl -l "'adv7180 3-0021':0 -> 'ipu1_csi0_mux':1[1]"
media-ctl -l "'ipu1_csi0_mux':2 -> 'ipu1_csi0':0[1]"
media-ctl -l "'ipu1_csi0':2 -> 'ipu1_csi0 capture':0[1]"
# Configure pads
media-ctl -V "'adv7180 3-0021':0 [fmt:UYV2X8/720x480 field:seq-bt]"
media-ctl -V "'ipu1_csi0_mux':2 [fmt:UYV2X8/720x480]"
media-ctl -V "'ipu1_csi0':2 [fmt:AYUV32/720x480]"
# Configure "ipu1_csi0 capture" interface (assumed at /dev/video4)
v4l2-ctl -d4 --set-fmt-video=field=interlaced_bt
```

Streaming can then begin on /dev/video4. The v4l2-ctl tool can also be used to select any supported YUV pixel format on /dev/video4.

This example configures a pipeline to capture from the ADV7180 video decoder, assuming PAL 720x576 input signals, with Motion Compensated de-interlacing. The adv7180 must output
sequential or alternating fields (field type ‘seq-tb’ for PAL, or ‘alternate’).

```bash
# Setup links
media-ctl -l "'adv7180 3-0021':0 -> 'ipu1_csi0_mux':1[1]"
media-ctl -l "'ipu1_csi0_mux':2 -> 'ipu1_csi0':0[1]"
media-ctl -l "'ipu1_csi0':1 -> 'ipu1_vdic':0[1]"
media-ctl -l "'ipu1_vdic':2 -> 'ipu1_ic_prp':0[1]"
media-ctl -l "'ipu1_ic_prp':2 -> 'ipu1_ic_prpvf':0[1]"
media-ctl -l "'ipu1_ic_prpvf':1 -> 'ipu1_ic_prpvf capture':0[1]"
# Configure pads
media-ctl -V "'adv7180 3-0021':0 [fmt:UYVY2X8/720x576 field:seq-tb]"
media-ctl -V "'ipu1_csi0_mux':2 [fmt:UYVY2X8/720x576]"
media-ctl -V "'ipu1_csi0':1 [fmt:AYUV32/720x576]"
media-ctl -V "'ipu1_vdic':2 [fmt:AYUV32/720x576 field:none]"
media-ctl -V "'ipu1_ic_prp':2 [fmt:AYUV32/720x576 field:none]"
media-ctl -V "'ipu1_ic_prpvf':1 [fmt:AYUV32/720x576 field:none]"
# Configure "ipu1_ic_prpvf capture" interface (assumed at /dev/video2)
v4l2-ctl -d2 --set-fmt-video=field=none
```

Streaming can then begin on /dev/video2. The v4l2-ctl tool can also be used to select any supported YUV pixelformat on /dev/video2.

This platform accepts Composite Video analog inputs to the ADV7180 on Ain1 (connector J42).

**i.MX6DL SabreAuto with ADV7180 decoder**

On the i.MX6DL SabreAuto, an on-board ADV7180 SD decoder is connected to the parallel bus input on the internal video mux to IPU1 CSI0.

The following example configures a pipeline to capture from the ADV7180 video decoder, assuming NTSC 720x480 input signals, using simple interweave (unconverted and without motion compensation). The adv7180 must output sequential or alternating fields (field type ‘seq-bt’ for NTSC, or ‘alternate’):

```bash
# Setup links
media-ctl -l "'adv7180 4-0021':0 -> 'ipu1_csi0_mux':4[1]"
media-ctl -l "'ipu1_csi0_mux':5 -> 'ipu1_csi0':0[1]"
media-ctl -l "'ipu1_csi0':2 -> 'ipu1_csi0 capture':0[1]"
# Configure pads
media-ctl -V "'adv7180 4-0021':0 [fmt:UYVY2X8/720x480 field:seq-bt]"
media-ctl -V "'ipu1_csi0_mux':5 [fmt:UYVY2X8/720x480]"
media-ctl -V "'ipu1_csi0':2 [fmt:AYUV32/720x480]"
# Configure "ipu1_csi0 capture" interface (assumed at /dev/video0)
v4l2-ctl -d0 --set-fmt-video=field=interlaced_bt
```

Streaming can then begin on /dev/video0. The v4l2-ctl tool can also be used to select any supported YUV pixelformat on /dev/video0.

This example configures a pipeline to capture from the ADV7180 video decoder, assuming PAL 720x576 input signals, with Motion Compensated de-interlacing. The adv7180 must output sequential or alternating fields (field type ‘seq-tb’ for PAL, or ‘alternate’):

```bash
# Setup links
media-ctl -l "'adv7180 4-0021':0 -> 'ipu1_csi0_mux':4[1]"
media-ctl -l "'ipu1_csi0_mux':5 -> 'ipu1_csi0':0[1]"
media-ctl -l "'ipu1_csi0':1 -> 'ipu1_vdic':0[1]"
```
Streaming can then begin on /dev/video2. The v4l2-ctl tool can also be used to select any supported YUV pixel format on /dev/video2.

This platform accepts Composite Video analog inputs to the ADV7180 on Ain1 (connector J42).

### i.MX6Q SabreSD with MIPI CSI-2 OV5640

Similarly to i.MX6Q SabreLite, the i.MX6Q SabreSD supports a parallel interface OV5642 module on IPU1 CSI0, and a MIPI CSI-2 OV5640 module. The OV5642 connects to i2c bus 1 and the OV5640 to i2c bus 2.

The device tree for SabreSD includes OF graphs for both the parallel OV5642 and the MIPI CSI-2 OV5640, but as of this writing only the MIPI CSI-2 OV5640 has been tested, so the OV5642 node is currently disabled. The OV5640 module connects to MIPI connector J5. The NXP part number for the OV5640 module that connects to the SabreSD board is H120729.

The following example configures unprocessed video capture pipeline to capture from the OV5640, transmitting on MIPI CSI-2 virtual channel 0:

```
# Setup links
media-ctl -l "'ov5640 1-003c':0 -> 'imx6-mipi-csi2':0[1]"
media-ctl -l "'imx6-mipi-csi2':1 -> 'ipu1_csi0_mux':0[1]"
media-ctl -l "'ipu1_csi0_mux':2 -> 'ipu1_csi0':0[1]"
media-ctl -l "'ipu1_csi0':2 -> 'ipu1_csi0 capture':0[1]"
# Configure pads
media-ctl -V "'ov5640 1-003c':0 [fmt:UYVY2X8/640x480]
media-ctl -V "'imx6-mipi-csi2':1 [fmt:UYVY2X8/640x480]"
media-ctl -V "'ipu1_csi0_mux':0 [fmt:UYVY2X8/640x480]"
media-ctl -V "'ipu1_csi0':0 [fmt:AYUV32/640x480]"
```

Streaming can then begin on “ipu1_csi0 capture” node. The v4l2-ctl tool can be used to select any supported pixel format on the capture device node.

To determine what is the /dev/video node correspondent to “ipu1_csi0 capture”:

```
media-ctl -e "ipu1_csi0 capture"
/dev/video0
```

/dev/video0 is the streaming element in this case.

Starting the streaming via v4l2-ctl:
v4l2-ctl --stream-mmap -d /dev/video0

Starting the streaming via Gstreamer and sending the content to the display:

gst-launch-1.0 v4l2src device=/dev/video0 ! kmssink

The following example configures a direct conversion pipeline to capture from the OV5640, transmitting on MIPI CSI-2 virtual channel 0. It also shows colorspace conversion and scaling at IC output.

```
# Setup links
media-ctl -l "'ov5640 1-003c':0 -> 'imx6-mipi-csi2':0[1]"
media-ctl -l "'imx6-mipi-csi2':1 -> 'ipu1_csi0_mux':0[1]"
media-ctl -l "'ipu1_csi0_mux':2 -> 'ipu1_csi0':0[1]"
media-ctl -l "'ipu1_csi0':1 -> 'ipu1_ic_prp':0[1]"
media-ctl -l "'ipu1_ic_prp':1 -> 'ipu1_ic_prpenc':0[1]"
media-ctl -l "'ipu1_ic_prpenc':1 -> 'ipu1_ic_prpenc capture':0[1]"

# Configure pads
media-ctl -V "'ov5640 1-003c':0 [fmt:UYVY2X8/640x480]"
media-ctl -V "'imx6-mipi-csi2':1 [fmt:UYVY2X8/640x480]"
media-ctl -V "'ipu1_csi0_mux':2 [fmt:UYVY2X8/640x480]"
media-ctl -V "'ipu1_csi0':1 [fmt:AYUV32/640x480]"
media-ctl -V "'ipu1_ic_prp':1 [fmt:AYUV32/640x480]"
media-ctl -V "'ipu1_ic_prpenc':1 [fmt:ARGB8888_1X32/800x600]"

# Set a format at the capture interface
v4l2-ctl -d /dev/video1 --set-fmt-video=pixelformat=RGB3

Streaming can then begin on “ipu1_ic_prpenc capture” node.

To determine what is the /dev/video node correspondent to “ipu1_ic_prpenc capture”:

media-ctl -e "'ipu1_ic_prpenc capture'
/dev/video1"

/dev/video1 is the streaming element in this case.

Starting the streaming via v4l2-ctl:

v4l2-ctl --stream-mmap -d /dev/video1

Starting the streaming via Gstreamer and sending the content to the display:

gst-launch-1.0 v4l2src device=/dev/video1 ! kmssink

Known Issues

1. When using 90 or 270 degree rotation control at capture resolutions near the IC resizer limit of 1024x1024, and combined with planar pixel formats (YUV420, YUV422p), frame capture will often fail with no end-of-frame interrupts from the IDMAC channel. To work around this, use lower resolution and/or packed formats (YUYV, RGB3, etc.) when 90 or 270 rotations are needed.

1.1.6.8 i.MX7 Video Capture Driver

Introduction

The i.MX7 contrary to the i.MX5/6 family does not contain an Image Processing Unit (IPU); because of that the capabilities to perform operations or manipulation of the capture frames are less feature rich.

For image capture the i.MX7 has three units: - CMOS Sensor Interface (CSI) - Video Multiplexer - MIPI CSI-2 Receiver

| MIPI Camera Input ---> MIPI CSI-2 ---> |
| \                                      |
|  \                                    |
|   M                                   |
|    U                   ---> CSI ---> Capture |
|     X                   |
|    /                                    |
|   /                                    |
| Parallel Camera Input ---------------> / |
|                                        |

For additional information, please refer to the latest versions of the i.MX7 reference manual1.

Entities

imx7-mipi-csi2

This is the MIPI CSI-2 receiver entity. It has one sink pad to receive the pixel data from MIPI CSI-2 camera sensor. It has one source pad, corresponding to the virtual channel 0. This module is compliant to previous version of Samsung D-phy, and supports two D-PHY Rx Data lanes.

---

csi-mux

This is the video multiplexer. It has two sink pads to select from either camera sensor with a parallel interface or from MIPI CSI-2 virtual channel 0. It has a single source pad that routes to the CSI.

csi

The CSI enables the chip to connect directly to external CMOS image sensor. CSI can interface directly with Parallel and MIPI CSI-2 buses. It has 256 x 64 FIFO to store received image pixel data and embedded DMA controllers to transfer data from the FIFO through AHB bus.

This entity has one sink pad that receives from the csi-mux entity and a single source pad that routes video frames directly to memory buffers. This pad is routed to a capture device node.

Usage Notes

To aid in configuration and for backward compatibility with V4L2 applications that access controls only from video device nodes, the capture device interfaces inherit controls from the active entities in the current pipeline, so controls can be accessed either directly from the subdev or from the active capture device interface. For example, the sensor controls are available either from the sensor subdevs or from the active capture device.

Warp7 with OV2680

On this platform an OV2680 MIPI CSI-2 module is connected to the internal MIPI CSI-2 receiver. The following example configures a video capture pipeline with an output of 800x600, and BGGR 10 bit bayer format:

```
# Setup links
media-ctl -l "'ov2680 1-0036':0 -> 'imx7-mipi-csis.0':0[1]"
media-ctl -l "'imx7-mipi-csis.0':1 -> 'csi-mux':1[1]"
media-ctl -l "'csi-mux':2 -> 'csi':0[1]"
media-ctl -l "'csi':1 -> 'csi capture':0[1]"

# Configure pads for pipeline
media-ctl -V "'ov2680 1-0036':0 [fmt:SBGGR10_1X10/800x600 field:none]"
media-ctl -V "'csi-mux':1 [fmt:SBGGR10_1X10/800x600 field:none]"
media-ctl -V "'imx7-mipi-csis.0':0 [fmt:SBGGR10_1X10/800x600 field:none]"
media-ctl -V "'csi':0 [fmt:SBGGR10_1X10/800x600 field:none]"
```

After this streaming can start. The v4l2-ctl tool can be used to select any of the resolutions supported by the sensor:

```
# media-ctl -p
Media controller API version 5.2.0

Introduction

This file documents the Intel IPU3 (3rd generation Image Processing Unit) Imaging Unit drivers located under drivers/media/pci/intel/ipu3 (CIO2) as well as under drivers/staging/media/ipu3 (ImgU).

The Intel IPU3 found in certain Kaby Lake (as well as certain Sky Lake) platforms (U/Y processor lines) is made up of two parts namely the Imaging Unit (ImgU) and the CIO2 device (MIPI CSI2 receiver).

The CIO2 device receives the raw Bayer data from the sensors and outputs the frames in a format that is specific to the IPU3 (for consumption by the IPU3 ImgU). The CIO2 driver is available as drivers/media/pci/intel/ipu3/ipu3-cio2* and is enabled through the CONFIG_VIDEO_IPU3_CIO2 config option.

The Imaging Unit (ImgU) is responsible for processing images captured by the IPU3 CIO2 device. The ImgU driver sources can be found under drivers/staging/media/ipu3 directory. The driver is enabled through the CONFIG_VIDEO_IPU3_IMGU config option.

The two driver modules are named ipu3_csi2 and ipu3_imgu, respectively.

The drivers has been tested on Kaby Lake platforms (U/Y processor lines).

Both of the drivers implement V4L2, Media Controller and V4L2 sub-device interfaces. The IPU3 CIO2 driver supports camera sensors connected to the CIO2 MIPI CSI-2 interfaces through V4L2 sub-device sensor drivers.

CIO2

The CIO2 is represented as a single V4L2 subdev, which provides a V4L2 subdev interface to the user space. There is a video node for each CSI-2 receiver, with a single media controller interface for the entire device.

The CIO2 contains four independent capture channel, each with its own MIPI CSI-2 receiver and DMA engine. Each channel is modelled as a V4L2 sub-device exposed to userspace as a V4L2 sub-device node and has two pads:

<table>
<thead>
<tr>
<th>pad</th>
<th>direction</th>
<th>purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>sink</td>
<td>MIPI CSI-2 input, connected to the sensor subdev</td>
</tr>
<tr>
<td>1</td>
<td>source</td>
<td>Raw video capture, connected to the V4L2 video interface</td>
</tr>
</tbody>
</table>
The V4L2 video interfaces model the DMA engines. They are exposed to userspace as V4L2 video device nodes.

**Capturing frames in raw Bayer format**

CIO2 MIPI CSI2 receiver is used to capture frames (in packed raw Bayer format) from the raw sensors connected to the CSI2 ports. The captured frames are used as input to the ImgU driver.

Image processing using IPU3 ImgU requires tools such as raw2pnm\(^2\), and yavta\(^3\) due to the following unique requirements and/or features specific to IPU3.

- The IPU3 CSI2 receiver outputs the captured frames from the sensor in packed raw Bayer format that is specific to IPU3.
- Multiple video nodes have to be operated simultaneously.

Let us take the example of ov5670 sensor connected to CSI2 port 0, for a 2592x1944 image capture.

Using the media controller APIs, the ov5670 sensor is configured to send frames in packed raw Bayer format to IPU3 CSI2 receiver.

```plaintext
# This example assumes /dev/media0 as the CIO2 media device
export MDEV=/dev/media0

# and that ov5670 sensor is connected to i2c bus 10 with address 0x36
export SDEV=$(media-ctl -d $MDEV -e "ov5670 10-0036")

# Establish the link for the media devices using media-ctl
media-ctl -d $MDEV -l "ov5670:0 -> ipu3-csi2 0:0[1]"

# Set the format for the media devices
media-ctl -d $MDEV -V "ov5670:0 [fmt:SGRBG10/2592x1944]"
media-ctl -d $MDEV -V "ipu3-csi2 0:0 [fmt:SGRBG10/2592x1944]"
media-ctl -d $MDEV -V "ipu3-csi2 0:1 [fmt:SGRBG10/2592x1944]"
```

Once the media pipeline is configured, desired sensor specific settings (such as exposure and gain settings) can be set, using the yavta tool.

e.g

```
yavta -w 0x009e0903 444 $SDEV
yavta -w 0x009e0913 1024 $SDEV
yavta -w 0x009e0911 2046 $SDEV
```

Once the desired sensor settings are set, frame captures can be done as below.

e.g

```
yavta --data-prefix -u -c10 -n5 -I -s2592x1944 --file=/tmp/frame-#.bin \`f IPU3_SGRBG10 $(media-ctl -d $MDEV -e "ipu3-cio2 0")
```

With the above command, 10 frames are captured at 2592x1944 resolution, with sGRBG10 format and output as IPU3_SGRBG10 format.

\(^2\) [https://github.com/intel/nvt](https://github.com/intel/nvt)
\(^3\) [http://git.ideasonboard.org/yavta.git](http://git.ideasonboard.org/yavta.git)
The captured frames are available as /tmp/frame-#.bin files.

**ImgU**

The ImgU is represented as two V4L2 subdevs, each of which provides a V4L2 subdev interface to the user space.

Each V4L2 subdev represents a pipe, which can support a maximum of 2 streams. This helps to support advanced camera features like Continuous View Finder (CVF) and Snapshot During Video (SDV).

The ImgU contains two independent pipes, each modelled as a V4L2 sub-device exposed to userspace as a V4L2 sub-device node.

Each pipe has two sink pads and three source pads for the following purpose:

<table>
<thead>
<tr>
<th>pad</th>
<th>direction</th>
<th>purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>sink</td>
<td>Input raw video stream</td>
</tr>
<tr>
<td>1</td>
<td>sink</td>
<td>Processing parameters</td>
</tr>
<tr>
<td>2</td>
<td>source</td>
<td>Output processed video stream</td>
</tr>
<tr>
<td>3</td>
<td>source</td>
<td>Output viewfinder video stream</td>
</tr>
<tr>
<td>4</td>
<td>source</td>
<td>3A statistics</td>
</tr>
</tbody>
</table>

Each pad is connected to a corresponding V4L2 video interface, exposed to userspace as a V4L2 video device node.

**Device operation**

With ImgU, once the input video node (“ipu3-imgu 0/1”:0, in <entity>:<pad-number> format) is queued with buffer (in packed raw Bayer format), ImgU starts processing the buffer and produces the video output in YUV format and statistics output on respective output nodes. The driver is expected to have buffers ready for all of parameter, output and statistics nodes, when input video node is queued with buffer.

At a minimum, all of input, main output, 3A statistics and viewfinder video nodes should be enabled for IPU3 to start image processing.

Each ImgU V4L2 subdev has the following set of video nodes.
input, output and viewfinder video nodes

The frames (in packed raw Bayer format specific to the IPU3) received by the input video node is processed by the IPU3 Imaging Unit and are output to 2 video nodes, with each targeting a different purpose (main output and viewfinder output).

Details on the Bayer format specific to the IPU3 can be found in `V4L2_PIX_FMT_IPU3_SBGGR10` (`ip3b`), `V4L2_PIX_FMT_IPU3_SGBRG10` (`ip3g`), `V4L2_PIX_FMT_IPU3_SGRBG10` (`ip3G`), `V4L2_PIX_FMT_IPU3_SRGGB10` (`ip3r`).

The driver supports V4L2 Video Capture Interface as defined at Interfaces. Only the multi-planar API is supported. More details can be found at Single- and multi-planar APIs.

Parameters video node

The parameters video node receives the ImgU algorithm parameters that are used to configure how the ImgU algorithms process the image.

Details on processing parameters specific to the IPU3 can be found in `V4L2_META_FMT_IPU3_PARAMS` (`ip3p`), `V4L2_META_FMT_IPU3_3A` (`ip3s`).

3A statistics video node

3A statistics video node is used by the ImgU driver to output the 3A (auto focus, auto exposure and auto white balance) statistics for the frames that are being processed by the ImgU to user space applications. User space applications can use this statistics data to compute the desired algorithm parameters for the ImgU.

Configuring the Intel IPU3

The IPU3 ImgU pipelines can be configured using the Media Controller, defined at Part IV - Media Controller API.

Running mode and firmware binary selection

ImgU works based on firmware, currently the ImgU firmware support run 2 pipes in time-sharing with single input frame data. Each pipe can run at certain mode - “VIDEO” or “STILL”. “VIDEO” mode is commonly used for video frames capture, and “STILL” is used for still frame capture. However, you can also select “VIDEO” to capture still frames if you want to capture images with less system load and power. For “STILL” mode, ImgU will try to use smaller BDS factor and output larger bayer frame for further YUV processing than “VIDEO” mode to get high quality images. Besides, “STILL” mode need XNR3 to do noise reduction, hence “STILL” mode will need more power and memory bandwidth than “VIDEO” mode. TNR will be enabled in “VIDEO” mode and bypassed by “STILL” mode. ImgU is running at “VIDEO” mode by default, the user can use v4l2 control `V4L2_CID_INTEL_IPU3_MODE` (currently defined in drivers/staging/media/ipu3/include/uapi/intel-ipu3.h) to query and set the running mode. For user, there is no difference for buffer queueing between the “VIDEO” and “STILL” mode.
mandatory input and main output node should be enabled and buffers need be queued, the 
statistics and the view-finder queues are optional.

The firmware binary will be selected according to current running mode, such log “using binary 
if_to_osys_striped” or “using binary if_to_osys_primary_striped” could be observed if you enable 
the ImgU dynamic debug, the binary if_to_osys_striped is selected for “VIDEO” and the binary 
“if_to_osys_primary_striped” is selected for “STILL”.

Processing the image in raw Bayer format

Configuring ImgU V4L2 subdev for image processing

The ImgU V4L2 subdevs have to be configured with media controller APIs to have all the video 
 nodes setup correctly.

Let us take “ipu3-imgu 0” subdev as an example.

```
mmedia-ctl -d $MDEV -r
media-ctl -d $MDEV -l "ipu3-imgu 0 input":0 -> "ipu3-imgu 0":0[1]
mmedia-ctl -d $MDEV -l "ipu3-imgu 0":2 -> "ipu3-imgu 0 output":0[1]
mmedia-ctl -d $MDEV -l "ipu3-imgu 0":3 -> "ipu3-imgu 0 viewfinder":0[1]
mmedia-ctl -d $MDEV -l "ipu3-imgu 0":4 -> "ipu3-imgu 0 3a stat":0[1]
```

Also the pipe mode of the corresponding V4L2 subdev should be set as desired (e.g 0 for video 
mode or 1 for still mode) through the control id 0x009819a1 as below.

```
yavta -w "0x009819A1 1" /dev/v4l-subdev7
```

Certain hardware blocks in ImgU pipeline can change the frame resolution by cropping or scal-
ing, these hardware blocks include Input Feeder(IF), Bayer Down Scaler (BDS) and Geometric 
Distortion Correction (GDC). There is also a block which can change the frame resolution - YUV 
Scaler, it is only applicable to the secondary output.

RAW Bayer frames go through these ImgU pipeline hardware blocks and the final processed 
image output to the DDR memory.

![Fig. 3: IPU3 resolution change hardware blocks](image)

**Input Feeder**

Input Feeder gets the Bayer frame data from the sensor, it can enable cropping of lines and 
columns from the frame and then store pixels into device’s internal pixel buffer which are ready 
to readout by following blocks.

**Bayer Down Scaler**
Bayer Down Scaler is capable of performing image scaling in Bayer domain, the downscale factor can be configured from 1X to 1/4X in each axis with configuration steps of 0.03125 (1/32).

**Geometric Distortion Correction**

Geometric Distortion Correction is used to perform correction of distortions and image filtering. It needs some extra filter and envelope padding pixels to work, so the input resolution of GDC should be larger than the output resolution.

**YUV Scaler**

YUV Scaler which similar with BDS, but it is mainly do image down scaling in YUV domain, it can support up to 1/12X down scaling, but it can not be applied to the main output.

The ImgU V4L2 subdev has to be configured with the supported resolutions in all the above hardware blocks, for a given input resolution. For a given supported resolution for an input frame, the Input Feeder, Bayer Down Scaler and GDC blocks should be configured with the supported resolutions as each hardware block has its own alignment requirement.

You must configure the output resolution of the hardware blocks smartly to meet the hardware requirement along with keeping the maximum field of view. The intermediate resolutions can be generated by specific tool -

https://github.com/intel/intel-ipu3-pipecfg

This tool can be used to generate intermediate resolutions. More information can be obtained by looking at the following IPU3 ImgU configuration table.

https://chromium.googlesource.com/chromiumos/overlays/board-overlays/+/master

Under baseboard-poppy/media-libs/cros-camera-hal-configs-poppy/files/gcss directory, graph_settings_ov5670.xml can be used as an example.

The following steps prepare the ImgU pipeline for the image processing.

1. The ImgU V4L2 subdev data format should be set by using the VIDIOC_SUBDEV_S_FMT on pad 0, using the GDC width and height obtained above.

2. The ImgU V4L2 subdev cropping should be set by using the VIDIOC_SUBDEV_S_SELECTION on pad 0, with V4L2_SEL_TGT_CROP as the target, using the input feeder height and width.

3. The ImgU V4L2 subdev composing should be set by using the VIDIOC_SUBDEV_S_SELECTION on pad 0, with V4L2_SEL_TGT_COMPOSE as the target, using the BDS height and width.

For the ov5670 example, for an input frame with a resolution of 2592x1944 (which is input to the ImgU subdev pad 0), the corresponding resolutions for input feeder, BDS and GDC are 2592x1944, 2592x1944 and 2560x1920 respectively.

Once this is done, the received raw Bayer frames can be input to the ImgU V4L2 subdev as below, using the open source application v4l2n².

For an image captured with 2592x1944 resolution, with desired output resolution as 2560x1920 and viewfinder resolution as 2560x1920, the following v4l2n command can be used. This helps process the raw Bayer frames and produces the desired results for the main output image and the viewfinder output, in NV12 format.

---

² ImgU limitation requires an additional 16x16 for all input resolutions
Linux Media Documentation

You can also use yavta command to do same thing as above:

\[ \text{yavta --data-prefix -Bcapture-mplane -c10 -n5 -I -s2592x1944 \} \]
\[ /dev/video5 \& \]
\[ \text{yavta --data-prefix -Bcapture-mplane -c10 -n5 -I -s2592x1944 \} \]
\[ /dev/video6 \& \]
\[ \text{yavta --data-prefix -Bmeta-capture -c10 -n5 -I \} \]
\[ /dev/video7 \& \]
\[ \text{yavta --data-prefix -Boutput-mplane -c10 -n5 -I -s2592x1944 \} \]
\[ /dev/video4 \]

Converting the raw Bayer image into YUV domain

The processed images after the above step, can be converted to YUV domain as below.

Main output frames

\[ \text{raw2pnm -x2560 -y1920 -fNV12 /tmp/frames.out /tmp/frames.out.ppm} \]

where 2560x1920 is output resolution, NV12 is the video format, followed by input frame and output PNM file.

Viewfinder output frames

\[ \text{raw2pnm -x2560 -y1920 -fNV12 /tmp/frames.vf /tmp/frames.vf.ppm} \]

where 2560x1920 is output resolution, NV12 is the video format, followed by input frame and output PNM file.
Example user space code for IPU3

User space code that configures and uses IPU3 is available here.
https://chromium.googlesource.com/chromiumos/platform/arc-camera/+/master/
The source can be located under hal/intel directory.

Overview of IPU3 pipeline

IPU3 pipeline has a number of image processing stages, each of which takes a set of parameters as input. The major stages of pipelines are shown here:

Fig. 4: IPU3 ImgU Pipeline Diagram

The table below presents a description of the above algorithms.
<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Optical Black Correction</td>
<td>Optical Black Correction block subtracts a pre-defined value from the respective pixel values to obtain better image quality. Defined in <code>struct ipu3_uapi_obgrid_param</code>.</td>
</tr>
<tr>
<td>Linearization</td>
<td>This algo block uses linearization parameters to address non-linearity sensor effects. The Lookup table table is defined in <code>struct ipu3_uapi_isp_lin_vmem_params</code>.</td>
</tr>
<tr>
<td>SHD</td>
<td>Lens shading correction is used to correct spatial non-uniformity of the pixel response due to optical lens shading. This is done by applying a different gain for each pixel. The gain, black level etc are configured in <code>struct ipu3_uapi_shd_config_static</code>.</td>
</tr>
<tr>
<td>BNR</td>
<td>Bayer noise reduction block removes image noise by applying a bilateral filter. See <code>struct ipu3_uapi_bnr_static_config</code> for details.</td>
</tr>
<tr>
<td>ANR</td>
<td>Advanced Noise Reduction is a block based algorithm that performs noise reduction in the Bayer domain. The convolution matrix etc can be found in <code>struct ipu3_uapi_anr_config</code>.</td>
</tr>
<tr>
<td>DM</td>
<td>Demosaicing converts raw sensor data in Bayer format into RGB (Red, Green, Blue) presentation. Then add outputs of estimation of Y channel for following stream processing by Firmware. The struct is defined as <code>struct ipu3_uapi_dm_config</code>.</td>
</tr>
<tr>
<td>Color Correction</td>
<td>Color Correction algo transforms sensor specific color space to the standard “sRGB” color space. This is done by applying 3x3 matrix defined in <code>struct ipu3_uapi_ccm_mat_config</code>.</td>
</tr>
<tr>
<td>Gamma correction</td>
<td>Gamma correction <code>struct ipu3_uapi_gamma_config</code> is a basic non-linear tone mapping correction that is applied per pixel for each pixel component.</td>
</tr>
<tr>
<td>CSC</td>
<td>Color space conversion transforms each pixel from the RGB primary presentation to YUV (Y: brightness, UV: Luminance) presentation. This is done by applying a 3x3 matrix defined in <code>struct ipu3_uapi_csc_mat_config</code>.</td>
</tr>
<tr>
<td>CDS</td>
<td>Chroma down sampling After the CSC is performed, the Chroma Down Sampling is applied for a UV plane down sampling by a factor of 2 in each direction for YUV 4:2:0 using a 4x2 configurable filter <code>struct ipu3_uapi_cds_params</code>.</td>
</tr>
<tr>
<td>CHNR</td>
<td>Chroma noise reduction This block processes only the chrominance pixels and performs noise reduction by cleaning the high frequency noise. See struct <code>struct ipu3_uapi_yuvp1_chnr_config</code>.</td>
</tr>
<tr>
<td>TCC</td>
<td>Total color correction as defined in struct <code>struct ipu3_uapi_yuvp2_tcc_static_config</code>.</td>
</tr>
<tr>
<td>XNR3</td>
<td>eXtreme Noise Reduction V3 is the third revision of noise reduction algorithm used to improve image quality. This removes the low frequency noise in the captured image. Two related structs are being defined, <code>struct ipu3_uapi_isp_xnr3_params</code> for ISP data memory and <code>struct ipu3_uapi_isp_xnr3_vmem_params</code> for vector memory.</td>
</tr>
<tr>
<td>TNR</td>
<td>Temporal Noise Reduction block compares successive frames in time to remove anomalies / noise in pixel values. <code>struct ipu3_uapi_isp_tnr3_vmem_params</code> and <code>struct ipu3_uapi_isp_tnr3_params</code> are defined for ISP vector and data memory respectively.</td>
</tr>
</tbody>
</table>
Other often encountered acronyms not listed in above table:

- **ACC** Accelerator cluster
- **AWB_FR** Auto white balance filter response statistics
- **BDS** Bayer downscaler parameters
- **CCM** Color correction matrix coefficients
- **IEFd** Image enhancement filter directed
- **Obgrid** Optical black level compensation
- **OSYS** Output system configuration
- **ROI** Region of interest
- **YDS** Y down sampling
- **YTM** Y-tone mapping

A few stages of the pipeline will be executed by firmware running on the ISP processor, while many others will use a set of fixed hardware blocks also called accelerator cluster (ACC) to crunch pixel data and produce statistics.

ACC parameters of individual algorithms, as defined by `struct ipu3_uapi_acc_param`, can be chosen to be applied by the user space through `struct struct ipu3_uapi_flagsembedded in struct ipu3_uapi_params` structure. For parameters that are configured as not enabled by the user space, the corresponding structs are ignored by the driver, in which case the existing configuration of the algorithm will be preserved.

1.1.6.10 The ivtv driver

Author: Hans Verkuil <hverkuil@xs4all.nl>

This is a v4l2 device driver for the Conexant cx23415/6 MPEG encoder/decoder. The cx23415 can do both encoding and decoding, the cx23416 can only do MPEG encoding. Currently the only card featuring full decoding support is the Hauppauge PVR-350.

**Note:**

1) This driver requires the latest encoder firmware (version 2.06.039, size 376836 bytes). Get the firmware from here:

   https://linuxtv.org/downloads/firmware/#conexant

2) ‘normal’ TV applications do not work with this driver, you need an application that can handle MPEG input such as mplayer, xine, MythTV, etc.

The primary goal of the IVTV project is to provide a “clean room” Linux Open Source driver implementation for video capture cards based on the iCompression iTVC15 or Conexant CX23415/CX23416 MPEG Codec.
Features

- Hardware mpeg2 capture of broadcast video (and sound) via the tuner or S-Video/Composite and audio line-in.
- Hardware mpeg2 capture of FM radio where hardware support exists
- Supports NTSC, PAL, SECAM with stereo sound
- Supports SAP and bilingual transmissions.
- Supports raw VBI (closed captions and teletext).
- Supports sliced VBI (closed captions and teletext) and is able to insert this into the captured MPEG stream.
- Supports raw YUV and PCM input.

Additional features for the PVR-350 (CX23415 based)

- Provides hardware mpeg2 playback
- Provides comprehensive OSD (On Screen Display: ie. graphics overlaying the video signal)
- Provides a framebuffer (allowing X applications to appear on the video device)
- Supports raw YUV output.

IMPORTANT: In case of problems first read this page: [https://help.ubuntu.com/community/Install_IVTV_Troubleshooting](https://help.ubuntu.com/community/Install_IVTV_Troubleshooting)

irc://irc.freenode.net/#v4l

Devices

A maximum of 12 ivtv boards are allowed at the moment.

Cards that don’t have a video output capability (i.e. non PVR350 cards) lack the vbi8, vbi16, video16 and video48 devices. They also do not support the framebuffer device /dev/fbx for OSD.

The radio0 device may or may not be present, depending on whether the card has a radio tuner or not.

Here is a list of the base v4l devices:
Base devices

For every extra card you have the numbers increased by one. For example, /dev/video0 is listed as the ‘base’ encoding capture device so we have:

- /dev/video0 is the encoding capture device for the first card (card 0)
- /dev/video1 is the encoding capture device for the second card (card 1)
- /dev/video2 is the encoding capture device for the third card (card 2)

Note that if the first card doesn’t have a feature (eg no decoder, so no video16, the second card will still use video17. The simple rule is ‘add the card number to the base device number’. If you have other capture cards (e.g. WinTV PCI) that are detected first, then you have to tell the ivtv module about it so that it will start counting at 1 (or 2, or whatever). Otherwise the device numbers can get confusing. The ivtv ‘ivtv_first_minor’ module option can be used for that.

- /dev/video0

The encoding capture device(s).

Read-only.

Reading from this device gets you the MPEG1/2 program stream. Example:

```
cat /dev/video0 > my.mpg (you need to hit ctrl-c to exit)
```

- /dev/video16

The decoder output device(s)

Write-only. Only present if the MPEG decoder (i.e. CX23415) exists.

An mpeg2 stream sent to this device will appear on the selected video display, audio will appear on the line-out/audio out. It is only available for cards that support video out. Example:

```
cat my.mpg >/dev/video16
```

- /dev/video24

The raw audio capture device(s).

Read-only

The raw audio PCM stereo stream from the currently selected tuner or audio line-in. Reading from this device results in a raw (signed 16 bit Little Endian, 48000 Hz, stereo pcm) capture. This device only captures audio. This should be replaced by an ALSA device in the
future. Note that there is no corresponding raw audio output device, this is not supported in the decoder firmware.

- **/dev/video32**
  
The raw video capture device(s)
  
  Read-only
  
The raw YUV video output from the current video input. The YUV format is non-standard (V4L2_PIX_FMT_HM12).
  
  Note that the YUV and PCM streams are not synchronized, so they are of limited use.

- **/dev/video48**
  
The raw video display device(s)
  
  Write-only. Only present if the MPEG decoder (i.e. CX23415) exists.
  
  Writes a YUV stream to the decoder of the card.

- **/dev/radio0**
  
The radio tuner device(s)
  
  Cannot be read or written.
  
  Used to enable the radio tuner and tune to a frequency. You cannot read or write audio streams with this device. Once you use this device to tune the radio, use /dev/video24 to read the raw pcm stream or /dev/video0 to get an mpeg2 stream with black video.

- **/dev/vbi0**
  
The ‘vertical blank interval’ (Teletext, CC, WSS etc) capture device(s)
  
  Read-only
  
  Captures the raw (or sliced) video data sent during the Vertical Blank Interval. This data is used to encode teletext, closed captions, VPS, widescreen signalling, electronic program guide information, and other services.

- **/dev/vbi8**
  
  Processed vbi feedback device(s)
  
  Read-only. Only present if the MPEG decoder (i.e. CX23415) exists.
  
  The sliced VBI data embedded in an MPEG stream is reproduced on this device. So while playing back a recording on /dev/video16, you can read the embedded VBI data from /dev/vbi8.

- **/dev/vbi16**
  
The vbi ‘display’ device(s)
  
  Write-only. Only present if the MPEG decoder (i.e. CX23415) exists.
  
  Can be used to send sliced VBI data to the video-out connector.
1.1.6.11 Vaio Picturebook Motion Eye Camera Driver

Copyright © 2001-2004 Stelian Pop <stelian@popies.net>
Copyright © 2001-2002 Alcôve <www.alcove.com>
Copyright © 2000 Andrew Tridgell <tridge@samba.org>

This driver enable the use of video4linux compatible applications with the Motion Eye camera. This driver requires the “Sony Laptop Extras” driver (which can be found in the “Misc devices” section of the kernel configuration utility) to be compiled and installed (using its “camera=1” parameter).

It can do at maximum 30 fps @ 320x240 or 15 fps @ 640x480.
Grabbing is supported in packed YUV colorspace only.
MJPEG hardware grabbing is supported via a private API (see below).

Hardware supported

This driver supports the ‘second’ version of the MotionEye camera :)
The first version was connected directly on the video bus of the Neomagic video card and is unsupported.
The second one, made by Kawasaki Steel is fully supported by this driver (PCI vendor/device is 0x136b/0xff01)
The third one, present in recent (more or less last year) Picturebooks (C1M* models), is not supported. The manufacturer has given the specs to the developers under a NDA (which allows the development of a GPL driver however), but things are not moving very fast (see http://r-engine.sourceforge.net/) (PCI vendor/device is 0x10cf/0x2011).

There is a forth model connected on the USB bus in TR1* Vaio laptops. This camera is not supported at all by the current driver, in fact little information if any is available for this camera (USB vendor/device is 0x054c/0x0107).

Driver options

Several options can be passed to the meye driver using the standard module argument syntax (<param>=<value> when passing the option to the module or meye.<param>=<value> on the kernel boot line when meye is statically linked into the kernel). Those options are:

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>gbuffers</td>
<td>number of capture buffers, default is 2 (32 max)</td>
</tr>
<tr>
<td>gbufsize</td>
<td>size of each capture buffer, default is 614400</td>
</tr>
<tr>
<td>video_nr</td>
<td>video device to register (0 = /dev/video0, etc)</td>
</tr>
</tbody>
</table>
Module use

In order to automatically load the meye module on use, you can put those lines in your /etc/modprobe.d/meye.conf file:

```bash
alias char-major-81 videodev
alias char-major-81-0 meye
options meye gbuffers=32
```

Usage:

```bash
xawtv >= 3.49 (http://bytesex.org/xawtv/)
    for display and uncompressed video capture:
        xawtv -c /dev/video0 -geometry 640x480
    or
        xawtv -c /dev/video0 -geometry 320x240
motioneye (http://popies.net/meye/)
    for getting ppm or jpg snapshots, mjpeg video
```

Bugs / Todo

- `motioneye` still uses the meye private v4l1 API extensions.

1.1.6.12 OMAP 3 Image Signal Processor (ISP) driver

Copyright © 2010 Nokia Corporation
Copyright © 2009 Texas Instruments, Inc.

Contacts: Laurent Pinchart <laurent.pinchart@ideasonboard.com>, Sakari Ailus <sakari.ailus@iki.fi>, David Cohen <dacohen@gmail.com>

Introduction

This file documents the Texas Instruments OMAP 3 Image Signal Processor (ISP) driver located under drivers/media/platform/omap3isp. The original driver was written by Texas Instruments but since that it has been rewritten (twice) at Nokia.

The driver has been successfully used on the following versions of OMAP 3:

- 3430
- 3530
- 3630

The driver implements V4L2, Media controller and v4l2_subdev interfaces. Sensor, lens and flash drivers using the v4l2_subdev interface in the kernel are supported.
Split to subdevs

The OMAP 3 ISP is split into V4L2 subdevs, each of the blocks inside the ISP having one subdev to represent it. Each of the subdevs provide a V4L2 subdev interface to userspace.

- OMAP3 ISP CCP2
- OMAP3 ISP CSI2a
- OMAP3 ISP CCDC
- OMAP3 ISP preview
- OMAP3 ISP resizer
- OMAP3 ISP AEWB
- OMAP3 ISP AF
- OMAP3 ISP histogram

Each possible link in the ISP is modelled by a link in the Media controller interface. For an example program see\(^1\).

Controlling the OMAP 3 ISP

In general, the settings given to the OMAP 3 ISP take effect at the beginning of the following frame. This is done when the module becomes idle during the vertical blanking period on the sensor. In memory-to-memory operation the pipe is run one frame at a time. Applying the settings is done between the frames.

All the blocks in the ISP, excluding the CSI-2 and possibly the CCP2 receiver, insist on receiving complete frames. Sensors must thus never send the ISP partial frames.

Autoidle does have issues with some ISP blocks on the 3430, at least. Autoidle is only enabled on 3630 when the omap3isp module parameter autoidle is non-zero.

1.1.6.13 OMAP4 ISS Driver

Author: Sergio Aguirre <sergio.a.aguirre@gmail.com>
Copyright (C) 2012, Texas Instruments

Introduction

The OMAP44XX family of chips contains the Imaging SubSystem (a.k.a. ISS), which contains several components that can be categorized in 3 big groups:

- Interfaces (2 Interfaces: CSI2-A & CSI2-B/CCP2)
- ISP (Image Signal Processor)
- SIMCOP (Still Image Coprocessor)

For more information, please look in\(^1\) for latest version of: “OMAP4430 Multimedia Device Silicon Revision 2.x”

As of Revision AB, the ISS is described in detail in section 8.

This driver is supporting only the CSI2-A/B interfaces for now.

It makes use of the Media Controller framework\(^2\), and inherited most of the code from OMAP3 ISP driver (found under drivers/media/platform/omap3isp/*), except that it doesn’t need an IOMMU now for ISS buffers memory mapping.

Supports usage of MMAP buffers only (for now).

Tested platforms

- OMAP4430SDP, w/ ES2.1 GP & SEVM4430-CAM-V1-0 (Contains IMX060 & OV5640, in which only the last one is supported, outputting YUV422 frames).
- TI Blaze MDP, w/ OMAP4430 ES2.2 EMU (Contains 1 IMX060 & 2 OV5650 sensors, in which only the OV5650 are supported, outputting RAW10 frames).
- PandaBoard, Rev. A2, w/ OMAP4430 ES2.1 GP & OV adapter board, tested with following sensors: *OV5640* *OV5650*
- Tested on mainline kernel:
  - Tag: v3.3 (commit c16fa4f2ad19908a47c63d8fa436a1178438c7e7)

1.1.6.14 Philips webcams (pwc driver)

This file contains some additional information for the Philips and OEM webcams. E-mail: webcam@smcc.demon.nl Last updated: 2004-01-19 Site: http://www.smcc.demon.nl/webcam/

As of this moment, the following cameras are supported:

- Philips PCA645
- Philips PCA646
- Philips PCVC675
- Philips PCVC680
- Philips PCVC690
- Philips PCVC720/40
- Philips PCVC730
- Philips PCVC740
- Philips PCVC750
- Askey VC010
- Creative Labs Webcam 5
- Creative Labs Webcam Pro Ex
- Logitech QuickCam 3000 Pro
- Logitech QuickCam 4000 Pro
- Logitech QuickCam Notebook Pro
- Logitech QuickCam Zoom
- Logitech QuickCam Orbit
- Logitech QuickCam Sphere
- Samsung MPC-C10
- Samsung MPC-C30
- Sotec Afina Eye
- AME CU-001
- Visionite VCS-UM100
- Visionite VCS-UC300
The main webpage for the Philips driver is at the address above. It contains a lot of extra information, a FAQ, and the binary plugin ‘PWCX’. This plugin contains decompression routines that allow you to use higher image sizes and framerates; in addition the webcam uses less bandwidth on the USB bus (handy if you want to run more than 1 camera simultaneously). These routines fall under a NDA, and may therefore not be distributed as source; however, its use is completely optional.

You can build this code either into your kernel, or as a module. I recommend the latter, since it makes troubleshooting a lot easier. The built-in microphone is supported through the USB Audio class.

When you load the module you can set some default settings for the camera; some programs depend on a particular image-size or -format and don’t know how to set it properly in the driver. The options are:

- **size** Can be one of ‘sqcif’, ‘qsif’, ‘qcif’, ‘sif’, ‘cif’ or ‘vga’, for an image size of resp. 128x96, 160x120, 176x144, 320x240, 352x288 and 640x480 (of course, only for those cameras that support these resolutions).

- **fps** Specifies the desired framerate. Is an integer in the range of 4-30.

- **fbufs** This parameter specifies the number of internal buffers to use for storing frames from the cam. This will help if the process that reads images from the cam is a bit slow or momentarily busy. However, on slow machines it only introduces lag, so choose carefully. The default is 3, which is reasonable. You can set it between 2 and 5.

- **mbufs** This is an integer between 1 and 10. It will tell the module the number of buffers to reserve for mmap(), VIDIOCCGMBUF, VIDIOCMCAPTURE and friends. The default is 2, which is adequate for most applications (double buffering).

  Should you experience a lot of ‘Dumping frame...’ messages during grabbing with a tool that uses mmap(), you might want to increase if. However, it doesn’t really buffer images, it just gives you a bit more slack when your program is behind. But you need a multi-threaded or forked program to really take advantage of these buffers.

  The absolute maximum is 10, but don’t set it too high! Every buffer takes up 460 KB of RAM, so unless you have a lot of memory setting this to something more than 4 is an absolute waste. This memory is only allocated during open(), so nothing is wasted when the camera is not in use.

- **power_save** When power_save is enabled (set to 1), the module will try to shut down the cam on close() and re-activate on open(). This will save power and turn off the LED. Not all cameras support this though (the 645 and 646 don’t have power saving at all), and some models don’t work either (they will shut down, but never wake up). Consider this experimental. By default this option is disabled.

- **compression (only useful with the plugin)** With this option you can control the compression factor that the camera uses to squeeze the image through the USB bus. You can set the parameter between 0 and 3:

  | 0 | prefer uncompressed images; if the requested mode is not available in an uncompressed format, the driver will silently switch to low compression. |
  | 1 | low compression. |
  | 2 | medium compression. |
  | 3 | high compression. |

High compression takes less bandwidth of course, but it could also introduce some unwanted artefacts. The default is 2, medium compression. See the FAQ on the website for an overview of which modes require compression.

The compression parameter does not apply to the 645 and 646 cameras and OEM models derived from those (only a few). Most cams honour this parameter.

**leds** This setting takes 2 integers, that define the on/off time for the LED (in milliseconds). One of the interesting things that you can do with this is let the LED blink while the camera is in use. This:

```plaintext
leds=500,500
```

will blink the LED once every second. But with:

```plaintext
leds=0,0
```

the LED never goes on, making it suitable for silent surveillance.

By default the camera’s LED is on solid while in use, and turned off when the camera is not used anymore.

This parameter works only with the ToUCam range of cameras (720, 730, 740, 750) and OEMs. For other cameras this command is silently ignored, and the LED cannot be controlled.

Finally: this parameters does not take effect UNTIL the first time you open the camera device. Until then, the LED remains on.

**dev_hint** A long standing problem with USB devices is their dynamic nature: you never know what device a camera gets assigned; it depends on module load order, the hub configuration, the order in which devices are plugged in, and the phase of the moon (i.e. it can be random). With this option you can give the driver a hint as to what video device node (/dev/videoX) it should use with a specific camera. This is also handy if you have two cameras of the same model.

A camera is specified by its type (the number from the camera model, like PCA645, PCVC750VC, etc) and optionally the serial number (visible in /sys/kernel/debug/usb/devices). A hint consists of a string with the following format:

```
[type[.serialnumber]:]node
```

The square brackets mean that both the type and the serialnumber are optional, but a serialnumber cannot be specified without a type (which would be rather pointless). The serialnumber is separated from the type by a ‘.’; the node number by a ‘:’.

This somewhat cryptic syntax is best explained by a few examples:

```plaintext
dev_hint=3,5           The first detected cam gets assigned
                      /dev/video3, the second /dev/video5. Any
                      other cameras will get the first free
                      available slot (see below).

dev_hint=645:1,680:2   The PCA645 camera will get /dev/video1,
                      and a PCVC680 /dev/video2.

dev_hint=645.0123:3,645.4567:0 The PCA645 camera with serialnumber
```

1.1. The media subsystem
0123 goes to /dev/video3, the same camera model with the 4567 serial gets /dev/video0.

dev_hint=750:1,4,5,6 The PCVC750 camera will get /dev/video1, the next 3 Philips cams will use /dev/video4 through /dev/video6.

Some points worth knowing:

- Serial numbers are case sensitive and must be written full, including leading zeroes (it’s treated as a string).
- If a device node is already occupied, registration will fail and the webcam is not available.
- You can have up to 64 video devices; be sure to make enough device nodes in /dev if you want to spread the numbers. After /dev/video9 comes /dev/video10 (not /dev/videoA).
- If a camera does not match any dev_hint, it will simply get assigned the first available device node, just as it used to be.

**trace** In order to better detect problems, it is now possible to turn on a ‘trace’ of some of the calls the module makes; it logs all items in your kernel log at debug level.

The trace variable is a bitmask; each bit represents a certain feature. If you want to trace something, look up the bit value(s) in the table below, add the values together and supply that to the trace variable.

<table>
<thead>
<tr>

For example, to trace the open() & read() functions, sum 8 + 4 = 12, so you would supply trace=12 during insmod or modprobe. If you want to turn the initialization and probing tracing off, set trace=0. The default value for trace is 35 (0x23).

Example:

```
# modprobe pwc size=cif fps=15 power_save=1
```

The fbufs, mbufs and trace parameters are global and apply to all connected cameras. Each camera has its own set of buffers.

size and fps only specify defaults when you open() the device; this is to accommodate some tools that don’t set the size. You can change these settings after open() with the Video4Linux ioctl() calls. The default of defaults is QCIF size at 10 fps.
The compression parameter is semiglobal; it sets the initial compression preference for all camera’s, but this parameter can be set per camera with the VIDIOCPCWSCQUAL ioctl() call.
All parameters are optional.

### 1.1.6.15 Qualcomm Camera Subsystem driver

**Introduction**

This file documents the Qualcomm Camera Subsystem driver located under drivers/media/platform/qcom/camss.

The current version of the driver supports the Camera Subsystem found on Qualcomm MSM8916/APQ8016 and MSM8996/APQ8096 processors.

The driver implements V4L2, Media controller and V4L2 subdev interfaces. Camera sensor using V4L2 subdev interface in the kernel is supported.

The driver is implemented using as a reference the Qualcomm Camera Subsystem driver for Android as found in Code Aurora.

**Qualcomm Camera Subsystem hardware**

The Camera Subsystem hardware found on 8x16 / 8x96 processors and supported by the driver consists of:

- **2 / 3 CSIPHY modules.** They handle the Physical layer of the CSI2 receivers. A separate camera sensor can be connected to each of the CSIPHY module;

- **2 / 4 CSID (CSI Decoder) modules.** They handle the Protocol and Application layer of the CSI2 receivers. A CSID can decode data stream from any of the CSIPHY. Each CSID also contains a TG (Test Generator) block which can generate artificial input data for test purposes;

- **ISPIF (ISP Interface) module.** Handles the routing of the data streams from the CSIDs to the inputs of the VFE;

- **1 / 2 VFE (Video Front End) module(s).** Contain a pipeline of image processing hardware blocks. The VFE has different input interfaces. The PIX (Pixel) input interface feeds the input data to the image processing pipeline. The image processing pipeline contains also a scale and crop module at the end. Three RDI (Raw Dump Interface) input interfaces bypass the image processing pipeline. The VFE also contains the AXI bus interface which writes the output data to memory.

---

1. [https://source.codeaurora.org/quic/la/kernel/msm-3.10/](https://source.codeaurora.org/quic/la/kernel/msm-3.10/)
2. [https://source.codeaurora.org/quic/la/kernel/msm-3.18/](https://source.codeaurora.org/quic/la/kernel/msm-3.18/)
Supported functionality

The current version of the driver supports:

- Input from camera sensor via CSIPHY;
- Generation of test input data by the TG in CSID;
- RDI interface of VFE
  - Raw dump of the input data to memory.

Supported formats:

- YUYV/UYVY/VYYU/VYUY (packed YUV 4:2:2 - V4L2_PIX_FMT_YUV422P / V4L2_PIX_FMT_UYVY / V4L2_PIX_FMT_VYYU / V4L2_PIX_FMT_VYUY);
- MIPI RAW8 (8-bit Bayer RAW - V4L2_PIX_FMT_SRGGB8 / V4L2_PIX_FMT_SGRBG8 / V4L2_PIX_FMT_SGBRG8 / V4L2_PIX_FMT_SRGBG8);
- MIPI RAW10 (10-bit packed Bayer RAW - V4L2_PIX_FMT_SBGGR10P / V4L2_PIX_FMT_SGRBG10P / V4L2_PIX_FMT_SGBRG10P / V4L2_PIX_FMT_SRGBG10P);
- MIPI RAW12 (12-bit packed Bayer RAW - V4L2_PIX_FMT_SBGGR12P / V4L2_PIX_FMT_SGRBG12P / V4L2_PIX_FMT_SGBRG12P / V4L2_PIX_FMT_SRGBG12P);
- (8x96 only) MIPI RAW14 (14-bit packed Bayer RAW - V4L2_PIX_FMT_SRGGB14P / V4L2_PIX_FMT_SGBRG14P / V4L2_PIX_FMT_SGRBG14P / V4L2_PIX_FMT_SRGGB14P);
- (8x96 only) Format conversion of the input data.

Supported input formats:

Supported output formats:

- Plain16 RAW10 (10-bit unpacked Bayer RAW - V4L2_PIX_FMT_SBGGR10 / V4L2_PIX_FMT_Y10).

- PIX interface of VFE
  - Format conversion of the input data.

Supported input formats:

Supported output formats:

- NV12/NV21 (two plane YUV 4:2:0 - V4L2_PIX_FMT_NV12 / V4L2_PIX_FMT_NV21);
- NV16/NV61 (two plane YUV 4:2:2 - V4L2_PIX_FMT_NV16 / V4L2_PIX_FMT_NV61);
- Scaling support. Configuration of the VFE Encoder Scale module for downscaling with ratio up to 16x.
- Cropping support. Configuration of the VFE Encoder Crop module.
  - Concurrent and independent usage of two (8x96: three) data inputs - could be camera sensors and/or TG.

**Driver Architecture and Design**

The driver implements the V4L2 subdev interface. With the goal to model the hardware links between the modules and to expose a clean, logical and usable interface, the driver is split into V4L2 sub-devices as follows (8x16 / 8x96):

- 2 / 3 CSIPHY sub-devices - each CSIPHY is represented by a single sub-device;
- 2 / 4 CSID sub-devices - each CSID is represented by a single sub-device;
- 2 / 4 ISPIF sub-devices - ISPIF is represented by a number of sub-devices equal to the number of CSID sub-devices;
- 4 / 8 VFE sub-devices - VFE is represented by a number of sub-devices equal to the number of the input interfaces (3 RDI and 1 PIX for each VFE).

The considerations to split the driver in this particular way are as follows:

- representing CSIPHY and CSID modules by a separate sub-device for each module allows to model the hardware links between these modules;
- representing VFE by a separate sub-devices for each input interface allows to use the input interfaces concurrently and independently as this is supported by the hardware;
- representing ISPIF by a number of sub-devices equal to the number of CSID sub-devices allows to create linear media controller pipelines when using two cameras simultaneously. This avoids branches in the pipelines which otherwise will require a) userspace and b) media framework (e.g. power on/off operations) to make assumptions about the data flow from a sink pad to a source pad on a single media entity.

Each VFE sub-device is linked to a separate video device node.

The media controller pipeline graph is as follows (with connected two / three OV5645 camera sensors):

**Implementation**

Runtime configuration of the hardware (updating settings while streaming) is not required to implement the currently supported functionality. The complete configuration on each hardware module is applied on STREAMON ioctl based on the current active media links, formats and controls set.

The output size of the scaler module in the VFE is configured with the actual compose selection rectangle on the sink pad of the ‘msm_vfe0_pix’ entity.

The crop output area of the crop module in the VFE is configured with the actual crop selection rectangle on the source pad of the ‘msm_vfe0_pix’ entity.

1.1.6.16 Renesas R-Car Fine Display Processor (FDP1) Driver

The R-Car FDP1 driver implements driver-specific controls as follows.

V4L2_CID_DEINTERLACING_MODE (menu) The video deinterlacing mode (such as Bob, Weave, ...). The R-Car FDP1 driver implements the following modes.
"Progressive" (0) | The input image video stream is progressive (not interlaced). No deinterlacing is performed. Apart from (optional) format and encoding conversion output frames are identical to the input frames.

"Adaptive 2D/3D" (1) | Motion adaptive version of 2D and 3D deinterlacing. Use 3D deinterlacing in the presence of fast motion and 2D deinterlacing with diagonal interpolation otherwise.

"Fixed 2D" (2) | The current field is scaled vertically by averaging adjacent lines to recover missing lines. This method is also known as blending or Line Averaging (LAV).

"Fixed 3D" (3) | The previous and next fields are averaged to recover lines missing from the current field. This method is also known as Field Averaging (FAV).

"Previous field" (4) | The current field is weaved with the previous field, i.e. the previous field is used to fill missing lines from the current field. This method is also known as weave deinterlacing.

"Next field" (5) | The current field is weaved with the next field, i.e. the next field is used to fill missing lines from the current field. This method is also known as weave deinterlacing.

1.1.6.17 Rockchip Image Signal Processor (rkisp1)

Introduction

This file documents the driver for the Rockchip ISP1 that is part of RK3288 and RK3399 SoCs. The driver is located under drivers/staging/media/rkisp1 and uses the Media-Controller API.

Revisions

There exist multiple smaller revisions to this ISP that got introduced in later SoCs. Revisions can be found in the enum `rkisp1_cif_isp_version` in the UAPI and the revision of the ISP inside the running SoC can be read in the field `hw_revision` of struct `media_device_info` as returned by ioctl `MEDIA_IOC_DEVICE_INFO`.

Versions in use are:

- RKISP1_V10: used at least in rk3288 and rk3399
- RKISP1_V11: declared in the original vendor code, but not used
- RKISP1_V12: used at least in rk3326 and px30
- RKISP1_V13: used at least in rk1808
The driver has 4 video devices:

- `rkisp1_mainpath`: capture device for retrieving images, usually in higher resolution.
- `rkisp1_selfpath`: capture device for retrieving images.
- `rkisp1_stats`: a metadata capture device that sends statistics.
- `rkisp1_params`: a metadata output device that receives parameters configurations from userspace.

The driver has 3 subdevices:

- `rkisp1_resizer_mainpath`: used to resize and downsample frames for the mainpath capture device.
- `rkisp1_resizer_selfpath`: used to resize and downsample frames for the selfpath capture device.
- `rkisp1_isp`: is connected to the sensor and is responsible for all the isp operations.
Linux Media Documentation

rkisp1_mainpath, rkisp1_selfpath - Frames Capture Video Nodes

Those are the mainpath and selfpath capture devices to capture frames. Those entities are the DMA engines that write the frames to memory. The selfpath video device can capture YUV/RGB formats. Its input is YUV encoded stream and it is able to convert it to RGB. The selfpath is not able to capture bayer formats. The mainpath can capture both bayer and YUV formats but it is not able to capture RGB formats. Both capture videos support the V4L2_CAP_IO_MC capability.

rkisp1_resizer_mainpath, rkisp1_resizer_selfpath - Resizers Subdevices Nodes

Those are resizer entities for the mainpath and the selfpath. Those entities can scale the frames up and down and also change the YUV sampling (for example YUV4:2:2 -&gt; YUV4:2:0). They also have cropping capability on the sink pad. The resizers entities can only operate on YUV4:2:2 format (MEDIA_BUS_FMT_YUVV8_2X8). The mainpath capture device supports capturing video in bayer formats. In that case the resizer of the mainpath is set to ‘bypass’ mode - it just forward the frame without operating on it.

rkisp1_isp - Image Signal Processing Subdevice Node

This is the isp entity. It is connected to the sensor on sink pad 0 and receives the frames using the CSI-2 protocol. It is responsible of configuring the CSI-2 protocol. It has a cropping capability on sink pad 0 that is connected to the sensor and on source pad 2 connected to the resizer entities. Cropping on sink pad 0 defines the image region from the sensor. Cropping on source pad 2 defines the region for the Image Stabilizer (IS).

rkisp1_stats - Statistics Video Node

The statistics video node outputs the 3A (auto focus, auto exposure and auto white balance) statistics, and also histogram statistics for the frames that are being processed by the rkisp1 to userspace applications. Using these data, applications can implement algorithms and re-parameterize the driver through the rkisp_params node to improve image quality during a video stream. The buffer format is defined by struct rkisp1_stat_buffer, and userspace should set V4L2_META_FMT_RK_ISP1_STAT_3A as the dataformat.

rkisp1_params - Parameters Video Node

The rkisp1_params video node receives a set of parameters from userspace to be applied to the hardware during a video stream, allowing userspace to dynamically modify values such as black level, cross talk corrections and others.

The buffer format is defined by struct rkisp1_params_cfg, and userspace should set V4L2_META_FMT_RK_ISP1_PARAMS as the dataformat.
Capturing Video Frames Example

In the following example, the sensor connected to pad 0 of ‘rkisp1_isp’ is imx219.

The following commands can be used to capture video from the selfpath video node with dimension 900x800 planar format YUV 4:2:2. It uses all cropping capabilities possible, (see explanation right below)

```
# set the links
"media-ctl" "-d" "platform:rkisp1" "-r"
"media-ctl" "-d" "platform:rkisp1" "-l" "imx219 4-0010":0 -> 'rkisp1_isp':0 [1]
"media-ctl" "-d" "platform:rkisp1" "-l" "rkisp1_isp":2 -> 'rkisp1_resizer_selfpath':0 [1]
"media-ctl" "-d" "platform:rkisp1" "-l" "rkisp1_isp":2 -> 'rkisp1_resizer_mainpath':0 [0]

# set format for imx219 4-0010:0
"media-ctl" "-d" "platform:rkisp1" "--set-v4l2" "imx219 4-0010":0 [fmt:SRGGB10_1X10/1640x1232]

# set format for rkisp1_isp pads:
"media-ctl" "-d" "platform:rkisp1" "--set-v4l2" "rkisp1_isp":0 [fmt:SRGGB10_1X10/1640x1232 crop: (0,0)/1600x1200]
"media-ctl" "-d" "platform:rkisp1" "--set-v4l2" "rkisp1_isp":2 [fmt:YUYV8_2X8/1600x1200 crop: (0,0)/1500x1100]

# set format for rkisp1_resizer_selfpath pads:
"media-ctl" "-d" "platform:rkisp1" "--set-v4l2" "rkisp1_resizer_selfpath":0 [fmt:YUYV8_2X8/1500x1100 crop: (300,400)/1400x1000]
"media-ctl" "-d" "platform:rkisp1" "--set-v4l2" "rkisp1_resizer_selfpath":1 [fmt:YUYV8_2X8/900x800]

# set format for rkisp1_selfpath:
"v4l2-ctl" "-z" "platform:rkisp1" "-d" "rkisp1_selfpath" "-v" "width=900, height=800,"
"v4l2-ctl" "-z" "platform:rkisp1" "-d" "rkisp1_selfpath" "-v" "pixelformat=422P"

# start streaming:
v4l2-ctl "-z" "platform:rkisp1" "-d" "rkisp1_selfpath" "--stream-mmap" "--stream-count "10"
```

In the above example the sensor is configured to bayer format: SRGGB10_1X10/1640x1232. The rkisp1_isp:0 pad should be configured to the same mbus format and dimensions as the sensor, otherwise streaming will fail with ‘EPIPE’ error. So it is also configured to SRGGB10_1X10/1640x1232. In addition, the rkisp1_isp:0 pad is configured to cropping (0,0)/1600x1200.

The cropping dimensions are automatically propagated to be the format of the isp source pad rkisp1_isp:2. Another cropping operation is configured on the isp source pad: (0,0)/1500x1100.

The resizer’s sink pad rkisp1_resizer_selfpath should be configured to format YUYV8_2X8/1500x1100 in order to match the format on the other side of the link. In addition a cropping (300,400)/1400x1000 is configured on it.

The source pad of the resizer, rkisp1_resizer_selfpath:1 is configured to format YUYV8_2X8/900x800. That means that the resizer first crop a window of (300,400)/1400x1000 from the received frame and then scales this window to dimension 900x800.
Note that the above example does not use the stats-params control loop. Therefore the capture frames will not go through the 3A algorithms and probably won’t have a good quality, and can even look dark and greenish.

**Configuring Quantization**

The driver supports limited and full range quantization on YUV formats, where limited is the default. To switch between one or the other, userspace should use the Colorspace Conversion API (CSC) for subdevices on source pad 2 of the isp (rkisp1_isp:2). The quantization configured on this pad is the quantization of the captured video frames on the main-path and selfpath video nodes. Note that the resizer and capture entities will always report **V4L2_QUANTIZATION_DEFAULT** even if the quantization is configured to full range on **rkisp1_isp:2**. So in order to get the configured quantization, application should get it from pad **rkisp1_isp:2**.

**1.1.6.18 The saa7134 driver**

Author Gerd Hoffmann

This is a v4l2/oss device driver for saa7130/33/34/35 based capture / TV boards.

**Status**

Almost everything is working. video, sound, tuner, radio, mpeg ts, ...

As with bttv, card-specific tweaks are needed. Check **CARDLIST** for a list of known TV cards and saa7134-cards.c for the drivers card configuration info.

**Build**

Once you pick up a Kernel source, you should configure, build, install and boot the new kernel. You’ll need at least these config options:

```
./scripts/config -e PCI
./scripts/config -e INPUT
./scripts/config -m I2C
./scripts/config -m MEDIA_SUPPORT
./scripts/config -e MEDIA_PCI_SUPPORT
./scripts/config -e MEDIA_ANALOG_TV_SUPPORT
./scripts/config -e MEDIA_DIGITAL_TV_SUPPORT
./scripts/config -e MEDIA_RADIO_SUPPORT
./scripts/config -e RC_CORE
./scripts/config -e MEDIA_SUBDRV_AUTOSELECT
./scripts/config -m VIDEO_SAA7134
./scripts/config -e SAA7134_ALSA
./scripts/config -e VIDEO_SAA7134_RC
./scripts/config -e VIDEO_SAA7134_DVB
./scripts/config -e VIDEO_SAA7134_G07007
```

To build and install, you should run:
make && make modules_install && make install

Once the new Kernel is booted, saa7134 driver should be loaded automatically.

Depending on the card you might have to pass card=<nr> as insmod option. If so, please check Documentation/admin-guide/media/saa7134-cardlist.rst for valid choices.

Once you have your card type number, you can pass a modules configuration via a file (usually, it is either /etc/modules.conf or some file at /etc/modules-load.d/, but the actual place depends on your distribution), with this content:

```
options saa7134 card=13 # Assuming that your card type is #13
```

**Changes / Fixes**

Please mail to linux-media AT vger.kernel.org unified diffs against the linux media git tree:

[https://git.linuxtv.org/media_tree.git/](https://git.linuxtv.org/media_tree.git/)

This is done by committing a patch at a clone of the git tree and submitting the patch using git send-email. Don’t forget to describe at the lots what it changes / which problem it fixes / whatever it is good for …

**Known Problems**

- The tuner for the flyvideos isn’t detected automatically and the default might not work for you depending on which version you have. There is a tuner= inmod option to override the driver’s default.

**Credits**

andrew.stevens@philips.com + werner.leeb@philips.com for providing saa7134 hardware specs and sample board.

1.1.6.19 The Silicon Labs Si470x FM Radio Receivers driver

Copyright © 2009 Tobias Lorenz <tobias.lorenz@gmx.net>

**Information from Silicon Labs**

Silicon Laboratories is the manufacturer of the radio ICs, that nowadays are the most often used radio receivers in cell phones. Usually they are connected with I2C. But SiLabs also provides a reference design, which integrates this IC, together with a small microcontroller C8051F321, to form a USB radio. Part of this reference design is also a radio application in binary and source code. The software also contains an automatic firmware upgrade to the most current version. Information on these can be downloaded here: [http://www.silabs.com/usbradio](http://www.silabs.com/usbradio)
Supported ICs

The following ICs have a very similar register set, so that they are or will be supported some-
when by the driver:

- Si4700: FM radio receiver
- Si4701: FM radio receiver, RDS Support
- Si4702: FM radio receiver
- Si4703: FM radio receiver, RDS Support
- Si4704: FM radio receiver, no external antenna required
- Si4705: FM radio receiver, no external antenna required, RDS support, Dig I/O
- **Si4706**: Enhanced FM RDS/TMC radio receiver, no external antenna required, RDS Support
  - Si4707: Dedicated weather band radio receiver with SAME decoder, RDS Support
  - Si4708: Smallest FM receivers
  - Si4709: Smallest FM receivers, RDS Support

More information on these can be downloaded here: [http://www.silabs.com/products/mcu/Pages/USBFMRadioRD.aspx](http://www.silabs.com/products/mcu/Pages/USBFMRadioRD.aspx)

Supported USB devices

Currently the following USB radios (vendor:product) with the Silicon Labs si470x chips are
known to work:

- 10c4:818a: Silicon Labs USB FM Radio Reference Design
- 1b80:d700: KWorld USB FM Radio SnapMusic Mobile 700 (FM700)
- 10c5:819a: Sanei Electric, Inc. FM USB Radio (sold as DealExtreme.com PCear)

Software

Testing is usually done with most application under Debian/testing:

- fmtools - Utility for managing FM tuner cards
- gnomeradio - FM-radio tuner for the GNOME desktop
- gradio - GTK FM radio tuner
- kradio - Comfortable Radio Application for KDE
- radio - ncurses-based radio application
- mplayer - The Ultimate Movie Player For Linux
- v4l2-ctl - Collection of command line video4linux utilities

For example, you can use:
There is also a library `libv4l`, which can be used. It’s going to have a function for frequency seeking, either by using hardware functionality as in radio-si470x or by implementing a function as we currently have in every of the mentioned programs. Somewhat the radio programs should make use of `libv4l`.

For processing RDS information, there is a project ongoing at: [http://rdsd.berlios.de/](http://rdsd.berlios.de/)

There is currently no project for making TMC sentences human readable.

### Audio Listing

USB Audio is provided by the ALSA snd_usb_audio module. It is recommended to also select `SND_USB_AUDIO`, as this is required to get sound from the radio. For listing you have to redirect the sound, for example using one of the following commands. Please adjust the audio devices to your needs (/dev/dsp* and hw:x,x).

If you just want to test audio (very poor quality):

```bash
cat /dev/dsp1 > /dev/dsp
```

If you use sox + OSS try:

```bash
sox -2 --endian little -r 96000 -t oss /dev/dsp1 -t oss /dev/dsp
```

or using sox + alsa:

```bash
sox --endian little -c 2 -S -r 96000 -t alsa hw:1 -t alsa -r 96000 hw:0
```

If you use arts try:

```bash
arecord -D hw:1,0 -r96000 -c2 -f S16_LE | artsdsp aplay -B -
```

If you use mplayer try:

```bash
mplayer -radio adevice=hw=1.0:arate=96000 \ 
         -rawaudio rate=96000 \ 
         radio://<frequency>/capture
```

### Module Parameters

After loading the module, you still have access to some of them in the sysfs mount under `/sys/module/radio_si470x/parameters`. The contents of read-only files (0444) are not updated, even if space, band and de are changed using private video controls. The others are runtime changeable.
Errors

Increase `tune_timeout`, if you often get `-EIO` errors.

When timed out or band limit is reached, `hw_freq_seek` returns `-EAGAIN`.

If you get any errors from `snd_usb_audio`, please report them to the ALSA people.

Open Issues

V4L minor device allocation and parameter setting is not perfect. A solution is currently under discussion.

There is an USB interface for downloading/uploading new firmware images. Support for it can be implemented using the request_firmware interface.

There is a RDS interrupt mode. The driver is already using the same interface for polling RDS information, but is currently not using the interrupt mode.

There is a LED interface, which can be used to override the LED control programmed in the firmware. This can be made available using the LED support functions in the kernel.

http://www.silabs.com/usbradio

1.1.6.20 The Silicon Labs Si4713 FM Radio Transmitter Driver

Copyright © 2009 Nokia Corporation
Contact: Eduardo Valentin <eduardo.valentin@nokia.com>

Information about the Device

This chip is a Silicon Labs product. It is a I2C device, currently on 0x63 address. Basically, it has transmission and signal noise level measurement features.

The Si4713 integrates transmit functions for FM broadcast stereo transmission. The chip also allows integrated receive power scanning to identify low signal power FM channels.

The chip is programmed using commands and responses. There are also several properties which can change the behavior of this chip.

Users must comply with local regulations on radio frequency (RF) transmission.
## Device driver description

There are two modules to handle this device. One is an I2C device driver and the other is a platform driver.

The I2C device driver exports a v4l2-subdev interface to the kernel. All properties can also be accessed by v4l2 extended controls interface, by using the v4l2-subdev calls (g_ext_ctrls, s_ext_ctrls).

The platform device driver exports a v4l2 radio device interface to user land. So, it uses the I2C device driver as a sub device in order to send the user commands to the actual device. Basically it is a wrapper to the I2C device driver.

Applications can use v4l2 radio API to specify frequency of operation, mute state, etc. But mostly of its properties will be present in the extended controls.

When the v4l2 mute property is set to 1 (true), the driver will turn the chip off.

## Properties description

The properties can be accessed using v4l2 extended controls. Here is an output from v4l2-ctl util:

```bash
/ # v4l2-ctl -d /dev/radio0 --all -L
Driver Info:
  Driver name : radio-si4713

```

### 1.1. The media subsystem
Here is a summary of them:

- **Pilot** is an audible tone sent by the device.
  - **pilot_frequency** - Configures the frequency of the stereo pilot tone.
  - **pilot_deviation** - Configures pilot tone frequency deviation level.
  - **pilot_enabled** - Enables or disables the pilot tone feature.
- The si4713 device is capable of applying audio compression to the transmitted signal.
  - **acomp_enabled** - Enables or disables the audio dynamic range control feature.
  - **acomp_gain** - Sets the gain for audio dynamic range control.
  - **acomp_threshold** - Sets the threshold level for audio dynamic range control.
  - **acomp_attack_time** - Sets the attack time for audio dynamic range control.
  - **acomp_release_time** - Sets the release time for audio dynamic range control.
- **Limiter** sets up audio deviation limiter feature. Once a over deviation occurs, it is possible to adjust the front-end gain of the audio input and always prevent over deviation.
  - **limiter_enabled** - Enables or disables the limiter feature.
  - **limiter_deviation** - Configures audio frequency deviation level.
  - **limiter_release_time** - Sets the limiter release time.
- **Tuning power**
  - **power_level** - Sets the output power level for signal transmission.
  - **antenna_capacitor** - This selects the value of antenna tuning capacitor manually or automatically if set to zero.
- **RDS related**
  - **rds_ps_name** - Sets the RDS ps name field for transmission.
  - **rds_radio_text** - Sets the RDS radio text for transmission.
- rds_pi - Sets the RDS PI field for transmission.
- rds_pty - Sets the RDS PTY field for transmission.
- Region related
- preemphasis - sets the preemphasis to be applied for transmission.

**RNL**

This device also has an interface to measure received noise level. To do that, you should ioctl the device node. Here is an code of example:

```c
int main (int argc, char *argv[]) {
    struct si4713_rnl rnl;
    int fd = open("/dev/radio0", O_RDWR);
    int rval;

    if (argc < 2)
        return -EINVAL;

    if (fd < 0)
        return fd;

    sscanf(argv[1], "%d", &rnl.frequency);

    rval = ioctl(fd, SI4713_IOC_MEASURE_RNL, &rnl);
    if (rval < 0)
        return rval;

    printf("received noise level: %d\n", rnl.rnl);

    close(fd);
}
```

The struct si4713_rnl and SI4713_IOC_MEASURE_RNL are defined under include/linux/platform_data/media/si4713.h.
Stereo/Mono and RDS subchannels

The device can also be configured using the available sub channels for transmission. To do that use S/G_MODULATOR ioctl and configure txsubchans properly. Refer to the V4L2 API specification for proper use of this ioctl.

Testing

Testing is usually done with v4l2-ctl utility for managing FM tuner cards. The tool can be found in v4l-dvb repository under v4l2-apps/util directory.

Example for setting rds_ps_name:

```
# v4l2-ctl -d /dev/radio0 --set-ctrl=rds_ps_name="Dummy"
```

1.1.6.21 The SI476x Driver

Copyright © 2013 Andrey Smirnov <andrew.smirnov@gmail.com>

TODO for the driver

- According to the SiLabs’ datasheet it is possible to update the firmware of the radio chip in the run-time, thus bringing it to the most recent version. Unfortunately I couldn’t find any mentioning of the said firmware update for the old chips that I tested the driver against, so for chips like that the driver only exposes the old functionality.

Parameters exposed over debugfs

SI476x allow user to get multiple characteristics that can be very useful for EoL testing/RF performance estimation, parameters that have very little to do with V4L2 subsystem. Such parameters are exposed via debugfs and can be accessed via regular file I/O operations.

The drivers exposes following files:

- `/sys/kernel/debug/<device-name>/acf` This file contains ACF(Automatically Controlled Features) status information. The contents of the file is binary data of the following layout:
### Offset | Name | Description
---|---|---
0x00 | blend_int | Flag, set when stereo separation has crossed below the blend threshold
0x01 | hblend_int | Flag, set when HiBlend cutoff frequency is lower than threshold
0x02 | hicut_int | Flag, set when HiCut cutoff frequency is lower than threshold
0x03 | chbw_int | Flag, set when channel filter bandwidth is less than threshold
0x04 | softmute_int | Flag indicating that softmute attenuation has increased above softmute threshold
0x05 | smute | 0 - Audio is not soft muted 1 - Audio is soft muted
0x06 | smatttn | Soft mute attenuation level in dB
0x07 | chbw | Channel filter bandwidth in kHz
0x08 | hicut | HiCut cutoff frequency in units of 100Hz
0x09 | hiblend | HiBlend cutoff frequency in units of 100 Hz
0x10 | pilot | 0 - Stereo pilot is not present 1 - Stereo pilot is present
0x11 | stblend | Stereo blend in %

• `/sys/kernel/debug/<device-name>/rds_blkcnt` This file contains statistics about RDS receptions. It’s binary data has the following layout:

<table>
<thead>
<tr>
<th>Offset</th>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>

1.1.6.22 The Virtual Media Controller Driver (vimc)

The vimc driver emulates complex video hardware using the V4L2 API and the Media API. It has a capture device and three subdevices: sensor, debayer and scaler.

Topology

The topology is hardcoded, although you could modify it in vimc-core and recompile the driver to achieve your own topology. This is the default topology:

![Media pipeline graph on vimc](image)

Fig. 7: Media pipeline graph on vimc

Configuring the topology

Each subdevice will come with its default configuration (pixelformat, height, width, ...). One needs to configure the topology in order to match the configuration on each linked subdevice to stream frames through the pipeline. If the configuration doesn’t match, the stream will fail. The v4l-utils package is a bundle of user-space applications, that comes with media-ctl and v4l2-ctl that can be used to configure the vimc configuration. This sequence of commands fits for the default topology:

```
media-ctl -d platform:vimc -V "Sensor A":0[fmt:SBGGR8_1X8/640x480]
media-ctl -d platform:vimc -V "Debayer A":0[fmt:SBGGR8_1X8/640x480]
media-ctl -d platform:vimc -V "Sensor B":0[fmt:SBGGR8_1X8/640x480]
media-ctl -d platform:vimc -V "Debayer B":0[fmt:SBGGR8_1X8/640x480]
v4l2-ctl -z platform:vimc -d "RGB/YUV Capture" -v width=1920,height=1440
```
Subdevices

Subdevices define the behavior of an entity in the topology. Depending on the subdevice, the entity can have multiple pads of type source or sink.

**vimc-sensor:** Generates images in several formats using video test pattern generator. Exposes:
- 1 Pad source

**vimc-debayer:** Transforms images in bayer format into a non-bayer format. Exposes:
- 1 Pad sink
- 1 Pad source

**vimc-scaler:** Scale up the image by a factor of 3. E.g.: a 640x480 image becomes a 1920x1440 image. (this value can be configured, see at Module options). Exposes:
- 1 Pad sink
- 1 Pad source

**vimc-capture:** Exposes node /dev/videoX to allow userspace to capture the stream. Exposes:
- 1 Pad sink
- 1 Pad source

Module options

Vimc has a module parameter to configure the driver.
- `sca_mult=<unsigned int>`
  
  Image size multiplier factor to be used to multiply both width and height, so the image size will be `sca_mult^2` bigger than the original one. Currently, only supports scaling up (the default value is 3).

1.1.6.23 The Virtual Video Test Driver (vivid)

This driver emulates video4linux hardware of various types: video capture, video output, vbi capture and output, metadata capture and output, radio receivers and transmitters, touch capture and a software defined radio receiver. In addition a simple framebuffer device is available for testing capture and output overlays.

Up to 64 vivid instances can be created, each with up to 16 inputs and 16 outputs.

Each input can be a webcam, TV capture device, S-Video capture device or an HDMI capture device. Each output can be an S-Video output device or an HDMI output device.
These inputs and outputs act exactly as a real hardware device would behave. This allows you to use this driver as a test input for application development, since you can test the various features without requiring special hardware.

This document describes the features implemented by this driver:

- Support for read()/write(), MMAP, USERPTR and DMABUF streaming I/O.
- A large list of test patterns and variations thereof
- Working brightness, contrast, saturation and hue controls
- Support for the alpha color component
- Full colorspace support, including limited/full RGB range
- All possible control types are present
- Support for various pixel aspect ratios and video aspect ratios
- Error injection to test what happens if errors occur
- Supports crop/compose/scale in any combination for both input and output
- Can emulate up to 4K resolutions
- All Field settings are supported for testing interlaced capturing
- Supports all standard YUV and RGB formats, including two multiplanar YUV formats
- Raw and Sliced VBI capture and output support
- Radio receiver and transmitter support, including RDS support
- Software defined radio (SDR) support
- Capture and output overlay support
- Metadata capture and output support
- Touch capture support

These features will be described in more detail below.

**Configuring the driver**

By default the driver will create a single instance that has a video capture device with webcam, TV, S-Video and HDMI inputs, a video output device with S-Video and HDMI outputs, one vbi capture device, one vbi output device, one radio receiver device, one radio transmitter device and one SDR device.

The number of instances, devices, video inputs and outputs and their types are all configurable using the following module options:

- n_devs:
  
  number of driver instances to create. By default set to 1. Up to 64 instances can be created.

- node_types:
which devices should each driver instance create. An array of hexadecimal values, one for each instance. The default is 0x1d3d. Each value is a bitmask with the following meaning:

- bit 0: Video Capture node
- bit 2-3: VBI Capture node: 0 = none, 1 = raw vbi, 2 = sliced vbi, 3 = both
- bit 4: Radio Receiver node
- bit 5: Software Defined Radio Receiver node
- bit 8: Video Output node
- bit 10-11: VBI Output node: 0 = none, 1 = raw vbi, 2 = sliced vbi, 3 = both
- bit 12: Radio Transmitter node
- bit 16: Framebuffer for testing overlays
- bit 17: Metadata Capture node
- bit 18: Metadata Output node
- bit 19: Touch Capture node

So to create four instances, the first two with just one video capture device, the second two with just one video output device you would pass these module options to vivid:

```
num_devs=4 node_types=0x1,0x1,0x100,0x100
```

- num_inputs:

  the number of inputs, one for each instance. By default 4 inputs are created for each video capture device. At most 16 inputs can be created, and there must be at least one.

- input_types:

  the input types for each instance, the default is 0xe4. This defines what the type of each input is when the inputs are created for each driver instance. This is a hexadecimal value with up to 16 pairs of bits, each pair gives the type and bits 0-1 map to input 0, bits 2-3 map to input 1, 30-31 map to input 15. Each pair of bits has the following meaning:

  - 00: this is a webcam input
  - 01: this is a TV tuner input
  - 10: this is an S-Video input
  - 11: this is an HDMI input

So to create a video capture device with 8 inputs where input 0 is a TV tuner, inputs 1-3 are S-Video inputs and inputs 4-7 are HDMI inputs you would use the following module options:

```
num_inputs=8 input_types=0xffa9
```

- num_outputs:
the number of outputs, one for each instance. By default 2 outputs are created for each video output device. At most 16 outputs can be created, and there must be at least one.

- **output_types:**
  
  the output types for each instance, the default is 0x02. This defines what the type of each output is when the outputs are created for each driver instance. This is a hexadecimal value with up to 16 bits, each bit gives the type and bit 0 maps to output 0, bit 1 maps to output 1, bit 15 maps to output 15. The meaning of each bit is as follows:
  
  - 0: this is an S-Video output
  - 1: this is an HDMI output

  So to create a video output device with 8 outputs where outputs 0-3 are S-Video outputs and outputs 4-7 are HDMI outputs you would use the following module options:

  ```
  num_outputs=8 output_types=0xf0
  ```

- **vid_cap_nr:**
  
  give the desired videoX start number for each video capture device. The default is -1 which will just take the first free number. This allows you to map capture video nodes to specific videoX device nodes. Example:

  ```
  n_devs=4 vid_cap_nr=2,4,6,8
  ```

  This will attempt to assign /dev/video2 for the video capture device of the first vivid instance, video4 for the next up to video8 for the last instance. If it can’t succeed, then it will just take the next free number.

- **vid_out_nr:**
  
  give the desired videoX start number for each video output device. The default is -1 which will just take the first free number.

- **vbi_cap_nr:**
  
  give the desired vbiX start number for each vbi capture device. The default is -1 which will just take the first free number.

- **vbi_out_nr:**
  
  give the desired vbiX start number for each vbi output device. The default is -1 which will just take the first free number.

- **radio_rx_nr:**
  
  give the desired radioX start number for each radio receiver device. The default is -1 which will just take the first free number.

- **radio_tx_nr:**
  
  give the desired radioX start number for each radio transmitter device. The default is -1 which will just take the first free number.

- **sdr_cap_nr:**
give the desired swradioX start number for each SDR capture device. The default is -1 which will just take the first free number.

- **meta_cap_nr:**
  
give the desired videoX start number for each metadata capture device. The default is -1 which will just take the first free number.

- **meta_out_nr:**
  
give the desired videoX start number for each metadata output device. The default is -1 which will just take the first free number.

- **touch_cap_nr:**
  
give the desired v4l-touchX start number for each touch capture device. The default is -1 which will just take the first free number.

- **ccs_cap_mode:**
  
specify the allowed video capture crop/compose/scaling combination for each driver instance. Video capture devices can have any combination of cropping, composing and scaling capabilities and this will tell the vivid driver which of those is should emulate. By default the user can select this through controls.

  The value is either -1 (controlled by the user) or a set of three bits, each enabling (1) or disabling (0) one of the features:

  - bit 0:
    
    Enable crop support. Cropping will take only part of the incoming picture.

  - bit 1:
    
    Enable compose support. Composing will copy the incoming picture into a larger buffer.

  - bit 2:
    
    Enable scaling support. Scaling can scale the incoming picture. The scaler of the vivid driver can enlarge up or down to four times the original size. The scaler is very simple and low-quality. Simplicity and speed were key, not quality.

    Note that this value is ignored by webcam inputs: those enumerate discrete framesizes and that is incompatible with cropping, composing or scaling.

- **ccs_out_mode:**
  
specify the allowed video output crop/compose/scaling combination for each driver instance. Video output devices can have any combination of cropping, composing and scaling capabilities and this will tell the vivid driver which of those is should emulate. By default the user can select this through controls.

  The value is either -1 (controlled by the user) or a set of three bits, each enabling (1) or disabling (0) one of the features:

  - bit 0:
    
    Enable crop support. Cropping will take only part of the outgoing buffer.
- bit 1:
  Enable compose support. Composing will copy the incoming buffer into a larger picture frame.

- bit 2:
  Enable scaling support. Scaling can scale the incoming buffer. The scaler of the vivid driver can enlarge up or down to four times the original size. The scaler is very simple and low-quality. Simplicity and speed were key, not quality.

- multiplanar:
  select whether each device instance supports multi-planar formats, and thus the V4L2 multi-planar API. By default device instances are single-planar.
  This module option can override that for each instance. Values are:
  - 1: this is a single-planar instance.
  - 2: this is a multi-planar instance.

- vivid_debug:
  enable driver debugging info

- no_error_inj:
  if set disable the error injecting controls. This option is needed in order to run a tool like v4l2-compliance. Tools like that exercise all controls including a control like ‘Disconnect’ which emulates a USB disconnect, making the device inaccessible and so all tests that v4l2-compliance is doing will fail afterwards.

  There may be other situations as well where you want to disable the error injection support of vivid. When this option is set, then the controls that select crop, compose and scale behavior are also removed. Unless overridden by ccs_cap_mode and/or ccs_out_mode the will default to enabling crop, compose and scaling.

- allocators:
  memory allocator selection, default is 0. It specifies the way buffers will be allocated.
  - 0: vmalloc
  - 1: dma-contig

- cache_hints:
  specifies if the device should set queues’ user-space cache and memory consistency hint capability (V4L2_BUF_CAP_SUPPORTS_MMAP_CACHE_HINTS). The hints are valid only when using MMAP streaming I/O. Default is 0.
  - 0: forbid hints
  - 1: allow hints

Taken together, all these module options allow you to precisely customize the driver behavior and test your application with all sorts of permutations. It is also very suitable to emulate hardware that is not yet available, e.g. when developing software for a new upcoming device.
Video Capture

This is probably the most frequently used feature. The video capture device can be configured by using the module options num_inputs, input_types and ccs_cap_mode (see section 1 for more detailed information), but by default four inputs are configured: a webcam, a TV tuner, an S-Video and an HDMI input, one input for each input type. Those are described in more detail below.

Special attention has been given to the rate at which new frames become available. The jitter will be around 1 jiffie (that depends on the HZ configuration of your kernel, so usually 1/100, 1/250 or 1/1000 of a second), but the long-term behavior is exactly following the framerate. So a framerate of 59.94 Hz is really different from 60 Hz. If the framerate exceeds your kernel’s HZ value, then you will get dropped frames, but the frame/field sequence counting will keep track of that so the sequence count will skip whenever frames are dropped.

Webcam Input

The webcam input supports three framesizes: 320x180, 640x360 and 1280x720. It supports frames per second settings of 10, 15, 25, 30, 50 and 60 fps. Which ones are available depends on the chosen framesize: the larger the framesize, the lower the maximum frames per second.

The initially selected colorspace when you switch to the webcam input will be sRGB.

TV and S-Video Inputs

The only difference between the TV and S-Video input is that the TV has a tuner. Otherwise they behave identically.

These inputs support audio inputs as well: one TV and one Line-In. They both support all TV standards. If the standard is queried, then the Vivid controls ‘Standard Signal Mode’ and ‘Standard’ determine what the result will be.

These inputs support all combinations of the field setting. Special care has been taken to faithfully reproduce how fields are handled for the different TV standards. This is particularly noticeable when generating a horizontally moving image so the temporal effect of using interlaced formats becomes clearly visible. For 50 Hz standards the top field is the oldest and the bottom field is the newest in time. For 60 Hz standards that is reversed: the bottom field is the oldest and the top field is the newest in time.

When you start capturing in V4L2_FIELD_ALTERNATE mode the first buffer will contain the top field for 50 Hz standards and the bottom field for 60 Hz standards. This is what capture hardware does as well.

Finally, for PAL/SECAM standards the first half of the top line contains noise. This simulates the Wide Screen Signal that is commonly placed there.

The initially selected colorspace when you switch to the TV or S-Video input will be SMPTE-170M.

The pixel aspect ratio will depend on the TV standard. The video aspect ratio can be selected through the ‘Standard Aspect Ratio’ Vivid control. Choices are ‘4x3’, ‘16x9’ which will give letterboxed widescreen video and ‘16x9 Anamorphic’ which will give full screen squashed anamorphic widescreen video that will need to be scaled accordingly.
The TV ‘tuner’ supports a frequency range of 44-958 MHz. Channels are available every 6 MHz, starting from 49.25 MHz. For each channel the generated image will be in color for the +/- 0.25 MHz around it, and in grayscale for +/- 1 MHz around the channel. Beyond that it is just noise. The VIDIOC_G_TUNER ioctl will return 100% signal strength for +/- 0.25 MHz and 50% for +/- 1 MHz. It will also return correct afc values to show whether the frequency is too low or too high.

The audio subchannels that are returned are MONO for the +/- 1 MHz range around a valid channel frequency. When the frequency is within +/- 0.25 MHz of the channel it will return either MONO, STEREO, either MONO | SAP (for NTSC) or LANG1 | LANG2 (for others), or STEREO | SAP.

Which one is returned depends on the chosen channel, each next valid channel will cycle through the possible audio subchannel combinations. This allows you to test the various combinations by just switching channels..

Finally, for these inputs the v4l2_timecode struct is filled in in the dequeued v4l2_buffer struct.

**HDMI Input**

The HDMI inputs supports all CEA-861 and DMT timings, both progressive and interlaced, for pixelclock frequencies between 25 and 600 MHz. The field mode for interlaced formats is always V4L2_FIELD_ALTERNATE. For HDMI the field order is always top field first, and when you start capturing an interlaced format you will receive the top field first.

The initially selected colorspace when you switch to the HDMI input or select an HDMI timing is based on the format resolution: for resolutions less than or equal to 720x576 the colorspace is set to SMPTE-170M, for others it is set to REC-709 (CEA-861 timings) or sRGB (VESA DMT timings).

The pixel aspect ratio will depend on the HDMI timing: for 720x480 is it set as for the NTSC TV standard, for 720x576 it is set as for the PAL TV standard, and for all others a 1:1 pixel aspect ratio is returned.

The video aspect ratio can be selected through the ‘DV Timings Aspect Ratio’ Vivid control. Choices are ‘Source Width x Height’ (just use the same ratio as the chosen format), ‘4x3’ or ‘16x9’, either of which can result in pillarboxed or letterboxed video.

For HDMI inputs it is possible to set the EDID. By default a simple EDID is provided. You can only set the EDID for HDMI inputs. Internally, however, the EDID is shared between all HDMI inputs.

No interpretation is done of the EDID data with the exception of the physical address. See the CEC section for more details.

There is a maximum of 15 HDMI inputs (if there are more, then they will be reduced to 15) since that’s the limitation of the EDID physical address.
**Video Output**

The video output device can be configured by using the module options `num_outputs`, `output_types`, and `ccs_out_mode` (see section 1 for more detailed information), but by default two outputs are configured: an S-Video and an HDMI input, one output for each output type. Those are described in more detail below.

Like with video capture the framerate is also exact in the long term.

**S-Video Output**

This output supports audio outputs as well: “Line-Out 1” and “Line-Out 2”. The S-Video output supports all TV standards.

This output supports all combinations of the field setting.

The initially selected colorspace when you switch to the TV or S-Video input will be SMPTE-170M.

**HDMI Output**

The HDMI output supports all CEA-861 and DMT timings, both progressive and interlaced, for pixelclock frequencies between 25 and 600 MHz. The field mode for interlaced formats is always V4L2_FIELD_ALTERNATE.

The initially selected colorspace when you switch to the HDMI output or select an HDMI timing is based on the format resolution: for resolutions less than or equal to 720x576 the colorspace is set to SMPTE-170M, for others it is set to REC-709 (CEA-861 timings) or sRGB (VESADMT timings).

The pixel aspect ratio will depend on the HDMI timing: for 720x480 is it set as for the NTSC TV standard, for 720x576 it is set as for the PAL TV standard, and for all others a 1:1 pixel aspect ratio is returned.

An HDMI output has a valid EDID which can be obtained through VIDIOC_G_EDID.

There is a maximum of 15 HDMI outputs (if there are more, then they will be reduced to 15) since that’s the limitation of the EDID physical address. See also the CEC section for more details.

**VBI Capture**

There are three types of VBI capture devices: those that only support raw (undecoded) VBI, those that only support sliced (decoded) VBI and those that support both. This is determined by the `node_types` module option. In all cases the driver will generate valid VBI data: for 60 Hz standards it will generate Closed Caption and XDS data. The closed caption stream will alternate between “Hello world!” and “Closed captions test” every second. The XDS stream will give the current time once a minute. For 50 Hz standards it will generate the Wide Screen Signal which is based on the actual Video Aspect Ratio control setting and teletext pages 100-159, one page per frame.
The VBI device will only work for the S-Video and TV inputs, it will give back an error if the current input is a webcam or HDMI.

VBI Output

There are three types of VBI output devices: those that only support raw (undecoded) VBI, those that only support sliced (decoded) VBI and those that support both. This is determined by the node_types module option.

The sliced VBI output supports the Wide Screen Signal and the teletext signal for 50 Hz standards and Closed Captioning + XDS for 60 Hz standards.

The VBI device will only work for the S-Video output, it will give back an error if the current output is HDMI.

Radio Receiver

The radio receiver emulates an FM/AM/SW receiver. The FM band also supports RDS. The frequency ranges are:

- **FM**: 64 MHz - 108 MHz
- **AM**: 520 kHz - 1710 kHz
- **SW**: 2300 kHz - 26.1 MHz

Valid channels are emulated every 1 MHz for FM and every 100 kHz for AM and SW. The signal strength decreases the further the frequency is from the valid frequency until it becomes 0% at +/- 50 kHz (FM) or 5 kHz (AM/SW) from the ideal frequency. The initial frequency when the driver is loaded is set to 95 MHz.

The FM receiver supports RDS as well, both using ‘Block I/O’ and ‘Controls’ modes. In the ‘Controls’ mode the RDS information is stored in read-only controls. These controls are updated every time the frequency is changed, or when the tuner status is requested. The Block I/O method uses the read() interface to pass the RDS blocks on to the application for decoding.

The RDS signal is ‘detected’ for +/- 12.5 kHz around the channel frequency, and the further the frequency is away from the valid frequency the more RDS errors are randomly introduced into the block I/O stream, up to 50% of all blocks if you are +/- 12.5 kHz from the channel frequency. All four errors can occur in equal proportions: blocks marked ‘CORRECTED’, blocks marked ‘ERROR’, blocks marked ‘INVALID’ and dropped blocks.

The generated RDS stream contains all the standard fields contained in a 0B group, and also radio text and the current time.

The receiver supports HW frequency seek, either in Bounded mode, Wrap Around mode or both, which is configurable with the “Radio HW Seek Mode” control.
Radio Transmitter

The radio transmitter emulates an FM/AM/SW transmitter. The FM band also supports RDS. The frequency ranges are:

- FM: 64 MHz - 108 MHz
- AM: 520 kHz - 1710 kHz
- SW: 2300 kHz - 26.1 MHz

The initial frequency when the driver is loaded is 95.5 MHz.

The FM transmitter supports RDS as well, both using ‘Block I/O’ and ‘Controls’ modes. In the ‘Controls’ mode the transmitted RDS information is configured using controls, and in ‘Block I/O’ mode the blocks are passed to the driver using write().

Software Defined Radio Receiver

The SDR receiver has three frequency bands for the ADC tuner:

- 300 kHz
- 900 kHz - 2800 kHz
- 3200 kHz

The RF tuner supports 50 MHz - 2000 MHz.

The generated data contains the In-phase and Quadrature components of a 1 kHz tone that has an amplitude of $\sqrt{2}$.

Metadata Capture

The Metadata capture generates UVC format metadata. The PTS and SCR are transmitted based on the values set in vivid controls.

The Metadata device will only work for the Webcam input, it will give back an error for all other inputs.

Metadata Output

The Metadata output can be used to set brightness, contrast, saturation and hue.

The Metadata device will only work for the Webcam output, it will give back an error for all other outputs.
**Touch Capture**

The Touch capture generates touch patterns simulating single tap, double tap, triple tap, move from left to right, zoom in, zoom out, palm press (simulating a large area being pressed on a touchpad), and simulating 16 simultaneous touch points.

**Controls**

Different devices support different controls. The sections below will describe each control and which devices support them.

**User Controls - Test Controls**

The Button, Boolean, Integer 32 Bits, Integer 64 Bits, Menu, String, Bitmask and Integer Menu are controls that represent all possible control types. The Menu control and the Integer Menu control both have ‘holes’ in their menu list, meaning that one or more menu items return EINVAL when VIDIOC_QUERYMENU is called. Both menu controls also have a non-zero minimum control value. These features allow you to check if your application can handle such things correctly. These controls are supported for every device type.

**User Controls - Video Capture**

The following controls are specific to video capture.

The Brightness, Contrast, Saturation and Hue controls actually work and are standard. There is one special feature with the Brightness control: each video input has its own brightness value, so changing input will restore the brightness for that input. In addition, each video input uses a different brightness range (minimum and maximum control values). Switching inputs will cause a control event to be sent with the V4L2_EVENT_CTRL_CH_RANGE flag set. This allows you to test controls that can change their range.

The ‘Gain, Automatic’ and Gain controls can be used to test volatile controls: if ‘Gain, Automatic’ is set, then the Gain control is volatile and changes constantly. If ‘Gain, Automatic’ is cleared, then the Gain control is a normal control.

The ‘Horizontal Flip’ and ‘Vertical Flip’ controls can be used to flip the image. These combine with the ‘Sensor Flipped Horizontally/Vertically’ Vivid controls.

The ‘Alpha Component’ control can be used to set the alpha component for formats containing an alpha channel.
User Controls - Audio

The following controls are specific to video capture and output and radio receivers and transmitters.

The ‘Volume’ and ‘Mute’ audio controls are typical for such devices to control the volume and mute the audio. They don’t actually do anything in the vivid driver.

Vivid Controls

These vivid custom controls control the image generation, error injection, etc.

Test Pattern Controls

The Test Pattern Controls are all specific to video capture.

• Test Pattern:
  selects which test pattern to use. Use the CSC Colorbar for testing colorspace conversions: the colors used in that test pattern map to valid colors in all colorspaces. The colorspace conversion is disabled for the other test patterns.

• OSD Text Mode:
  selects whether the text superimposed on the test pattern should be shown, and if so, whether only counters should be displayed or the full text.

• Horizontal Movement:
  selects whether the test pattern should move to the left or right and at what speed.

• Vertical Movement:
  does the same for the vertical direction.

• Show Border:
  show a two-pixel wide border at the edge of the actual image, excluding letter or pillarboxing.

• Show Square:
  show a square in the middle of the image. If the image is displayed with the correct pixel and image aspect ratio corrections, then the width and height of the square on the monitor should be the same.

• Insert SAV Code in Image:
  adds a SAV (Start of Active Video) code to the image. This can be used to check if such codes in the image are inadvertently interpreted instead of being ignored.

• Insert EAV Code in Image:
  does the same for the EAV (End of Active Video) code.
Capture Feature Selection Controls

These controls are all specific to video capture.

- **Sensor Flipped Horizontally:**
  
  The image is flipped horizontally and the V4L2_IN_ST_HFLIP input status flag is set. This emulates the case where a sensor is for example mounted upside down.

- **Sensor Flipped Vertically:**
  
  The image is flipped vertically and the V4L2_IN_ST_VFLIP input status flag is set. This emulates the case where a sensor is for example mounted upside down.

- **Standard Aspect Ratio:**
  
  Selects if the image aspect ratio as used for the TV or S-Video input should be 4x3, 16x9 or anamorphic widescreen. This may introduce letterboxing.

- **DV Timings Aspect Ratio:**
  
  Selects if the image aspect ratio as used for the HDMI input should be the same as the source width and height ratio, or if it should be 4x3 or 16x9. This may introduce letter or pillarboxing.

- **Timestamp Source:**
  
  Selects when the timestamp for each buffer is taken.

- **Colorspace:**
  
  Selects which colorspace should be used when generating the image. This only applies if the CSC Colorbar test pattern is selected, otherwise the test pattern will go through unconverted. This behavior is also what you want, since a 75% Colorbar should really have 75% signal intensity and should not be affected by colorspace conversions.

  Changing the colorspace will result in the V4L2_EVENT_SOURCE_CHANGE to be sent since it emulates a detected colorspace change.

- **Transfer Function:**
  
  Selects which colorspace transfer function should be used when generating an image. This only applies if the CSC Colorbar test pattern is selected, otherwise the test pattern will go through unconverted. This behavior is also what you want, since a 75% Colorbar should really have 75% signal intensity and should not be affected by colorspace conversions.

  Changing the transfer function will result in the V4L2_EVENT_SOURCE_CHANGE to be sent since it emulates a detected colorspace change.

- **Y’CbCr Encoding:**
  
  Selects which Y’CbCr encoding should be used when generating a Y’CbCr image. This only applies if the format is set to a Y’CbCr format as opposed to an RGB format.

  Changing the Y’CbCr encoding will result in the V4L2_EVENT_SOURCE_CHANGE to be sent since it emulates a detected
colorschange.

- **Quantization:**
  
  selects which quantization should be used for the RGB or Y’CbCr encoding when generating the test pattern.

  Changing the quantization will result in the V4L2\_EVENT\_SOURCE\_CHANGE to be sent since it emulates a detected colorspace change.

- **Limited RGB Range (16-235):**
  
  selects if the RGB range of the HDMI source should be limited or full range. This combines with the Digital Video ‘Rx RGB Quantization Range’ control and can be used to test what happens if a source provides you with the wrong quantization range information. See the description of that control for more details.

- **Apply Alpha To Red Only:**
  
  apply the alpha channel as set by the ‘Alpha Component’ user control to the red color of the test pattern only.

- **Enable Capture Cropping:**
  
  enables crop support. This control is only present if the ccs_cap_mode module option is set to the default value of -1 and if the no_error_inj module option is set to 0 (the default).

- **Enable Capture Composing:**
  
  enables compositing support. This control is only present if the ccs_cap_mode module option is set to the default value of -1 and if the no_error_inj module option is set to 0 (the default).

- **Enable Capture Scaler:**
  
  enables support for a scaler (maximum 4 times upscaling and downscaling). This control is only present if the ccs_cap_mode module option is set to the default value of -1 and if the no_error_inj module option is set to 0 (the default).

- **Maximum EDID Blocks:**
  
  determines how many EDID blocks the driver supports. Note that the vivid driver does not actually interpret new EDID data, it just stores it. It allows for up to 256 EDID blocks which is the maximum supported by the standard.

- **Fill Percentage of Frame:**
  
  can be used to draw only the top X percent of the image. Since each frame has to be drawn by the driver, this demands a lot of the CPU. For large resolutions this becomes problematic. By drawing only part of the image this CPU load can be reduced.
Output Feature Selection Controls

These controls are all specific to video output.

- **Enable Output Cropping:**
  enables crop support. This control is only present if the ccs_out_mode module option is set to the default value of -1 and if the no_error_inj module option is set to 0 (the default).

- **Enable Output Composing:**
  enables composing support. This control is only present if the ccs_out_mode module option is set to the default value of -1 and if the no_error_inj module option is set to 0 (the default).

- **Enable Output Scaler:**
  enables support for a scaler (maximum 4 times upscaling and downscaling). This control is only present if the ccs_out_mode module option is set to the default value of -1 and if the no_error_inj module option is set to 0 (the default).

Error Injection Controls

The following two controls are only valid for video and vbi capture.

- **Standard Signal Mode:**
  selects the behavior of VIDIOC_QUERYSTD: what should it return?
  Changing this control will result in the V4L2_EVENT_SOURCE_CHANGE to be sent since it emulates a changed input condition (e.g. a cable was plugged in or out).

- **Standard:**
  selects the standard that VIDIOC_QUERYSTD should return if the previous control is set to “Selected Standard”.
  Changing this control will result in the V4L2_EVENT_SOURCE_CHANGE to be sent since it emulates a changed input standard.

The following two controls are only valid for video capture.

- **DV Timings Signal Mode:**
  selects the behavior of VIDIOC_QUERY_DV_TIMINGS: what should it return?
  Changing this control will result in the V4L2_EVENT_SOURCE_CHANGE to be sent since it emulates a changed input condition (e.g. a cable was plugged in or out).

- **DV Timings:**
  selects the timings the VIDIOC_QUERY_DV_TIMINGS should return if the previous control is set to “Selected DV Timings”.
  Changing this control will result in the V4L2_EVENT_SOURCE_CHANGE to be sent since it emulates changed input timings.
The following controls are only present if the no_error_inj module option is set to 0 (the default). These controls are valid for video and vbi capture and output streams and for the SDR capture device except for the Disconnect control which is valid for all devices.

- **Wrap Sequence Number:**
  test what happens when you wrap the sequence number in struct v4l2_buffer around.

- **Wrap Timestamp:**
  test what happens when you wrap the timestamp in struct v4l2_buffer around.

- **Percentage of Dropped Buffers:**
  sets the percentage of buffers that are never returned by the driver (i.e., they are dropped).

- **Disconnect:**
  emulates a USB disconnect. The device will act as if it has been disconnected. Only after all open file handles to the device node have been closed will the device become ‘connected’ again.

- **Inject V4L2_BUF_FLAG_ERROR:**
  when pressed, the next frame returned by the driver will have the error flag set (i.e. the frame is marked corrupt).

- **Inject VIDIOC_REQBUFS Error:**
  when pressed, the next REQBUFS or CREATE_BUFS ioctl call will fail with an error. To be precise: the videobuf2 queue_setup() op will return -EINVAL.

- **Inject VIDIOC_QBUF Error:**
  when pressed, the next VIDIOC_QBUF or VIDIOC_PREPARE_BUFFER ioctl call will fail with an error. To be precise: the videobuf2 buf_prepare() op will return -EINVAL.

- **Inject VIDIOC_STREAMON Error:**
  when pressed, the next VIDIOC_STREAMON ioctl call will fail with an error. To be precise: the videobuf2 start_streaming() op will return -EINVAL.

- **Inject Fatal Streaming Error:**
  when pressed, the streaming core will be marked as having suffered a fatal error, the only way to recover from that is to stop streaming. To be precise: the videobuf2 vb2_queue_error() function is called.
VBI Raw Capture Controls

- Interlaced VBI Format:
  
  if set, then the raw VBI data will be interlaced instead of providing it grouped by field.

Digital Video Controls

- Rx RGB Quantization Range:
  
  sets the RGB quantization detection of the HDMI input. This combines with the Vivid ‘Limited RGB Range (16-235)’ control and can be used to test what happens if a source provides you with the wrong quantization range information. This can be tested by selecting an HDMI input, setting this control to Full or Limited range and selecting the opposite in the ‘Limited RGB Range (16-235)’ control. The effect is easy to see if the ‘Gray Ramp’ test pattern is selected.

- Tx RGB Quantization Range:
  
  sets the RGB quantization detection of the HDMI output. It is currently not used for anything in vivid, but most HDMI transmitters would typically have this control.

- Transmit Mode:
  
  sets the transmit mode of the HDMI output to HDMI or DVI-D. This affects the reported colorspace since DVI_D outputs will always use sRGB.

- Display Present:
  
  sets the presence of a “display” on the HDMI output. This affects the tx_edid_present, tx_hotplug and tx_rxsense controls.

FM Radio Receiver Controls

- RDS Reception:
  
  set if the RDS receiver should be enabled.

- RDS Program Type:
- RDS PS Name:
- RDS Radio Text:
- RDS Traffic Announcement:
- RDS Traffic Program:
- RDS Music:

  these are all read-only controls. If RDS Rx I/O Mode is set to “Block I/O”, then they are inactive as well. If RDS Rx I/O Mode is set to “Controls”, then these controls report the received RDS data.
Note: The vivid implementation of this is pretty basic: they are only updated when you set a new frequency or when you get the tuner status (VIDIOC_G_TUNER).

- Radio HW Seek Mode:
  can be one of “Bounded”, “Wrap Around” or “Both”. This determines if VIDIOC_S_HW_FREQ_SEEK will be bounded by the frequency range or wrap-around or if it is selectable by the user.

- Radio Programmable HW Seek:
  if set, then the user can provide the lower and upper bound of the HW Seek. Otherwise the frequency range boundaries will be used.

- Generate RBDS Instead of RDS:
  if set, then generate RBDS (the US variant of RDS) data instead of RDS (European-style RDS). This affects only the PICODE and PTY codes.

- RDS Rx I/O Mode:
  this can be “Block I/O” where the RDS blocks have to be read() by the application, or “Controls” where the RDS data is provided by the RDS controls mentioned above.

FM Radio Modulator Controls

- RDS Program ID:
- RDS Program Type:
- RDS PS Name:
- RDS Radio Text:
- RDS Stereo:
- RDS Artificial Head:
- RDS Compressed:
- RDS Dynamic PTY:
- RDS Traffic Announcement:
- RDS Traffic Program:
- RDS Music:
  these are all controls that set the RDS data that is transmitted by the FM modulator.

- RDS Tx I/O Mode:
  this can be “Block I/O” where the application has to use write() to pass the RDS blocks to the driver, or “Controls” where the RDS data is provided by the RDS controls mentioned above.
**Metadata Capture Controls**

- Generate PTS
  
  if set, then the generated metadata stream contains Presentation timestamp.

- Generate SCR
  
  if set, then the generated metadata stream contains Source Clock information.

**Video, VBI and RDS Looping**

The vivid driver supports looping of video output to video input, VBI output to VBI input and RDS output to RDS input. For video/VBI looping this emulates as if a cable was hooked up between the output and input connector. So video and VBI looping is only supported between S-Video and HDMI inputs and outputs. VBI is only valid for S-Video as it makes no sense for HDMI.

Since radio is wireless this looping always happens if the radio receiver frequency is close to the radio transmitter frequency. In that case the radio transmitter will ‘override’ the emulated radio stations.

Looping is currently supported only between devices created by the same vivid driver instance.

**Video and Sliced VBI looping**

The way to enable video/VBI looping is currently fairly crude. A ‘Loop Video’ control is available in the “Vivid” control class of the video capture and VBI capture devices. When checked the video looping will be enabled. Once enabled any video S-Video or HDMI input will show a static test pattern until the video output has started. At that time the video output will be looped to the video input provided that:

- the input type matches the output type. So the HDMI input cannot receive video from the S-Video output.

- the video resolution of the video input must match that of the video output. So it is not possible to loop a 50 Hz (720x576) S-Video output to a 60 Hz (720x480) S-Video input, or a 720p60 HDMI output to a 1080p30 input.

- the pixel formats must be identical on both sides. Otherwise the driver would have to do pixel format conversion as well, and that’s taking things too far.

- the field settings must be identical on both sides. Same reason as above: requiring the driver to convert from one field format to another complicated matters too much. This also prohibits capturing with ‘Field Top’ or ‘Field Bottom’ when the output video is set to ‘Field Alternate’. This combination, while legal, became too complicated to support. Both sides have to be ‘Field Alternate’ for this to work. Also note that for this specific case the sequence and field counting in struct v4l2_buffer on the capture side may not be 100% accurate.

- field settings V4L2\_FIELD\_SEQ\_TB/BT are not supported. While it is possible to implement this, it would mean a lot of work to get this right. Since these field values are rarely used the decision was made not to implement this for now.
• on the input side the “Standard Signal Mode” for the S-Video input or the “DV Timings Signal Mode” for the HDMI input should be configured so that a valid signal is passed to the video input.

The framerates do not have to match, although this might change in the future.

By default you will see the OSD text superimposed on top of the looped video. This can be turned off by changing the “OSD Text Mode” control of the video capture device.

For VBI looping to work all of the above must be valid and in addition the vbi output must be configured for sliced VBI. The VBI capture side can be configured for either raw or sliced VBI. Note that at the moment only CC/XDS (60 Hz formats) and WSS (50 Hz formats) VBI data is looped. Teletext VBI data is not looped.

Radio & RDS Looping

As mentioned in section 6 the radio receiver emulates stations at regular frequency intervals. Depending on the frequency of the radio receiver a signal strength value is calculated (this is returned by VIDIOC_G_TUNER). However, it will also look at the frequency set by the radio transmitter and if that results in a higher signal strength than the settings of the radio transmitter will be used as if it was a valid station. This also includes the RDS data (if any) that the transmitter ‘transmits’. This is received faithfully on the receiver side. Note that when the driver is loaded the frequencies of the radio receiver and transmitter are not identical, so initially no looping takes place.

Cropping, Composing, Scaling

This driver supports cropping, composing and scaling in any combination. Normally which features are supported can be selected through the Vivid controls, but it is also possible to hardcode it when the module is loaded through the ccs_cap_mode and ccs_out_mode module options. See section 1 on the details of these module options.

This allows you to test your application for all these variations.

Note that the webcam input never supports cropping, composing or scaling. That only applies to the TV/S-Video/HDMI inputs and outputs. The reason is that webcams, including this virtual implementation, normally use VIDIOC_ENUM_FRAMESIZES to list a set of discrete framesizes that it supports. And that does not combine with cropping, composing or scaling. This is primarily a limitation of the V4L2 API which is carefully reproduced here.

The minimum and maximum resolutions that the scaler can achieve are 16x16 and (4096 * 4) x (2160 x 4), but it can only scale up or down by a factor of 4 or less. So for a source resolution of 1280x720 the minimum the scaler can do is 320x180 and the maximum is 5120x2880. You can play around with this using the qv4l2 test tool and you will see these dependencies.

This driver also supports larger ‘bytesperline’ settings, something that VIDIOC_S_FMT allows but that few drivers implement.

The scaler is a simple scaler that uses the Coarse Bresenham algorithm. It’s designed for speed and simplicity, not quality.

If the combination of crop, compose and scaling allows it, then it is possible to change crop and compose rectangles on the fly.
Formats

The driver supports all the regular packed and planar 4:4:4, 4:2:2 and 4:2:0 YUYV formats, 8, 16, 24 and 32 RGB packed formats and various multiplanar formats.

The alpha component can be set through the ‘Alpha Component’ User control for those formats that support it. If the ‘Apply Alpha To Red Only’ control is set, then the alpha component is only used for the color red and set to 0 otherwise.

The driver has to be configured to support the multiplanar formats. By default the driver instances are single-planar. This can be changed by setting the multiplanar module option, see section 1 for more details on that option.

If the driver instance is using the multiplanar formats/API, then the first single planar format (YUYV) and the multiplanar NV16M and NV61M formats the will have a plane that has a non-zero data_offset of 128 bytes. It is rare for data_offset to be non-zero, so this is a useful feature for testing applications.

Video output will also honor any data_offset that the application set.

Capture Overlay

Note: capture overlay support is implemented primarily to test the existing V4L2 capture overlay API. In practice few if any GPUs support such overlays anymore, and neither are they generally needed anymore since modern hardware is so much more capable. By setting flag 0x10000 in the node_types module option the vivid driver will create a simple framebuffer device that can be used for testing this API. Whether this API should be used for new drivers is questionable.

This driver has support for a destructive capture overlay with bitmap clipping and list clipping (up to 16 rectangles) capabilities. Overlays are not supported for multiplanar formats. It also honors the struct v4l2_window field setting: if it is set to FIELD_TOP or FIELD_BOTTOM and the capture setting is FIELD_ALTERNATE, then only the top or bottom fields will be copied to the overlay.

The overlay only works if you are also capturing at that same time. This is a vivid limitation since it copies from a buffer to the overlay instead of filling the overlay directly. And if you are not capturing, then no buffers are available to fill.

In addition, the pixelformat of the capture format and that of the framebuffer must be the same for the overlay to work. Otherwise VIDIOC_OVERLAY will return an error.

In order to really see what it going on you will need to create two vivid instances: the first with a framebuffer enabled. You configure the capture overlay of the second instance to use the framebuffer of the first, then you start capturing in the second instance. For the first instance you setup the output overlay for the video output, turn on video looping and capture to see the blended framebuffer overlay that’s being written to by the second instance. This setup would require the following commands:

```
$ sudo modprobe vivid n_devs=2 node_types=0x10101,0x1
$ v4l2-ctl -d1 --find-fb
/dev/fb1 is the framebuffer associated with base address 0x12800000
$ sudo v4l2-ctl -d2 --set-fbuf fb=1
$ v4l2-ctl -d1 --set-fbuf fb=1
$ v4l2-ctl -d0 --set-fmt-video=pixelformat='AR15'
$ v4l2-ctl -d1 --set-fmt-video-out=pixelformat='AR15'
```
$ v4l2-ctl -d2 --set-fmt-video=pixelformat='AR15'
$ v4l2-ctl -d0 -i2
$ v4l2-ctl -d2 -i2
$ v4l2-ctl -d2 -c horizontal_movement=4
$ v4l2-ctl -d1 --overlay=1
$ v4l2-ctl -d1 -c loop_video=1
$ v4l2-ctl -d2 --stream-mmap --overlay=1

And from another console:

$ v4l2-ctl -d1 --stream-out-mmap

And yet another console:

$ qv4l2

and start streaming.

As you can see, this is not for the faint of heart...

**Output Overlay**

Note: output overlays are primarily implemented in order to test the existing V4L2 output overlay API. Whether this API should be used for new drivers is questionable.

This driver has support for an output overlay and is capable of:

- bitmap clipping,
- list clipping (up to 16 rectangles)
- chromakey
- source chromakey
- global alpha
- local alpha
- local inverse alpha

Output overlays are not supported for multiplanar formats. In addition, the pixelformat of the capture format and that of the framebuffer must be the same for the overlay to work. Otherwise VIDIOC_OVERLAY will return an error.

Output overlays only work if the driver has been configured to create a framebuffer by setting flag 0x10000 in the node types module option. The created framebuffer has a size of 720x576 and supports ARGB 1:5:5:5 and RGB 5:6:5.

In order to see the effects of the various clipping, chromakeying or alpha processing capabilities you need to turn on video looping and see the results on the capture side. The use of the clipping, chromakeying or alpha processing capabilities will slow down the video loop considerably as a lot of checks have to be done per pixel.
**CEC (Consumer Electronics Control)**

If there are HDMI inputs then a CEC adapter will be created that has the same number of input ports. This is the equivalent of e.g. a TV that has that number of inputs. Each HDMI output will also create a CEC adapter that is hooked up to the corresponding input port, or (if there are more outputs than inputs) is not hooked up at all. In other words, this is the equivalent of hooking up each output device to an input port of the TV. Any remaining output devices remain unconnected.

The EDID that each output reads reports a unique CEC physical address that is based on the physical address of the EDID of the input. So if the EDID of the receiver has physical address A.B.0.0, then each output will see an EDID containing physical address A.B.C.0 where C is 1 to the number of inputs. If there are more outputs than inputs then the remaining outputs have a CEC adapter that is disabled and reports an invalid physical address.

**Some Future Improvements**

Just as a reminder and in no particular order:

- Add a virtual alsa driver to test audio
- Add virtual sub-devices and media controller support
- Some support for testing compressed video
- Add support to loop raw VBI output to raw VBI input
- Add support to loop teletext sliced VBI output to VBI input
- Fix sequence/field numbering when looping of video with alternate fields
- Add support for V4L2_CID_BG_COLOR for video outputs
- Add ARGB888 overlay support: better testing of the alpha channel
- Improve pixel aspect support in the tpg code by passing a real v4l2_fRACT
- Use per-queue locks and/or per-device locks to improve throughput
- Add support to loop from a specific output to a specific input across vivid instances
- The SDR radio should use the same ‘frequencies’ for stations as the normal radio receiver, and give back noise if the frequency doesn’t match up with a station frequency
- Make a thread for the RDS generation, that would help in particular for the “Controls” RDS Rx I/O Mode as the read-only RDS controls could be updated in real-time.
- Changing the EDID should cause hotplug detect emulation to happen.
1.1.7 Digital TV driver-specific documentation

1.1.7.1 Avermedia DVB-T on BT878 Release Notes

February 14th 2006

Note: Several other Avermedia devices are supported. For a more broader and updated content about that, please check:
https://linuxtv.org/wiki/index.php/AVerMedia

The Avermedia DVB-T

The Avermedia DVB-T is a budget PCI DVB card. It has 3 inputs:

- RF Tuner Input
- Composite Video Input (RCA Jack)
- SVIDEO Input (Mini-DIN)

The RF Tuner Input is the input to the tuner module of the card. The Tuner is otherwise known as the “Frontend”. The Frontend of the Avermedia DVB-T is a Microtune 7202D. A timely post to the linux-dvb mailing list ascertained that the Microtune 7202D is supported by the sp887x driver which is found in the dvb-hw CVS module.

The DVB-T card is based around the BT878 chip which is a very common multimedia bridge and often found on Analogue TV cards. There is no on-board MPEG2 decoder, which means that all MPEG2 decoding must be done in software, or if you have one, on an MPEG2 hardware decoding card or chipset.

Getting the card going

At this stage, it has not been able to ascertain the functionality of the remaining device nodes in respect of the Avermedia DVBT. However, full functionality in respect of tuning, receiving and supplying the MPEG2 data stream is possible with the currently available versions of the driver. It may be possible that additional functionality is available from the card (i.e. viewing the additional analogue inputs that the card presents), but this has not been tested yet. If I get around to this, I’ll update the document with whatever I find.

To power up the card, load the following modules in the following order:

- modprobe bttv (normally loaded automatically)
- modprobe dvb-bt8xx (or place dvb-bt8xx in /etc/modules)

Insertion of these modules into the running kernel will activate the appropriate DVB device nodes. It is then possible to start accessing the card with utilities such as scan, tzap, dvbstream etc.

The frontend module sp887x.o, requires an external firmware. Please use the command “get_dvb_firmware sp887x” to download it. Then copy it to /usr/lib/hotplug/firmware or /lib/firmware/ (depending on configuration of firmware hotplug).
Known Limitations

At present I can say with confidence that the frontend tunes via /dev/dvb/adapter{x}/frontend0 and supplies an MPEG2 stream via /dev/dvb/adapter{x}/dvr0. I have not tested the functionality of any other part of the card yet. I will do so over time and update this document.

There are some limitations in the i2c layer due to a returned error message inconsistency. Although this generates errors in dmesg and the system logs, it does not appear to affect the ability of the frontend to function correctly.

Further Update

dvbstream and VideoLAN Client on windows works a treat with DVB, in fact this is currently serving as my main way of viewing DVB-T at the moment. Additionally, VLC is happily decoding HDTV signals, although the PC is dropping the odd frame here and there - I assume due to processing capability - as all the decoding is being done under windows in software.

Many thanks to Nigel Pearson for the updates to this document since the recent revision of the driver.

1.1.7.2 How to get the bt8xx cards working

Authors: Richard Walker, Jamie Honan, Michael Hunold, Manu Abraham, Uwe Bugla, Michael Krufky

General information

This class of cards has a bt878a as the PCI interface, and require the bttv driver for accessing the i2c bus and the gpio pins of the bt8xx chipset.

Please see Documentation/admin-guide/media/bttv-cardlist.rst for a complete list of Cards based on the Conexant Bt8xx PCI bridge supported by the Linux Kernel.

In order to be able to compile the kernel, some config options should be enabled:

```bash
./scripts/config -e PCI
./scripts/config -e INPUT
./scripts/config -m I2C
./scripts/config -m MEDIA_SUPPORT
./scripts/config -e MEDIA_PCI_SUPPORT
./scripts/config -e MEDIA_ANALOG_TV_SUPPORT
./scripts/config -e MEDIA_DIGITAL_TV_SUPPORT
./scripts/config -e MEDIA_RADIO_SUPPORT
./scripts/config -e RC_CORE
./scripts/config -m VIDEO_BT848
./scripts/config -m DVB_BT8XX
```

If you want to automatically support all possible variants of the Bt8xx cards, you should also do:

```bash
./scripts/config -e MEDIA_SUBDRV_AUTOSELECT
```
Note: Please use the following options with care as deselection of drivers which are in fact necessary may result in DVB devices that cannot be tuned due to lack of driver support.

If your goal is to just support an specific board, you may, instead, disable MEDIA_SUBDRV_AUTOSELECT and manually select the frontend drivers required by your board. With that, you can save some RAM.

You can do that by calling make xconfig/qconfig/menuconfig and look at the options on those menu options (only enabled if Autoselect ancillary drivers is disabled):

1) Device drivers => Multimedia support => Customize TV tuners
2) Device drivers => Multimedia support => Customize DVB frontends

Then, on each of the above menu, please select your card-specific frontend and tuner modules.

Loading Modules

Regular case: If the bttv driver detects a bt8xx-based DVB card, all frontend and backend modules will be loaded automatically.

Exceptions are:

• Old TV cards without EEPROMs, sharing a common PCI subsystem ID;
• Old TwinHan DST cards or clones with or without CA slot and not containing an Eeprom.

In the following cases overriding the PCI type detection for bttv and for dvb-bt8xx drivers by passing modprobe parameters may be necessary.

Running TwinHan and Clones

As shown at Documentation/admin-guide/media/bttv-cardlist.rst, TwinHan and clones use card=113 modprobe parameter. So, in order to properly detect it for devices without EEPROM, you should use:

```
$ modprobe bttv card=113
$ modprobe dst
```

Useful parameters for verbosity level and debugging the dst module:

```
verbose=0: messages are disabled
1: only error messages are displayed
2: notifications are displayed
3: other useful messages are displayed
4: debug setting
dst_addons=0: card is a free to air (FTA) card only
0x20: card has a conditional access slot for scrambled channels
dst_algo=0: (default) Software tuning algorithm
1: Hardware tuning algorithm
```

The autodetected values are determined by the cards’ “response string”.

In your logs see f. ex.: dst_get_device_id: Recognize [DSTMCI].

224 Chapter 1. Media subsystem admin and user guide
For bug reports please send in a complete log with verbose=4 activated. Please also see Documentation/admin-guide/media/ci.rst.

Running multiple cards

See Documentation/admin-guide/media/bttv-cardlist.rst for a complete list of Card ID. Some examples:

<table>
<thead>
<tr>
<th>Brand name</th>
<th>ID</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pinnacle PCTV Sat</td>
<td>94</td>
</tr>
<tr>
<td>Nebula Electronics Digi TV</td>
<td>104</td>
</tr>
<tr>
<td>pcHDTV HD-2000 TV</td>
<td>112</td>
</tr>
<tr>
<td>Twinhan DST and clones</td>
<td>113</td>
</tr>
<tr>
<td>Avermedia AverTV DVB-T 77:</td>
<td>123</td>
</tr>
<tr>
<td>Avermedia AverTV DVB-T 761</td>
<td>124</td>
</tr>
<tr>
<td>DViCO Fusion HDTV DVB-T Lite</td>
<td>128</td>
</tr>
<tr>
<td>DViCO Fusion HDTV 5 Lite</td>
<td>135</td>
</tr>
</tbody>
</table>

Note: When you have multiple cards, the order of the card ID should match the order where they’re detected by the system. Please notice that removing/inserting other PCI cards may change the detection order.

Example:

```
$ modprobe bttv card=113 card=135
```

In case of further problems please subscribe and send questions to the mailing list: linux-media@vger.kernel.org.

Probing the cards with broken PCI subsystem ID

There are some TwinHan cards whose EEPROM has become corrupted for some reason. The cards do not have a correct PCI subsystem ID. Still, it is possible to force probing the cards with:

```
$ echo 109e 0878 $subvendor $subdevice > \
/sys/bus/pci/drivers/bt878/new_id
```

The two numbers there are:

```
109e: PCI_VENDOR_ID_BROOKTREE
0878: PCI_DEVICE_ID_BROOKTREE_878
```
1.1.7.3 Firmware files for lmedm04 cards

To extract firmware for the DM04/QQBOX you need to copy the following file(s) to this directory.

**For DM04+/QQBOX LME2510C (Sharp 7395 Tuner)**

The Sharp 7395 driver can be found in windows/system32/drivers
US2A0D.sys (dated 17 Mar 2009)
and run:

```
scripts/get_dvb_firmware lme2510c_s7395
```

will produce dvb-usb-lme2510c-s7395.fw

An alternative but older firmware can be found on the driver disk DVB-S_EN_3.5A in BDADriver/driver
LMEBDA_DVBS7395C.sys (dated 18 Jan 2008)
and run:

```
./get_dvb_firmware lme2510c_s7395_old
```

will produce dvb-usb-lme2510c-s7395.fw

The LG firmware can be found on the driver disk DM04+_.5.1A[LG] in BDADriver/driver

**For DM04 LME2510 (LG Tuner)**

LMEBDA_DVBS.sys (dated 13 Nov 2007)
and run:

```
./get_dvb_firmware lme2510_lg
```

will produce dvb-usb-lme2510-lg.fw

Other LG firmware can be extracted manually from US280D.sys only found in windows/system32/drivers

```
dd if=US280D.sys ibs=1 skip=42360 count=3924 of=dvb-usb-lme2510-lg.fw
```

**For DM04 LME2510C (LG Tuner)**

```
dd if=US280D.sys ibs=1 skip=35200 count=3850 of=dvb-usb-lme2510c-lg.fw
```

The Sharp 0194 tuner driver can be found in windows/system32/drivers
US290D.sys (dated 09 Apr 2009)
For LME2510

dd if=US290D.sys ibs=1 skip=36856 count=3976 of=dvb-usb-lme2510-s0194.fw

For LME2510C

dd if=US290D.sys ibs=1 skip=33152 count=3697 of=dvb-usb-lme2510c-s0194.fw

The m88rs2000 tuner driver can be found in windows/system32/drivers
US2B0D.sys (dated 29 Jun 2010)

dd if=US2B0D.sys ibs=1 skip=34432 count=3871 of=dvb-usb-lme2510c-rs2000.fw

We need to modify id of rs2000 firmware or it will warm boot id 3344:1120.

echo -ne \xF0\x22 | dd conv=notrunc bs=1 count=2 seek=266 of=dvb-usb-lme2510c-rs2000.fw

Copy the firmware file(s) to /lib/firmware

1.1.7.4 Opera firmware

Author: Marco Gittler <g.marco@freenet.de>
To extract the firmware for the Opera DVB-S1 USB-Box you need to copy the files:
2830SCap2.sys 2830SLoad2.sys
from the windriver disk into this directory.
Then run:

scripts/get_dvb_firmware opera1

and after that you have 2 files:
dvb-usb-opera-01.fw dvb-usb-opera1-fpga-01.fw
in here.
Copy them into /lib/firmware/.
After that the driver can load the firmware (if you have enabled firmware loading in kernel config and have hotplug running).

1.1. The media subsystem
1.1.7.5 How to set up the Technisat/B2C2 Flexcop devices

**Note:** This documentation is outdated.

Author: Uwe Bugla <uwe.bugla@gmx.de> August 2009

**Find out what device you have**

Important Notice: The driver does NOT support Technisat USB 2 devices!

First start your linux box with a shipped kernel:

```
lspci -vvv for a PCI device (lsusb -vvv for an USB device) will show you for example:
02:0b.0 Network controller: Teclnsan Electronics Co Ltd B2C2 FlexCopII DVB chip /
Technisat SkyStar2 DVB card (rev 02)

dmesg | grep frontend may show you for example:
DVB: registering frontend 0 (Conexant CX24123/CX24109)...
```

**Kernel compilation:**

If the Flexcop / Technisat is the only DVB / TV / Radio device in your box get rid of unnecessary modules and check this one:

**Multimedia support => Customise analog and hybrid tuner modules to build**

In this directory uncheck every driver which is activated there (except Simple tuner support for ATSC 3rd generation only -> see case 9 please).

Then please activate:

- **Main module part:**
  - **Multimedia support => DVB/ATSC adapters => Technisat/B2C2 FlexcopII(b) and FlexCopIII adapters**
    1) => Technisat/B2C2 Air/Sky/Cable2PC PCI (PCI card) or
    2) => Technisat/B2C2 Air/Sky/Cable2PC USB (USB 1.1 adapter) and for troubleshooting purposes:
    3) => Enable debug for the B2C2 FlexCop drivers

- **Frontend / Tuner / Demodulator module part:**
  - **Multimedia support => DVB/ATSC adapters** => Customise the frontend modules to build Customise DVB frontends =>
    - SkyStar DVB-S Revision 2.3:
      1) => Zarlink VP310/MT312/ZL10313 based
      2) => Generic I2C PLL based tuners
    - SkyStar DVB-S Revision 2.6:
1) => ST STV0299 based
2) => Generic I2C PLL based tuners

- SkyStar DVB-S Revision 2.7:
  1) => Samsung S5H1420 based
  2) => Integrand ITD1000 Zero IF tuner for DVB-S/DSS
  3) => ISL6421 SEC controller

- SkyStar DVB-S Revision 2.8:
  1) => Conexant CX24123 based
  2) => Conexant CX24113/CX24128 tuner for DVB-S/DSS
  3) => ISL6421 SEC controller

- AirStar DVB-T card:
  1) => Zarlink MT352 based
  2) => Generic I2C PLL based tuners

- CableStar DVB-C card:
  1) => ST STV0297 based
  2) => Generic I2C PLL based tuners

- AirStar ATSC card 1st generation:
  1) => Broadcom BCM3510

- AirStar ATSC card 2nd generation:
  1) => NxtWave Communications NXT2002/NXT2004 based
  2) => Generic I2C PLL based tuners

- AirStar ATSC card 3rd generation:
  1) => LG Electronics LGDT3302/LGDT3303 based
  2) Multimedia support => Customise analog and hybrid tuner modules to build => Simple tuner support

### 1.1.7.6 TechnoTrend/Hauppauge DEC USB Driver

**Driver Status**

Supported:
- DEC2000-t
- DEC2450-t
- DEC3000-s
- Video Streaming
- Audio Streaming
• Section Filters
• Channel Zapping
• Hotplug firmware loader

To Do:
• Tuner status information
• DVB network interface
• Streaming video PC->DEC
• Conax support for 2450-t

**Getting the Firmware**

To download the firmware, use the following commands:

```bash
scripts/get_dvb_firmware dec2000t
scripts/get_dvb_firmware dec2540t
scripts/get_dvb_firmware dec3000s
```

**Hotplug Firmware Loading**

Since 2.6 kernels, the firmware is loaded at the point that the driver module is loaded.

Copy the three files downloaded above into the `/usr/lib/hotplug/firmware` or `/lib/firmware` directory (depending on configuration of firmware hotplug).

### 1.1.7.7 Zoran 364xx based USB webcam module

**mail:** royale@zerezo.com

**Introduction**

This brings support under Linux for the Aiptek PocketDV 3300 and similar devices in webcam mode. If you just want to get on your PC the pictures and movies on the camera, you should use the usb-storage module instead.

The driver works with several other cameras in webcam mode (see the list below).

Possible chipsets are: ZR36430 (ZR36430BGC) and maybe ZR36431, ZR36440, ZR36442...

You can try the experience changing the vendor/product ID values (look at the source code).

You can get these values by looking at `/var/log/messages` when you plug your camera, or by typing: `cat /sys/kernel/debug/usb/devices`. 
Install

In order to use this driver, you must compile it with your kernel, with the following config options:

```
./scripts/config -e USB
./scripts/config -m MEDIA_SUPPORT
./scripts/config -e MEDIA_USB_SUPPORT
./scripts/config -e MEDIA_CAMERA_SUPPORT
./scripts/config -m USB_ZR364XX
```

Usage

modprobe zr364xx debug=X mode=Y

- debug : set to 1 to enable verbose debug messages
- mode : 0 = 320x240, 1 = 160x120, 2 = 640x480

You can then use the camera with V4L2 compatible applications, for example Ekiga.
To capture a single image, try this: `dd if=/dev/video0 of=test.jpg bs=1M count=1`

links

http://mxhaard.free.fr/ (support for many others cams including some Aiptek PocketDV) http://www.harmwal.nl/pccam880/ (this project also supports cameras based on this chipset)

### 1.1.8 CEC driver-specific documentation

#### 1.1.8.1 Pulse-Eight CEC Adapter driver

The pulse8-cec driver implements the following module option:

**persistent_config**

By default this is off, but when set to 1 the driver will store the current settings to the device’s internal eeprom and restore it the next time the device is connected to the USB port.

MEDIA SUBSYSTEM KERNEL INTERNAL API

This section contains usage information about media subsystem and its supported drivers. Please see:

Documentation/admin-guide/media/index.rst
  • for usage information about media subsystem and supported drivers;

Documentation/userspace-api/media/index.rst
  • for the userspace APIs used on media devices.

2.1 Media Subsystem Profile

2.1.1 Overview

The media subsystem covers support for a variety of devices: stream capture, analog and digital TV streams, cameras, remote controllers, HDMI CEC and media pipeline control.

It covers, mainly, the contents of those directories:

  • drivers/media
  • drivers/staging/media
  • Documentation/admin-guide/media
  • Documentation/driver-api/media
  • Documentation/userspace-api/media
  • Documentation/devicetree/bindings/media/¹
  • include/media

Both media userspace and Kernel APIs are documented and the documentation must be kept in sync with the API changes. It means that all patches that add new features to the subsystem must also bring changes to the corresponding API files.

Due to the size and wide scope of the media subsystem, media’s maintainership model is to have sub-maintainers that have a broad knowledge of a specific aspect of the subsystem. It is

¹ Device tree bindings are maintained by the OPEN FIRMWARE AND FLATTENED DEVICE TREE BINDINGS maintainers (see the MAINTAINERS file). So, changes there must be reviewed by them before being merged via the media subsystem’s development tree.
the sub-maintainers’ task to review the patches, providing feedback to users if the patches are following the subsystem rules and are properly using the media kernel and userspace APIs.

Patches for the media subsystem must be sent to the media mailing list at linux-media@vger.kernel.org as plain text only e-mail. Emails with HTML will be automatically rejected by the mail server. It could be wise to also copy the sub-maintainer(s).

Media’s workflow is heavily based on Patchwork, meaning that, once a patch is submitted, the e-mail will first be accepted by the mailing list server, and, after a while, it should appear at:

- \[\text{https://patchwork.linuxtv.org/project/linux-media/list/}\]

If it doesn’t automatically appear there after a few minutes, then probably something went wrong on your submission. Please check if the email is in plain text\(^2\) only and if your emailer is not mangling whitespaces before complaining or submitting them again.

You can check if the mailing list server accepted your patch, by looking at:

- \[\text{https://lore.kernel.org/linux-media/}\]

### 2.1.1.1 Media maintainers

At the media subsystem, we have a group of senior developers that are responsible for doing the code reviews at the drivers (also known as sub-maintainers), and another senior developer responsible for the subsystem as a whole. For core changes, whenever possible, multiple media maintainers do the review.

The media maintainers that work on specific areas of the subsystem are:

- **Digital TV and remote controllers**: Sean Young <sean@mess.org>
- **HDMI CEC**: Hans Verkuil <hverkuil@xs4all.nl>
- **Media controller drivers**: Laurent Pinchart <laurent.pinchart@ideasonboard.com>
- **ISP, v4l2-async, v4l2-fwnode, v4l2-flash-led-class and Sensor drivers**: Sakari Ailus <sakari.ailus@linux.intel.com>

The **subsystem maintainer** is: Mauro Carvalho Chehab <mchehab@kernel.org>

Media maintainers may delegate a patch to other media maintainers as needed. On such case, checkpatch’s delegate field indicates who’s currently responsible for reviewing a patch.

### 2.1.2 Submit Checklist Addendum

Patches that change the Open Firmware/Device Tree bindings must be reviewed by the Device Tree maintainers. So, DT maintainers should be Cc:ed when those are submitted via device-tree@vger.kernel.org mailing list.

There is a set of compliance tools at \[https://git.linuxtv.org/v4l-utils.git/\] that should be used in order to check if the drivers are properly implementing the media APIs:

\(^2\) If your email contains HTML, the mailing list server will simply drop it, without any further notice.
Other compliance tools are under development to check other parts of the subsystem.

Those tests need to pass before the patches go upstream.

Also, please notice that we build the Kernel with:

```
make CF=-D__CHECK_ENDIAN__ CONFIG_DEBUG_SECTION_MISMATCH=y C=1 W=1 CHECK=check_script
```

Where the check script is:

```
#!/bin/bash
/devel/smatch/smatch -p=kernel $@ >&2
/devel/sparse/sparse $@ >&2
```

Be sure to not introduce new warnings on your patches without a very good reason.

### 2.1.2.1 Style Cleanup Patches

Style cleanups are welcome when they come together with other changes at the files where the style changes will affect.

We may accept pure standalone style cleanups, but they should ideally be one patch for the whole subsystem (if the cleanup is low volume), or at least be grouped per directory. So, for example, if you’re doing a big cleanup change set at drivers under drivers/media, please send a single patch for all drivers under drivers/media/pci, another one for drivers/media/usb and so on.

### 2.1.2.2 Coding Style Addendum

Media development uses checkpatch.pl on strict mode to verify the code style, e.g.:

```
$ ./scripts/checkpatch.pl --strict --max-line-length=80
```

In principle, patches should follow the coding style rules, but exceptions are allowed if there are good reasons. On such case, maintainers and reviewers may question about the rationale for not addressing the checkpatch.pl.

Please notice that the goal here is to improve code readability. On a few cases, checkpatch.pl may actually point to something that would look worse. So, you should use good sense.

Note that addressing one checkpatch.pl issue (of any kind) alone may lead to having longer lines than 80 characters per line. While this is not strictly prohibited, efforts should be made towards staying within 80 characters per line. This could include using re-factoring code that leads to less indentation, shorter variable or function names and last but not least, simply wrapping the lines.

In particular, we accept lines with more than 80 columns:

---

3 The v4l2-compliance also covers the media controller usage inside V4L2 drivers.
• on strings, as they shouldn’t be broken due to line length limits;
• when a function or variable name need to have a big identifier name, which keeps hard to honor the 80 columns limit;
• on arithmetic expressions, when breaking lines makes them harder to read;
• when they avoid a line to end with an open parenthesis or an open bracket.

2.1.3 Key Cycle Dates

New submissions can be sent at any time, but if they intend to hit the next merge window they should be sent before -rc5, and ideally stabilized in the linux-media branch by -rc6.

2.1.4 Review Cadence

Provided that your patch is at https://patchwork.linuxtv.org, it should be sooner or later handled, so you don’t need to re-submit a patch.

Except for bug fixes, we don’t usually add new patches to the development tree between -rc6 and the next -rc1.

Please notice that the media subsystem is a high traffic one, so it could take a while for us to be able to review your patches. Feel free to ping if you don’t get a feedback in a couple of weeks or to ask other developers to publicly add Reviewed-by and, more importantly, Tested-by: tags.

Please note that we expect a detailed description for Tested-by:, identifying what boards were used at the test and what it was tested.

2.2 Video4Linux devices

2.2.1 Introduction

The V4L2 drivers tend to be very complex due to the complexity of the hardware: most devices have multiple ICs, export multiple device nodes in /dev, and create also non-V4L2 devices such as DVB, ALSA, FB, I2C and input (IR) devices.

Especially the fact that V4L2 drivers have to setup supporting ICs to do audio/video muxing/encoding/decoding makes it more complex than most. Usually these ICs are connected to the main bridge driver through one or more I2C buses, but other buses can also be used. Such devices are called ‘sub-devices’.

For a long time the framework was limited to the video_device struct for creating V4L device nodes and video_buf for handling the video buffers (note that this document does not discuss the video_buf framework).

This meant that all drivers had to do the setup of device instances and connecting to sub-devices themselves. Some of this is quite complicated to do right and many drivers never did do it correctly.

There is also a lot of common code that could never be refactored due to the lack of a framework.
So this framework sets up the basic building blocks that all drivers need and this same framework should make it much easier to refactor common code into utility functions shared by all drivers.

A good example to look at as a reference is the v4l2-pci-skeleton.c source that is available in samples/v4l/. It is a skeleton driver for a PCI capture card, and demonstrates how to use the V4L2 driver framework. It can be used as a template for real PCI video capture driver.

### 2.2.2 Structure of a V4L driver

All drivers have the following structure:

1) A struct for each device instance containing the device state.
2) A way of initializing and commanding sub-devices (if any).
3) Creating V4L2 device nodes (/dev/videoX, /dev/vbiX and /dev/radioX) and keeping track of device-node specific data.
4) Filehandle-specific structs containing per-filehandle data;
5) video buffer handling.

This is a rough schematic of how it all relates:

```
device instances
 |  +--sub-device instances
 |    |  -V4L2 device nodes
 |    |  |  -filehandle instances
```

### 2.2.3 Structure of the V4L2 framework

The framework closely resembles the driver structure: it has a v4l2_device struct for the device instance data, a v4l2_subdev struct to refer to sub-device instances, the video_device struct stores V4L2 device node data and the v4l2_fh struct keeps track of filehandle instances.

The V4L2 framework also optionally integrates with the media framework. If a driver sets the `struct v4l2_device` mdev field, sub-devices and video nodes will automatically appear in the media framework as entities.

### 2.2.4 Video device’s internal representation

The actual device nodes in the /dev directory are created using the `video_device` struct (v4l2-dev.h). This struct can either be allocated dynamically or embedded in a larger struct.

To allocate it dynamically use `video_device_alloc()`:

```
struct video_device vdev = video_device_alloc();
if (vdev == NULL)
   return -ENOMEM;
```
vdev->release = video_device_release;

If you embed it in a larger struct, then you must set the release() callback to your own function:

```c
struct video_device *vdev = &my_vdev->vdev;

vdev->release = my_vdev_release;
```

The release() callback must be set and it is called when the last user of the video device exits. The default video_device_release() callback currently just calls kfree to free the allocated memory.

There is also a video_device_release_empty() function that does nothing (is empty) and should be used if the struct is embedded and there is nothing to do when it is released.

You should also set these fields of video_device:

- **video_device->v4l2_dev**: must be set to the v4l2_device parent device.
- **video_device->name**: set to something descriptive and unique.
- **video_device->vfl_dir**: set this to VFL_DIR_RX for capture devices (VFL_DIR_RX has value 0, so this is normally already the default), set to VFL_DIR_TX for output devices and VFL_DIR_M2M for mem2mem (codec) devices.
- **video_device->fops**: set to the v4l2_file_operations struct.
- **video_device->ioctl_ops**: if you use the v4l2_ioctl_ops to simplify ioctl maintenance (highly recommended to use this and it might become compulsory in the future!), then set this to your v4l2_ioctl_ops struct. The video_device->vfl_type and video_device->vfl_dir fields are used to disable ops that do not match the type/dir combination. E.g. VBI ops are disabled for non-VBI nodes, and output ops are disabled for a capture device. This makes it possible to provide just one v4l2_ioctl_ops struct for both vbi and video nodes.
- **video_device->lock**: leave to NULL if you want to do all the locking in the driver. Otherwise you give it a pointer to a struct mutex_lock and before the video_device->unlocked_ioctl file operation is called this lock will be taken by the core and released afterwards. See the next section for more details.
- **video_device->queue**: a pointer to the struct vb2_queue associated with this device node. If queue is not NULL, and queue->lock is not NULL, then queue->lock is used for the queuing ioctls (VIDIOC_REQBUFS, CREATE_BUFS, QBUF, DQBUF, QUERYBUF, PREPARE_BUF, STREAMON and STREAMOFF) instead of the lock above. That way the vb2 queuing framework does not have to wait for other ioctls. This queue pointer is also used by the vb2 helper functions to check for queuing ownership (i.e. is the filehandle calling it allowed to do the operation).
- **video_device->prio**: keeps track of the priorities. Used to implement VIDIOC_G_PRIORITY and VIDIOC_S_PRIORITY. If left to NULL, then it will use the struct v4l2_prio_state in v4l2_device. If you want to have a separate priority state per (group of) device node(s), then you can point it to your own struct v4l2_prio_state.
- **video_device->dev_parent**: you only set this if v4l2_device was registered with NULL as the parent device struct. This only happens in cases where one hardware device has multiple PCI devices that all share the same v4l2_device core.
The cx88 driver is an example of this: one core v4l2_device struct, but it is used by both a raw video PCI device (cx8800) and a MPEG PCI device (cx8802). Since the v4l2_device cannot be associated with two PCI devices at the same time it is setup without a parent device. But when the struct video_device is initialized you do know which parent PCI device to use and so you set dev_device to the correct PCI device.

If you use v4l2_ioctl_ops, then you should set video_device->unlocked_ioctl to video_ioctl2() in your v4l2_file_operations struct.

In some cases you want to tell the core that a function you had specified in your v4l2_ioctl_ops should be ignored. You can mark such ioctls by calling this function before video_register_device() is called:

    v4l2_disable_ioctl(vdev, cmd).

This tends to be needed if based on external factors (e.g. which card is being used) you want to turn off certain features in v4l2_ioctl_ops without having to make a new struct.

The v4l2_file_operations struct is a subset of file_operations. The main difference is that the inode argument is omitted since it is never used.

If integration with the media framework is needed, you must initialize the media_entity struct embedded in the video_device struct (entity field) by calling media_entity_pads_init():

```c
struct media_pad *pad = &my_vdev->pad;
int err;

err = media_entity_pads_init(&vdev->entity, 1, pad);
```

The pads array must have been previously initialized. There is no need to manually set the struct media_entity type and name fields.

A reference to the entity will be automatically acquired/released when the video device is opened/closed.

### 2.2.4.1 ioctls and locking

The V4L core provides optional locking services. The main service is the lock field in struct video_device, which is a pointer to a mutex. If you set this pointer, then that will be used by unlocked_ioctl to serialize all ioctls.

If you are using the videobuf2 framework, then there is a second lock that you can set: video_device->queue->lock. If set, then this lock will be used instead of video_device->lock to serialize all queuing ioctls (see the previous section for the full list of those ioctls).

The advantage of using a different lock for the queuing ioctls is that for some drivers (particularly USB drivers) certain commands such as setting controls can take a long time, so you want to use a separate lock for the buffer queuing ioctls. That way your VIDIOC_DQBUF doesn’t stall because the driver is busy changing the e.g. exposure of the webcam.

Of course, you can always do all the locking yourself by leaving both lock pointers at NULL.

If you use the old videobuf framework then you must pass the video_device->lock to the videobuf queue initialize function: if videobuf has to wait for a frame to arrive, then it will temporarily unlock the lock and relock it afterwards. If your driver also waits in the code, then you should do the same to allow other processes to access the device node while the first process is waiting for something.
In the case of videobuf2 you will need to implement the wait_prepare() and wait_finish() callbacks to unlock/lock if applicable. If you use the queue->lock pointer, then you can use the helper functions vb2_ops_wait_prepare() and vb2_ops_wait_finish().

The implementation of a hotplug disconnect should also take the lock from video_device before calling v4l2_device_disconnect. If you are also using video_device->queue->lock, then you have to first lock video_device->queue->lock followed by video_device->lock. That way you can be sure no ioctl is running when you call v4l2_device_disconnect().

2.2.4.2 Video device registration

Next you register the video device with video_register_device(). This will create the character device for you.

```c
err = video_register_device(vdev, VFL_TYPE_VIDEO, -1);
if (err) {
    video_device_release(vdev); /* or kfree(my_vdev); */
    return err;
}
```

If the v4l2_device parent device has a not NULL mdev field, the video device entity will be automatically registered with the media device.

Which device is registered depends on the type argument. The following types exist:

<table>
<thead>
<tr>
<th>vfl_devnode_type</th>
<th>Device name</th>
<th>Usage</th>
</tr>
</thead>
<tbody>
<tr>
<td>VFL_TYPE_VIDEO</td>
<td>/dev/videoX</td>
<td>for video input/output devices</td>
</tr>
<tr>
<td>VFL_TYPE_VBI</td>
<td>/dev/vbiX</td>
<td>for vertical blank data (i.e. closed captions, teletext)</td>
</tr>
<tr>
<td>VFL_TYPE_RADIO</td>
<td>/dev/radioX</td>
<td>for radio tuners</td>
</tr>
<tr>
<td>VFL_TYPE_SUBDEV</td>
<td>/dev/v4l-subdevX</td>
<td>for V4L2 subdevices</td>
</tr>
<tr>
<td>VFL_TYPE_SDR</td>
<td>/dev/swradioX</td>
<td>for Software Defined Radio (SDR) tuners</td>
</tr>
<tr>
<td>VFL_TYPE_TOUCH</td>
<td>/dev/v4l-touchX</td>
<td>for touch sensors</td>
</tr>
</tbody>
</table>

The last argument gives you a certain amount of control over the device node number used (i.e. the X in videoX). Normally you will pass -1 to let the v4l2 framework pick the first free number. But sometimes users want to select a specific node number. It is common that drivers allow the user to select a specific device node number through a driver module option. That number is then passed to this function and video_register_device will attempt to select that device node number. If that number was already in use, then the next free device node number will be selected and it will send a warning to the kernel log.

Another use-case is if a driver creates many devices. In that case it can be useful to place different video devices in separate ranges. For example, video capture devices start at 0, video output devices start at 16. So you can use the last argument to specify a minimum device node number and the v4l2 framework will try to pick the first free number that is equal or higher to what you passed. If that fails, then it will just pick the first free number.

Since in this case you do not care about a warning about not being able to select the specified device node number, you can call the function video_register_device_no_warn() instead.

Whenever a device node is created some attributes are also created for you. If you look in /sys/class/video4linux you see the devices. Go into e.g. video0 and you will see ‘name’,
‘dev_debug’ and ‘index’ attributes. The ‘name’ attribute is the ‘name’ field of the video_device struct. The ‘dev_debug’ attribute can be used to enable core debugging. See the next section for more detailed information on this.

The ‘index’ attribute is the index of the device node: for each call to `video_register_device()` the index is just increased by 1. The first video device node you register always starts with index 0.

Users can setup udev rules that utilize the index attribute to make fancy device names (e.g. ‘mpegX’ for MPEG video capture device nodes).

After the device was successfully registered, then you can use these fields:

- `video_device->vfl_type`: the device type passed to `video_register_device()`.
- `video_device->minor`: the assigned device minor number.
- `video_device->num`: the device node number (i.e. the X in videoX).
- `video_device->index`: the device index number.

If the registration failed, then you need to call `video_device_release()` to free the allocated `video_device` struct, or free your own struct if the `video_device` was embedded in it. The vdev->release() callback will never be called if the registration failed, nor should you ever attempt to unregister the device if the registration failed.

### 2.2.4.3 video device debugging

The ‘dev_debug’ attribute that is created for each video, vbi, radio or swradio device in `/sys/class/video4linux/<devX>/` allows you to enable logging of file operations.

It is a bitmask and the following bits can be set:

<table>
<thead>
<tr>
<th>Mask</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>0x01</td>
<td>Log the ioctl name and error code. VIDIOC_(D)QBUF ioctl are only logged if bit 0x08 is also set.</td>
</tr>
<tr>
<td>0x02</td>
<td>Log the ioctl name arguments and error code. VIDIOC_(D)QBUF ioctl are only logged if bit 0x08 is also set.</td>
</tr>
<tr>
<td>0x04</td>
<td>Log the file operations open, release, read, write, mmap and get_unmapped_area. The read and write operations are only logged if bit 0x08 is also set.</td>
</tr>
<tr>
<td>0x08</td>
<td>Log the read and write file operations and the VIDIOC_QBUF and VIDIOC_DQBUF ioctl.</td>
</tr>
<tr>
<td>0x10</td>
<td>Log the poll file operation.</td>
</tr>
<tr>
<td>0x20</td>
<td>Log error and messages in the control operations.</td>
</tr>
</tbody>
</table>

---

2.2. Video4Linux devices
2.2.4.4 Video device cleanup

When the video device nodes have to be removed, either during the unload of the driver or because the USB device was disconnected, then you should unregister them with:

```c
video_unregister_device(vdev);
```

This will remove the device nodes from sysfs (causing udev to remove them from /dev).

After `video_unregister_device()` returns no new opens can be done. However, in the case of USB devices some application might still have one of these device nodes open. So after the unregister all file operations (except release, of course) will return an error as well.

When the last user of the video device node exits, then the `vdev->release()` callback is called and you can do the final cleanup there.

Don’t forget to cleanup the media entity associated with the video device if it has been initialized:

```c
media_entity_cleanup(&vdev->entity);
```

This can be done from the release callback.

2.2.4.5 helper functions

There are a few useful helper functions:

- file and `video_device` private data

You can set/get driver private data in the video_device struct using:

```c
video_get_drvdata(vdev);
```

```c
video_set_drvdata(vdev);
```

Note that you can safely call `video_set_drvdata()` before calling `video_register_device()`.

And this function:

```c
video_devdata(struct file* file);
```

returns the video_device belonging to the file struct.

The `video_devdata()` function combines `video_get_drvdata()` with `video_devdata()`:

```c
video_devdata(struct file* file);
```

You can go from a `video_device` struct to the v4l2_device struct using:

```c
struct v4l2_device *v4l2_dev = vdev->v4l2_dev;
```

- Device node name

The `video_device` node kernel name can be retrieved using:

```c
video_device_node_name(vdev);
```

The name is used as a hint by userspace tools such as udev. The function should be used where possible instead of accessing the video_device::num and video_device::minor fields.
2.2.4.6 video_device functions and data structures

enum vfl_devnode_type
    type of V4L2 device node

Constants

VFL_TYPE_VIDEO  for video input/output devices
VFL_TYPE_VBI for vertical blank data (i.e. closed captions, teletext)
VFL_TYPE_RADIO for radio tuners
VFL_TYPE_SUBDEV for V4L2 subdevices
VFL_TYPE_SDR for Software Defined Radio tuners
VFL_TYPE_TOUCH for touch sensors
VFL_TYPE_MAX number of VFL types, must always be last in the enum

enum vfl_devnode_direction
    Identifies if a struct video_device corresponds to a receiver, a transmitter or a mem-to-mem device.

Constants

VFL_DIR_RX device is a receiver.
VFL_DIR_TX device is a transmitter.
VFL_DIR_M2M device is a memory to memory device.

Note

Ignored if enum vfl_devnode_type is VFL_TYPE_SUBDEV.

enum v4l2_video_device_flags
    Flags used by struct video_device

Constants

V4L2_FL_REGISTERED
    indicates that a struct video_device is registered. Drivers can clear this flag if they want to block all future device access. It is cleared by video_unregister_device.

V4L2_FL_USES_V4L2_FH
    indicates that file->private_data points to struct v4l2_fh. This flag is set by the core when v4l2_fh_init() is called. All new drivers should use it.

V4L2_FL_QUIRK_INVERTED_CROP
    some old M2M drivers use g/s_crop/cropcap incorrectly: crop and compose are swapped. If this flag is set, then the selection targets are swapped in the g/s_crop/cropcap functions in v4l2-ioctl.c. This allows those drivers to correctly implement the selection API, but the old crop API will still work as expected in order to preserve backwards compatibility. Never set this flag for new drivers.

V4L2_FL_SUBDEV_RO_DEVNODE
indicates that the video device node is registered in read-only mode. The flag only applies to device nodes registered for sub-devices, it is set by the core when the sub-devices device nodes are registered with `v4l2_device_register_ro_subdev_nodes()` and used by the sub-device ioctl handler to restrict access to some ioctl calls.

```c
struct v4l2_prio_state
    stores the priority states
```

**Definition**

```c
struct v4l2_prio_state {
    atomic_t prios[4];
};
```

**Members**

- **prios** array with elements to store the array priorities

**Description**

**Note:** The size of **prios** array matches the number of priority types defined by enum **v4l2_priority**.

```c
void v4l2_prio_init(struct v4l2_prio_state *global)
    initializes a **struct v4l2_prio_state**
```

**Parameters**

- **struct v4l2_prio_state *global** pointer to **struct v4l2_prio_state**

```c
int v4l2_prio_change(struct v4l2_prio_state *global, enum v4l2_priority *local, enum v4l2_priority new)
    changes the v4l2 file handler priority
```

**Parameters**

- **struct v4l2_prio_state *global** pointer to the **struct v4l2_prio_state** of the device node.
- **enum v4l2_priority *local** pointer to the desired priority, as defined by enum **v4l2_priority**
- **enum v4l2_priority new** Priority type requested, as defined by enum **v4l2_priority**.

**Description**

**Note:** This function should be used only by the V4L2 core.

```c
void v4l2_prio_open(struct v4l2_prio_state *global, enum v4l2_priority *local)
    Implements the priority logic for a file handler open
```

**Parameters**

- **struct v4l2_prio_state *global** pointer to the **struct v4l2_prio_state** of the device node.
enum v4l2_priority *local
pointer to the desired priority, as defined by enum v4l2_priority

Description

Note: This function should be used only by the V4L2 core.

void v4l2_prio_close (struct v4l2_prio_state *global, enum v4l2_priority local)
Implements the priority logic for a file handler close

Parameters
struct v4l2_prio_state *global pointer to the struct v4l2_prio_state of the device node.
enum v4l2_priority local priority to be released, as defined by enum v4l2_priority

Description

Note: This function should be used only by the V4L2 core.

enum v4l2_priority v4l2_prio_max (struct v4l2_prio_state *global)
Return the maximum priority, as stored at the global array.

Parameters
struct v4l2_prio_state *global pointer to the struct v4l2_prio_state of the device node.

Description

Note: This function should be used only by the V4L2 core.

int v4l2_prio_check (struct v4l2_prio_state *global, enum v4l2_priority local)
Implements the priority logic for a file handler close

Parameters
struct v4l2_prio_state *global pointer to the struct v4l2_prio_state of the device node.
enum v4l2_priority local desired priority, as defined by enum v4l2_priority local

Description

Note: This function should be used only by the V4L2 core.

struct v4l2_file_operations
fs operations used by a V4L2 device

Definition

2.2. Video4Linux devices
struct v4l2_file_operations {
    struct module *owner;
    ssize_t (*read) (struct file *, char __user *, size_t, loff_t *);
    ssize_t (*write) (struct file *, const char __user *, size_t, loff_t *);
    __poll_t (*poll) (struct file *, struct poll_table_struct *);
    long (*unlocked_ioctl) (struct file *, unsigned int, unsigned long);
    #ifdef CONFIG_COMPAT;
    long (*compat_ioctl32) (struct file *, unsigned int, unsigned long);
    #endif;
    unsigned long (*get_unmapped_area) (struct file *, unsigned long, unsigned long,
                                          unsigned long, unsigned long);
    int (*mmap) (struct file *, struct vm_area_struct *);
    int (*open) (struct file *);
    int (*release) (struct file *);
};

Members

owner  pointer to struct module

read  operations needed to implement the read() syscall

write operations needed to implement the write() syscall

poll  operations needed to implement the poll() syscall

unlocked_ioctl  operations needed to implement the ioctl() syscall

compat_ioctl32  operations needed to implement the ioctl() syscall for the special case where
the Kernel uses 64 bits instructions, but the userspace uses 32 bits.

get_unmapped_area  called by the mmap() syscall, used when %!CONFIG_MMU

mmap  operations needed to implement the mmap() syscall

open  operations needed to implement the open() syscall

release  operations needed to implement the release() syscall

Description

Note: Those operations are used to implemente the fs struct file operations at the V4L2 drivers. The V4L2 core overrides the fs ops with some extra logic needed by the subsystem.

struct video_device

    Structure used to create and manage the V4L2 device nodes.

Definition

struct video device {
    #if defined(CONFIG_MEDIA_CONTROLLER);
    struct media_entity entity;
    struct media_intf_devnode *intf_devnode;
    struct media_pipeline pipe;
    #endif;
    const struct v4l2_file_operations *fops;
    u32 device_caps;
    struct device dev;
    struct cdev *cdev;
};
struct v4l2_device *v4l2_dev;
struct device *dev_parent;
struct v4l2_ctrl_handler *ctrl_handler;
struct vb2_queue *queue;
struct v4l2_prio_state *prio;
char name[32];
enum vfl_devnode_type vfl_type;
enum vfl_devnode_direction vfl_dir;
int minor;
u16 num;
unsigned long flags;
int dev_debug;
v4l2_std_id tvnorms;
void (*release)(struct video_device *vdev);
const struct v4l2_ioctl_ops *ioctl_ops;
unsigned long valid_iocls[BITS_TO_LONGS(BASE_VIDIOC_PRIVATE)];
struct mutex *lock;
};

Members

entity struct media_entity

intf_devnode pointer to struct media_intf_devnode

pipe struct media_pipeline

fops pointer to struct v4l2_file_operations for the video device

device_caps device capabilities as used in v4l2_capabilities

dev struct device for the video device

cdev character device

v4l2_dev pointer to struct v4l2_device parent

dev_parent pointer to struct device parent

ctrl_handler Control handler associated with this device node. May be NULL.

queue struct vb2_queue associated with this device node. May be NULL.

prio pointer to struct v4l2_prio_state with device’s Priority state. If NULL, then v4l2_dev->prio will be used.

name video device name

vfl_type V4L device type, as defined by enum vfl_devnode_type

vfl_dir V4L receiver, transmitter or m2m

minor device node ‘minor’. It is set to -1 if the registration failed

num number of the video device node

flags video device flags. Use bitops to set/clear/test flags. Contains a set of enum v4l2_video_device_flags.

index attribute to differentiate multiple indices on one physical device

2.2. Video4Linux devices
fh_lock  Lock for all v4l2_fhs
fh_list  List of struct v4l2_fh
dev_debug  Internal device debug flags, not for use by drivers
tvnorms  Supported tv norms
release  video device release() callback
ioctl_ops  pointer to struct v4l2_ioctl_ops with ioctl callbacks
valid_ioctl  bitmap with the valid ioctls for this device
lock  pointer to struct mutex serialization lock
Description

Note: Only set dev_parent if that can’t be deduced from v4l2_dev.

media_entity_to_video_device(__entity)
   Returns a struct video_device from the struct media_entity embedded on it.

Parameters
__entity  pointer to struct media_entity
to_video_device(cd)
   Returns a struct video_device from the struct device embedded on it.

Parameters
cd  pointer to struct device

int __video_register_device(struct video_device *vdev, enum vfl_devnode_type type,
   int nr, int warn_if_nr_in_use, struct module *owner)
   register video4linux devices

Parameters
struct video_device *vdev  struct video_device to register
enum vfl_devnode_type type  type of device to register, as defined by enum vfl_devnode_type
int nr  which device node number is desired: (0 == /dev/video0, 1 == /dev/video1, ..., -1 ==
   first free)
int warn_if_nr_in_use  warn if the desired device node number was already in use and an-
   other number was chosen instead.
struct module *owner  module that owns the video device node

Description
The registration code assigns minor numbers and device node numbers based on the requested
   type and registers the new device node with the kernel.
This function assumes that struct video_device was zeroed when it was allocated and does not contain any stale date.
An error is returned if no free minor or device node number could be found, or if the registration of the device node failed.

Returns 0 on success.

**Note:** This function is meant to be used only inside the V4L2 core. Drivers should use `video_register_device()` or `video_register_device_no_warn()`.

```c
int video_register_device(struct video_device *vdev, enum vfl_devnode_type type, int nr)
```

**Parameters**

- `struct video_device *vdev`: `struct video_device` to register
- `enum vfl_devnode_type type`: type of device to register, as defined by `enum vfl_devnode_type`
- `int nr`: which device node number is desired: (0 == /dev/video0, 1 == /dev/video1, ..., -1 == first free)

**Description**

Internally, it calls `__video_register_device()`. Please see its documentation for more details.

**Note:** if `video_register_device` fails, the release() callback of `struct video_device` structure is not called, so the caller is responsible for freeing any data. Usually that means that you `video_device_release()` should be called on failure.

```c
int video_register_device_no_warn(struct video_device *vdev, enum vfl_devnode_type type, int nr)
```

**Parameters**

- `struct video_device *vdev`: `struct video_device` to register
- `enum vfl_devnode_type type`: type of device to register, as defined by `enum vfl_devnode_type`
- `int nr`: which device node number is desired: (0 == /dev/video0, 1 == /dev/video1, ..., -1 == first free)

**Description**

This function is identical to `video_register_device()` except that no warning is issued if the desired device node number was already in use.

Internally, it calls `__video_register_device()`. Please see its documentation for more details.

**Note:** if `video_register_device` fails, the release() callback of `struct video_device` structure is not called, so the caller is responsible for freeing any data. Usually that means that you `video_device_release()` should be called on failure.

### 2.2. Video4Linux devices
void video_unregister_device(struct video_device *vdev)
    Unregister video devices.

Parameters
struct video_device *vdev struct video_device to register

Description
Does nothing if vdev == NULL or if video_is_registered() returns false.

struct video_device *video_device_alloc(void)
    helper function to alloc struct video_device

Parameters
void no arguments

Description
Returns NULL if -ENOMEM or a struct video_device on success.

void video_device_release(struct video_device *vdev)
    helper function to release struct video_device

Parameters
struct video_device *vdev pointer to struct video_device

Description
Can also be used for video_device->release().

void video_device_release_empty(struct video_device *vdev)
    helper function to implement the video_device->release() callback.

Parameters
struct video_device *vdev pointer to struct video_device

Description
This release function does nothing.
It should be used when the video_device is a static global struct.

Note: Having a static video_device is a dubious construction at best.

void v4l2_disable_ioctl(struct video_device *vdev, unsigned int cmd)
    mark that a given command isn’t implemented. shouldn’t use core locking

Parameters
struct video_device *vdev pointer to struct video_device
unsigned int cmd ioctl command

Description
This function allows drivers to provide just one v4l2_ioctl_ops struct, but disable ioctls based on the specific card that is actually found.
Note: This must be called before video_register_device. See also the comments for determine_valid_ioctl().

```c
void *video_get_drvdata(struct video_device *vdev)
    gets private data from struct video_device.

Parameters
struct video_device *vdev pointer to struct video_device

Description
returns a pointer to the private data

void video_set_drvdata(struct video_device *vdev, void *data)
    sets private data from struct video_device.

Parameters
struct video_device *vdev pointer to struct video_device
void *data private data pointer

struct video_device *video_devdata(struct file *file)
    gets struct video_device from struct file.

Parameters
struct file *file pointer to struct file

void *video_drvdata(struct file *file)
    gets private data from struct video_device using the struct file.

Parameters
struct file *file pointer to struct file

const char *video_device_node_name(struct video_device *vdev)
    returns the video device name

Parameters
struct video_device *vdev pointer to struct video_device

Description
Returns the device name string

int video_is_registered(struct video_device *vdev)
    returns true if the struct video_device is registered.

Parameters
struct video_device *vdev pointer to struct video_device

Description

2.2. Video4Linux devices

251
2.2.5 V4L2 device instance

Each device instance is represented by a `struct v4l2_device`. Very simple devices can just allocate this struct, but most of the time you would embed this struct inside a larger struct.

You must register the device instance by calling:

```c
v4l2_device_register (dev, v4l2_dev);
```

Registration will initialize the `v4l2_device` struct. If the dev->driver_data field is NULL, it will be linked to `v4l2_dev` argument.

Drivers that want integration with the media device framework need to set dev->driver_data manually to point to the driver-specific device structure that embed the `struct v4l2_device` instance. This is achieved by a `dev_set_drvdata()` call before registering the V4L2 device instance. They must also set the `struct v4l2_device` mdev field to point to a properly initialized and registered `media_device` instance.

If `v4l2_dev`->name is empty then it will be set to a value derived from dev (driver name followed by the bus id, to be precise). If you set it up before calling `v4l2_device_register()` then it will be untouched. If dev is NULL, then you must setup `v4l2_dev`->name before calling `v4l2_device_register()`.

You can use `v4l2_device_set_name()` to set the name based on a driver name and a driver-global atomic_t instance. This will generate names like ivtv0, ivtv1, etc. If the name ends with a digit, then it will insert a dash: cx18-0, cx18-1, etc. This function returns the instance number.

The first dev argument is normally the struct device pointer of a pci_dev, usb_interface or platform_device. It is rare for dev to be NULL, but it happens with ISA devices or when one device creates multiple PCI devices, thus making it impossible to associate `v4l2_dev` with a particular parent.

You can also supply a notify() callback that can be called by sub-devices to notify you of events. Whether you need to set this depends on the sub-device. Any notifications a sub-device supports must be defined in a header in include/media/subdevice.h.

V4L2 devices are unregistered by calling:

```c
v4l2_device_unregister (v4l2_dev);
```

If the dev->driver_data field points to `v4l2_dev`, it will be reset to NULL. Unregistering will also automatically unregister all subdevs from the device.

If you have a hotpluggable device (e.g. a USB device), then when a disconnect happens the parent device becomes invalid. Since `v4l2_device` has a pointer to that parent device it has to be cleared as well to mark that the parent is gone. To do this call:

```c
v4l2_device_disconnect (v4l2_dev);
```

This does not unregister the subdevs, so you still need to call the `v4l2_device_unregister()` function for that. If your driver is not hotpluggable, then there is no need to call `v4l2_device_disconnect()`.

Sometimes you need to iterate over all devices registered by a specific driver. This is usually the case if multiple device drivers use the same hardware. E.g. the ivtvfb driver is a framebuffer driver that uses the ivtv hardware. The same is true for alsad drivers for example.

You can iterate over all registered devices as follows:
static int callback(struct device *dev, void *p)
{
    struct v4l2_device *v4l2_dev = dev_get_drvdata(dev);

    /* test if this device was inited */
    if (v4l2_dev == NULL)
        return 0;

    ...

    return 0;
}

int iterate(void *p)
{
    struct device_driver *drv;
    int err;

    /* Find driver 'ivtv' on the PCI bus.
    pci_bus_type is a global. For USB buses use usb_bus_type. */
    drv = driver_find("ivtv", &pci_bus_type);
    /* iterate over all ivtv device instances */
    err = driver_for_each_device(drv, NULL, p, callback);
    put_driver(drv);

    return err;
}

Sometimes you need to keep a running counter of the device instance. This is commonly used to map a device instance to an index of a module option array.

The recommended approach is as follows:

static atomic_t drv_instance = ATOMIC_INIT(0);

static int drv_probe(struct pci_dev *pdev, const struct pci_device_id *pci_id)
{
    ...
    state->instance = atomic_inc_return(&drv_instance) - 1;
}

If you have multiple device nodes then it can be difficult to know when it is safe to unregister v4l2_device for hotpluggable devices. For this purpose v4l2_device has refcounting support. The refcount is increased whenever video_register_device() is called and it is decreased whenever that device node is released. When the refcount reaches zero, then the v4l2_device release() callback is called. You can do your final cleanup there.

If other device nodes (e.g. ALSA) are created, then you can increase and decrease the refcount manually as well by calling:

    v4l2_device_get() (v4l2_dev).

or:

    v4l2_device_put() (v4l2_dev).

Since the initial refcount is 1 you also need to call v4l2_device_put() in the disconnect() callback (for USB devices) or in the remove() callback (for e.g. PCI devices), otherwise the refcount will never reach 0.

2.2. Video4Linux devices

253
2.2.5.1 v4l2_device functions and data structures

struct v4l2_device
  main struct to for V4L2 device drivers

Definition

```c
struct v4l2_device {
  struct device *dev;
  struct media_device *mdev;
  struct list_head subdevs;
  spinlock_t lock;
  char name[V4L2_DEVICE_NAME_SIZE];
  void (*notify)(struct v4l2_subdev *sd, unsigned int notification, void *arg);
  struct v4l2_ctrl_handler *ctrl_handler;
  struct v4l2_prio_state prio;
  struct kref ref;
  void (*release)(struct v4l2_device *v4l2_dev);
};
```

Members

dev pointer to struct device.

mdev pointer to struct media_device, may be NULL.

subdevs used to keep track of the registered subdevs

lock lock this struct; can be used by the driver as well if this struct is embedded into a larger struct.

name unique device name, by default the driver name + bus ID

notify notify operation called by some sub-devices.

ctrl_handler The control handler. May be NULL.

prio Device’s priority state

ref Keep track of the references to this struct.

release Release function that is called when the ref count goes to 0.

Description

Each instance of a V4L2 device should create the v4l2_device struct, either stand-alone or embedded in a larger struct.

It allows easy access to sub-devices (see v4l2-subdev.h) and provides basic V4L2 device-level support.

Note:

1) dev->driver_data points to this struct.

2) dev might be NULL if there is no parent device

void v4l2_device_get(struct v4l2_device *v4l2_dev)
  gets a V4L2 device reference
Parameters

\texttt{struct v4l2\_device *v4l2\_dev} pointer to \texttt{v4l2\_device}

Description

This is an ancillary routine meant to increment the usage for the struct \texttt{v4l2\_device} pointed by \texttt{v4l2\_dev}.

\texttt{int v4l2\_device\_put(struct v4l2\_device *v4l2\_dev)}

puts a V4L2 device reference

Parameters

\texttt{struct v4l2\_device *v4l2\_dev} pointer to \texttt{v4l2\_device}

Description

This is an ancillary routine meant to decrement the usage for the struct \texttt{v4l2\_device} pointed by \texttt{v4l2\_dev}.

\texttt{int v4l2\_device\_register(struct device *dev, struct v4l2\_device *v4l2\_dev)}

Initialize \texttt{v4l2\_dev} and make \texttt{dev->driver\_data} point to \texttt{v4l2\_dev}.

Parameters

\texttt{struct device *dev} pointer to \texttt{device}

\texttt{struct v4l2\_device *v4l2\_dev} pointer to \texttt{v4l2\_device}

Description

\textbf{Note:} \texttt{dev} may be NULL in rare cases (ISA devices). In such case the caller must fill in the \texttt{v4l2\_dev->name} field before calling this function.

\texttt{int v4l2\_device\_set\_name(struct v4l2\_device *v4l2\_dev, const char *basename, atomic\_t *instance)}

Optional function to initialize the name field of struct \texttt{v4l2\_device}

Parameters

\texttt{struct v4l2\_device *v4l2\_dev} pointer to \texttt{v4l2\_device}

\texttt{const char *basename} base name for the device name

\texttt{atomic\_t *instance} pointer to a static atomic\_t var with the instance usage for the device driver.

Description

\texttt{v4l2\_device\_set\_name()} initializes the name field of struct \texttt{v4l2\_device} using the driver name and a driver-global atomic\_t instance.

This function will increment the instance counter and returns the instance value used in the name.

The first time this is called the name field will be set to foo0 and this function returns 0. If the name ends with a digit (e.g. cx18), then the name will be set to cx18-0 since cx180 would look really odd.

Example
static atomic_t drv_instance = ATOMIC_INIT(0);
...
instance = v4l2_device_set_name(&v4l2_dev, "foo", &drv_instance);

void v4l2_device_disconnect(struct v4l2_device *v4l2_dev)
    Change V4L2 device state to disconnected.

**Parameters**

**struct v4l2_device *v4l2_dev** pointer to **struct v4l2_device**

**Description**

Should be called when the USB parent disconnects. Since the parent disappears, this ensures that **v4l2_dev** doesn’t have an invalid parent pointer.

**Note:** This function sets **v4l2_dev->dev** to NULL.

void v4l2_device_unregister(struct v4l2_device *v4l2_dev)
    Unregister all sub-devices and any other resources related to **v4l2_dev**.

**Parameters**

**struct v4l2_device *v4l2_dev** pointer to **struct v4l2_device**

int v4l2_device_register_subdev(struct v4l2_device *v4l2_dev, struct v4l2_subdev *sd)
    Registers a subdev with a v4l2 device.

**Parameters**

**struct v4l2_device *v4l2_dev** pointer to **struct v4l2_device**

**struct v4l2_subdev *sd** pointer to **struct v4l2_subdev**

**Description**

While registered, the subdev module is marked as in-use.

An error is returned if the module is no longer loaded on any attempts to register it.

void v4l2_device_unregister_subdev(struct v4l2_subdev *sd)
    Unregisters a subdev with a v4l2 device.

**Parameters**

**struct v4l2_subdev *sd** pointer to **struct v4l2_subdev**

**Description**

**Note:** Can also be called if the subdev wasn’t registered. In such case, it will do nothing.

int __v4l2_device_register_subdev_nodes(struct v4l2_device *v4l2_dev, bool read_only)
    Registers device nodes for all subdevs of the v4l2 device that are marked with the V4L2_SUBDEV_FL_HAS_DEVNODE flag.

**Parameters**
struct v4l2_device *v4l2_dev pointer to struct v4l2_device

bool read_only subdevices read-only flag. True to register the subdevices device nodes in read-only mode, false to allow full access to the subdevice userspace API.

int v4l2_device_register_subdev_nodes(struct v4l2_device *v4l2_dev)
Registers subdevices device nodes with unrestricted access to the subdevice userspace operations

Parameters

struct v4l2_device *v4l2_dev pointer to struct v4l2_device

Description

Internally calls __v4l2_device_register_subdev_nodes(). See its documentation for more details.

int v4l2_device_register_ro_subdev_nodes(struct v4l2_device *v4l2_dev)
Registers subdevices device nodes in read-only mode

Parameters

struct v4l2_device *v4l2_dev pointer to struct v4l2_device

Description

Internally calls __v4l2_device_register_subdev_nodes(). See its documentation for more details.

void v4l2_subdev_notify(struct v4l2_subdev *sd, unsigned int notification, void *arg)
Sends a notification to v4l2_device.

Parameters

struct v4l2_subdev *sd pointer to struct v4l2_subdev
unsigned int notification type of notification. Please notice that the notification type is driver-specific.
void *arg arguments for the notification. Those are specific to each notification type.

bool v4l2_device_supports_requests(struct v4l2_device *v4l2_dev)
Test if requests are supported.

Parameters

struct v4l2_device *v4l2_dev pointer to struct v4l2_device

v4l2_device_for_each_subdev(sd, v4l2_dev)
Helper macro that iterates overall sub-devices of a given v4l2_device.

Parameters

sd pointer that will be filled by the macro with all struct v4l2_subdev pointer used as an iterator by the loop.

v4l2_dev struct v4l2_device owning the sub-devices to iterate over.

Description

This macro iterates over all sub-devices owned by the v4l2_dev device. It acts as a for loop iterator and executes the next statement with the sd variable pointing to each sub-device in turn.

2.2. Video4Linux devices
__v4l2_device_call_subdevs_p(v4l2_dev, sd, cond, o, f, args...)

Calls the specified operation for all subdevs matching the condition.

Parameters

v4l2_dev struct v4l2_device owning the sub-devices to iterate over.

sd pointer that will be filled by the macro with all struct v4l2_subdev pointer used as an iterator by the loop.

cond condition to be match

o name of the element at struct v4l2_subdev_ops that contains f. Each element there groups a set of operations functions.

f operation function that will be called if cond matches. The operation functions are defined in groups, according to each element at struct v4l2_subdev_ops.

args... arguments for f.

Description

Ignore any errors.

Note

subdevs cannot be added or deleted while walking the subdevs list.

__v4l2_device_call_subdevs(v4l2_dev, cond, o, f, args...)

Calls the specified operation for all subdevs matching the condition.

Parameters

v4l2_dev struct v4l2_device owning the sub-devices to iterate over.

cond condition to be match

o name of the element at struct v4l2_subdev_ops that contains f. Each element there groups a set of operations functions.

f operation function that will be called if cond matches. The operation functions are defined in groups, according to each element at struct v4l2_subdev_ops.

args... arguments for f.

Description

Ignore any errors.

Note

subdevs cannot be added or deleted while walking the subdevs list.

__v4l2_device_call_subdevs_until_err_p(v4l2_dev, sd, cond, o, f, args...)

Calls the specified operation for all subdevs matching the condition.

Parameters

v4l2_dev struct v4l2_device owning the sub-devices to iterate over.

sd pointer that will be filled by the macro with all struct v4l2_subdev sub-devices associated with v4l2_dev.

cond condition to be match
o name of the element at \texttt{struct v4l2_subdev_ops} that contains \texttt{f}. Each element there groups a set of operations functions.

\texttt{f} operation function that will be called if \texttt{cond} matches. The operation functions are defined in groups, according to each element at \texttt{struct v4l2_subdev_ops}.

\texttt{args...} arguments for \texttt{f}.

\textbf{Return}

\textbf{Description}

If the operation returns an error other than 0 or -ENOIOCTLCMD for any subdevice, then abort and return with that error code, zero otherwise.

\textbf{Note}

subdevs cannot be added or deleted while walking the subdevs list.

\texttt{__v4l2_device_call_subdevs_until_err(v4l2_dev, cond, o, f, args...)}

Calls the specified operation for all subdevs matching the condition.

\textbf{Parameters}

\texttt{v4l2_dev struct v4l2_device} owning the sub-devices to iterate over.

\texttt{cond} condition to be match

\texttt{o name of the element at struct v4l2_subdev_ops} that contains \texttt{f}. Each element there groups a set of operations functions.

\texttt{f} operation function that will be called if \texttt{cond} matches. The operation functions are defined in groups, according to each element at \texttt{struct v4l2_subdev_ops}.

\texttt{args...} arguments for \texttt{f}.

\textbf{Return}

\textbf{Description}

If the operation returns an error other than 0 or -ENOIOCTLCMD for any subdevice, then abort and return with that error code, zero otherwise.

\textbf{Note}

subdevs cannot be added or deleted while walking the subdevs list.

\texttt{v4l2_device_call_all(v4l2_dev, grpid, o, f, args...)}

Calls the specified operation for all subdevs matching the \texttt{v4l2_subdev.grp_id}, as assigned by the bridge driver.

\textbf{Parameters}

\texttt{v4l2_dev struct v4l2_device} owning the sub-devices to iterate over.

\texttt{grpid struct v4l2_subdev->grp_id} group ID to match. Use 0 to match them all.

\texttt{o name of the element at struct v4l2_subdev_ops} that contains \texttt{f}. Each element there groups a set of operations functions.

\texttt{f} operation function that will be called if \texttt{cond} matches. The operation functions are defined in groups, according to each element at \texttt{struct v4l2_subdev_ops}.

\texttt{args...} arguments for \texttt{f}.
Description
Ignore any errors.

Note
subdevs cannot be added or deleted while walking the subdevs list.

`v4l2_device_call_until_err(v4l2_dev, grpid, o, f, args...)`
Calls the specified operation for all subdevs matching the `v4l2_subdev.grp_id`, as assigned by the bridge driver, until an error occurs.

Parameters
- `v4l2_dev` *struct v4l2_device* owning the sub-devices to iterate over.
- `grpid` *struct v4l2_subdev->grp_id* group ID to match. Use 0 to match them all.
- `o` name of the element at *struct v4l2_subdev_ops* that contains `f`. Each element there groups a set of operations functions.
- `f` operation function that will be called if `cond` matches. The operation functions are defined in groups, according to each element at `struct v4l2_subdev_ops`.
- `args...` arguments for `f`.

Return
Description
If the operation returns an error other than 0 or -ENOIOCTLCMD for any subdevice, then abort and return with that error code, zero otherwise.

Note
subdevs cannot be added or deleted while walking the subdevs list.

`v4l2_device_mask_call_all(v4l2_dev, grpmsk, o, f, args...)`
Calls the specified operation for all subdevices where a group ID matches a specified bitmask.

Parameters
- `v4l2_dev` *struct v4l2_device* owning the sub-devices to iterate over.
- `grpmsk` bitmask to be checked against `struct v4l2_subdev->grp_id` group ID to be matched. Use 0 to match them all.
- `o` name of the element at *struct v4l2_subdev_ops* that contains `f`. Each element there groups a set of operations functions.
- `f` operation function that will be called if `cond` matches. The operation functions are defined in groups, according to each element at `struct v4l2_subdev_ops`.
- `args...` arguments for `f`.

Description
Ignore any errors.

Note
subdevs cannot be added or deleted while walking the subdevs list.
v4l2_device_mask_call_until_err(v4l2_dev, grpmsk, o, f, args...)

Calls the specified operation for all subdevices where a group ID matches a specified bitmask.

Parameters

v4l2_dev struct v4l2_device owning the sub-devices to iterate over.

grpmsk bitmask to be checked against struct v4l2_subdev->grp_id group ID to be matched. Use 0 to match them all.

o name of the element at struct v4l2_subdev_ops that contains f. Each element there groups a set of operations functions.

f operation function that will be called if cond matches. The operation functions are defined in groups, according to each element at struct v4l2_subdev_ops.

args... arguments for f.

Return

Description

If the operation returns an error other than 0 or -ENOIOCTL_CMD for any subdevice, then abort and return with that error code, zero otherwise.

Note

subdevs cannot be added or deleted while walking the subdevs list.

v4l2_device_has_op(v4l2_dev, grpid, o, f)

checks if any subdev with matching grpid has a given ops.

Parameters

v4l2_dev struct v4l2_device owning the sub-devices to iterate over.

grpid struct v4l2_subdev->grp_id group ID to match. Use 0 to match them all.

o name of the element at struct v4l2_subdev_ops that contains f. Each element there groups a set of operations functions.

f operation function that will be called if cond matches. The operation functions are defined in groups, according to each element at struct v4l2_subdev_ops.

v4l2_device_mask_has_op(v4l2_dev, grpmsk, o, f)

checks if any subdev with matching group mask has a given ops.

Parameters

v4l2_dev struct v4l2_device owning the sub-devices to iterate over.

grpmsk bitmask to be checked against struct v4l2_subdev->grp_id group ID to be matched. Use 0 to match them all.

o name of the element at struct v4l2_subdev_ops that contains f. Each element there groups a set of operations functions.

f operation function that will be called if cond matches. The operation functions are defined in groups, according to each element at struct v4l2_subdev_ops.
2.2.6 V4L2 File handlers

`struct v4l2_fh` provides a way to easily keep file handle specific data that is used by the V4L2 framework.

**Attention:** New drivers must use `struct v4l2_fh` since it is also used to implement priority handling (`ioctl VIDIOC_G_PRIORITY, VIDIOC_S_PRIORITY`).

The users of `v4l2_fh` (in the V4L2 framework, not the driver) know whether a driver uses `v4l2_fh` as its `file->private_data` pointer by testing the `V4L2_FL_USES_V4L2_FH` bit in `video_device->flags`. This bit is set whenever `v4l2_fh_init()` is called.

`struct v4l2_fh` is allocated as a part of the driver's own file handle structure and `file->private_data` is set to it in the driver's `open()` function by the driver.

In many cases the `struct v4l2_fh` will be embedded in a larger structure. In that case you should call:

1) `v4l2_fh_init()` and `v4l2_fh_add()` in `open()`
2) `v4l2_fh_del()` and `v4l2_fh_exit()` in `release()`

Drivers can extract their own file handle structure by using the `container_of` macro.

Example:

```c
struct my_fh {
    int blah;
    struct v4l2_fh fh;
};
...

int my_open(struct file *file) {
    struct my_fh *my_fh;
    struct video_device *vfd;
    int ret;
    ...
    my_fh = kzalloc(sizeof(*my_fh), GFP_KERNEL);
    ...
    v4l2_fh_init(&my_fh->fh, vfd);
    ...
    file->private_data = &my_fh->fh;
    v4l2_fh_add(&my_fh->fh);
    return 0;
}

int my_release(struct file *file) {
```
Below is a short description of the `v4l2_fh` functions used:

**v4l2_fh_init** (*fh, vdev*)
- Initialise the file handle. This **MUST** be performed in the driver's `v4l2_file_operations->open()` handler.

**v4l2_fh_add** (*fh*)
- Add a `v4l2_fh` to `video_device` file handle list. Must be called once the file handle is completely initialized.

**v4l2_fh_del** (*fh*)
- Unassociate the file handle from `video_device`. The file handle exit function may now be called.

**v4l2_fh_exit** (*fh*)
- Uninitialise the file handle. After uninitialisation the `v4l2_fh` memory can be freed.

If `struct v4l2_fh` is not embedded, then you can use these helper functions:

**v4l2_fh_open** (struct file *filp)
- This allocates a `struct v4l2_fh`, initializes it and adds it to the `struct video_device` associated with the file struct.

**v4l2_fh_release** (struct file *filp)
- This deletes it from the `struct video_device` associated with the file struct, uninitialised the `v4l2_fh` and frees it.

These two functions can be plugged into the `v4l2_file_operation`'s `open()` and `release()` ops. Several drivers need to do something when the first file handle is opened and when the last file handle closes. Two helper functions were added to check whether the `v4l2_fh` struct is the only open filehandle of the associated device node:

**v4l2_fh_is_singular** (*fh*)
- Returns 1 if the file handle is the only open file handle, else 0.

**v4l2_fh_is_singular_file** (struct file *filp)
- Same, but it calls `v4l2_fh_is_singular` with `filp->private_data`. 

```c
struct v4l2_fh *fh = file->private_data;
struct my_fh *my_fh = container_of(fh, struct my_fh, fh);
...
v4l2_fh_del(&my_fh->fh);
v4l2_fh_exit(&my_fh->fh);
kfree(my_fh);
return 0;
}
2.2.6.1 V4L2 fh functions and data structures

struct v4l2_fh
    Describes a V4L2 file handler

Definition

```
struct v4l2_fh {
    struct list_head    list;
    struct video_device *vdev;
    struct v4l2_ctrl_handler *ctrl_handler;
    enum v4l2_priority   prio;
    wait_queue_head_t   wait;
    struct mutex        subscribe_lock;
    struct list_head    subscribed;
    struct list_head    available;
    unsigned int        navailable;
    u32 sequence;
    struct v4l2_m2m_ctx *m2m_ctx;
};
```

Members

list list of file handlers

vdev pointer to `struct video_device`

ctrl_handler pointer to `struct v4l2_ctrl_handler`

prio priority of the file handler, as defined by `enum v4l2_priority`

wait event’s wait queue

subscribe_lock serialise changes to the subscribed list; guarantee that the add and del event callbacks are orderly called

subscribed list of subscribed events

available list of events waiting to be dequeued

navailable number of available events at `available` list

sequence event sequence number

m2m_ctx pointer to `struct v4l2_m2m_ctx`

void v4l2_fh_init(struct v4l2_fh *fh, struct video_device *vdev)
    Initialise the file handle.

Parameters

struct v4l2_fh *fh pointer to `struct v4l2_fh`

struct video_device *vdev pointer to `struct video_device`

Description

Parts of the V4L2 framework using the file handles should be initialised in this function. Must be called from driver’s `v4l2_file_operations->open()` handler if the driver uses `struct v4l2_fh`. 
void v4l2_fh_add(struct v4l2_fh *fh)
    Add the fh to the list of file handles on a video_device.

Parameters
struct v4l2_fh *fh pointer to struct v4l2_fh

Description

Note: The fh file handle must be initialised first.

int v4l2_fh_open(struct file *filp)
    Ancillary routine that can be used as the open() op of v4l2_file_operations.

Parameters
struct file *filp pointer to struct file

Description
It allocates a v4l2_fh and inits and adds it to the struct video_device associated with the file pointer.

void v4l2_fh_del(struct v4l2_fh *fh)
    Remove file handle from the list of file handles.

Parameters
struct v4l2_fh *fh pointer to struct v4l2_fh

Description
On error filp->private_data will be NULL, otherwise it will point to the struct v4l2_fh.

Note: Must be called in v4l2_file_operations->release() handler if the driver uses struct v4l2_fh.

void v4l2_fh_exit(struct v4l2_fh *fh)
    Release resources related to a file handle.

Parameters
struct v4l2_fh *fh pointer to struct v4l2_fh

Description
Parts of the V4L2 framework using the v4l2_fh must release their resources here, too.

Note: Must be called in v4l2_file_operations->release() handler if the driver uses struct v4l2_fh.

int v4l2_fh_release(struct file *filp)
    Ancillary routine that can be used as the release() op of v4l2_file_operations.

Parameters
struct file *filp pointer to struct file

2.2. Video4Linux devices
Description
It deletes and exits the v4l2_fh associated with the file pointer and frees it. It will do nothing if filp->private_data (the pointer to the v4l2_fh struct) is NULL.

This function always returns 0.

```c
int v4l2_fh_is_singular(struct v4l2_fh *fh)
```

Returns 1 if this filehandle is the only filehandle opened for the associated video_device.

Parameters
struct v4l2_fh *fh  pointer to struct v4l2_fh

Description
If fh is NULL, then it returns 0.

```c
int v4l2_fh_is_singular_file(struct file *filp)
```

Returns 1 if this filehandle is the only filehandle opened for the associated video_device.

Parameters
struct file *filp  pointer to struct file

Description
This is a helper function variant of v4l2_fh_is_singular() with uses struct file as argument. If filp->private_data is NULL, then it will return 0.

2.2.7 V4L2 sub-devices

Many drivers need to communicate with sub-devices. These devices can do all sort of tasks, but most commonly they handle audio and/or video muxing, encoding or decoding. For webcams common sub-devices are sensors and camera controllers.

Usually these are I2C devices, but not necessarily. In order to provide the driver with a consistent interface to these sub-devices the v4l2_subdev struct (v4l2-subdev.h) was created.

Each sub-device driver must have a v4l2_subdev struct. This struct can be stand-alone for simple sub-devices or it might be embedded in a larger struct if more state information needs to be stored. Usually there is a low-level device struct (e.g. i2c_client) that contains the device data as setup by the kernel. It is recommended to store that pointer in the private data of v4l2_subdev using v4l2_set_subdevdata(). That makes it easy to go from a v4l2_subdev to the actual low-level bus-specific device data.

You also need a way to go from the low-level struct to v4l2_subdev. For the common i2c_client struct the i2c_set_clientdata() call is used to store a v4l2_subdev pointer, for other buses you may have to use other methods.

Bridges might also need to store per-subdev private data, such as a pointer to bridge-specific per-subdev private data. The v4l2_subdev structure provides host private data for that purpose that can be accessed with v4l2_get_subdev_hostdata() and v4l2_set_subdev_hostdata().

From the bridge driver perspective, you load the sub-device module and somehow obtain the v4l2_subdev pointer. For i2c devices this is easy: you call i2c_get_clientdata(). For other buses something similar needs to be done. Helper functions exist for sub-devices on an I2C bus that do most of this tricky work for you.
Each `v4l2_subdev` contains function pointers that sub-device drivers can implement (or leave NULL if it is not applicable). Since sub-devices can do so many different things and you do not want to end up with a huge ops struct of which only a handful of ops are commonly implemented, the function pointers are sorted according to category and each category has its own ops struct.

The top-level ops struct contains pointers to the category ops structs, which may be NULL if the subdev driver does not support anything from that category.

It looks like this:

```c
struct v4l2_subdev_core_ops {
    int (*log_status)(struct v4l2_subdev *sd);
    int (*init)(struct v4l2_subdev *sd, u32 val);
    ...
};

struct v4l2_subdev_tuner_ops {
    ...
};

struct v4l2_subdev_audio_ops {
    ...
};

struct v4l2_subdev_video_ops {
    ...
};

struct v4l2_subdev_pad_ops {
    ...
};

struct v4l2_subdev_ops {
    const struct v4l2_subdev_core_ops  *core;
    const struct v4l2_subdev_tuner_ops  *tuner;
    const struct v4l2_subdev_audio_ops  *audio;
    const struct v4l2_subdev_video_ops  *video;
    const struct v4l2_subdev_pad_ops    *video;
};
```

The core ops are common to all subdevs, the other categories are implemented depending on the sub-device. E.g. a video device is unlikely to support the audio ops and vice versa.

This setup limits the number of function pointers while still making it easy to add new ops and categories.

A sub-device driver initializes the `v4l2_subdev` struct using:

```c
v4l2_subdev_init(sd, &ops).
```

Afterwards you need to initialize `sd`->name with a unique name and set the module owner. This is done for you if you use the i2c helper functions.

If integration with the media framework is needed, you must initialize the `media_entity` struct embedded in the `v4l2_subdev` struct (entity field) by calling `media_entity_pads_init()`, if the entity has pads:

```c
struct media_pad  *pads = &my_sd->pads;
int err;
```
The pads array must have been previously initialized. There is no need to manually set the `struct media_entity` function and name fields, but the revision field must be initialized if needed.

A reference to the entity will be automatically acquired/released when the subdev device node (if any) is opened/closed.

Don’t forget to cleanup the media entity before the sub-device is destroyed:

```c
media_entity_cleanup(&sd->entity);
```

If a sub-device driver implements sink pads, the subdev driver may set the `link_validate` field in `v4l2_subdev_pad_ops` to provide its own link validation function. For every link in the pipeline, the `link_validate` pad operation of the sink end of the link is called. In both cases the driver is still responsible for validating the correctness of the format configuration between sub-devices and video nodes.

If `link_validate` op is not set, the default function `v4l2_subdev_link_validate_default()` is used instead. This function ensures that width, height and the media bus pixel code are equal on both source and sink of the link. Subdev drivers are also free to use this function to perform the checks mentioned above in addition to their own checks.

### 2.2.7.1 Subdev registration

There are currently two ways to register subdevices with the V4L2 core. The first (traditional) possibility is to have subdevices registered by bridge drivers. This can be done when the bridge driver has the complete information about subdevices connected to it and knows exactly when to register them. This is typically the case for internal subdevices, like video data processing units within SoCs or complex PCI(e) boards, camera sensors in USB cameras or connected to SoCs, which pass information about them to bridge drivers, usually in their platform data.

There are however also situations where subdevices have to be registered asynchronously to bridge devices. An example of such a configuration is a Device Tree based system where information about subdevices is made available to the system independently from the bridge devices, e.g. when subdevices are defined in DT as I2C device nodes. The API used in this second case is described further below.

Using one or the other registration method only affects the probing process, the run-time bridge-subdevice interaction is in both cases the same.

In the **synchronous** case a device (bridge) driver needs to register the `v4l2_subdev` with the `v4l2_device`:

```c
v4l2_device_register_subdev(v4l2_dev, sd).
```

This can fail if the subdev module disappeared before it could be registered. After this function was called successfully the subdev->dev field points to the `v4l2_device`.

If the `v4l2_device` parent device has a non-NULL mdev field, the sub-device entity will be automatically registered with the media device.

You can unregister a sub-device using:
Afterwards the subdev module can be unloaded and \texttt{sd->dev == NULL}.

In the \textbf{asynchronous} case subdevice probing can be invoked independently of the bridge driver availability. The subdevice driver then has to verify whether all the requirements for a successful probing are satisfied. This can include a check for a master clock availability. If any of the conditions aren’t satisfied the driver might decide to return \texttt{-EPROBE_DEFER} to request further reprobing attempts. Once all conditions are met the subdevice shall be registered using the \texttt{v4l2_async_register_subdev()} function. Unregistration is performed using the \texttt{v4l2_async_unregister_subdev()} call. Subdevices registered this way are stored in a global list of subdevices, ready to be picked up by bridge drivers.

Bridge drivers in turn have to register a notifier object. This is performed using the \texttt{v4l2_async_notifier_register()} call. To unregister the notifier the driver has to call \texttt{v4l2_asyncNotifier_unregister()}. The former of the two functions takes two arguments: a pointer to \texttt{struct v4l2_device} and a pointer to \texttt{struct v4l2_async_notifier}.

Before registering the notifier, bridge drivers must do two things: first, the notifier must be initialized using the \texttt{v4l2_async_notifier_init()} function. Second, bridge drivers can then begin to form a list of subdevice descriptors that the bridge device needs for its operation. Several functions are available to add subdevice descriptors to a notifier, depending on the type of device and the needs of the driver.\texttt{v4l2_async_notifier_add_fwnode_remote_subdev()} and \texttt{v4l2_async_notifier_add_i2c_subdev()} are for bridge and ISP drivers for registering their async sub-devices with the notifier. \texttt{v4l2_async_register_subdev_sensor()} is a helper function for sensor drivers registering their own async sub-device, but it also registers a notifier and further registers async sub-devices for lens and flash devices found in firmware. The notifier for the sub-device is unregistered with the async sub-device.

These functions allocate an async sub-device descriptor which is of type \texttt{struct v4l2_async_subdev} embedded in a driver-specific struct. The \texttt{&struct v4l2_async_subdev} shall be the first member of this struct:

```c
struct my_async_subdev {
    struct v4l2_async_subdev asd;
    ...
};

struct my_async_subdev *my_asd;
struct fwnode_handle *ep;
...

my_asd = v4l2_async_notifier_add_fwnode_remote_subdev(&notifier, ep, &struct my_async_subdev);
fwnode_handle_put(ep);

if (IS_ERR(asd))
    return PTR_ERR(asd);
```

The V4L2 core will then use these descriptors to match asynchronously registered subdevices to them. If a match is detected the \texttt{.bound()} notifier callback is called. After all subdevices have been located the \texttt{.complete()} callback is called. When a subdevice is removed from the system the \texttt{.unbind()} method is called. All three callbacks are optional.

\section*{2.2. Video4Linux devices}
2.2.7.2 Calling subdev operations

The advantage of using *v4l2_subdev* is that it is a generic struct and does not contain any knowledge about the underlying hardware. So a driver might contain several subdevs that use an I2C bus, but also a subdev that is controlled through GPIO pins. This distinction is only relevant when setting up the device, but once the subdev is registered it is completely transparent.

Once the subdev has been registered you can call an ops function either directly:

```c
err = sd->ops->core->g_std(sd, &norm);
```

but it is better and easier to use this macro:

```c
err = v4l2_subdev_call(sd, core, g_std, &norm);
```

The macro will do the right NULL pointer checks and returns -ENODEV if *sd* is NULL, -ENOIOCTLCMD if either *sd-*->core or *sd-*->core->g_std is NULL, or the actual result of the *sd-*->ops->core->g_std ops.

It is also possible to call all or a subset of the sub-devices:

```c
v4l2_device_call_all(v4l2_dev, 0, core, g_std, &norm);
```

Any subdev that does not support this ops is skipped and error results are ignored. If you want to check for errors use this:

```c
err = v4l2_device_call_until_err(v4l2_dev, 0, core, g_std, &norm);
```

Any error except -ENOIOCTLCMD will exit the loop with that error. If no errors (except -ENOIOCTLCMD) occurred, then 0 is returned.

The second argument to both calls is a group ID. If 0, then all subdevs are called. If non-zero, then only those whose group ID match that value will be called. Before a bridge driver registers a subdev it can set *sd-*->grp_id to whatever value it wants (it’s 0 by default). This value is owned by the bridge driver and the sub-device driver will never modify or use it.

The group ID gives the bridge driver more control how callbacks are called. For example, there may be multiple audio chips on a board, each capable of changing the volume. But usually only one will actually be used when the user want to change the volume. You can set the group ID for that subdev to e.g. AUDIO_CONTROLLER and specify that as the group ID value when calling *v4l2_device_call_all()* . That ensures that it will only go to the subdev that needs it.

If the sub-device needs to notify its v4l2_device parent of an event, then it can call *v4l2_subdev_notify(sd, notification, arg)*. This macro checks whether there is a notify() callback defined and returns -ENODEV if not. Otherwise the result of the notify() call is returned.
2.2.8 V4L2 sub-device userspace API

Bridge drivers traditionally expose one or multiple video nodes to userspace, and control sub-devices through the \texttt{v4l2_subdev_ops} operations in response to video node operations. This hides the complexity of the underlying hardware from applications. For complex devices, finer-grained control of the device than what the video nodes offer may be required. In those cases, bridge drivers that implement the media controller API may opt for making the subdevice operations directly accessible from userspace.

Device nodes named \texttt{v4l-subdevX} can be created in \texttt{/dev} to access sub-devices directly. If a sub-device supports direct userspace configuration it must set the \texttt{V4L2_SUBDEV_FL_HAS_DEVNODE} flag before being registered.

After registering sub-devices, the \texttt{v4l2_device} driver can create device nodes for all registered sub-devices marked with \texttt{V4L2_SUBDEV_FL_HAS_DEVNODE} by calling \texttt{v4l2_device_register_subdev_nodes()}. Those device nodes will be automatically removed when sub-devices are unregistered.

The device node handles a subset of the V4L2 API.

\begin{itemize}
\item \texttt{VIDIOC_QUERYCTRL}, \texttt{VIDIOC_QUERYMENU}, \texttt{VIDIOC_G_CTRL}, \texttt{VIDIOC_S_CTRL}, \texttt{VIDIOC_G_EXT_CTRLS}, \texttt{VIDIOC_S_EXT_CTRLS} and \texttt{VIDIOC_TRY_EXT_CTRLS}:
  \begin{quote}
  The controls ioctls are identical to the ones defined in V4L2. They behave identically, with the only exception that they deal only with controls implemented in the sub-device. Depending on the driver, those controls can be also be accessed through one (or several) V4L2 device nodes.
  \end{quote}
\item \texttt{VIDIOC_DQEVENT}, \texttt{VIDIOC_SUBSCRIBE_EVENT} and \texttt{VIDIOC_UNSUBSCRIBE_EVENT}
  \begin{quote}
  The events ioctls are identical to the ones defined in V4L2. They behave identically, with the only exception that they deal only with events generated by the sub-device. Depending on the driver, those events can also be reported by one (or several) V4L2 device nodes.
  \end{quote}
\item \texttt{V4L2_SUBDEV_FL_HAS_EVENTS}\texttt{v4l2_subdev.flags} before registering the sub-device.
\end{itemize}

Sub-device drivers that want to use events need to set the \texttt{V4L2_SUBDEV_FL_HAS_EVENTS} flag before registering the sub-device. After registration events can be queued as usual on the \texttt{v4l2_subdev.devnode} device node.

To properly support events, the \texttt{poll()} file operation is also implemented.

Private ioctls

All ioctls not in the above list are passed directly to the sub-device driver through the core:::ioctl operation.
2.2.9 Read-only sub-device userspace API

Bridge drivers that control their connected subdevices through direct calls to the kernel API realized by `v4l2_subdev_ops` structure do not usually want userspace to be able to change the same parameters through the subdevice device node and thus do not usually register any.

It is sometimes useful to report to userspace the current subdevice configuration through a read-only API, that does not permit applications to change to the device parameters but allows interfacing to the subdevice device node to inspect them.

For instance, to implement cameras based on computational photography, userspace needs to know the detailed camera sensor configuration (in terms of skipping, binning, cropping and scaling) for each supported output resolution. To support such use cases, bridge drivers may expose the subdevice operations to userspace through a read-only API.

To create a read-only device node for all the subdevices registered with `V4L2_SUBDEV_FL_HAS_DEVNODE` set, the `v4l2_device` driver should call `v4l2_device_register_ro_subdev_nodes()`.

Access to the following ioctls for userspace applications is restricted on sub-device device nodes registered with `v4l2_device_register_ro_subdev_nodes()`.

`VIDIOC_SUBDEV_S_FMT`, `VIDIOC_SUBDEV_S_CROP`, `VIDIOC_SUBDEV_S_SELECTION`:

These ioctls are only allowed on a read-only subdevice device node for the `V4L2_SUBDEV_FORMAT_TRY` formats and selection rectangles.

`VIDIOC_SUBDEV_S_FRAME_INTERVAL`, `VIDIOC_SUBDEV_S_DV_TIMINGS`, `VIDIOC_SUBDEV_S_STD`:

These ioctls are not allowed on a read-only subdevice node.

In case the ioctl is not allowed, or the format to modify is set to V4L2_SUBDEV_FORMAT_ACTIVE, the core returns a negative error code and the errno variable is set to -EPERM.

2.2.10 I2C sub-device drivers

Since these drivers are so common, special helper functions are available to ease the use of these drivers (v4l2-common.h).

The recommended method of adding `v4l2_subdev` support to an I2C driver is to embed the `v4l2_subdev` struct into the state struct that is created for each I2C device instance. Very simple devices have no state struct and in that case you can just create a `v4l2_subdev` directly.

A typical state struct would look like this (where ‘chipname’ is replaced by the name of the chip):

```c
struct chipname_state {
    struct v4l2_subdev sd;
    ... /* additional state fields */
};
```

Initialize the `v4l2_subdev` struct as follows:

```c
v4l2_i2c_subdev_init(&state->sd, client, subdev_ops);
```

This function will fill in all the fields of `v4l2_subdev` ensure that the `v4l2_subdev` and i2c_client both point to one another.
You should also add a helper inline function to go from a v4l2_subdev pointer to a chip-name_state struct:

```c
static inline struct chipname_state *to_state(struct v4l2_subdev *sd)
{
    return container_of(sd, struct chipname_state, sd);
}
```

Use this to go from the v4l2_subdev struct to the i2c_client struct:

```c
struct i2c_client *client = v4l2_get_subdevdata(sd);
```

And this to go from an i2c_client to a v4l2_subdev struct:

```c
struct v4l2_subdev *sd = i2c_get_clientdata(client);
```

Make sure to call v4l2_device_unregister_subdev(sd) when the remove() callback is called. This will unregister the sub-device from the bridge driver. It is safe to call this even if the sub-device was never registered.

You need to do this because when the bridge driver destroys the i2c adapter the remove() callbacks are called of the i2c devices on that adapter. After that the corresponding v4l2_subdev structures are invalid, so they have to be unregistered first. Calling v4l2_device_unregister_subdev(sd) from the remove() callback ensures that this is always done correctly.

The bridge driver also has some helper functions it can use:

```c
struct v4l2_subdev *sd = v4l2_i2c_new_subdev(v4l2_dev, adapter, "module_foo", "chipid", 0x36, NULL);
```

This loads the given module (can be NULL if no module needs to be loaded) and calls i2c_new_client_device with the given i2c_adapter and chip/address arguments. If all goes well, then it registers the subdev with the v4l2_device.

You can also use the last argument of v4l2_i2c_new_subdev() to pass an array of possible I2C addresses that it should probe. These probe addresses are only used if the previous argument is 0. A non-zero argument means that you know the exact i2c address so in that case no probing will take place.

Both functions return NULL if something went wrong.

Note that the chipid you pass to v4l2_i2c_new_subdev() is usually the same as the module name. It allows you to specify a chip variant, e.g. “saa7114” or “saa7115”. In general though the i2c driver autodetects this. The use of chipid is something that needs to be looked at more closely at a later date. It differs between i2c drivers and as such can be confusing. To see which chip variants are supported you can look in the i2c driver code for the i2c_device_id table. This lists all the possibilities.

There are one more helper function:

v4l2_i2c_new_subdev_board() uses an i2c_board_info struct which is passed to the i2c driver and replaces the irq, platform_data and addr arguments.

If the subdev supports the s_config core ops, then that op is called with the irq and platform_data arguments after the subdev was setup.
The `v4l2_i2c_new_subdev()` function will call `v4l2_i2c_new_subdev_board()`, internally filling a `i2c_board_info` structure using the `client_type` and the `addr` to fill it.

### 2.2.11 V4L2 sub-device functions and data structures

**struct v4l2_decode_vbi_line**

used to decode_vbi_line

**Definition**

```c
struct v4l2_decode_vbi_line {
    u32 is_second_field;
    u8 *p;
    u32 line;
    u32 type;
};
```

**Members**

- **is_second_field** Set to 0 for the first (odd) field; set to 1 for the second (even) field.
- **p** Pointer to the sliced VBI data from the decoder. On exit, points to the start of the payload.
- **line** Line number of the sliced VBI data (1-23)
- **type** VBI service type (V4L2_SLICED_*). 0 if no service found

**enum v4l2_subdev_io_pin_bits**

Subdevice external IO pin configuration bits

**Constants**

- **V4L2_SUBDEV_IO_PIN_DISABLE** disables a pin config. ENABLE assumed.
- **V4L2_SUBDEV_IO_PIN_OUTPUT** set it if pin is an output.
- **V4L2_SUBDEV_IO_PIN_INPUT** set it if pin is an input.
- **V4L2_SUBDEV_IO_PIN_SET_VALUE** to set the output value via `struct v4l2_subdev_io_pin_config->value`.
- **V4L2_SUBDEV_IO_PIN_ACTIVE_LOW** pin active is bit 0. Otherwise, ACTIVE HIGH is assumed.

**struct v4l2_subdev_io_pin_config**

Subdevice external IO pin configuration

**Definition**

```c
struct v4l2_subdev_io_pin_config {
    u32 flags;
    u8 pin;
    u8 function;
    u8 value;
    u8 strength;
};
```

**Members**

- **flags** bitmask with flags for this pin’s config, whose bits are defined by `enum v4l2_subdev_io_pin_bits`.

274 Chapter 2. Media subsystem kernel internal API
pin Chip external IO pin to configure

function Internal signal pad/function to route to IO pin

value Initial value for pin - e.g. GPIO output value

strength Pin drive strength

struct v4l2_subdev_core_ops
  Define core ops callbacks for subdevs

Definition

struct v4l2_subdev_core_ops {
  int (*log_status)(struct v4l2_subdev *sd);
  int (*s_io_pin_config)(struct v4l2_subdev *sd, size_t n, struct v4l2_subdev_io_pin_config *pincfg);
  int (*init)(struct v4l2_subdev *sd, u32 val);
  int (*load_fw)(struct v4l2_subdev *sd);
  int (*reset)(struct v4l2_subdev *sd, u32 val);
  int (*s_gpio)(struct v4l2_subdev *sd, u32 val);
  long (*command)(struct v4l2_subdev *sd, unsigned int cmd, void *arg);
  long (*ioctl)(struct v4l2_subdev *sd, unsigned int cmd, void *arg);

  long (*compat_ioctl32)(struct v4l2_subdev *sd, unsigned int cmd, unsigned long arg);
  #endif;
  #ifdef CONFIG_VIDEO_ADV_DEBUG;
  int (*g_register)(struct v4l2_subdev *sd, struct v4l2_dbg_register *reg);
  int (*s_register)(struct v4l2_subdev *sd, const struct v4l2_dbg_register *reg);
  #endif;
  int (*s_power)(struct v4l2_subdev *sd, int on);
  int (*interrupt_service_routine)(struct v4l2_subdev *sd, u32 status, bool *handled);
  int (*subscribe_event)(struct v4l2_subdev *sd, struct v4l2_fh *fh, struct v4l2_event_subscription *sub);
  int (*unsubscribe_event)(struct v4l2_subdev *sd, struct v4l2_fh *fh, struct v4l2_event_subscription *sub);
};

Members

log_status callback for VIDIOC_LOG_STATUS() ioctl handler code.

s_io_pin_config configure one or more chip I/O pins for chips that multiplex different internal signal pads out to IO pins. This function takes a pointer to an array of 'n' pin configuration entries, one for each pin being configured. This function could be called at times other than just subdevice initialization.

init initialize the sensor registers to some sort of reasonable default values. Do not use for new drivers and should be removed in existing drivers.

load_fw load firmware.

reset generic reset command. The argument selects which subsystems to reset. Passing 0 will always reset the whole chip. Do not use for new drivers without discussing this first on the linux-media mailinglist. There should be no reason normally to reset a device.

s_gpio set GPIO pins. Very simple right now, might need to be extended with a direction argument if needed.

2.2. Video4Linux devices
command called by in-kernel drivers in order to call functions internal to subdev drivers driver that have a separate callback.

ioctl called at the end of ioctl() syscall handler at the V4L2 core. used to provide support for private ioctl}s used on the driver.

compat_ioctl32 called when a 32 bits application uses a 64 bits Kernel, in order to fix data passed from/to userspace.

g_register callback for VIDIOC_DBG_G_REGISTER() ioctl handler code.

s_register callback for VIDIOC_DBG_S_REGISTER() ioctl handler code.

s_power puts subdevice in power saving mode (on == 0) or normal operation mode (on == 1).

interrupt_service_routine Called by the bridge chip’s interrupt service handler, when an interrupt status has be raised due to this subdev, so that this subdev can handle the details. It may schedule work to be performed later. It must not sleep. Called from an IRQ context.

subscribe_event used by the drivers to request the control framework that for it to be warned when the value of a control changes.

unsubscribe_event remove event subscription from the control framework.

struct v4l2_subdev_tuner_ops

Callbacks used when v4l device was opened in radio mode.

Definition

```c
struct v4l2_subdev_tuner_ops {
    int (*standby)(struct v4l2_subdev *sd);
    int (*s_radio)(struct v4l2_subdev *sd);
    int (*s_frequency)(struct v4l2_subdev *sd, const struct v4l2_frequency *freq);
    int (*g_frequency)(struct v4l2_subdev *sd, struct v4l2_frequency *freq);
    int (*enum_freq_bands)(struct v4l2_subdev *sd, struct v4l2_frequency_band *band);
    int (*g_tuner)(struct v4l2_subdev *sd, struct v4l2_tuner *vt);
    int (*s_tuner)(struct v4l2_subdev *sd, const struct v4l2_tuner *vt);
    int (*g_modulator)(struct v4l2_subdev *sd, struct v4l2_modulator *vm);
    int (*s_modulator)(struct v4l2_subdev *sd, const struct v4l2_modulator *vm);
    int (*s_type_addr)(struct v4l2_subdev *sd, struct tuner_setup *type);
    int (*s_config)(struct v4l2_subdev *sd, const struct v4l2_priv_tun_config *config);
};
```

Members

standby puts the tuner in standby mode. It will be woken up automatically the next time it is used.

s_radio callback that switches the tuner to radio mode. drivers should explicitly call it when a tuner ops should operate on radio mode, before being able to handle it. Used on devices that have both AM/FM radio receiver and TV.

s_frequency callback for VIDIOC_S_FREQUENCY() ioctl handler code.

g_frequency callback for VIDIOC_G_FREQUENCY() ioctl handler code. freq->type must be filled in. Normally done by video_ioctl2() or the bridge driver.

enum_freq_bands callback for VIDIOC_ENUM_FREQ_BANDS() ioctl handler code.

g_tuner callback for VIDIOC_G_TUNER() ioctl handler code.
s_tuner callback for VIDIOC_S_TUNER() ioctl handler code. vt->type must be filled in. Normally done by video_ioctl2 or the bridge driver.

g_modulator callback for VIDIOC_G_MODULATOR() ioctl handler code.

s_modulator callback for VIDIOC_S_MODULATOR() ioctl handler code.

s_type_addr sets tuner type and its I2C addr.

s_config sets tda9887 specific stuff, like port1, port2 and qss

Description

Note: On devices that have both AM/FM and TV, it is up to the driver to explicitly call s_radio when the tuner should be switched to radio mode, before handling other struct v4l2_subdev_tuner_ops that would require it. An example of such usage is:

```c
static void s_frequency(void *priv, const struct v4l2_frequency *f) {
    ...
    if (f.type == V4L2_TUNER_RADIO)
        v4l2_device_call_all(v4l2_dev, 0, tuner, s_radio);
    ...
    v4l2_device_call_all(v4l2_dev, 0, tuner, s_frequency);
}
```

struct v4l2_subdev_audio_ops

Callbacks used for audio-related settings

Definition

```c
struct v4l2_subdev_audio_ops {
    int (*s_clock_freq)(struct v4l2_subdev *sd, u32 freq);
    int (*s_i2s_clock_freq)(struct v4l2_subdev *sd, u32 freq);
    int (*s_routing)(struct v4l2_subdev *sd, u32 input, u32 output, u32 config);
    int (*s_stream)(struct v4l2_subdev *sd, int enable);
};
```

Members

s_clock_freq set the frequency (in Hz) of the audio clock output. Used to slave an audio processor to the video decoder, ensuring that audio and video remain synchronized. Usual values for the frequency are 48000, 44100 or 32000 Hz. If the frequency is not supported, then -EINVAL is returned.

s_i2s_clock_freq sets I2S speed in bps. This is used to provide a standard way to select I2S clock used by driving digital audio streams at some board designs. Usual values for the frequency are 1024000 and 2048000. If the frequency is not supported, then -EINVAL is returned.

s_routing used to define the input and/or output pins of an audio chip, and any additional configuration data. Never attempt to use user-level input IDs (e.g. Composite, S-Video, Tuner) at this level. An i2c device shouldn’t know about whether an input pin is connected to a Composite connector, become on another board or platform it might be connected to something else entirely. The calling driver is responsible for mapping a user-level input to the right pins on the i2c device.

2.2. Video4Linux devices 277
s_stream used to notify the audio code that stream will start or has stopped.

enum v4l2_mbus_frame_desc_flags
    media bus frame description flags

Constants

V4L2_MBUS_FRAME_DESC_FL_LEN_MAX
    Indicates that struct v4l2_mbus_frame_desc_entry->length field specifies maximum data length.

V4L2_MBUS_FRAME_DESC_FL_BLOB
    Indicates that the format does not have line offsets, i.e. the receiver should use 1D DMA.

struct v4l2_mbus_frame_desc_entry
    media bus frame description structure

Definition

struct v4l2_mbus_frame_desc_entry {
    enum v4l2_mbus_frame_desc_flags flags;
    u32 pixelcode;
    u32 length;
};

Members

flags bitmask flags, as defined by enum v4l2_mbus_frame_desc_flags.

pixelcode media bus pixel code, valid if flags FRAME_DESC_FL_BLOB is not set.

length number of octets per frame, valid if flags V4L2_MBUS_FRAME_DESC_FL_LEN_MAX is set.

struct v4l2_mbus_frame_desc
    media bus data frame description

Definition

struct v4l2_mbus_frame_desc {
    struct v4l2_mbus_frame_desc_entry entry[V4L2_FRAME_DESC_ENTRY_MAX];
    unsigned short num_entries;
};

Members

entry frame descriptors array

num_entries number of entries in entry array

enum v4l2_subdev_pre_streamon_flags
    Flags for pre_streamon subdev core op

Constants

V4L2_SUBDEV_PRE_STREAMON_FL_MANUAL_LP Set the transmitter to either LP-11 or LP-111 mode before call to s_stream().

struct v4l2_subdev_video_ops
    Callbacks used when v4l device was opened in video mode.
Definition

```c
struct v4l2_subdev_video_ops {
    int (*s_routing)(struct v4l2_subdev *sd, u32 input, u32 output, u32 config);
    int (*s_crystal_freq)(struct v4l2_subdev *sd, u32 freq, u32 flags);
    int (*g_std)(struct v4l2_subdev *sd, v4l2_std_id *norm);
    int (*s_std)(struct v4l2_subdev *sd, v4l2_std_id norm);
    int (*s_std_output)(struct v4l2_subdev *sd, v4l2_std_id std);
    int (*g_std_output)(struct v4l2_subdev *sd, v4l2_std_id *std);
    int (*querystd)(struct v4l2_subdev *sd, v4l2_std_id std);
    int (*g_tvnorms)(struct v4l2_subdev *sd, v4l2_std_id *std);
    int (*g_tvnorms_output)(struct v4l2_subdev *sd, v4l2_std_id *std);
    int (*g_input_status)(struct v4l2_subdev *sd, u32 *status);
    int (*s_stream)(struct v4l2_subdev *sd, int enable);
    int (*g_pixelaspect)(struct v4l2_subdev *sd, struct v4l2_fract *aspect);
    int (*g_frame_interval)(struct v4l2_subdev *sd, struct v4l2_subdev_frame_interval *interval);
    int (*s_frame_interval)(struct v4l2_subdev *sd, struct v4l2_subdev_frame_interval *interval);
    int (*s_dv_timings)(struct v4l2_subdev *sd, struct v4l2_dv_timings *timings);
    int (*g_dv_timings)(struct v4l2_subdev *sd, struct v4l2_dv_timings *timings);
    int (*query_dv_timings)(struct v4l2_subdev *sd, struct v4l2_dv_timings *timings);
    int (*s_rx_buffer)(struct v4l2_subdev *sd, void *buf, unsigned int *size);
    int (*pre_streamon)(struct v4l2_subdev *sd, u32 flags);
    int (*post_streamoff)(struct v4l2_subdev *sd);
};
```

Members

`s_routing` see `s_routing` in `audio_ops`, except this version is for video devices.

`s_crystal_freq` sets the frequency of the crystal used to generate the clocks in Hz. An extra `flags` field allows device specific configuration regarding clock frequency dividers, etc. If not used, then set flags to 0. If the frequency is not supported, then -EINVAL is returned.

`g_std` callback for VIDIOC_G_STD() ioctl handler code.

`s_std` callback for VIDIOC_S_STD() ioctl handler code.

`s_std_output` set `v4l2_std_id` for video OUTPUT devices. This is ignored by video input devices.

`g_std_output` get current standard for video OUTPUT devices. This is ignored by video input devices.

`querystd` callback for VIDIOC_QUERYSTD() ioctl handler code.

`g_tvnorms` get `v4l2_std_id` with all standards supported by the video CAPTURE device. This is ignored by video output devices.

`g_tvnorms_output` get `v4l2_std_id` with all standards supported by the video OUTPUT device. This is ignored by video capture devices.

`g_input_status` get input status. Same as the status field in the `struct v4l2_input`

`s_stream` used to notify the driver that a video stream will start or has stopped.

`g_pixelaspect` callback to return the pixelaspect ratio.

`g_frame_interval` callback for VIDIOC_SUBDEV_G_FRAME_INTERVAL() ioctl handler code.

`s_frame_interval` callback for VIDIOC_SUBDEV_S_FRAME_INTERVAL() ioctl handler code.

2.2. Video4Linux devices
**s_dv_timings** Set custom dv timings in the sub device. This is used when sub device is capable of setting detailed timing information in the hardware to generate/detect the video signal.

**g_dv_timings** Get custom dv timings in the sub device.

**query_dv_timings** callback for VIDIOC_QUERY_DV_TIMINGS() ioctl handler code.

**s_rx_buffer** set a host allocated memory buffer for the subdev. The subdev can adjust **size** to a lower value and must not write more data to the buffer starting at **data** than the original value of **size**.

**pre_streamon** May be called before streaming is actually started, to help initialising the bus. Current usage is to set a CSI-2 transmitter to LP-11 or LP-111 mode before streaming. See **enum v4l2_subdev_pre_streamon_flags**.

pre_streamon shall return error if it cannot perform the operation as indicated by the flags argument. In particular, -EACCES indicates lack of support for the operation. The caller shall call post_streamoff for each successful call of pre_streamon.

**post_streamoff** Called after streaming is stopped, but if and only if pre_streamon was called earlier.

**struct v4l2_subdev_vbi_ops**

Callbacks used when v4l device was opened in video mode via the vbi device node.

**Definition**

```c
struct v4l2_subdev_vbi_ops {
    int (*decode_vbi_line)(struct v4l2_subdev *sd, struct v4l2_decode_vbi_line *vbi_line);
    int (*s_vbi_data)(struct v4l2_subdev *sd, const struct v4l2_sliced_vbi_data *vbi_data);
    int (*g_vbi_data)(struct v4l2_subdev *sd, struct v4l2_sliced_vbi_data *vbi_data);
    int (*g_sliced_vbi_cap)(struct v4l2_subdev *sd, struct v4l2_sliced_vbi_cap *cap);
    int (*s_raw_fmt)(struct v4l2_subdev *sd, struct v4l2_vbi_format *fmt);
    int (*g_sliced_fmt)(struct v4l2_subdev *sd, struct v4l2_sliced_vbi_format *fmt);
    int (*s_sliced_fmt)(struct v4l2_subdev *sd, struct v4l2_sliced_vbi_format *fmt);
};
```

**Members**

**decode_vbi_line** video decoders that support sliced VBI need to implement this ioctl. Field **p** of the **struct v4l2_decode_vbi_line** is set to the start of the VBI data that was generated by the decoder. The driver then parses the sliced VBI data and sets the other fields in the struct accordingly. The pointer **p** is updated to point to the start of the payload which can be copied verbatim into the data field of the struct **v4l2_sliced_vbi_data**. If no valid VBI data was found, then the type field is set to 0 on return.

**s_vbi_data** used to generate VBI signals on a video signal. **struct v4l2_sliced_vbi_data** is filled with the data packets that should be output. Note that if you set the line field to 0, then that VBI signal is disabled. If no valid VBI data was found, then the type field is set to 0 on return.

**g_vbi_data** used to obtain the sliced VBI packet from a readback register. Not all video decoders support this. If no data is available because the readback register contains invalid or erroneous data - EIO is returned. Note that you must fill in the ‘id’ member and the ‘field’ member (to determine whether CC data from the first or second field should be obtained).

**g_sliced_vbi_cap** callback for VIDIOC_G_SLICED_VBI_CAP() ioctl handler code.
s_raw_fmt setup the video encoder/decoder for raw VBI.

g_sliced_fmt retrieve the current sliced VBI settings.

s_sliced_fmt setup the sliced VBI settings.

struct v4l2_subdev_sensor_ops
    v4l2-subdev sensor operations

Definition

```c
struct v4l2_subdev_sensor_ops {
    int (*g_skip_top_lines)(struct v4l2_subdev *sd, u32 *lines);
    int (*g_skip_frames)(struct v4l2_subdev *sd, u32 *frames);
};
```

Members

g_skip_top_lines number of lines at the top of the image to be skipped. This is needed for
    some sensors, which always corrupt several top lines of the output image, or which send
    their metadata in them.

g_skip_frames number of frames to skip at stream start. This is needed for buggy sensors that
    generate faulty frames when they are turned on.

enum v4l2_subdev_ir_mode
    describes the type of IR supported

Constants

V4L2_SUBDEV_IR_MODE_PULSE_WIDTH IR uses struct ir_raw_event records

struct v4l2_subdev_ir_parameters
    Parameters for IR TX or TX

Definition

```c
struct v4l2_subdev_ir_parameters {
    unsigned int bytes_per_data_element;
    enum v4l2_subdev_ir_mode mode;
    bool enable;
    bool interrupt_enable;
    bool shutdown;
    bool modulation;
    u32 max_pulse_width;
    unsigned int carrier_freq;
    unsigned int duty_cycle;
    bool invert_level;
    bool invert_carrier_sense;
    u32 noise_filter_min_width;
    unsigned int carrier_range_lower;
    unsigned int carrier_range_upper;
    u32 resolution;
};
```

 Members

bytes_per_data_element bytes per data element of data in read or write call.

mode IR mode as defined by enum v4l2_subdev_ir_mode.

2.2. Video4Linux devices
enable device is active if true

interrupt_enable IR interrupts are enabled if true

shutdown if true: set hardware to low/no power; false: normal mode

modulation if true, it uses carrier; if false: baseband

max_pulse_width maximum pulse width in ns, valid only for baseband signal

carrier_freq carrier frequency in Hz, valid only for modulated signal

duty_cycle duty cycle percentage, valid only for modulated signal

invert_level invert signal level

invert_carrier_sense Send 0/space as a carrier burst. used only in TX.

noise_filter_min_width min time of a valid pulse, in ns. Used only for RX.

carrier_range_lower Lower carrier range, in Hz, valid only for modulated signal. Used only for RX.

carrier_range_upper Upper carrier range, in Hz, valid only for modulated signal. Used only for RX.

resolution The receive resolution, in ns . Used only for RX.

struct v4l2_subdev_ir_ops
operations for IR subdevices

Definition

```c
struct v4l2_subdev_ir_ops {
    int (*rx_read)(struct v4l2_subdev *sd, u8 *buf, size_t count, ssize_t *num);
    int (*rx_g_parameters)(struct v4l2_subdev *sd, struct v4l2_subdev_ir_parameters *,
                           *params);
    int (*rx_s_parameters)(struct v4l2_subdev *sd, struct v4l2_subdev_ir_parameters *,
                           *params);
    int (*tx_write)(struct v4l2_subdev *sd, u8 *buf, size_t count, ssize_t *num);
    int (*tx_g_parameters)(struct v4l2_subdev *sd, struct v4l2_subdev_ir_parameters *,
                           *params);
    int (*tx_s_parameters)(struct v4l2_subdev *sd, struct v4l2_subdev_ir_parameters *,
                           *params);
};
```

Members

rx_read Reads received codes or pulse width data. The semantics are similar to a non-blocking read() call.

rx_g_parameters Get the current operating parameters and state of the IR receiver.

rx_s_parameters Set the current operating parameters and state of the IR receiver. It is recommended to call [rtx] g_parameters first to fill out the current state, and only change the fields that need to be changed. Upon return, the actual device operating parameters and state will be returned. Note that hardware limitations may prevent the actual settings from matching the requested settings - e.g. an actual carrier setting of 35,904 Hz when 36,000 Hz was requested. An exception is when the shutdown parameter is true. The last used operational parameters will be returned, but the actual state of the hardware be different to minimize power consumption and processing when shutdown is true.
**tx_write** Writes codes or pulse width data for transmission. The semantics are similar to a non-blocking write() call.

**tx_g_parameters** Get the current operating parameters and state of the IR transmitter.

**tx_s_parameters** Set the current operating parameters and state of the IR transmitter. It is recommended to call [rt]x_g_parameters first to fill out the current state, and only change the fields that need to be changed. Upon return, the actual device operating parameters and state will be returned. Note that hardware limitations may prevent the actual settings from matching the requested settings - e.g. an actual carrier setting of 35,904 Hz when 36,000 Hz was requested. An exception is when the shutdown parameter is true. The last used operational parameters will be returned, but the actual state of the hardware be different to minimize power consumption and processing when shutdown is true.

```c
struct v4l2_subdev_pad_config
    Used for storing subdev pad information.

Definition
```

```c
struct v4l2_subdev_pad_config {
    struct v4l2_mbus_framefmt try_fmt;
    struct v4l2_rect try_crop;
    struct v4l2_rect try_compose;
};
```

**Members**

- **try_fmt** struct v4l2_mbus_framefmt
- **try_crop** struct v4l2_rect to be used for crop
- **try_compose** struct v4l2_rect to be used for compose

**Description**

This structure only needs to be passed to the pad op if the ‘which’ field of the main argument is set to V4L2_SUBDEV_FORMAT_TRY. For V4L2_SUBDEV_FORMAT_ACTIVE it is safe to pass NULL.

```c
struct v4l2_subdev_state
    Used for storing subdev state information.

Definition
```

```c
struct v4l2_subdev_state {
    struct v4l2_subdev_pad_config *pads;
};
```

**Members**

- **pads** struct v4l2_subdev_pad_config array

**Description**

This structure only needs to be passed to the pad op if the ‘which’ field of the main argument is set to V4L2_SUBDEV_FORMAT_TRY. For V4L2_SUBDEV_FORMAT_ACTIVE it is safe to pass NULL.

```c
struct v4l2_subdev_pad_ops
    v4l2-subdev pad level operations

Definition
```
struct v4l2_subdev_pad_ops {
    int (*init_cfg)(struct v4l2_subdev *sd, struct v4l2_subdev_state *state);
    int (*enum_mbus_code)(struct v4l2_subdev *sd, struct v4l2_subdev_state *state,
                         struct v4l2_subdev_mbus_code_enum *code);
    int (*enum_frame_size)(struct v4l2_subdev *sd, struct v4l2_subdev_state *state,
                           struct v4l2_subdev_frame_size_enum *fse);
    int (*enum_frame_interval)(struct v4l2_subdev *sd, struct v4l2_subdev_state *state,
                              struct v4l2_subdev_frame_interval_enum *fie);
    int (*get_fmt)(struct v4l2_subdev *sd, struct v4l2_subdev_state *state, struct v4l2_
                   subdev_format *format);
    int (*set_fmt)(struct v4l2_subdev *sd, struct v4l2_subdev_state *state, struct v4l2_
                   subdev_format *format);
    int (*get_selection)(struct v4l2_subdev *sd, struct v4l2_subdev_state *state, struct
                         v4l2_subdev_selection *sel);
    int (*set_selection)(struct v4l2_subdev *sd, struct v4l2_subdev_state *state, struct
                         v4l2_subdev_selection *sel);
    int (*get_edid)(struct v4l2_subdev *sd, struct v4l2_edid *edid);
    int (*set_edid)(struct v4l2_subdev *sd, struct v4l2_edid *edid);
    int (*dv_timings_cap)(struct v4l2_subdev *sd, struct v4l2_dv_timings_cap *cap);
    int (*enum_dv_timings)(struct v4l2_subdev *sd, struct v4l2_enum_dv_timings *timings);
    #ifdef CONFIG_MEDIA_CONTROLLER;
    int (*link_validate)(struct v4l2_subdev *sd, struct media_link *link, struct v4l2_
                         subdev_format *source_fmt, struct v4l2_subdev_format *sink_fmt);
    #endif ;
    int (*get_frame_desc)(struct v4l2_subdev *sd, unsigned int pad, struct v4l2_mbus_
                          frame_desc *fd);
    int (*set_frame_desc)(struct v4l2_subdev *sd, unsigned int pad, struct v4l2_mbus_
                          frame_desc *fd);
    int (*get_mbus_config)(struct v4l2_subdev *sd, unsigned int pad, struct v4l2_mbus_
                           config *config);
    int (*set_mbus_config)(struct v4l2_subdev *sd, unsigned int pad, struct v4l2_mbus_
                            config *config);
};
**link_validate** used by the media controller code to check if the links that belongs to a pipeline can be used for stream.

**get_frame_desc** get the current low level media bus frame parameters.

**set_frame_desc** set the low level media bus frame parameters, **fd** array may be adjusted by the subdev driver to device capabilities.

**get_mbus_config** get the media bus configuration of a remote sub-device. The media bus configuration is usually retrieved from the firmware interface at sub-device probe time, immediately applied to the hardware and eventually adjusted by the driver. Remote sub-devices (usually video receivers) shall use this operation to query the transmitting end bus configuration in order to adjust their own one accordingly. Callers should make sure they get the most up-to-date as possible configuration from the remote end, likely calling this operation as close as possible to stream on time. The operation shall fail if the pad index it has been called on is not valid or in case of unrecoverable failures.

**set_mbus_config** set the media bus configuration of a remote sub-device. This operation is intended to allow, in combination with the **get_mbus_config** operation, the negotiation of media bus configuration parameters between media sub-devices. The operation shall not fail if the requested configuration is not supported, but the driver shall update the content of the **config** argument to reflect what has been actually applied to the hardware. The operation shall fail if the pad index it has been called on is not valid or in case of unrecoverable failures.

**struct v4l2_subdev_ops**
Subdev operations

**Definition**

```c
struct v4l2_subdev_ops {
    const struct v4l2_subdev_core_ops   *core;
    const struct v4l2_subdev_tuner_ops  *tuner;
    const struct v4l2_subdev_audio_ops  *audio;
    const struct v4l2_subdev_video_ops  *video;
    const struct v4l2_subdev_vbi_ops    *vbi;
    const struct v4l2_subdev_ir_ops     *ir;
    const struct v4l2_subdev_sensor_ops *sensor;
    const struct v4l2_subdev_pad_ops    *pad;
};
```

**Members**

- **core** pointer to **struct v4l2_subdev_core_ops**. Can be NULL
- **tuner** pointer to **struct v4l2_subdev_tuner_ops**. Can be NULL
- **audio** pointer to **struct v4l2_subdev_audio_ops**. Can be NULL
- **video** pointer to **struct v4l2_subdev_video_ops**. Can be NULL
- **vbi** pointer to **struct v4l2_subdev_vbi_ops**. Can be NULL
- **ir** pointer to **struct v4l2_subdev_ir_ops**. Can be NULL
- **sensor** pointer to **struct v4l2_subdev_sensor_ops**. Can be NULL
- **pad** pointer to **struct v4l2_subdev_pad_ops**. Can be NULL
struct `v4l2_subdev_internal_ops`

V4L2 subdev internal ops

**Definition**

```c
struct v4l2_subdev_internal_ops {
    int (*registered)(struct v4l2_subdev *sd);
    void (*unregistered)(struct v4l2_subdev *sd);
    int (*open)(struct v4l2_subdev *sd, struct v4l2_subdev_fh *fh);
    int (*close)(struct v4l2_subdev *sd, struct v4l2_subdev_fh *fh);
    void (*release)(struct v4l2_subdev *sd);
};
```

**Members**

- **registered** called when this subdev is registered. When called the v4l2_dev field is set to the correct v4l2_device.
- **unregistered** called when this subdev is unregistered. When called the v4l2_dev field is still set to the correct v4l2_device.
- **open** called when the subdev device node is opened by an application.
- **close** called when the subdev device node is closed. Please note that it is possible for **close** to be called after **unregistered**!
- **release** called when the last user of the subdev device is gone. This happens after the **unregistered** callback and when the last open filehandle to the v4l-subdevX device node was closed. If no device node was created for this sub-device, then the **release** callback is called right after the **unregistered** callback. The **release** callback is typically used to free the memory containing the v4l2_subdev structure. It is almost certainly required for any sub-device that sets the V4L2_SUBDEV_FL_HAS_DEVNODE flag.

**Description**

**Note:** Never call this from drivers, only the v4l2 framework can call these ops.

struct `v4l2_subdev_platform_data`

regulators config struct

**Definition**

```c
struct v4l2_subdev_platform_data {
    struct regulator_bulk_data *regulators;
    int num_regulators;
    void *host_priv;
};
```

**Members**

- **regulators** Optional regulators used to power on/off the subdevice
- **num_regulators** Number of regulators
- **host_priv** Per-subdevice data, specific for a certain video host device
- **v4l2_subdev** describes a V4L2 sub-device
Definition

```c
struct v4l2_subdev {
  #if defined(CONFIG_MEDIA_CONTROLLER);
      struct media_entity entity;
  #endif;
  struct list_head list;
  struct module *owner;
  bool owner_v4l2_dev;
  u32 flags;
  struct v4l2_device *v4l2_dev;
  const struct v4l2_subdev_ops *ops;
  const struct v4l2_subdev_internal_ops *internal_ops;
  struct v4l2_ctrl_handler *ctrl_handler;
  char name[V4L2_SUBDEV_NAME_SIZE];
  u32 grp_id;
  void *dev_priv;
  void *host_priv;
  struct video_device *devnode;
  struct device *dev;
  struct fwnode_handle *fwnode;
  struct list_head async_list;
  struct v4l2_async_subdev *asd;
  struct v4l2_async_notifier *notifier;
  struct v4l2_async_notifier *subdev_notifier;
  struct v4l2_subdev_platform_data *pdata;
};
```

Members

- **entity** pointer to `struct media_entity`
- **list** List of sub-devices
- **owner** The owner is the same as the driver’s `struct device` owner.
- **owner_v4l2_dev** true if the sd->owner matches the owner of `v4l2_dev->dev` owner. Initialized by `v4l2_device_register_subdev()`.
- **flags** subdev flags. Can be: `V4L2_SUBDEV_FL_IS_I2C` - Set this flag if this subdev is a i2c device; `V4L2_SUBDEV_FL_IS_SPI` - Set this flag if this subdev is a spi device; `V4L2_SUBDEV_FL_HAS_DEVNODE` - Set this flag if this subdev needs a device node; `V4L2_SUBDEV_FL_HAS_EVENTS` - Set this flag if this subdev generates events.
- **v4l2_dev** pointer to `struct v4l2_device`
- **ops** pointer to `struct v4l2_subdev_ops`
- **internal_ops** pointer to `struct v4l2_subdev_internal_ops`. Never call these internal ops from within a driver!
- **ctrl_handler** The control handler of this subdev. May be NULL.
- **name** Name of the sub-device. Please notice that the name must be unique.
- **grp_id** can be used to group similar subdevs. Value is driver-specific
- **dev_priv** pointer to private data
- **host_priv** pointer to private data used by the device where the subdev is attached.

2.2. Video4Linux devices
devnode subdev device node

dev pointer to the physical device, if any

fwnode The fwnode_handle of the subdev, usually the same as either dev->of_node->fwnode or
dev->fwnode (whichever is non-NULL).

async_list Links this subdev to a global subdev_list or notifier->done list.

asd Pointer to respective struct v4l2_async_subdev.

notifier Pointer to the managing notifier.

subdev_notifier A sub-device notifier implicitly registered for the sub-device using
v4l2_async_register_subdev_sensor().

pdata common part of subdevice platform data

Description

Each instance of a subdev driver should create this struct, either stand-alone or embedded in
a larger struct.

This structure should be initialized by v4l2_subdev_init() or one of its variants:
v4l2_spi_subdev_init(), v4l2_i2c_subdev_init().

media_entity_to_v4l2_subdev(ent)
Returns a struct v4l2_subdev from the struct media_entity embedded in it.

Parameters

ent pointer to struct media_entity.

vdev_to_v4l2_subdev(vdev)
Returns a struct v4l2_subdev from the struct video_device embedded on it.

Parameters

vdev pointer to struct video_device

struct v4l2_subdev_fh
Used for storing subdev information per file handle

Definition

struct v4l2_subdev_fh {
    struct v4l2_fh vfh;
    struct module *owner;
#ifdef (CONFIG_VIDEO_V4L2_SUBDEV_API);
    struct v4l2_subdev_state *state;
#endif;
};

Members

vfh pointer to struct v4l2_fh

owner module pointer to the owner of this file handle

state pointer to struct v4l2_subdev_state

to_v4l2_subdev_fh(fh)
Returns a struct v4l2_subdev_fh from the struct v4l2_fh embedded on it.
Parameters

fh pointer to `struct v4l2_fh`

`struct v4l2_mbus_framefmt * v4l2_subdev_get_try_format(struct v4l2_subdev *sd, struct v4l2_subdev_state *state, unsigned int pad)`

ancillary routine to call `struct v4l2_subdev_pad_config->try_fmt`

Parameters

`struct v4l2_subdev *sd` pointer to `struct v4l2_subdev`

`struct v4l2_subdev_state *state` pointer to `struct v4l2_subdev_state`

`unsigned int pad` index of the pad in the `struct v4l2_subdev_state->pads` array

`struct v4l2_rect * v4l2_subdev_get_try_crop(struct v4l2_subdev *sd, struct v4l2_subdev_state *state, unsigned int pad)`

ancillary routine to call `struct v4l2_subdev_pad_config->try_crop`

Parameters

`struct v4l2_subdev *sd` pointer to `struct v4l2_subdev`

`struct v4l2_subdev_state *state` pointer to `struct v4l2_subdev_state`

`unsigned int pad` index of the pad in the `struct v4l2_subdev_state->pads` array.

`struct v4l2_rect * v4l2_subdev_get_try_compose(struct v4l2_subdev *sd, struct v4l2_subdev_state *state, unsigned int pad)`

ancillary routine to call `struct v4l2_subdev_pad_config->try_compose`

Parameters

`struct v4l2_subdev *sd` pointer to `struct v4l2_subdev`

`struct v4l2_subdev_state *state` pointer to `struct v4l2_subdev_state`.

`unsigned int pad` index of the pad in the `struct v4l2_subdev_state->pads` array.

`void v4l2_set_subdevdata(struct v4l2_subdev *sd, void *p)`

Sets V4L2 dev private device data

Parameters

`struct v4l2_subdev *sd` pointer to `struct v4l2_subdev`

`void *p` pointer to the private device data to be stored.

`void * v4l2_get_subdevdata(const struct v4l2_subdev *sd)`

Gets V4L2 dev private device data

Parameters

`const struct v4l2_subdev *sd` pointer to `struct v4l2_subdev`

Description

Returns the pointer to the private device data to be stored.

2.2. Video4Linux devices
void v4l2_set_subdev_hostdata(struct v4l2_subdev *sd, void *p)
    Sets V4L2 dev private host data

Parameters
struct v4l2_subdev *sd  pointer to struct v4l2_subdev
void *p  pointer to the private data to be stored.

void *v4l2_get_subdev_hostdata(const struct v4l2_subdev *sd)
    Gets V4L2 dev private data

Parameters
const struct v4l2_subdev *sd  pointer to struct v4l2_subdev

Description
Returns the pointer to the private host data to be stored.

int v4l2_subdev_get_fwnode_pad_1_to_1(struct media_entity *entity, struct fwnode_endpoint *endpoint)
    Get pad number from a subdev fwnode endpoint, assuming 1:1 port:pad

Parameters
struct media_entity *entity  Pointer to the subdev entity
struct fwnode_endpoint *endpoint  Pointer to a parsed fwnode endpoint

Description
This function can be used as the .get_fwnode_pad operation for subdevices that map port numbers and pad indexes 1:1. If the endpoint is owned by the subdevice, the function returns the endpoint port number.

Returns the endpoint port number on success or a negative error code.

int v4l2_subdev_link_validate_default(struct v4l2_subdev *sd, struct media_link *link, struct v4l2_subdev_format *source_fmt, struct v4l2_subdev_format *sink_fmt)
    validates a media link

Parameters
struct v4l2_subdev *sd  pointer to struct v4l2_subdev
struct media_link *link  pointer to struct media_link
struct v4l2_subdev_format *source_fmt  pointer to struct v4l2_subdev_format
struct v4l2_subdev_format *sink_fmt  pointer to struct v4l2_subdev_format

Description
This function ensures that width, height and the media bus pixel code are equal on both source and sink of the link.

int v4l2_subdev_link_validate(struct media_link *link)
    validates a media link

Parameters
struct media_link *link  

Description

This function calls the subdev’s link_validate ops to validate if a media link is valid for streaming. It also internally calls v4l2_subdev_link_validate_default() to ensure that width, height and the media bus pixel code are equal on both source and sink of the link.

struct v4l2_subdev_state * v4l2_subdev_alloc_state(struct v4l2_subdev *sd)

allocate v4l2_subdev_state

Parameters

struct v4l2_subdev *sd  

pointer to  struct v4l2_subdev  

for which the state is being allocated.

Description

Must call v4l2_subdev_free_state() when state is no longer needed.

void v4l2_subdev_free_state(struct v4l2_subdev_state *state)

free a v4l2_subdev_state

Parameters

struct v4l2_subdev_state *state  

v4l2_subdev_state  

to be freed.

void v4l2_subdev_init(struct v4l2_subdev *sd, const struct v4l2_subdev_ops *ops)

initializes the sub-device struct

Parameters

struct v4l2_subdev *sd  

pointer to the  struct v4l2_subdev  

to be initialized

const struct v4l2_subdev_ops *ops  

pointer to  struct v4l2_subdev_ops.

v4l2_subdev_call(sd, o, f, args…)

call an operation of a v4l2_subdev.

Parameters

sd  

pointer to the  struct v4l2_subdev

o  

name of the element at  struct v4l2_subdev_ops  

that contains f. Each element there groups a set of callbacks functions.

f  

callback function to be called. The callback functions are defined in groups, according to each element at  struct v4l2_subdev_ops.

args…  

arguments for f.

Example

err = v4l2_subdev_call(sd, video, s_std, norm);

v4l2_subdev_has_op(sd, o, f)

Checks if a subdev defines a certain operation.

Parameters

sd  

pointer to the  struct v4l2_subdev

o  

The group of callback functions in  struct v4l2_subdev_ops  

which f is a part of.

f  

callback function to be checked for its existence.
void \texttt{v4l2\_subdev\_notify\_event}(\texttt{struct v4l2\_subdev} *\texttt{sd}, \texttt{const struct v4l2\_event} *\texttt{ev})
\begin{itemize}
  \item Delivers event notification for subdevice
\end{itemize}

\textbf{Parameters}

\begin{itemize}
  \item \texttt{struct v4l2\_subdev} *\texttt{sd} The subdev for which to deliver the event
  \item \texttt{const struct v4l2\_event} *\texttt{ev} The event to deliver
\end{itemize}

\textbf{Description}

Will deliver the specified event to all userspace event listeners which are subscribed to the \texttt{v4l2\_subdevice} event queue as well as to the bridge driver using the notify callback. The notification type for the notify callback will be \texttt{V4L2\_DEVICE\_NOTIFY\_EVENT}.

\subsection*{2.2.12 V4L2 events}

The V4L2 events provide a generic way to pass events to user space. The driver must use \texttt{v4l2\_fh} to be able to support V4L2 events.

Events are subscribed per-filehandle. An event specification consists of a type and is optionally associated with an object identified through the \texttt{id} field. If unused, then the \texttt{id} is 0. So an event is uniquely identified by the \texttt{(type, id)} tuple.

The \texttt{v4l2\_fh} struct has a list of subscribed events on its \texttt{subscribed} field.

When the user subscribes to an event, a \texttt{v4l2\_subscribed\_event} struct is added to \texttt{v4l2\_fh}. subscribed, one for every subscribed event.

Each \texttt{v4l2\_subscribed\_event} struct ends with a \texttt{v4l2\_kevent} ringbuffer, with the size given by the caller of \texttt{v4l2\_event\_subscribe()}. This ringbuffer is used to store any events raised by the driver.

So every \texttt{(type, ID)} event tuple will have its own \texttt{v4l2\_kevent} ringbuffer. This guarantees that if a driver is generating lots of events of one type in a short time, then that will not overwrite events of another type.

But if you get more events of one type than the size of the \texttt{v4l2\_kevent} ringbuffer, then the oldest event will be dropped and the new one added.

The \texttt{v4l2\_kevent} struct links into the available list of the \texttt{v4l2\_fh} struct so \texttt{ioctl VID-IOC_DQEVENT} will know which event to dequeue first.

Finally, if the event subscription is associated with a particular object such as a V4L2 control, then that object needs to know about that as well so that an event can be raised by that object. So the node field can be used to link the \texttt{v4l2\_subscribed\_event} struct into a list of such objects.

So to summarize:

\begin{itemize}
  \item \texttt{struct v4l2\_fh} has two lists: one of the subscribed events, and one of the available events.
  \item \texttt{struct v4l2\_subscribed\_event} has a ringbuffer of raised (pending) events of that particular type.
  \item If \texttt{struct v4l2\_subscribed\_event} is associated with a specific object, then that object will have an internal list of \texttt{struct v4l2\_subscribed\_event} so it knows who subscribed an event to that object.
\end{itemize}
Furthermore, the internal `struct v4l2_subscribed_event` has `merge()` and `replace()` callbacks which drivers can set. These callbacks are called when a new event is raised and there is no more room.

The `replace()` callback allows you to replace the payload of the old event with that of the new event, merging any relevant data from the old payload into the new payload that replaces it. It is called when this event type has a ringbuffer with size is one, i.e. only one event can be stored in the ringbuffer.

The `merge()` callback allows you to merge the oldest event payload into that of the second-oldest event payload. It is called when the ringbuffer has size is greater than one.

This way no status information is lost, just the intermediate steps leading up to that state.

A good example of these `replace/merge` callbacks is in `v4l2-event.c`: `ctrls_replace()` and `ctrls_merge()` callbacks for the control event.

**Note:** these callbacks can be called from interrupt context, so they must be fast.

In order to queue events to video device, drivers should call:

```c
v4l2_event_queue (vdev, ev)
```

The driver’s only responsibility is to fill in the type and the data fields. The other fields will be filled in by V4L2.

### 2.2.12.1 Event subscription

Subscribing to an event is via:

```c
v4l2_event_subscribe (fh, sub, elems, ops)
```

This function is used to implement `video_device->ioctl_ops->vidioc_subscribe_event`, but the driver must check first if the driver is able to produce events with specified event id, and then should call `v4l2_event_subscribe()` to subscribe the event.

The `elems` argument is the size of the event queue for this event. If it is 0, then the framework will fill in a default value (this depends on the event type).

The `ops` argument allows the driver to specify a number of callbacks:

<table>
<thead>
<tr>
<th>Callback</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>add</td>
<td>called when a new listener gets added (subscribing to the same event twice will only cause this callback to get called once)</td>
</tr>
<tr>
<td>del</td>
<td>called when a listener stops listening</td>
</tr>
<tr>
<td>replace</td>
<td>replace event ‘old’ with event ‘new’.</td>
</tr>
<tr>
<td>merge</td>
<td>merge event ‘old’ into event ‘new’.</td>
</tr>
</tbody>
</table>

All 4 callbacks are optional, if you don’t want to specify any callbacks the `ops` argument itself maybe `NULL`.

### 2.2. Video4Linux devices
2.2.12.2 Unsubscribing an event

Unsubscribing to an event is via:

\[ v4l2\_event\_unsubscribe (fh, sub) \]

This function is used to implement `video_device->ioctl_ops->vidioc_unsubscribe_event`. A driver may call `v4l2_event_unsubscribe()` directly unless it wants to be involved in unsubscribing process.

The special type `V4L2_EVENT_ALL` may be used to unsubscribe all events. The drivers may want to handle this in a special way.

2.2.12.3 Check if there’s a pending event

Checking if there’s a pending event is via:

\[ v4l2\_event\_pending (fh) \]

This function returns the number of pending events. Useful when implementing poll.

2.2.12.4 How events work

Events are delivered to user space through the poll system call. The driver can use `v4l2_fh->wait (a wait_queue_head_t) as the argument for poll_wait()`.

There are standard and private events. New standard events must use the smallest available event type. The drivers must allocate their events from their own class starting from class base. Class base is `V4L2_EVENT_PRIVATE_START + n * 1000` where `n` is the lowest available number. The first event type in the class is reserved for future use, so the first available event type is ‘class base + 1’.

An example on how the V4L2 events may be used can be found in the OMAP 3 ISP driver (drivers/media/platform/omap3isp).

A subdev can directly send an event to the `v4l2_device notify function with V4L2_DEVICE_NOTIFY_EVENT`. This allows the bridge to map the subdev that sends the event to the video node(s) associated with the subdev that need to be informed about such an event.

V4L2 event functions and data structures

struct `v4l2_kevent`

Internal kernel event struct.

Definition

```c
struct v4l2_kevent {
    struct list_head list;
    struct v4l2_subscribed_event *sev;
    struct v4l2_event event;
    u64 ts;
};
```
Members

**list** List node for the v4l2_fh->available list.

**sev** Pointer to parent v4l2_subscribed_event.

**event** The event itself.

**ts** The timestamp of the event.

**struct v4l2_subscribed_event_ops**

Subscribed event operations.

Definition

```c
struct v4l2_subscribed_event_ops {
    int (*add)(struct v4l2_subscribed_event *sev, unsigned int elems);
    void (*del)(struct v4l2_subscribed_event *sev);
    void (*replace)(struct v4l2_event *old, const struct v4l2_event *new);
    void (*merge)(const struct v4l2_event *old, struct v4l2_event *new);
};
```

Members

**add** Optional callback, called when a new listener is added

**del** Optional callback, called when a listener stops listening

**replace** Optional callback that can replace event ‘old’ with event ‘new’.

**merge** Optional callback that can merge event ‘old’ into event ‘new’.

**struct v4l2_subscribed_event**

Internal struct representing a subscribed event.

Definition

```c
struct v4l2_subscribed_event {
    struct list_head list;
    u32 type;
    u32 id;
    u32 flags;
    struct v4l2_fh *fh;
    struct list_head node;
    const struct v4l2_subscribed_event_ops *ops;
    unsigned int elems;
    unsigned int first;
    unsigned int in_use;
    struct v4l2_kevent events[];
};
```

Members

**list** List node for the v4l2_fh->subscribed list.

**type** Event type.

**id** Associated object ID (e.g. control ID). 0 if there isn’t any.

**flags** Copy of v4l2_event_subscription->flags.

**fh** Filehandle that subscribed to this event.
node  List node that hooks into the object’s event list (if there is one).

ops  v4l2_subscribed_event_ops

elems  The number of elements in the events array.

first  The index of the events containing the oldest available event.

in_use  The number of queued events.

events  An array of elems events.

int v4l2_event_dequeue(struct v4l2_fh *fh, struct v4l2_event *event, int nonblocking)
   Dequeue events from video device.

Parameters

struct v4l2_fh *fh  pointer to struct v4l2_fh
struct v4l2_event *event  pointer to struct v4l2_event
int nonblocking  if not zero, waits for an event to arrive

void v4l2_event_queue(struct video_device *vdev, const struct v4l2_event *ev)
   Queue events to video device.

Parameters

struct video_device *vdev  pointer to struct video_device
const struct v4l2_event *ev  pointer to struct v4l2_event

Description

The event will be queued for all struct v4l2_fh file handlers.

Note:  The driver’s only responsibility is to fill in the type and the data fields. The other fields
will be filled in by V4L2.

void v4l2_event_queue_fh(struct v4l2_fh *fh, const struct v4l2_event *ev)
   Queue events to video device.

Parameters

struct v4l2_fh *fh  pointer to struct v4l2_fh
const struct v4l2_event *ev  pointer to struct v4l2_event

Description

The event will be queued only for the specified struct v4l2_fh file handler.

Note:  The driver’s only responsibility is to fill in the type and the data fields. The other fields
will be filled in by V4L2.

void v4l2_event_wake_all(struct video_device *vdev)
   Wake all filehandles.

Parameters

struct video_device *vdev  pointer to struct video_device
Description

Used when unregistering a video device.

```c
int v4l2_event_pending(struct v4l2_fh *fh)
```

Check if an event is available

Parameters

```c
struct v4l2_fh *fh pointer to struct v4l2_fh
```

Description

Returns the number of pending events.

```c
int v4l2_event_subscribe(struct v4l2_fh *fh, const struct v4l2_event_subscription *sub,
                          unsigned int elems, const struct v4l2_subscribed_event_ops *ops)
```

Subscribes to an event

Parameters

```c
struct v4l2_fh *fh pointer to struct v4l2_fh
const struct v4l2_event_subscription *sub pointer to struct v4l2_event_subscription
unsigned int elems size of the events queue
const struct v4l2_subscribed_event_ops *ops pointer to v4l2_subscribed_event_ops
```

Note: if `elems` is zero, the framework will fill in a default value, with is currently 1 element.

```c
int v4l2_event_unsubscribe(struct v4l2_fh *fh, const struct v4l2_event_subscription *sub)
```

Unsubscribes to an event

Parameters

```c
struct v4l2_fh *fh pointer to struct v4l2_fh
const struct v4l2_event_subscription *sub pointer to struct v4l2_event_subscription
```

```c
void v4l2_event_unsubscribe_all(struct v4l2_fh *fh)
```

Unsubscribes to all events

Parameters

```c
struct v4l2_fh *fh pointer to struct v4l2_fh
```

```c
int v4l2_event_subdev_unsubscribe(struct v4l2_subdev *sd, struct v4l2_fh *fh, struct v4l2_event_subscription *sub)
```

Subdev variant of `v4l2_event_unsubscribe()`

Parameters

```c
struct v4l2_subdev *sd pointer to struct v4l2_subdev
struct v4l2_fh *fh pointer to struct v4l2_fh
```
struct v4l2_event_subscription *sub  pointer to struct v4l2_event_subscription

Description

Note: This function should be used for the struct v4l2_subdev_core_ops unsubscribe_event field.

int v4l2_src_change_event_subscribe(struct v4l2_fh *fh, const struct v4l2_event_subscription *sub)

helper function that calls v4l2_event_subscribe() if the event is V4L2_EVENT_SOURCE_CHANGE.

Parameters

struct v4l2_fh *fh  pointer to struct v4l2_fh

const struct v4l2_event_subscription *sub  pointer to struct v4l2_event_subscription

int v4l2_src_change_event_subdev_subscribe(struct v4l2_subdev *sd, struct v4l2_fh *fh, struct v4l2_event_subscription *sub)

Variant of v4l2_event_subscribe(), meant to subscribe only events of the type V4L2_EVENT_SOURCE_CHANGE.

Parameters

struct v4l2_subdev *sd  pointer to struct v4l2_subdev

struct v4l2_fh *fh  pointer to struct v4l2_fh

struct v4l2_event_subscription *sub  pointer to struct v4l2_event_subscription

2.2.13 V4L2 Controls

2.2.13.1 Introduction

The V4L2 control API seems simple enough, but quickly becomes very hard to implement correctly in drivers. But much of the code needed to handle controls is actually not driver specific and can be moved to the V4L core framework.

After all, the only part that a driver developer is interested in is:

1) How do I add a control?

2) How do I set the control’s value? (i.e. s_ctrl)

And occasionally:

3) How do I get the control’s value? (i.e. g_volatile_ctrl)

4) How do I validate the user’s proposed control value? (i.e. try_ctrl)

All the rest is something that can be done centrally.

The control framework was created in order to implement all the rules of the V4L2 specification with respect to controls in a central place. And to make life as easy as possible for the driver developer.
Note that the control framework relies on the presence of a struct `v4l2_device` for V4L2 drivers and `struct v4l2_subdev` for sub-device drivers.

### 2.2.13.2 Objects in the framework

There are two main objects:

The `v4l2_ctrl` object describes the control properties and keeps track of the control’s value (both the current value and the proposed new value).

`v4l2_ctrl_handler` is the object that keeps track of controls. It maintains a list of `v4l2_ctrl` objects that it owns and another list of references to controls, possibly to controls owned by other handlers.

### 2.2.13.3 Basic usage for V4L2 and sub-device drivers

1) Prepare the driver:

```c
#include <media/v4l2-ctrls.h>
```

1.1) Add the handler to your driver’s top-level struct:

For V4L2 drivers:

```c
struct foo_dev {
    ...
    struct v4l2_device v4l2_dev;
    ...
    struct v4l2_ctrl_handler ctrl_handler;
    ...
};
```

For sub-device drivers:

```c
struct foo_dev {
    ...
    struct v4l2_subdev sd;
    ...
    struct v4l2_ctrl_handler ctrl_handler;
    ...
};
```

1.2) Initialize the handler:

```c
v4l2_ctrl_handler_init(&foo->ctrl_handler, nr_of_controls);
```

The second argument is a hint telling the function how many controls this handler is expected to handle. It will allocate a hashtable based on this information. It is a hint only.

1.3) Hook the control handler into the driver:

For V4L2 drivers:

```c
foo->v4l2_dev.ctrl_handler = &foo->ctrl_handler;
```

For sub-device drivers:
foo->sd.ctrl_handler = &foo->ctrl_handler;

1.4) Clean up the handler at the end:

v4l2_ctrl_handler_free(&foo->ctrl_handler);

2) Add controls:
You add non-menu controls by calling `v4l2_ctrl_new_std()`:

```c
struct v4l2_ctrl *v4l2_ctrl_new_std(struct v4l2_ctrl_handler *hdl,
const struct v4l2_ctrl_ops *ops,
u32 id, s32 min, s32 max, u32 step, s32 def);
```

Menu and integer menu controls are added by calling `v4l2_ctrl_new_std_menu()`:

```c
struct v4l2_ctrl *v4l2_ctrl_new_std_menu(struct v4l2_ctrl_handler *hdl,
const struct v4l2_ctrl_ops *ops,
u32 id, s32 max, s32 skip_mask, s32 def);
```

Menu controls with a driver specific menu are added by calling `v4l2_ctrl_new_std_menu_items()`:

```c
struct v4l2_ctrl *v4l2_ctrl_new_std_menu_items(
struct v4l2_ctrl_handler *hdl,
const struct v4l2_ctrl_ops *ops,
u32 id, s32 max, s32 skip_mask, s32 def,
const char *const *qmenu);
```

Standard compound controls can be added by calling `v4l2_ctrl_new_std_compound()`:

```c
struct v4l2_ctrl *v4l2_ctrl_new_std_compound(struct v4l2_ctrl_handler *hdl,
const struct v4l2_ctrl_ops *ops,
const union v4l2_ctrl_ptr p_def);
```

Integer menu controls with a driver specific menu can be added by calling `v4l2_ctrl_new_int_menu()`:

```c
struct v4l2_ctrl *v4l2_ctrl_new_int_menu(struct v4l2_ctrl_handler *hdl,
const struct v4l2_ctrl_ops *ops,
u32 id, s32 max, s32 def, const s64 *qmenu_int);
```

These functions are typically called right after the `v4l2_ctrl_handler_init()`:

```c
static const s64 exp_bias_qmenu[] = {
  -2, -1, 0, 1, 2
};
static const char * const test_pattern[] = {
  "Disabled",
  "Vertical Bars",
  "Solid Black",
  "Solid White",
};

v4l2_ctrl_handler_init(&foo->ctrl_handler, nr_of_controls);
v4l2_ctrl_new_std(&foo->ctrl_handler, &foo_ctrl_ops,
  V4L2_CID_BRIGHTNESS, 0, 255, 1, 128);
```
The `v4l2_ctrl_new_std()` function returns the `v4l2_ctrl` pointer to the new control, but if you do not need to access the pointer outside the control ops, then there is no need to store it.

The `v4l2_ctrl_new_std()` function will fill in most fields based on the control ID except for the min, max, step and default values. These are passed in the last four arguments. These values are driver specific while control attributes like type, name, flags are all global. The control’s current value will be set to the default value.

The `v4l2_ctrl_new_std_menu()` function is very similar but it is used for menu controls. There is no min argument since that is always 0 for menu controls, and instead of a step there is a skip_mask argument: if bit X is 1, then menu item X is skipped.

The `v4l2_ctrl_new_int_menu()` function creates a new standard integer menu control with driver-specific items in the menu. It differs from `v4l2_ctrl_new_std_menu` in that it doesn’t have the mask argument and takes as the last argument an array of signed 64-bit integers that form an exact menu item list.

The `v4l2_ctrl_new_std_menu_items()` function is very similar to `v4l2_ctrl_new_std_menu` but takes an extra parameter qmenu, which is the driver specific menu for an otherwise standard menu control. A good example for this control is the test pattern control for capture/display/sensors devices that have the capability to generate test patterns. These test patterns are hardware specific, so the contents of the menu will vary from device to device.

Note that if something fails, the function will return NULL or an error and set `ctrl_handler->error` to the error code. If `ctrl_handler->error` was already set, then it will just return and do nothing. This is also true for `v4l2_ctrl_handler_init` if it cannot allocate the internal data structure.

This makes it easy to init the handler and just add all controls and only check the error code at the end. Saves a lot of repetitive error checking.

It is recommended to add controls in ascending control ID order: it will be a bit faster that way.

3) Optionally force initial control setup:
This will call s_ctrl for all controls unconditionally. Effectively this initializes the hardware to the default control values. It is recommended that you do this as this ensures that both the internal data structures and the hardware are in sync.

4) Finally: implement the `v4l2_ctrl_ops`

```c
static const struct v4l2_ctrl_ops foo_ctrl_ops = {
    .s_ctrl = foo_s_ctrl,
};
```

Usually all you need is `s_ctrl`:

```c
static int foo_s_ctrl(struct v4l2_ctrl *ctrl) {
    struct foo *state = container_of(ctrl->handler, struct foo, ctrl_handler);
    switch (ctrl->id) {
    case V4L2_CID_BRIGHTNESS:
        write_reg(0x123, ctrl->val);
        break;
    case V4L2_CID_CONTRAST:
        write_reg(0x456, ctrl->val);
        break;
    }
    return 0;
}
```

The control ops are called with the v4l2_ctrl pointer as argument. The new control value has already been validated, so all you need to do is to actually update the hardware registers.

You're done! And this is sufficient for most of the drivers we have. No need to do any validation of control values, or implement QUERYCTRL, QUERY_EXT_CTRL and QUERYMENU. And G/S_CTRL as well as G/TRY/S_EXT_CTRLS are automatically supported.

**Note:** The remainder sections deal with more advanced controls topics and scenarios. In practice the basic usage as described above is sufficient for most drivers.

### 2.2.13.4 Inheriting Sub-device Controls

When a sub-device is registered with a V4L2 driver by calling `v4l2_device_register_subdev()` and the ctrl_handler fields of both v4l2_subdev and v4l2_device are set, then the controls of the subdev will become automatically available in the V4L2 driver as well. If the subdev driver contains controls that already exist in the V4L2 driver, then those will be skipped (so a V4L2 driver can always override a subdev control).

What happens here is that `v4l2_device_register_subdev()` calls `v4l2_ctrl_add_handler()` adding the controls of the subdev to the controls of v4l2_device.
2.2.13.5 Accessing Control Values

The following union is used inside the control framework to access control values:

```c
union v4l2_ctrl_ptr {
    s32 *p_s32;
    s64 *p_s64;
    char *p_char;
    void *p;
};
```

The `v4l2_ctrl` struct contains these fields that can be used to access both current and new values:

```c
s32 val;
struct {
    s32 val;
} cur;

union v4l2_ctrl_ptr p_new;
union v4l2_ctrl_ptr p_cur;
```

If the control has a simple `s32` type, then:

```c
&ctrl->val == ctrl->p_new.p_s32
&ctrl->cur.val == ctrl->p_cur.p_s32
```

For all other types use `ctrl->p_cur.p<something>` . Basically the val and cur.val fields can be considered an alias since these are used so often.

Within the control ops you can freely use these. The val and cur.val speak for themselves. The p_char pointers point to character buffers of length `ctrl->maximum + 1`, and are always 0-terminated.

Unless the control is marked volatile the p_cur field points to the current cached control value. When you create a new control this value is made identical to the default value. After calling `v4l2_ctrl_handler_setup()` this value is passed to the hardware. It is generally a good idea to call this function.

Whenever a new value is set that new value is automatically cached. This means that most drivers do not need to implement the `g_volatile_ctrl()` op. The exception is for controls that return a volatile register such as a signal strength read-out that changes continuously. In that case you will need to implement `g_volatile_ctrl` like this:

```c
static int foo_g_volatile_ctrl(struct v4l2_ctrl *ctrl)
{
    switch (ctrl->id) {
    case V4L2_CID_BRIGHTNESS:
        ctrl->val = read_reg(0x123);
        break;
    }
}
```

Note that you use the ‘new value’ union as well in `g_volatile_ctrl`. In general controls that need to implement `g_volatile_ctrl` are read-only controls. If they are not, a `V4L2_EVENT_CTRL.CH_VALUE` will not be generated when the control changes.
To mark a control as volatile you have to set V4L2_CTRL_FLAG_VOLATILE:

```c
ctrl = v4l2_ctrl_new_std(&sd->ctrl_handler, ...);
if (ctrl)
    ctrl->flags |= V4L2_CTRL_FLAG_VOLATILE;
```

For try/s_ctrl the new values (i.e. as passed by the user) are filled in and you can modify them in try_ctrl or set them in s_ctrl. The ‘cur’ union contains the current value, which you can use (but not change!) as well.

If s_ctrl returns 0 (OK), then the control framework will copy the new final values to the ‘cur’ union.

While in g_volatile/s/try_ctrl you can access the value of all controls owned by the same handler since the handler’s lock is held. If you need to access the value of controls owned by other handlers, then you have to be very careful not to introduce deadlocks.

Outside of the control ops you have to go through to helper functions to get or set a single control value safely in your driver:

```c
s32 v4l2_ctrl_g_ctrl(struct v4l2_ctrl *ctrl);
int v4l2_ctrl_s_ctrl(struct v4l2_ctrl *ctrl, s32 val);
```

These functions go through the control framework just as VIDIOC_G/S_CTRL ioctl do. Don’t use these inside the control ops g_volatile/s/try_ctrl, though, that will result in a deadlock since these helpers lock the handler as well.

You can also take the handler lock yourself:

```c
mutex_lock(&state->ctrl_handler.lock);
pr_info("String value is \"%s\n\", ctrl1->p_cur.p_char);
pr_info("Integer value is \"%s\n\", ctrl2->cur.val);
mutex_unlock(&state->ctrl_handler.lock);
```

### 2.2.13.6 Menu Controls

The v4l2_ctrl struct contains this union:

```c
union {
    u32 step;
    u32 menu_skip_mask;
};
```

For menu controls menu_skip_mask is used. What it does is that it allows you to easily exclude certain menu items. This is used in the VIDIOC_QUERYMENU implementation where you can return -EINVAL if a certain menu item is not present. Note that VIDIOC_QUERYCTRL always returns a step value of 1 for menu controls.

A good example is the MPEG Audio Layer II Bitrate menu control where the menu is a list of standardized possible bitrates. But in practice hardware implementations will only support a subset of those. By setting the skip mask you can tell the framework which menu items should be skipped. Setting it to 0 means that all menu items are supported.

You set this mask either through the v4l2_ctrl_config struct for a custom control, or by calling v4l2_ctrl_new_std_menu().
2.2.13.7 Custom Controls

Driver specific controls can be created using `v4l2_ctrl_new_custom()`:

```c
static const struct v4l2_ctrl_config ctrl_filter = {
    .ops = &ctrl_custom_ops,
    .id = V4L2_CID_MPEG_CX2341X_VIDEO_SPATIAL_FILTER,
    .name = "Spatial Filter",
    .type = V4L2_CTRL_TYPE_INTEGER,
    .flags = V4L2_CTRL_FLAG_SLIDER,
    .max = 15,
    .step = 1,
};

ctrl = v4l2_ctrl_new_custom(&foo->ctrl_handler, &ctrl_filter, NULL);
```

The last argument is the priv pointer which can be set to driver-specific private data. The `v4l2_ctrl_config` struct also has a field to set the `is_private` flag.

If the name field is not set, then the framework will assume this is a standard control and will fill in the name, type and flags fields accordingly.

2.2.13.8 Active and Grabbed Controls

If you get more complex relationships between controls, then you may have to activate and deactivate controls. For example, if the Chroma AGC control is on, then the Chroma Gain control is inactive. That is, you may set it, but the value will not be used by the hardware as long as the automatic gain control is on. Typically user interfaces can disable such input fields.

You can set the ‘active’ status using `v4l2_ctrl_activate()`. By default all controls are active. Note that the framework does not check for this flag. It is meant purely for GUIs. The function is typically called from within `s_ctrl`.

The other flag is the ‘grabbed’ flag. A grabbed control means that you cannot change it because it is in use by some resource. Typical examples are MPEG bitrate controls that cannot be changed while capturing is in progress.

If a control is set to ‘grabbed’ using `v4l2_ctrl_grab()`, then the framework will return -EBUSY if an attempt is made to set this control. The `v4l2_ctrl_grab()` function is typically called from the driver when it starts or stops streaming.

2.2.13.9 Control Clusters

By default all controls are independent from the others. But in more complex scenarios you can get dependencies from one control to another. In that case you need to ‘cluster’ them:

```c
struct foo {
    struct v4l2_ctrl_handler ctrl_handler;
    #define AUDIO_CL_VOLUME (0)
    #define AUDIO_CL_MUTE (1)
    struct v4l2_ctrl *audio_cluster[2];
    ...
};
```

2.2. Video4Linux devices
From now on whenever one or more of the controls belonging to the same cluster is set (or ‘gotten’, or ‘tried’), only the control ops of the first control (‘volume’ in this example) is called. You effectively create a new composite control. Similar to how a ‘struct’ works in C.

So when s_ctrl is called with V4L2_CID_AUDIO_VOLUME as argument, you should set all two controls belonging to the audio_cluster:

```c
static int foo_s_ctrl(struct v4l2_ctrl *ctrl)
{
    struct foo *state = container_of(ctrl->handler, struct foo, ctrl_handler);
    switch (ctrl->id) {
    case V4L2_CID_AUDIO_VOLUME: {
        struct v4l2_ctrl *mute = ctrl->cluster[AUDIO_CL_MUTE];
        write_reg(0x123, mute->val ? 0 : ctrl->val);
        break;
    }
    case V4L2_CID_CONTRAST:
        write_reg(0x456, ctrl->val);
        break;
    }
    return 0;
}
```

In the example above the following are equivalent for the VOLUME case:

```c
ctrl == ctrl->cluster[AUDIO_CL_VOLUME] == state->audio_cluster[AUDIO_CL_VOLUME]
ctrl->cluster[AUDIO_CL_MUTE] == state->audio_cluster[AUDIO_CL_MUTE]
```

In practice using cluster arrays like this becomes very tiresome. So instead the following equivalent method is used:

```c
struct {
    /* audio cluster */
    struct v4l2_ctrl *volume;
    struct v4l2_ctrl *mute;
};
```

The anonymous struct is used to clearly ‘cluster’ these two control pointers, but it serves no other purpose. The effect is the same as creating an array with two control pointers. So you can just do:

```c
state->volume = v4l2_ctrl_new_std(&state->ctrl_handler, ...);
state->mute = v4l2_ctrl_new_std(&state->ctrl_handler, ...);
v4l2_ctrl_cluster(2, &state->volume);
```

And in foo_s_ctrl you can use these pointers directly: state->mute->val.

Note that controls in a cluster may be NULL. For example, if for some reason mute was never added (because the hardware doesn’t support that particular feature), then mute will be NULL.
So in that case we have a cluster of 2 controls, of which only 1 is actually instantiated. The only restriction is that the first control of the cluster must always be present, since that is the ‘master’ control of the cluster. The master control is the one that identifies the cluster and that provides the pointer to the v4l2_ctrl_ops struct that is used for that cluster.

Obviously, all controls in the cluster array must be initialized to either a valid control or to NULL.

In rare cases you might want to know which controls of a cluster actually were set explicitly by the user. For this you can check the ‘is_new’ flag of each control. For example, in the case of a volume/mute cluster the ‘is_new’ flag of the mute control would be set if the user called VIDIOC_S_CTRL for mute only. If the user would call VIDIOC_S_EXT_CTRLS for both mute and volume controls, then the ‘is_new’ flag would be 1 for both controls.

The ‘is_new’ flag is always 1 when called from v4l2_ctrl_handler_setup().

### 2.2.13.10 Handling autogain/gain-type Controls with Auto Clusters

A common type of control cluster is one that handles ‘auto-foo/foo’-type controls. Typical examples are autogain/gain, autoexposure/exposure, autowhitebalance/red balance/blue balance. In all cases you have one control that determines whether another control is handled automatically by the hardware, or whether it is under manual control from the user.

If the cluster is in automatic mode, then the manual controls should be marked inactive and volatile. When the volatile controls are read the g_volatile_ctrl operation should return the value that the hardware’s automatic mode set up automatically.

If the cluster is put in manual mode, then the manual controls should become active again and the volatile flag is cleared (so g_volatile_ctrl is no longer called while in manual mode). In addition just before switching to manual mode the current values as determined by the auto mode are copied as the new manual values.

Finally the V4L2_CTRL_FLAG_UPDATE should be set for the auto control since changing that control affects the control flags of the manual controls.

In order to simplify this a special variation of v4l2_ctrl_cluster was introduced:

```c
void v4l2_ctrl_auto_cluster(unsigned ncontrols, struct v4l2_ctrl **controls,
                           u8 manual_val, bool set_volatile);
```

The first two arguments are identical to v4l2_ctrl_cluster. The third argument tells the framework which value switches the cluster into manual mode. The last argument will optionally set V4L2_CTRL_FLAG_VOLATILE for the non-auto controls. If it is false, then the manual controls are never volatile. You would typically use that if the hardware does not give you the option to read back to values as determined by the auto mode (e.g. if autogain is on, the hardware doesn’t allow you to obtain the current gain value).

The first control of the cluster is assumed to be the ‘auto’ control.

Using this function will ensure that you don’t need to handle all the complex flag and volatile handling.
2.2.13.11 VIDIOC_LOG_STATUS Support

This ioctl allow you to dump the current status of a driver to the kernel log. The
v4l2_ctrl_handler_log_status(ctrl_handler, prefix) can be used to dump the value of the con-
trols owned by the given handler to the log. You can supply a prefix as well. If the prefix didn’t
end with a space, then ‘: ‘ will be added for you.

2.2.13.12 Different Handlers for Different Video Nodes

Usually the V4L2 driver has just one control handler that is global for all video nodes. But
you can also specify different control handlers for different video nodes. You can do that by
manually setting the ctrl_handler field of struct video_device.

That is no problem if there are no subdevs involved but if there are, then you need
to block the automatic merging of subdev controls to the global control handler. You
do that by simply setting the ctrl_handler field in struct v4l2_device to NULL. Now
v4l2_device_register_subdev() will no longer merge subdev controls.

After each subdev was added, you will then have to call v4l2_ctrl_add_handler manually to add
the subdev’s control handler (sd->ctrl_handler) to the desired control handler. This control
handler may be specific to the video_device or for a subset of video_device’s. For example: the
radio device nodes only have audio controls, while the video and vbi device nodes share the
same control handler for the audio and video controls.

If you want to have one handler (e.g. for a radio device node) have a subset of another handler
(e.g. for a video device node), then you should first add the controls to the first handler, add
the other controls to the second handler and finally add the first handler to the second. For
example:

```c
v4l2_ctrl_new_std(&radio_ctrl_handler, &radio_ops, V4L2_CID_AUDIO_VOLUME, ...);
v4l2_ctrl_new_std(&radio_ctrl_handler, &radio_ops, V4L2_CID_AUDIO_MUTE, ...);
v4l2_ctrl_new_std(&video_ctrl_handler, &video_ops, V4L2_CID_BRIGHTNESS, ...);
v4l2_ctrl_new_std(&video_ctrl_handler, &video_ops, V4L2_CID_CONTRAST, ...);
v4l2_ctrl_add_handler(&video_ctrl_handler, &radio_ctrl_handler, NULL);
```

The last argument to v4l2_ctrl_add_handler() is a filter function that allows you to filter
which controls will be added. Set it to NULL if you want to add all controls.

Or you can add specific controls to a handler:

```c
volume = v4l2_ctrl_new_std(&video_ctrl_handler, &ops, V4L2_CID_AUDIO_VOLUME, ...);
v4l2_ctrl_new_std(&video_ctrl_handler, &ops, V4L2_CID_BRIGHTNESS, ...);
v4l2_ctrl_new_std(&video_ctrl_handler, &ops, V4L2_CID_CONTRAST, ...);
```

What you should not do is make two identical controls for two handlers. For example:

```c
v4l2_ctrl_new_std(&radio_ctrl_handler, &radio_ops, V4L2_CID_AUDIO_MUTE, ...);
v4l2_ctrl_new_std(&video_ctrl_handler, &video_ops, V4L2_CID_AUDIO_MUTE, ...);
```

This would be bad since muting the radio would not change the video mute control. The rule is
to have one control for each hardware ‘knob’ that you can twiddle.
2.2.13.13 Finding Controls

Normally you have created the controls yourself and you can store the `struct v4l2_ctrl` pointer into your own struct.

But sometimes you need to find a control from another handler that you do not own. For example, if you have to find a volume control from a subdev.

You can do that by calling `v4l2_ctrl_find`:

```c
struct v4l2_ctrl *volume;
volume = v4l2_ctrl_find(sd->ctrl_handler, V4L2_CID_AUDIO_VOLUME);
```

Since `v4l2_ctrl_find` will lock the handler you have to be careful where you use it. For example, this is not a good idea:

```c
struct v4l2_ctrl_handler ctrl_handler;

v4l2_ctrl_new_std(&ctrl_handler, &video_ops, V4L2_CID_BRIGHTNESS, ...);
v4l2_ctrl_new_std(&ctrl_handler, &video_ops, V4L2_CID_CONTRAST, ...);
```

...and in `video_ops.s_ctrl`:

```c
case V4L2_CID_BRIGHTNESS:
    contrast = v4l2_find_ctrl(&ctrl_handler, V4L2_CID_CONTRAST);
...
```

When `s_ctrl` is called by the framework the `ctrl_handler.lock` is already taken, so attempting to find another control from the same handler will deadlock.

It is recommended not to use this function from inside the control ops.

2.2.13.14 Preventing Controls inheritance

When one control handler is added to another using `v4l2_ctrl_add_handler`, then by default all controls from one are merged to the other. But a subdev might have low-level controls that make sense for some advanced embedded system, but not when it is used in consumer-level hardware. In that case you want to keep those low-level controls local to the subdev. You can do this by simply setting the `is_private` flag of the control to 1:

```c
static const struct v4l2_ctrl_config ctrl_private = {
    .ops = &ctrl_custom_ops,
    .id = V4L2_CID,...,
    .name = "Some Private Control",
    .type = V4L2_CTRL_TYPE_INTEGER,
    .max = 15,
    .step = 1,
    .is_private = 1,
};

ctrl = v4l2_ctrl_new_custom(&foo->ctrl_handler, &ctrl_private, NULL);
```

These controls will now be skipped when `v4l2_ctrl_add_handler` is called.
2.2.13.15 V4L2_CTRL_TYPE_CTRL_CLASS Controls

Controls of this type can be used by GUIs to get the name of the control class. A fully featured GUI can make a dialog with multiple tabs with each tab containing the controls belonging to a particular control class. The name of each tab can be found by querying a special control with ID <control class|1>.

Drivers do not have to care about this. The framework will automatically add a control of this type whenever the first control belonging to a new control class is added.

2.2.13.16 Adding Notify Callbacks

Sometimes the platform or bridge driver needs to be notified when a control from a sub-device driver changes. You can set a notify callback by calling this function:

```c
void v4l2_ctrl_notify(struct v4l2_ctrl *ctrl, void (*)(struct v4l2_ctrl *ctrl, void *priv), void *priv);
```

Whenever the given control changes value the notify callback will be called with a pointer to the control and the priv pointer that was passed with v4l2_ctrl_notify. Note that the control’s handler lock is held when the notify function is called.

There can be only one notify function per control handler. Any attempt to set another notify function will cause a WARN_ON.

2.2.13.17 v4l2_ctrl functions and data structures

union v4l2_ctrl_ptr

A pointer to a control value.

Definition

```c
union v4l2_ctrl_ptr {
    s32 *p_s32;
    s64 *p_s64;
    u8 *p_u8;
    u16 *p_u16;
    u32 *p_u32;
    char *p_char;
    struct v4l2_ctrl_mpeg2_sequence *p_mpeg2_sequence;
    struct v4l2_ctrl_mpeg2_picture *p_mpeg2_picture;
    struct v4l2_ctrl_mpeg2_quantisation *p_mpeg2_quantisation;
    struct v4l2_ctrl_fwht_params *p_fwht_params;
    struct v4l2_ctrl_h264_sps *p_h264_sps;
    struct v4l2_ctrl_h264_pss *p_h264_pss;
    struct v4l2_ctrl_h264_scaling_matrix *p_h264_scaling_matrix;
    struct v4l2_ctrl_h264_slice_params *p_h264_slice_params;
    struct v4l2_ctrl_h264_decode_params *p_h264_decode_params;
    struct v4l2_ctrl_h264_pred_weights *p_h264_pred_weights;
    struct v4l2_ctrl_vp8_frame *p_vp8_frame;
    struct v4l2_ctrl_hevc_sps *p_hevc_sps;
    struct v4l2_ctrl_hevc_pss *p_hevc_pss;
    struct v4l2_ctrl_hevc_slice_params *p_hevc_slice_params;
    struct v4l2_ctrl_hdr10_cll_info *p_hdr10_cll;
    struct v4l2_ctrl_hdr10_mastering_display *p_hdr10_mastering;
};
```
struct v4l2_area *p_area;
void *p;
const void *p_const;
}

Members

p_s32 Pointer to a 32-bit signed value.
p_s64 Pointer to a 64-bit signed value.
p_u8 Pointer to a 8-bit unsigned value.
p_u16 Pointer to a 16-bit unsigned value.
p_u32 Pointer to a 32-bit unsigned value.
p_char Pointer to a string.
p_mpeg2_sequence Pointer to a MPEG2 sequence structure.
p_mpeg2_picture Pointer to a MPEG2 picture structure.
p_mpeg2_quantisation Pointer to a MPEG2 quantisation data structure.
p_fwhit_params Pointer to a FWHT stateless parameters structure.
p_h264_sps Pointer to a struct v4l2_ctrl_h264_sps.
p_h264_pps Pointer to a struct v4l2_ctrl_h264_pps.
p_h264_scaling_matrix Pointer to a struct v4l2_ctrl_h264_scaling_matrix.
p_h264_slice_params Pointer to a struct v4l2_ctrl_h264_slice_params.
p_h264_decode_params Pointer to a struct v4l2_ctrl_h264_decode_params.
p_h264_pred_weights Pointer to a struct v4l2_ctrl_h264_pred_weights.
p_vp8_frame Pointer to a VP8 frame params structure.
p_hevc_sps Pointer to an HEVC sequence parameter set structure.
p_hevc_pps Pointer to an HEVC picture parameter set structure.
p_hevc_slice_params Pointer to an HEVC slice parameters structure.
p_hdr10_cll Pointer to an HDR10 Content Light Level structure.
p_hdr10_mastering Pointer to an HDR10 Mastering Display structure.
p_area Pointer to an area.
p Pointer to a compound value.
p_const Pointer to a constant compound value.

union v4l2_ctrl_ptr v4l2_ctrl_ptr_create(void *ptr)
    Helper function to return a v4l2_ctrl_ptr from a void pointer

Parameters

void *ptr The void pointer
struct v4l2_ctrl_ops The control operations that the driver has to provide.
Definition

```c
struct v4l2_ctrl_ops {
    int (*g_volatile_ctrl)(struct v4l2_ctrl *ctrl);
    int (*try_ctrl)(struct v4l2_ctrl *ctrl);
    int (*s_ctrl)(struct v4l2_ctrl *ctrl);
};
```

**Members**

**g_volatile_ctrl** Get a new value for this control. Generally only relevant for volatile (and usually read-only) controls such as a control that returns the current signal strength which changes continuously. If not set, then the currently cached value will be returned.

**try_ctrl** Test whether the control’s value is valid. Only relevant when the usual min/max/step checks are not sufficient.

**s_ctrl** Actually set the new control value. s_ctrl is compulsory. The ctrl->handler->lock is held when these ops are called, so no one else can access controls owned by that handler.

**struct v4l2_ctrl_type_ops**
The control type operations that the driver has to provide.

Definition

```c
struct v4l2_ctrl_type_ops {
    bool (*equal)(const struct v4l2_ctrl *ctrl, u32 idx, union v4l2_ctrl_ptr ptr1, union v4l2_ctrl_ptr ptr2);
    void (*init)(const struct v4l2_ctrl *ctrl, u32 idx, union v4l2_ctrl_ptr ptr);
    void (*log)(const struct v4l2_ctrl *ctrl);
    int (*validate)(const struct v4l2_ctrl *ctrl, u32 idx, union v4l2_ctrl_ptr ptr);
};
```

**Members**

**equal** return true if both values are equal.

**init** initialize the value.

**log** log the value.

**validate** validate the value. Return 0 on success and a negative value otherwise.

**v4l2_ctrl_notify_fnc**
**Typedef**: typedef for a notify argument with a function that should be called when a control value has changed.

**Syntax**

```c
void v4l2_ctrl_notify_fnc (struct v4l2_ctrl *ctrl, void *priv)
```

**Parameters**

**struct v4l2_ctrl *ctrl** pointer to struct v4l2_ctrl

**void *priv** control private data

**Description**

This typedef definition is used as an argument to `v4l2_ctrl_notify()` and as an argument at struct `v4l2_ctrl_handler`. 
struct **v4l2_ctrl**
The control structure.

**Definition**

```
struct v4l2_ctrl {
    struct list_head node;
    struct list_head ev_subs;
    struct v4l2_ctrl_handler *handler;
    struct v4l2_ctrl **cluster;
    unsigned int ncontrols;
    unsigned int done:1;
    unsigned int is_new:1;
    unsigned int has_changed:1;
    unsigned int is_private:1;
    unsigned int is_auto:1;
    unsigned int is_int:1;
    unsigned int is_string:1;
    unsigned int is_ptr:1;
    unsigned int is_array:1;
    unsigned int has_volatiles:1;
    unsigned int call_notify:1;
    unsigned int manual_mode_value:8;
    const struct v4l2_ctrl_ops *ops;
    const struct v4l2_ctrl_type_ops *type_ops;
    u32 id;
    const char *name;
    enum v4l2_ctrl_type type;
    s64 minimum, maximum, default_value;
    u32 elements;
    u32 element_size;
    u32 dims[V4L2_CTRL_MAX_DIMS];
    u32 nr_of_dims;
    union {
        u64 step;
        u64 menu_skip_mask;
    };
    union {
        const char *const *qmenu;
        const s64 *qmenu_int;
    };
    unsigned long flags;
    void *priv;
    s32 val;
    struct {
        s32 val;
    } cur;
    union v4l2_ctrl_ptr p_def;
    union v4l2_ctrl_ptr p_new;
    union v4l2_ctrl_ptr p_cur;
};
```

Members

**node** The list node.

**ev_subs** The list of control event subscriptions.

**handler** The handler that owns the control.

2.2. Video4Linux devices
cluster  Point to start of cluster array.

ncontrols  Number of controls in cluster array.

done  Internal flag: set for each processed control.

is_new  Set when the user specified a new value for this control. It is also set when called from v4l2_ctrl_handler_setup(). Drivers should never set this flag.

has_changed  Set when the current value differs from the new value. Drivers should never use this flag.

is_private  If set, then this control is private to its handler and it will not be added to any other handlers. Drivers can set this flag.

is_auto  If set, then this control selects whether the other cluster members are in ‘automatic’ mode or ‘manual’ mode. This is used for autogain/gain type clusters. Drivers should never set this flag directly.

is_int  If set, then this control has a simple integer value (i.e. it uses ctrl->val).

is_string  If set, then this control has type V4L2_CTRL_TYPE_STRING.

is_ptr  If set, then this control is an array and/or has type >= V4L2_CTRL_COMPOUND_TYPES and/or has type V4L2_CTRL_TYPE_STRING. In other words, struct v4l2_ext_control uses field p to point to the data.

is_array  If set, then this control contains an N-dimensional array.

has_voltiles  If set, then one or more members of the cluster are volatile. Drivers should never touch this flag.

call_notify  If set, then call the handler’s notify function whenever the control’s value changes.

manual_mode_value  If the is_auto flag is set, then this is the value of the auto control that determines if that control is in manual mode. So if the value of the auto control equals this value, then the whole cluster is in manual mode. Drivers should never set this flag directly.

ops  The control ops.

type_ops  The control type ops.

id  The control ID.

name  The control name.

type  The control type.

minimum  The control’s minimum value.

maximum  The control’s maximum value.

default_value  The control’s default value.

elems  The number of elements in the N-dimensional array.

elem_size  The size in bytes of the control.

dims  The size of each dimension.

nr_of_dims  The number of dimensions in dims.
anonymous

{anonymous} anonymous

**step** The control’s step value for non-menu controls.

**menu_skip_mask** The control’s skip mask for menu controls. This makes it easy to skip menu items that are not valid. If bit X is set, then menu item X is skipped. Of course, this only works for menus with <= 32 menu items. There are no menus that come close to that number, so this is OK. Should we ever need more, then this will have to be extended to a u64 or a bit array.

{anonymous} anonymous

**qmenu** A const char * array for all menu items. Array entries that are empty strings ("") correspond to non-existing menu items (this is in addition to the menu_skip_mask above). The last entry must be NULL. Used only if the **type** is V4L2_CTRL_TYPE_MENU.

**qmenu_int** A 64-bit integer array for with integer menu items. The size of array must be equal to the menu size, e. g.: \(ceil\left(\frac{maximum - minimum}{step}\right) + 1\). Used only if the **type** is V4L2_CTRL_TYPE_INTEGER_MENU.

**flags** The control’s flags.

**priv** The control’s private pointer. For use by the driver. It is untouched by the control framework. Note that this pointer is not freed when the control is deleted. Should this be needed then a new internal bitfield can be added to tell the framework to free this pointer.

**val** The control’s new s32 value.

**cur** Structure to store the current value.

**cur.val** The control’s current value, if the **type** is represented via a u32 integer (see enum v4l2_ctrl_type).

**p_def** The control’s default value represented via a union which provides a standard way of accessing control types through a pointer (for compound controls only).

**p_new** The control’s new value represented via a union which provides a standard way of accessing control types through a pointer.

**p_cur** The control’s current value represented via a union which provides a standard way of accessing control types through a pointer.

**struct v4l2_ctrl_ref**

The control reference.

**Definition**

```c
struct v4l2_ctrl_ref {
    struct list_head node;
    struct v4l2_ctrl_ref *next;
    struct v4l2_ctrl *ctrl;
    struct v4l2_ctrl_helper *helper;
    bool from_other_dev;
    bool req_done;
    bool valid_p_req;
    union v4l2_ctrl_ptr p_req;
};
```

**Members**

**node** List node for the sorted list.

---

### 2.2. Video4Linux devices

315
next  Single-link list node for the hash.

ctrl  The actual control information.

helper  Pointer to helper struct. Used internally in prepare_extCtrls function at v4l2-ctrl.c.

from_other_dev  If true, then ctrl was defined in another device than the struct v4l2_ctrl_handler.

req_done  Internal flag: if the control handler containing this control reference is bound to a media request, then this is set when the control has been applied. This prevents applying controls from a cluster with multiple controls twice (when the first control of a cluster is applied, they all are).

valid_p_req  If set, then p_req contains the control value for the request.

p_req  If the control handler containing this control reference is bound to a media request, then this points to the value of the control that must be applied when the request is executed, or to the value of the control at the time that the request was completed. If valid_p_req is false, then this control was never set for this request and the control will not be updated when this request is applied.

Description

Each control handler has a list of these refs. The list_head is used to keep a sorted-by-control-ID list of all controls, while the next pointer is used to link the control in the hash’s bucket.

struct v4l2_ctrl_handler
The control handler keeps track of all the controls: both the controls owned by the handler and those inherited from other handlers.

Definition

```c
struct v4l2_ctrl_handler {
    struct mutex _lock;
    struct mutex *lock;
    struct list_head ctrls;
    struct list_head ctrl_refs;
    struct v4l2_ctrl_ref *cached;
    struct v4l2_ctrl_ref **buckets;
    v4l2_ctrl_notify_fnc notify;
    void *notify_priv;
    u16 nr_of_buckets;
    int error;
    bool request_is_queued;
    struct list_head requests;
    struct list_head requests_queued;
    struct media_request_object req_obj;
};
```

Members

_lock  Default for “lock”.

lock  Lock to control access to this handler and its controls. May be replaced by the user right after init.

ctrls  The list of controls owned by this handler.
**ctrl_refs**  The list of control references.

**cached**  The last found control reference. It is common that the same control is needed multiple times, so this is a simple optimization.

**buckets**  Buckets for the hashing. Allows for quick control lookup.

**notify**  A notify callback that is called whenever the control changes value. Note that the handler’s lock is held when the notify function is called!

**notify_priv**  Passed as argument to the v4l2_ctrl notify callback.

**nr_of_buckets**  Total number of buckets in the array.

**error**  The error code of the first failed control addition.

**request_is_queued**  True if the request was queued.

**requests**  List to keep track of open control handler request objects. For the parent control handler (req_obj.ops == NULL) this is the list header. When the parent control handler is removed, it has to unbind and put all these requests since they refer to the parent.

**requests_queued**  List of the queued requests. This determines the order in which these controls are applied. Once the request is completed it is removed from this list.

**req_obj**  The `struct media_request_object`, used to link into a `struct media_request`. This request object has a refcount.

**struct v4l2_ctrl_config**  Control configuration structure.

### Definition

```c
struct v4l2_ctrl_config {
    const struct v4l2_ctrl_ops *ops;
    const struct v4l2_ctrl_type_ops *type_ops;
    u32 id;
    const char *name;
    enum v4l2_ctrl_type type;
    s64 min;
    s64 max;
    u64 step;
    s64 def;
    union v4l2_ctrl_ptr p_def;
    u32 dims[V4L2_CTRL_MAX_DIMS];
    u32 elem_size;
    u32 flags;
    u64 menu_skip_mask;
    const char * const *qmenu;
    const s64 *qmenu_int;
    unsigned int is_private:1;
};
```

### Members

**ops**  The control ops.

**type_ops**  The control type ops. Only needed for compound controls.

**id**  The control ID.

**name**  The control name.
type The control type.

min The control’s minimum value.

max The control’s maximum value.

step The control’s step value for non-menu controls.

def The control’s default value.

p_def The control’s default value for compound controls.

dims The size of each dimension.

elem_size The size in bytes of the control.

flags The control’s flags.

menu_skip_mask The control’s skip mask for menu controls. This makes it easy to skip menu items that are not valid. If bit X is set, then menu item X is skipped. Of course, this only works for menus with \( \leq 64 \) menu items. There are no menus that come close to that number, so this is OK. Should we ever need more, then this will have to be extended to a bit array.

qmenu A const char * array for all menu items. Array entries that are empty strings (""") correspond to non-existing menu items (this is in addition to the menu_skip_mask above). The last entry must be NULL.

qmenu_int A const s64 integer array for all menu items of the type V4L2_CTRL_TYPE_INTEGER_MENU.

is_private If set, then this control is private to its handler and it will not be added to any other handlers.

void v4l2_ctrl_fill(u32 id, const char **name, enum v4l2_ctrl_type *type, s64 *min, s64 *max, u64 *step, s64 *def, u32 *flags)

Fill in the control fields based on the control ID.

Parameters

u32 id ID of the control

const char **name pointer to be filled with a string with the name of the control

enum v4l2_ctrl_type *type pointer for storing the type of the control

s64 *min pointer for storing the minimum value for the control

s64 *max pointer for storing the maximum value for the control

u64 *step pointer for storing the control step

s64 *def pointer for storing the default value for the control

u32 *flags pointer for storing the flags to be used on the control

Description

This works for all standard V4L2 controls. For non-standard controls it will only fill in the given arguments and name content will be set to NULL.

This function will overwrite the contents of name, type and flags. The contents of min, max, step and def may be modified depending on the type.
Note: Do not use in drivers! It is used internally for backwards compatibility control handling only. Once all drivers are converted to use the new control framework this function will no longer be exported.

```c
int v4l2_ctrl_handler_init_class(
    struct v4l2_ctrl_handler *hdl, 
    unsigned int nr_of_controls_hint, 
    struct lock_class_key *key, 
    const char *name)
```

Initialize the control handler.

### Parameters

- **struct v4l2_ctrl_handler *hdl** The control handler.
- **unsigned int nr_of_controls_hint** A hint of how many controls this handler is expected to refer to. This is the total number, so including any inherited controls. It doesn’t have to be precise, but if it is way off, then you either waste memory (too many buckets are allocated) or the control lookup becomes slower (not enough buckets are allocated, so there are more slow list lookups). It will always work, though.
- **struct lock_class_key *key** Used by the lock validator if CONFIG_LOCKDEP is set.
- **const char *name** Used by the lock validator if CONFIG_LOCKDEP is set.

### Description

**Attention:** Never use this call directly, always use the `v4l2_ctrl_handler_init()` macro that hides the `key` and `name` arguments.

### Return

Returns an error if the buckets could not be allocated. This error will also be stored in `hdl->error`.

```c
v4l2_ctrl_handler_init(hdl, nr_of_controls_hint)
```

Helper function to create a static struct lock_class_key and calls `v4l2_ctrl_handler_init_class()`.

### Parameters

- **hdl** The control handler.
- **nr_of_controls_hint** A hint of how many controls this handler is expected to refer to. This is the total number, so including any inherited controls. It doesn’t have to be precise, but if it is way off, then you either waste memory (too many buckets are allocated) or the control lookup becomes slower (not enough buckets are allocated, so there are more slow list lookups). It will always work, though.

### Description

This helper function creates a static struct lock_class_key and calls `v4l2_ctrl_handler_init_class()`, providing a proper name for the lock validator.

Use this helper function to initialize a control handler.

```c
void v4l2_ctrl_handler_free(struct v4l2_ctrl_handler *hdl)
```

Free all controls owned by the handler and free the control list.

### 2.2. Video4Linux devices
**Parameters**

`struct v4l2_ctrl_handler *hdl` The control handler.

**Description**

Does nothing if `hdl == NULL`.

```c
void v4l2_ctrl_lock(struct v4l2_ctrl *ctrl)
    Helper function to lock the handler associated with the control.
```

**Parameters**

`struct v4l2_ctrl *ctrl` The control to lock.

```c
void v4l2_ctrl_unlock(struct v4l2_ctrl *ctrl)
    Helper function to unlock the handler associated with the control.
```

**Parameters**

`struct v4l2_ctrl *ctrl` The control to unlock.

```c
int __v4l2_ctrl_handler_setup(struct v4l2_ctrl_handler *hdl)
    Call the s_ctrl_op for all controls belonging to the handler to initialize the hardware to the current control values. The caller is responsible for acquiring the control handler mutex on behalf of __v4l2_ctrl_handler_setup().
```

**Parameters**

`struct v4l2_ctrl_handler *hdl` The control handler.

**Description**

Button controls will be skipped, as are read-only controls.

If `hdl == NULL`, then this just returns 0.

```c
int v4l2_ctrl_handler_setup(struct v4l2_ctrl_handler *hdl)
    Call the s_ctrl_op for all controls belonging to the handler to initialize the hardware to the current control values.
```

**Parameters**

`struct v4l2_ctrl_handler *hdl` The control handler.

**Description**

Button controls will be skipped, as are read-only controls.

If `hdl == NULL`, then this just returns 0.

```c
void v4l2_ctrl_handler_log_status(struct v4l2_ctrl_handler *hdl, const char *prefix)
    Log all controls owned by the handler.
```

**Parameters**

`struct v4l2_ctrl_handler *hdl` The control handler.

**const char *prefix** The prefix to use when logging the control values. If the prefix does not end with a space, then “: ” will be added after the prefix. If `prefix == NULL`, then no prefix will be used.

**Description**

For use with VIDIOC_LOG_STATUS.
Does nothing if `hdl == NULL`.

```c
struct v4l2_ctrl *v4l2_ctrl_new_custom(struct v4l2_ctrl_handler *hdl, const struct v4l2_ctrl_config *cfg, void *priv)
```

Allocate and initialize a new custom V4L2 control.

**Parameters**

- `struct v4l2_ctrl_handler *hdl` The control handler.
- `const struct v4l2_ctrl_config *cfg` The control’s configuration data.
- `void *priv` The control’s driver-specific private data.

**Description**

If the `v4l2_ctrl` struct could not be allocated then NULL is returned and `hdl->error` is set to the error code (if it wasn’t set already).

```c
struct v4l2_ctrl *v4l2_ctrl_new_std(struct v4l2_ctrl_handler *hdl, const struct v4l2_ctrl_ops *ops, u32 id, s64 min, s64 max, u64 step, s64 def)
```

Allocate and initialize a new standard V4L2 non-menu control.

**Parameters**

- `struct v4l2_ctrl_handler *hdl` The control handler.
- `const struct v4l2_ctrl_ops *ops` The control ops.
- `u32 id` The control ID.
- `s64 min` The control’s minimum value.
- `s64 max` The control’s maximum value.
- `u64 step` The control’s step value
- `s64 def` The control’s default value.

**Description**

If the `v4l2_ctrl` struct could not be allocated, or the control ID is not known, then NULL is returned and `hdl->error` is set to the appropriate error code (if it wasn’t set already).

If `id` refers to a menu control, then this function will return NULL.

Use `v4l2_ctrl_new_std_menu()` when adding menu controls.

```c
struct v4l2_ctrl *v4l2_ctrl_new_std_menu(struct v4l2_ctrl_handler *hdl, const struct v4l2_ctrl_ops *ops, u32 id, u8 max, u64 mask, u8 def)
```

Allocate and initialize a new standard V4L2 menu control.

**Parameters**

- `struct v4l2_ctrl_handler *hdl` The control handler.
- `const struct v4l2_ctrl_ops *ops` The control ops.
- `u32 id` The control ID.
- `u8 max` The control’s maximum value.
u64 mask  The control’s skip mask for menu controls. This makes it easy to skip menu items that are not valid. If bit X is set, then menu item X is skipped. Of course, this only works for menus with <= 64 menu items. There are no menus that come close to that number, so this is OK. Should we ever need more, then this will have to be extended to a bit array.

u8 def  The control’s default value.

Description
Same as \texttt{v4l2\_ctrl\_new\_std()}, but \texttt{min} is set to 0 and the \texttt{mask} value determines which menu items are to be skipped.

If \texttt{id} refers to a non-menu control, then this function will return NULL.

\begin{verbatim}
struct v4l2\_ctrl \* v4l2\_ctrl\_new\_std\_menu\_items( struct v4l2\_ctrl\_handler \*hdl, const struct v4l2\_ctrl\_ops \*ops, u32 id, u8 max, u64 mask, u8 def, const char \* const \*qmenu)

Create a new standard V4L2 menu control with driver specific menu.
\end{verbatim}

Parameters
\begin{itemize}
\item \texttt{struct v4l2\_ctrl\_handler \*hdl}  The control handler.
\item \texttt{const struct v4l2\_ctrl\_ops \*ops}  The control ops.
\item \texttt{u32 id}  The control ID.
\item \texttt{u8 max}  The control’s maximum value.
\item \texttt{u64 mask}  The control’s skip mask for menu controls. This makes it easy to skip menu items that are not valid. If bit X is set, then menu item X is skipped. Of course, this only works for menus with <= 64 menu items. There are no menus that come close to that number, so this is OK. Should we ever need more, then this will have to be extended to a bit array.
\item \texttt{u8 def}  The control’s default value.
\item \texttt{const char \* const \*qmenu}  The new menu.
\end{itemize}

Description
Same as \texttt{v4l2\_ctrl\_new\_std\_menu()}, but \texttt{qmenu} will be the driver specific menu of this control.

\begin{verbatim}
struct v4l2\_ctrl \* v4l2\_ctrl\_new\_std\_compound( struct v4l2\_ctrl\_handler \*hdl, const struct v4l2\_ctrl\_ops \*ops, u32 id, const union v4l2\_ctrl\_ptr p\_def)

Allocate and initialize a new standard V4L2 compound control.
\end{verbatim}

Parameters
\begin{itemize}
\item \texttt{struct v4l2\_ctrl\_handler \*hdl}  The control handler.
\item \texttt{const struct v4l2\_ctrl\_ops \*ops}  The control ops.
\item \texttt{u32 id}  The control ID.
\item \texttt{const union v4l2\_ctrl\_ptr p\_def}  The control’s default value.
\end{itemize}

Description
Same as `v4l2_ctrl_new_std()`, but with support to compound controls, thanks to the `p_def` field. Use `v4l2_ctrl_ptr_create()` to create `p_def` from a pointer. Use `v4l2_ctrl_ptr_create(NULL)` if the default value of the compound control should be all zeroes.

```c
struct v4l2_ctrl *v4l2_ctrl_new_int_menu(struct v4l2_ctrl_handler *hdl, const struct v4l2_ctrl_ops *ops, u32 id, u8 max, u8 def, const s64 *qmenu_int)
```

Create a new standard V4L2 integer menu control.

**Parameters**

- `struct v4l2_ctrl_handler *hdl` The control handler.
- `const struct v4l2_ctrl_ops *ops` The control ops.
- `u32 id` The control ID.
- `u8 max` The control’s maximum value.
- `u8 def` The control’s default value.
- `const s64 *qmenu_int` The control’s menu entries.

**Description**

Same as `v4l2_ctrl_new_std_menu()`, but `mask` is set to 0 and it additionally takes as an argument an array of integers determining the menu items.

If `id` refers to a non-integer-menu control, then this function will return NULL.

**v4l2_ctrl_filter**

**Typedef:** Typedef to define the filter function to be used when adding a control handler.

**Syntax**

```c
bool v4l2_ctrl_filter (const struct v4l2_ctrl *ctrl)
```

**Parameters**

- `const struct v4l2_ctrl *ctrl` pointer to struct `v4l2_ctrl`.

**Syntax**

```c
int v4l2_ctrl_add_handler(struct v4l2_ctrl_handler *hdl, struct v4l2_ctrl_handler *add, v4l2_ctrl_filter filter, bool from_other_dev)
```

Add all controls from handler `add` to handler `hdl`.

**Parameters**

- `struct v4l2_ctrl_handler *hdl` The control handler.
- `struct v4l2_ctrl_handler *add` The control handler whose controls you want to add to the `hdl` control handler.
- `v4l2_ctrl_filter filter` This function will filter which controls should be added.
- `bool from_other_dev` If true, then the controls in `add` were defined in another device than `hdl`.

**Description**

Does nothing if either of the two handlers is a NULL pointer. If `filter` is NULL, then all controls are added. Otherwise only those controls for which `filter` returns true will be added. In case of an error `hdl->error` will be set to the error code (if it wasn’t set already).
bool v4l2_ctrl_radio_filter(const struct v4l2_ctrl *ctrl)
        Standard filter for radio controls.

Parameters

const struct v4l2_ctrl *ctrl The control that is filtered.

Description

This will return true for any controls that are valid for radio device nodes. Those are all of the
V4L2_CID_AUDIO_* user controls and all FM transmitter class controls.

This function is to be used with v4l2_ctrl_add_handler().

void v4l2_ctrl_cluster(unsigned int ncontrols, struct v4l2_ctrl **controls)
        Mark all controls in the cluster as belonging to that cluster.

Parameters

unsigned int ncontrols The number of controls in this cluster.
struct v4l2_ctrl **controls The cluster control array of size ncontrols.

void v4l2_ctrl_auto_cluster(unsigned int ncontrols, struct v4l2_ctrl **controls,
                           u8 manual_val, bool set_volatile)
        Mark all controls in the cluster as belonging to that cluster and set it up for autofoo/foo-
type handling.

Parameters

unsigned int ncontrols The number of controls in this cluster.
struct v4l2_ctrl **controls The cluster control array of size ncontrols. The first control
must be the ‘auto’ control (e.g. autogain, autoexposure, etc.)
u8 manual_val The value for the first control in the cluster that equals the manual setting.
bool set_volatile If true, then all controls except the first auto control will be volatile.

Description

Use for control groups where one control selects some automatic feature and the other controls
are only active whenever the automatic feature is turned off (manual mode). Typical examples:
autogain vs gain, auto-whitebalance vs red and blue balance, etc.

The behavior of such controls is as follows:

When the autofoo control is set to automatic, then any manual controls are set to inactive and
any reads will call g_volatile_ctrl (if the control was marked volatile).

When the autofoo control is set to manual, then any manual controls will be marked active, and
any reads will just return the current value without going through g_volatile_ctrl.

In addition, this function will set the V4L2_CTRL_FLAG_UPDATE flag on the autofoo control and
V4L2_CTRL_FLAG_INACTIVE on the foo control(s) if autofoo is in auto mode.

struct v4l2_ctrl *v4l2_ctrl_find(struct v4l2_ctrl_handler *hdl, u32 id)
        Find a control with the given ID.

Parameters

struct v4l2_ctrl_handler *hdl The control handler.
u32 id The control ID to find.
Description
If hdl == NULL this will return NULL as well. Will lock the handler so do not use from inside v4l2_ctrl_ops.

```c
void v4l2_ctrl_activate(struct v4l2_ctrl *ctrl, bool active)
    Make the control active or inactive.
```

**Parameters**
- **struct v4l2_ctrl *ctrl** The control to (de)activate.
- **bool active** True if the control should become active.

**Description**
This sets or clears the V4L2_CTRL_FLAG_INACTIVE flag atomically. Does nothing if ctrl == NULL. This will usually be called from within the s_ctrl op. The V4L2_EVENT_CTRL event will be generated afterwards.

This function assumes that the control handler is locked.

```c
void __v4l2_ctrl_grab(struct v4l2_ctrl *ctrl, bool grabbed)
    Unlocked variant of v4l2_ctrl_grab.
```

**Parameters**
- **struct v4l2_ctrl *ctrl** The control to (de)activate.
- **bool grabbed** True if the control should become grabbed.

**Description**
This sets or clears the V4L2_CTRL_FLAG_GRABBED flag atomically. Does nothing if ctrl == NULL. The V4L2_EVENT_CTRL event will be generated afterwards. This will usually be called when starting or stopping streaming in the driver.

This function assumes that the control handler is locked by the caller.

```c
void v4l2_ctrl_grab(struct v4l2_ctrl *ctrl, bool grabbed)
    Mark the control as grabbed or not grabbed.
```

**Parameters**
- **struct v4l2_ctrl *ctrl** The control to (de)activate.
- **bool grabbed** True if the control should become grabbed.

**Description**
This sets or clears the V4L2_CTRL_FLAG_GRABBED flag atomically. Does nothing if ctrl == NULL. The V4L2_EVENT_CTRL event will be generated afterwards. This will usually be called when starting or stopping streaming in the driver.

This function assumes that the control handler is not locked and will take the lock itself.

```c
int __v4l2_ctrl_modify_range(struct v4l2_ctrl *ctrl, s64 min, s64 max, u64 step, s64 def)
    Unlocked variant of v4l2_ctrl_modify_range()
```

**Parameters**
- **struct v4l2_ctrl *ctrl** The control to update.
s64 min The control’s minimum value.
s64 max The control’s maximum value.
u64 step The control’s step value
s64 def The control’s default value.

Description
Update the range of a control on the fly. This works for control types INTEGER, BOOLEAN, MENU, INTEGER MENU and BITMASK. For menu controls the step value is interpreted as a menu_skip_mask.

An error is returned if one of the range arguments is invalid for this control type.
The caller is responsible for acquiring the control handler mutex on behalf of __v4l2_ctrl_modify_range().

```
int v4l2_ctrl_modify_range(struct v4l2_ctrl *ctrl, s64 min, s64 max, u64 step, s64 def)
```
Update the range of a control.

Parameters
struct v4l2_ctrl *ctrl The control to update.
s64 min The control’s minimum value.
s64 max The control’s maximum value.
u64 step The control’s step value
s64 def The control’s default value.

Description
Update the range of a control on the fly. This works for control types INTEGER, BOOLEAN, MENU, INTEGER MENU and BITMASK. For menu controls the step value is interpreted as a menu_skip_mask.

An error is returned if one of the range arguments is invalid for this control type.

This function assumes that the control handler is not locked and will take the lock itself.

```
void v4l2_ctrl_notify(struct v4l2_ctrl *ctrl, v4l2_ctrl_notify_fnc notify, void *priv)
```
Function to set a notify callback for a control.

Parameters
struct v4l2_ctrl *ctrl The control.
v4l2_ctrl_notify_fnc notify The callback function.
void *priv The callback private handle, passed as argument to the callback.

Description
This function sets a callback function for the control. If ctrl is NULL, then it will do nothing. If notify is NULL, then the notify callback will be removed.

There can be only one notify. If another already exists, then a WARN_ON will be issued and the function will do nothing.

```
const char *v4l2_ctrl_get_name(u32 id)
```
Get the name of the control
Parameters

u32 id The control ID.

Description

This function returns the name of the given control ID or NULL if it isn’t a known control.

const char * const * v4l2_ctrl_get_menu(u32 id)
    Get the menu string array of the control

Parameters

u32 id The control ID.

Description

This function returns the NULL-terminated menu string array name of the given control ID or NULL if it isn’t a known menu control.

const s64 * v4l2_ctrl_get_int_menu(u32 id, u32 *len)
    Get the integer menu array of the control

Parameters

u32 id The control ID.

u32 *len The size of the integer array.

Description

This function returns the integer array of the given control ID or NULL if it if it isn’t a known integer menu control.

s32 v4l2_ctrl_g_ctrl(struct v4l2_ctrl *ctrl)
    Helper function to get the control’s value from within a driver.

Parameters

struct v4l2_ctrl *ctrl The control.

Description

This returns the control’s value safely by going through the control framework. This function will lock the control’s handler, so it cannot be used from within the v4l2_ctrl_ops functions.

This function is for integer type controls only.

int __v4l2_ctrl_s_ctrl(struct v4l2_ctrl *ctrl, s32 val)
    Unlocked variant of v4l2_ctrl_s_ctrl().

Parameters

struct v4l2_ctrl *ctrl The control.

s32 val The new value.

Description

This sets the control’s new value safely by going through the control framework. This function assumes the control’s handler is already locked, allowing it to be used from within the v4l2_ctrl_ops functions.

This function is for integer type controls only.

2.2. Video4Linux devices
int v4l2_ctrl_s_ctrl (struct v4l2_ctrl *ctrl, s32 val)
    Helper function to set the control’s value from within a driver.

Parameters
struct v4l2_ctrl *ctrl  The control.
s32  val  The new value.

Description
This sets the control’s new value safely by going through the control framework. This function
will lock the control’s handler, so it cannot be used from within the v4l2_ctrl_ops functions.
This function is for integer type controls only.

s64 v4l2_ctrl_g_ctrl_int64 (struct v4l2_ctrl *ctrl)
    Helper function to get a 64-bit control’s value from within a driver.

Parameters
struct v4l2_ctrl *ctrl  The control.

Description
This returns the control’s value safely by going through the control framework. This function
will lock the control’s handler, so it cannot be used from within the v4l2_ctrl_ops functions.
This function is for 64-bit integer type controls only.

int __v4l2_ctrl_s_ctrl_int64 (struct v4l2_ctrl *ctrl, s64 val)
    Unlocked variant of v4l2_ctrl_s_ctrl_int64().

Parameters
struct v4l2_ctrl *ctrl  The control.
s64  val  The new value.

Description
This sets the control’s new value safely by going through the control framework. This function
assumes the control’s handler is already locked, allowing it to be used from within the v4l2_ctrl_ops functions.
This function is for 64-bit integer type controls only.

int v4l2_ctrl_s_ctrl_int64 (struct v4l2_ctrl *ctrl, s64 val)
    Helper function to set a 64-bit control’s value from within a driver.

Parameters
struct v4l2_ctrl *ctrl  The control.
s64  val  The new value.

Description
This sets the control’s new value safely by going through the control framework. This function
will lock the control’s handler, so it cannot be used from within the v4l2_ctrl_ops functions.
This function is for 64-bit integer type controls only.

int __v4l2_ctrl_s_ctrl_string (struct v4l2_ctrl *ctrl, const char *s)
    Unlocked variant of v4l2_ctrl_s_ctrl_string().
Parameters

struct v4l2_ctrl *ctrl The control.
const char *s The new string.

Description

This sets the control’s new string safely by going through the control framework. This function assumes the control’s handler is already locked, allowing it to be used from within the v4l2_ctrl_ops functions.

This function is for string type controls only.

int v4l2_ctrl_s_ctrl_string(struct v4l2_ctrl *ctrl, const char *s)
    Helper function to set a control’s string value from within a driver.

Parameters

struct v4l2_ctrl *ctrl The control.
const char *s The new string.

Description

This sets the control’s new string safely by going through the control framework. This function will lock the control’s handler, so it cannot be used from within the v4l2_ctrl_ops functions.

This function is for string type controls only.

int __v4l2_ctrl_s_ctrl_compound(struct v4l2_ctrl *ctrl, enum v4l2_ctrl_type type, const void *p)
    Unlocked variant to set a compound control

Parameters

struct v4l2_ctrl *ctrl The control.
enum v4l2_ctrl_type type The type of the data.
const void *p The new compound payload.

Description

This sets the control’s new compound payload safely by going through the control framework. This function assumes the control’s handler is already locked, allowing it to be used from within the v4l2_ctrl_ops functions.

This function is for compound type controls only.

int v4l2_ctrl_s_ctrl_compound(struct v4l2_ctrl *ctrl, enum v4l2_ctrl_type type, const void *p)
    Helper function to set a compound control from within a driver.

Parameters

struct v4l2_ctrl *ctrl The control.
enum v4l2_ctrl_type type The type of the data.
const void *p The new compound payload.

Description
This sets the control’s new compound payload safely by going through the control framework. This function will lock the control’s handler, so it cannot be used from within the v4l2_ctrl_ops functions.

This function is for compound type controls only.

```c
void v4l2_ctrl_replace(struct v4l2_event *old, const struct v4l2_event *new)
```

Function to be used as a callback to struct v4l2_subscribed_event_ops replace()

**Parameters**

- **struct v4l2_event *old** pointer to struct v4l2_event with the reported event;
- **const struct v4l2_event *new** pointer to struct v4l2_event with the modified event;

```c
void v4l2_ctrl_merge(const struct v4l2_event *old, struct v4l2_event *new)
```

Function to be used as a callback to struct v4l2_subscribed_event_ops merge()

**Parameters**

- **const struct v4l2_event *old** pointer to struct v4l2_event with the reported event;
- **struct v4l2_event *new** pointer to struct v4l2_event with the merged event;

```c
int v4l2_ctrl_log_status(struct file *file, void *fh)
```

helper function to implement VIDIOC_LOG_STATUS ioctl

**Parameters**

- **struct file *file** pointer to struct file
- **void *fh** unused. Kept just to be compatible to the arguments expected by struct v4l2_ioctl_ops.vidioc_log_status.

**Description**

Can be used as a vidioc_log_status function that just dumps all controls associated with the filehandle.

```c
int v4l2_ctrl_subscribe_event(struct v4l2_fh *fh, const struct v4l2_event_subscription *sub)
```

Subscribes to an event

**Parameters**

- **struct v4l2_fh *fh** pointer to struct v4l2_fh
- **const struct v4l2_event_subscription *sub** pointer to struct v4l2_event_subscription

**Description**

Can be used as a vidioc_subscribe_event function that just subscribes control events.

```c
__poll_t v4l2_ctrl_poll(struct *file, struct poll_table_struct *wait)
```

function to be used as a callback to the poll() That just polls for control events.

**Parameters**

- **struct file *file** pointer to struct file
- **struct poll_table_struct *wait** pointer to struct poll_table_struct
int \texttt{v4l2\_ctrl\_request\_setup}(\texttt{struct media\_request *req}, \texttt{struct v4l2\_ctrl\_handler *parent})

helper function to apply control values in a request

Parameters

\begin{itemize}
\item \texttt{struct media\_request *req} The request
\item \texttt{struct v4l2\_ctrl\_handler *parent} The parent control handler (‘priv’ in \texttt{media\_request\_object\_find()})
\end{itemize}

Description

This is a helper function to call the control handler’s s_ctrl callback with the control values contained in the request. Do note that this approach of applying control values in a request is only applicable to memory-to-memory devices.

void \texttt{v4l2\_ctrl\_request\_complete}(\texttt{struct media\_request *req}, \texttt{struct v4l2\_ctrl\_handler *parent})

Complete a control handler request object

Parameters

\begin{itemize}
\item \texttt{struct media\_request *req} The request
\item \texttt{struct v4l2\_ctrl\_handler *parent} The parent control handler (‘priv’ in \texttt{media\_request\_object\_find()})
\end{itemize}

Description

This function is to be called on each control handler that may have had a request object associated with it, i.e. control handlers of a driver that supports requests.

The function first obtains the values of any volatile controls in the control handler and attach them to the request. Then, the function completes the request object.

\begin{itemize}
\item \texttt{struct v4l2\_ctrl\_handler *v4l2\_ctrl\_request\_hdl\_find}(\texttt{struct media\_request *req}, \texttt{struct v4l2\_ctrl\_handler *parent})
\end{itemize}

Find the control handler in the request

Parameters

\begin{itemize}
\item \texttt{struct media\_request *req} The request
\item \texttt{struct v4l2\_ctrl\_handler *parent} The parent control handler (‘priv’ in \texttt{media\_request\_object\_find()})
\end{itemize}

Description

This function finds the control handler in the request. It may return NULL if not found. When done, you must call \texttt{v4l2\_ctrl\_request\_put\_hdl()} with the returned handler pointer.

If the request is not in state VALIDATING or QUEUED, then this function will always return NULL.

Note that in state VALIDATING the req_queue_mutex is held, so no objects can be added or deleted from the request.

In state QUEUED it is the driver that will have to ensure this.

void \texttt{v4l2\_ctrl\_request\_hdl\_put}(\texttt{struct v4l2\_ctrl\_handler *hdl})

Put the control handler

2.2. Video4Linux devices
Parameters

struct v4l2_ctrl_handler *hdl  Put this control handler

Description

This function released the control handler previously obtained from v4l2_ctrl_request_hdl_find().

struct v4l2_ctrl *v4l2_ctrl_request_hdl_ctrl_find(struct v4l2_ctrl_handler *hdl, u32 id)

Find a control with the given ID.

Parameters

struct v4l2_ctrl_handler *hdl  The control handler from the request.

u32 id  The ID of the control to find.

Description

This function returns a pointer to the control if this control is part of the request or NULL otherwise.

int v4l2_queryctrl(struct v4l2_ctrl_handler *hdl, struct v4l2_queryctrl *qc)

Helper function to implement VIDIOC_QUERYCTRL ioctl

Parameters

struct v4l2_ctrl_handler *hdl  pointer to struct v4l2_ctrl_handler

struct v4l2_queryctrl *qc  pointer to struct v4l2_queryctrl

Description

If hdl == NULL then they will all return -EINVAL.

int v4l2_query_ext_ctrl(struct v4l2_ctrl_handler *hdl, struct v4l2_query_ext_ctrl *qc)

Helper function to implement VIDIOC_QUERY_EXT_CTRL ioctl

Parameters

struct v4l2_ctrl_handler *hdl  pointer to struct v4l2_ctrl_handler

struct v4l2_query_ext_ctrl *qc  pointer to struct v4l2_query_ext_ctrl

Description

If hdl == NULL then they will all return -EINVAL.

int v4l2_querymenu(struct v4l2_ctrl_handler *hdl, struct v4l2_querymenu *qm)

Helper function to implement VIDIOC_QUERYMENU ioctl

Parameters

struct v4l2_ctrl_handler *hdl  pointer to struct v4l2_ctrl_handler

struct v4l2_querymenu *qm  pointer to struct v4l2_querymenu

Description

If hdl == NULL then they will all return -EINVAL.

int v4l2_g_ctrl(struct v4l2_ctrl_handler *hdl, struct v4l2_control *ctrl)

Helper function to implement VIDIOC_G_CTRL ioctl
Parameters

```c
struct v4l2_ctrl_handler *hdl pointer to struct v4l2_ctrl_handler
struct v4l2_control *ctrl pointer to struct v4l2_control
```

Description

If `hdl` == NULL then they will all return -EINVAL.

```c
int v4l2_s_ctrl(struct v4l2_fh *fh, struct v4l2_ctrl_handler *hdl, struct v4l2_control *ctrl)
```

Helper function to implement `VIDIOC_S_CTRL` ioctl

Parameters

```c
struct v4l2_fh *fh pointer to struct v4l2_fh
struct v4l2_ctrl_handler *hdl pointer to struct v4l2_ctrl_handler
struct v4l2_control *ctrl pointer to struct v4l2_control
```

Description

If `hdl` == NULL then they will all return -EINVAL.

```c
int v4l2_g_extCtrls(struct v4l2_ctrl_handler *hdl, struct video_device *vdev, struct media_device *mdev, struct v4l2_ext_controls *c)
```

Helper function to implement `VIDIOC_G_EXT_CTRLS` ioctl

Parameters

```c
struct v4l2_ctrl_handler *hdl pointer to struct v4l2_ctrl_handler
struct video_device *vdev pointer to struct video_device
struct media_device *mdev pointer to struct media_device
struct v4l2_ext_controls *c pointer to struct v4l2_ext_controls
```

Description

If `hdl` == NULL then they will all return -EINVAL.

```c
int v4l2_try_extCtrls(struct v4l2_ctrl_handler *hdl, struct video_device *vdev, struct media_device *mdev, struct v4l2_ext_controls *c)
```

Helper function to implement `VIDIOC_TRY_EXT_CTRLS` ioctl

Parameters

```c
struct v4l2_ctrl_handler *hdl pointer to struct v4l2_ctrl_handler
struct video_device *vdev pointer to struct video_device
struct media_device *mdev pointer to struct media_device
struct v4l2_ext_controls *c pointer to struct v4l2_ext_controls
```

Description

If `hdl` == NULL then they will all return -EINVAL.

```c
int v4l2_s_extCtrls(struct v4l2_fh *fh, struct v4l2_ctrl_handler *hdl, struct v4l2_control *ctrl)
```

Helper function to implement `VIDIOC_S_EXT_CTRLS` ioctl

2.2. Video4Linux devices
Parameters

struct v4l2_fh *fh pointer to struct v4l2_fh
struct v4l2_ctrl_handler *hdl pointer to struct v4l2_ctrl_handler
struct video_device *vdev pointer to struct video_device
struct media_device *mdev pointer to struct media_device
struct v4l2_ext_controls *c pointer to struct v4l2_ext_controls

Description

If hdl == NULL then they will all return -EINVAL.

int v4l2_ctrl_subdev_subscribe_event(struct v4l2_subdev *sd, struct v4l2_fh *fh, struct v4l2_event_subscription *sub)

    Helper function to implement as a struct v4l2_subdev_core_ops subscribe_event function that just subscribes control events.

Parameters

struct v4l2_subdev *sd pointer to struct v4l2_subdev
struct v4l2_fh *fh pointer to struct v4l2_fh
struct v4l2_event_subscription *sub pointer to struct v4l2_event_subscription

int v4l2_ctrl_subdev_log_status(struct v4l2_subdev *sd)

    Log all controls owned by subdev’s control handler.

Parameters

struct v4l2_subdev *sd pointer to struct v4l2_subdev

int v4l2_ctrl_new_fwnode_properties(struct v4l2_ctrl_handler *hdl, const struct v4l2_ctrl_ops *ctrl_ops, const struct v4l2_fwnode_device_properties *p)

    Register controls for the device properties

Parameters

struct v4l2_ctrl_handler *hdl pointer to struct v4l2_ctrl_handler to register controls
const struct v4l2_ctrl_ops *ctrl_ops pointer to struct v4l2_ctrl_ops to register controls with
const struct v4l2_fwnode_device_properties *p pointer to struct v4l2_fwnode_device_properties

Description

This function registers controls associated to device properties, using the property values contained in p parameter, if the property has been set to a value.

Currently the following v4l2 controls are parsed and registered: - V4L2_CID_CAMERA_ORIENTATION - V4L2_CID_CAMERA_SENSOR_ROTATION;

Controls already registered by the caller with the hdl control handler are not overwritten. Callers should register the controls they want to handle themselves before calling this function.

Return
0 on success, a negative error code on failure.

### 2.2.14 Videobuf Framework

Author: Jonathan Corbet <corbet@lwn.net>
Current as of 2.6.33

#### Note:
The videobuf framework was deprecated in favor of videobuf2. Shouldn’t be used on new drivers.

#### 2.2.14.1 Introduction

The videobuf layer functions as a sort of glue layer between a V4L2 driver and user space. It handles the allocation and management of buffers for the storage of video frames. There is a set of functions which can be used to implement many of the standard POSIX I/O system calls, including read(), poll(), and, happily, mmap(). Another set of functions can be used to implement the bulk of the V4L2 ioctl() calls related to streaming I/O, including buffer allocation, queueing and dequeueing, and streaming control. Using videobuf imposes a few design decisions on the driver author, but the payback comes in the form of reduced code in the driver and a consistent implementation of the V4L2 user-space API.

#### 2.2.14.2 Buffer types

Not all video devices use the same kind of buffers. In fact, there are (at least) three common variations:

- Buffers which are scattered in both the physical and (kernel) virtual address spaces. (Almost) all user-space buffers are like this, but it makes great sense to allocate kernel-space buffers this way as well when it is possible. Unfortunately, it is not always possible; working with this kind of buffer normally requires hardware which can do scatter/gather DMA operations.

- Buffers which are physically scattered, but which are virtually contiguous; buffers allocated with vmalloc(), in other words. These buffers are just as hard to use for DMA operations, but they can be useful in situations where DMA is not available but virtually-contiguous buffers are convenient.

- Buffers which are physically contiguous. Allocation of this kind of buffer can be unreliable on fragmented systems, but simpler DMA controllers cannot deal with anything else.

Videobuf can work with all three types of buffers, but the driver author must pick one at the outset and design the driver around that decision.

[It’s worth noting that there’s a fourth kind of buffer: “overlay” buffers which are located within the system’s video memory. The overlay functionality is considered to be deprecated for most use, but it still shows up occasionally in system-on-chip drivers where the performance benefits merit the use of this technique. Overlay buffers can be handled as a form of scattered buffer, but there are very few implementations in the kernel and a description of this technique is currently beyond the scope of this document.]
2.2.14.3 Data structures, callbacks, and initialization

Depending on which type of buffers are being used, the driver should include one of the following files:

```c
#include <media/videobuf-dma-sg.h> /* Physically scattered */
#include <media/videobuf-vmalloc.h> /* vmalloc() buffers */
#include <media/videobuf-dma-contig.h> /* Physically contiguous */
```

The driver’s data structure describing a V4L2 device should include a `struct videobuf_queue` instance for the management of the buffer queue, along with a `list_head` for the queue of available buffers. There will also need to be an interrupt-safe spinlock which is used to protect (at least) the queue.

The next step is to write four simple callbacks to help videobuf deal with the management of buffers:

```c
text struct videobuf_queue_ops {
    int (*buf_setup)(struct videobuf_queue *q,
                     unsigned int *count, unsigned int *size);
    int (*buf_prepare)(struct videobuf_queue *q,
                       struct videobuf_buffer *vb,
                       enum v4l2_field field);
    void (*buf_queue)(struct videobuf_queue *q,
                      struct videobuf_buffer *vb);
    void (*buf_release)(struct videobuf_queue *q,
                        struct videobuf_buffer *vb);
};
```

`buf_setup()` is called early in the I/O process, when streaming is being initiated; its purpose is to tell videobuf about the I/O stream. The count parameter will be a suggested number of buffers to use; the driver should check it for rationality and adjust it if need be. As a practical rule, a minimum of two buffers are needed for proper streaming, and there is usually a maximum (which cannot exceed 32) which makes sense for each device. The size parameter should be set to the expected (maximum) size for each frame of data.

Each buffer (in the form of a `struct videobuf_buffer` pointer) will be passed to `buf_prepare()`, which should set the buffer’s size, width, height, and field fields properly. If the buffer’s state field is `VIDEOBUF_NEEDS_INIT`, the driver should pass it to:

```c
text int videobuf_iolock(struct videobuf_queue* q, struct videobuf_buffer *vb,
                      struct v4l2_framebuffer *fbuf);
```

Among other things, this call will usually allocate memory for the buffer. Finally, the `buf_prepare()` function should set the buffer’s state to `VIDEOBUF_PREPARED`.

When a buffer is queued for I/O, it is passed to `buf_queue()`, which should put it onto the driver’s list of available buffers and set its state to `VIDEOBUF_QUEUED`. Note that this function is called with the queue spinlock held; if it tries to acquire it as well things will come to a screeching halt. Yes, this is the voice of experience. Note also that videobuf may wait on the first buffer in the queue; placing other buffers in front of it could again gum up the works. So use `list_add_tail()` to enqueue buffers.

Finally, `buf_release()` is called when a buffer is no longer intended to be used. The driver should ensure that there is no I/O active on the buffer, then pass it to the appropriate free routine(s):
/* Scatter/gather drivers */
int videobuf_dma_unmap(struct videobuf_queue *q,
    struct videobuf_dmabuf *dma);
int videobuf_dma_free(struct videobuf_dmabuf *dma);

/* vmalloc drivers */
void videobuf_vmalloc_free (struct videobuf_buffer *buf);

/* Contiguous drivers */
void videobuf_dma_contig_free(struct videobuf_queue *q,
    struct videobuf_buffer *buf);

One way to ensure that a buffer is no longer under I/O is to pass it to:

int videobuf_waiton(struct videobuf_buffer *vb, int non_blocking, int intr);

Here, vb is the buffer, non_blocking indicates whether non-blocking I/O should be used (it should be zero in the buf_release() case), and intr controls whether an interruptible wait is used.

### 2.2.14.4 File operations

At this point, much of the work is done; much of the rest is slipping videobuf calls into the implementation of the other driver callbacks. The first step is in the open() function, which must initialize the videobuf queue. The function to use depends on the type of buffer used:

```c
void videobuf_queue_sg_init(struct videobuf_queue *q,
    struct videobuf_queue_ops *ops,
    struct device *dev,
    spinlock_t *irqlock,
    enum v4l2_buf_type type,
    enum v4l2_field field,
    unsigned int msize,
    void *priv);

void videobuf_queue_vmalloc_init(struct videobuf_queue *q,
    struct videobuf_queue_ops *ops,
    struct device *dev,
    spinlock_t *irqlock,
    enum v4l2_buf_type type,
    enum v4l2_field field,
    unsigned int msize,
    void *priv);

void videobuf_queue_dma_contig_init(struct videobuf_queue *q,
    struct videobuf_queue_ops *ops,
    struct device *dev,
    spinlock_t *irqlock,
    enum v4l2_buf_type type,
    enum v4l2_field field,
    unsigned int msize,
    void *priv);
```

In each case, the parameters are the same: q is the queue structure for the device, ops is the set of callbacks as described above, dev is the device structure for this video device, irqlock is an interrupt-safe spinlock to protect access to the data structures, type is the buffer type used by
the device (cameras will use V4L2_BUF_TYPE_VIDEO_CAPTURE, for example), field describes
which field is being captured (often V4L2_FIELD_NONE for progressive devices), msize is the
size of any containing structure used around struct videobuf_buffer, and priv is a private data
pointer which shows up in the priv_data field of struct videobuf_queue. Note that these are void
functions which, evidently, are immune to failure.

V4L2 capture drivers can be written to support either of two APIs: the read() system call and
the rather more complicated streaming mechanism. As a general rule, it is necessary to support
both to ensure that all applications have a chance of working with the device. Videobuf makes
it easy to do that with the same code. To implement read(), the driver need only make a call to
one of:

```c
ssize_t videobuf_read_one(struct videobuf_queue *q,
                        char __user *data, size_t count,
                        loff_t *ppos, int nonblocking);

ssize_t videobuf_read_stream(struct videobuf_queue *q,
                            char __user *data, size_t count,
                            loff_t *ppos, int vbihack, int nonblocking);
```

Either one of these functions will read frame data into data, returning the amount actu-
ally read; the difference is that videobuf_read_one() will only read a single frame, while
videobuf_read_stream() will read multiple frames if they are needed to satisfy the count re-
quested by the application. A typical driver read() implementation will start the capture engine,
call one of the above functions, then stop the engine before returning (though a smarter imple-
mentation might leave the engine running for a little while in anticipation of another read() call
happening in the near future).

The poll() function can usually be implemented with a direct call to:

```c
unsigned int videobuf_poll_stream(struct file *file,
                                  struct videobuf_queue *q,
                                  poll_table *wait);
```

Note that the actual wait queue eventually used will be the one associated with the first available
buffer.

When streaming I/O is done to kernel-space buffers, the driver must support the mmap() system
call to enable user space to access the data. In many V4L2 drivers, the often-complex mmap() imple-
mentation simplifies to a single call to:

```c
int videobuf_mmap_mapper(struct videobuf_queue *q,
                         struct vm_area_struct *vma);
```

Everything else is handled by the videobuf code.

The release() function requires two separate videobuf calls:

```c
void videobuf_stop(struct videobuf_queue *q);
int videobuf_mmap_free(struct videobuf_queue *q);
```

The call to videobuf_stop() terminates any I/O in progress - though it is still up to the driver
to stop the capture engine. The call to videobuf_mmap_free() will ensure that all buffers have
been unmapped; if so, they will all be passed to the buf_release() callback. If buffers remain
mapped, videobuf_mmap_free() returns an error code instead. The purpose is clearly to cause
the closing of the file descriptor to fail if buffers are still mapped, but every driver in the 2.6.32 kernel cheerfully ignores its return value.

### 2.2.14.5 ioctl() operations

The V4L2 API includes a very long list of driver callbacks to respond to the many ioctl() commands made available to user space. A number of these - those associated with streaming I/O - turn almost directly into videobuf calls. The relevant helper functions are:

```c
int videobuf_reqbufs(struct videobuf_queue *q, struct v4l2_requestbuffers *req);
int videobuf_querybuf(struct videobuf_queue *q, struct v4l2_buffer *b);
int videobuf_qbuf(struct videobuf_queue *q, struct v4l2_buffer *b);
int videobuf_dqbuf(struct videobuf_queue *q, struct v4l2_buffer *b, int nonblocking);
int videobuf_streamon(struct videobuf_queue *q);
int videobuf_streamoff(struct videobuf_queue *q);
```

So, for example, a VIDIOC_REQBUFS call turns into a call to the driver’s vidioc_reqbufs() callback which, in turn, usually only needs to locate the proper struct videobuf_queue pointer and pass it to videobuf_reqbufs(). These support functions can replace a great deal of buffer management boilerplate in a lot of V4L2 drivers.

The vidioc_streamon() and vidioc_streamoff() functions will be a bit more complex, of course, since they will also need to deal with starting and stopping the capture engine.

### 2.2.14.6 Buffer allocation

Thus far, we have talked about buffers, but have not looked at how they are allocated. The scatter/gather case is the most complex on this front. For allocation, the driver can leave buffer allocation entirely up to the videobuf layer; in this case, buffers will be allocated as anonymous user-space pages and will be very scattered indeed. If the application is using user-space buffers, no allocation is needed; the videobuf layer will take care of calling get_user_pages() and filling in the scatterlist array.

If the driver needs to do its own memory allocation, it should be done in the vidioc_reqbufs() function, after calling videobuf_reqbufs(). The first step is a call to:

```c
struct videobuf_dmabuf *videobuf_to_dma(struct videobuf_buffer *buf);
```

The returned videobuf_dmabuf structure (defined in `<media/videobuf-dma-sg.h>`) includes a couple of relevant fields:

```c
struct scatterlist *sglist;
int sglen;
```

The driver must allocate an appropriately-sized scatterlist array and populate it with pointers to the pieces of the allocated buffer; sglen should be set to the length of the array.

Drivers using the vmalloc() method need not (and cannot) concern themselves with buffer allocation at all; videobuf will handle those details. The same is normally true of contiguous-DMA drivers as well; videobuf will allocate the buffers (with dma_alloc_coherent()) when it sees fit.

### 2.2. Video4Linux devices

339
That means that these drivers may be trying to do high-order allocations at any time, an operation which is not always guaranteed to work. Some drivers play tricks by allocating DMA space at system boot time; videobuf does not currently play well with those drivers.

As of 2.6.31, contiguous-DMA drivers can work with a user-supplied buffer, as long as that buffer is physically contiguous. Normal user-space allocations will not meet that criterion, but buffers obtained from other kernel drivers, or those contained within huge pages, will work with these drivers.

### 2.2.14.7 Filling the buffers

The final part of a videobuf implementation has no direct callback - it’s the portion of the code which actually puts frame data into the buffers, usually in response to interrupts from the device. For all types of drivers, this process works approximately as follows:

- Obtain the next available buffer and make sure that somebody is actually waiting for it.
- Get a pointer to the memory and put video data there.
- Mark the buffer as done and wake up the process waiting for it.

Step (1) above is done by looking at the driver-managed list_head structure - the one which is filled in the buf_queue() callback. Because starting the engine and enqueueing buffers are done in separate steps, it’s possible for the engine to be running without any buffers available - in the vmalloc() case especially. So the driver should be prepared for the list to be empty. It is equally possible that nobody is yet interested in the buffer; the driver should not remove it from the list or fill it until a process is waiting on it. That test can be done by examining the buffer’s done field (a wait_queue_head_t structure) with waitqueue_active().

A buffer’s state should be set to VIDEOBUF_ACTIVE before being mapped for DMA; that ensures that the videobuf layer will not try to do anything with it while the device is transferring data.

For scatter/gather drivers, the needed memory pointers will be found in the scatterlist structure described above. Drivers using the vmalloc() method can get a memory pointer with:

```c
void *videobuf_to_vmalloc(struct videobuf_buffer *buf);
```

For contiguous DMA drivers, the function to use is:

```c
dma_addr_t videobuf_to_dma_contig(struct videobuf_buffer *buf);
```

The contiguous DMA API goes out of its way to hide the kernel-space address of the DMA buffer from drivers.

The final step is to set the size field of the relevant videobuf_buffer structure to the actual size of the captured image, set state to VIDEOBUF_DONE, then call wake_up() on the done queue. At this point, the buffer is owned by the videobuf layer and the driver should not touch it again.

Developers who are interested in more information can go into the relevant header files; there are a few low-level functions declared there which have not been talked about here. Note also that all of these calls are exported GPL-only, so they will not be available to non-GPL kernel modules.
2.2.15 V4L2 videobuf2 functions and data structures

enum vb2_memory
    type of memory model used to make the buffers visible on userspace.

Constants

VB2_MEMORY_UNKNOWN  Buffer status is unknown or it is not used yet on userspace.

VB2_MEMORY_MMAP    The buffers are allocated by the Kernel and it is memory mapped via mmap() ioctl. This model is also used when the user is using the buffers via read() or write() system calls.

VB2_MEMORY_USERPTR The buffers was allocated in userspace and it is memory mapped via mmap() ioctl.

VB2_MEMORY_DMBUF   The buffers are passed to userspace via DMA buffer.

struct vb2_mem_ops
    memory handling/memory allocator operations.

Definition

struct vb2_mem_ops {
    void (*allocate)(struct device *dev, unsigned long attrs,unsigned long size,enum dma_direction dma_dir, gfp_t gfp_flags);
    void (*put)(void *buf_priv);
    struct dma_buf *(*get_dmabuf)(void *buf_priv, unsigned long flags);
    void (*get_userptr)(struct device *dev, unsigned long vaddr,unsigned long size,enum dma_data_direction dma_dir);
    void (*put_userptr)(void *buf_priv);
    struct dma_buf *(*get_dmabuf)(void *buf_priv, unsigned long flags);
    void (*prepare)(void *buf_priv);
    void (*finish)(void *buf_priv);
    void (*attach_dmabuf)(struct device *dev,struct dma_buf *dbuf,unsigned long size,enum dma_data_direction dma_dir);
    void (*detach_dmabuf)(void *buf_priv);
    int (*map_dmabuf)(void *buf_priv);
    int (*unmap_dmabuf)(void *buf_priv);
    void (*vaddr)(void *buf_priv);
    void (*cookie)(void *buf_priv);
    unsigned int (*num_users)(void *buf_priv);
    int (*mmap)(void *buf_priv, struct vm_area_struct *vma);
};

Members

allocate  allocate video memory and, optionally, allocator private data, return ERR_PTR() on failure or a pointer to allocator private, per-buffer data on success; the returned private structure will then be passed as buf_priv argument to other ops in this structure. Additional gfp_flags to use when allocating the are also passed to this operation. These flags are from the gfp_flags field of vb2_queue. The size argument to this function shall be page aligned.

put    inform the allocator that the buffer will no longer be used; usually will result in the allocator freeing the buffer (if no other users of this buffer are present); the buf_priv argument is the allocator private per-buffer structure previously returned from the alloc callback.

get_dmabuf acquire userspace memory for a hardware operation; used for DMABUF memory types.
get_userptr acquire userspace memory for a hardware operation; used for USERPTR memory types; vaddr is the address passed to the videobuf layer when queuing a video buffer of USERPTR type; should return an allocator private per-buffer structure associated with the buffer on success, ERR_PTR() on failure; the returned private structure will then be passed as buf_priv argument to other ops in this structure.

put_userptr inform the allocator that a USERPTR buffer will no longer be used.

prepare called every time the buffer is passed from userspace to the driver, useful for cache synchronisation, optional.

finish called every time the buffer is passed back from the driver to the userspace, also optional.

attach_dmabuf attach a shared struct dma_buf for a hardware operation; used for DMABUF memory types; dev is the alloc device dbuf is the shared dma_buf; returns ERR_PTR() on failure; allocator private per-buffer structure on success; this needs to be used for further accesses to the buffer.

detach_dmabuf inform the exporter of the buffer that the current DMABUF buffer is no longer used; the buf_priv argument is the allocator private per-buffer structure previously returned from the attach_dmabuf callback.

map_dmabuf request for access to the dmabuf from allocator; the allocator of dmabuf is informed that this driver is going to use the dmabuf.

unmap_dmabuf releases access control to the dmabuf - allocator is notified that this driver is done using the dmabuf.

vaddr return a kernel virtual address to a given memory buffer associated with the passed private structure or NULL if no such mapping exists.

cookie return allocator specific cookie for a given memory buffer associated with the passed private structure or NULL if not available.

num_users return the current number of users of a memory buffer; return 1 if the videobuf layer (or actually the driver using it) is the only user.

mmap setup a userspace mapping for a given memory buffer under the provided virtual memory region.

Description
Those operations are used by the videobuf2 core to implement the memory handling/memory allocators for each type of supported streaming I/O method.

Note:
1) Required ops for USERPTR types: get_userptr, put_userptr.
2) Required ops for MMAP types: alloc, put, num_users, mmap.
3) Required ops for read/write access types: alloc, put, num_users, vaddr.
4) Required ops for DMABUF types: attach_dmabuf, detach_dmabuf, map_dmabuf, unmap_dmabuf.

struct vb2_plane
plane information.
Definition

```c
struct vb2_plane {
    void *mem_priv;
    struct dma_buf *dbuf;
    unsigned int dbuf_mapped;
    unsigned int bytesused;
    unsigned int length;
    unsigned int min_length;
    union {
        unsigned int offset;
        unsigned long userptr;
        int fd;
    } m;
    unsigned int data_offset;
};
```

Members

- `mem_priv` private data with this plane.
- `dbuf` dma_buf - shared buffer object.
- `dbuf_mapped` flag to show whether dbuf is mapped or not
- `bytesused` number of bytes occupied by data in the plane (payload).
- `length` size of this plane (NOT the payload) in bytes. The maximum valid size is `MAX_UINT - PAGE_SIZE`.
- `min_length` minimum required size of this plane (NOT the payload) in bytes. `length` is always greater or equal to `min_length`, and like `length`, it is limited to `MAX_UINT - PAGE_SIZE`.
- `m` Union with memtype-specific data.
  - `m.offset` when memory in the associated `struct vb2_buffer` is `VB2_MEMORY_MMAP`, equals the offset from the start of the device memory for this plane (or is a “cookie” that should be passed to mmap() called on the video node).
  - `m.userptr` when memory is `VB2_MEMORY_USERPTR`, a userspace pointer pointing to this plane.
  - `m.fd` when memory is `VB2_MEMORY_DMABUF`, a userspace file descriptor associated with this plane.
- `data_offset` offset in the plane to the start of data; usually 0, unless there is a header in front of the data.

Description

Should contain enough information to be able to cover all the fields of `struct v4l2_plane` at videodev2.h.

- `enum vb2_io_modes` queue access methods.

Constants

- `VB2_MMAP` driver supports MMAP with streaming API.
- `VB2_USERPTR` driver supports USERPTR with streaming API.
- `VB2_READ` driver supports read() style access.

2.2. Video4Linux devices
VB2_WRITE driver supports write() style access.

VB2_DMABUF driver supports DMABUF with streaming API.

```c
enum vb2_buffer_state
    current video buffer state.

Constants
```

```c
VB2_BUF_STATE_DEQUEUED buffer under userspace control.
VB2_BUF_STATE_IN_REQUEST buffer is queued in media request.
VB2_BUF_STATE_PREPARING buffer is being prepared in videobuf.
VB2_BUF_STATE_QUEUED buffer queued in videobuf, but not in driver.
VB2_BUF_STATE_ACTIVE buffer queued in driver and possibly used in a hardware operation.
VB2_BUF_STATE_DONE buffer returned from driver to videobuf, but not yet dequeued to userspace.
VB2_BUF_STATE_ERROR same as above, but the operation on the buffer has ended with an error, which will be reported to the userspace when it is dequeued.

struct vb2_buffer
    represents a video buffer.

Definition
```

```c
struct vb2_buffer {
    struct vb2_queue *vb2_queue;
    unsigned int index;
    unsigned int type;
    unsigned int memory;
    unsigned int num_planes;
    u64 timestamp;
    struct media_request *request;
    struct media_request_object req_obj;
};
```

```c
Members
```

```c
vb2_queue pointer to struct vb2_queue with the queue to which this driver belongs.
index id number of the buffer.
type buffer type.
memory the method, in which the actual data is passed.
um_planes number of planes in the buffer on an internal driver queue.
timestamp frame timestamp in ns.
request the request this buffer is associated with.
req_obj used to bind this buffer to a request. This request object has a refcount.
```

```c
struct vb2_ops
    driver-specific callbacks.
```

Definition
struct vb2_ops {
    int (*queue_setup)(struct vb2_queue *q, unsigned int *num_buffers, unsigned int *num_planes, unsigned int sizes[], struct device *alloc_devs[]);

    void (*buf_request_complete)(struct vb2_buffer *vb);
};

Members

queue_setup called from VIDIOC_REQBUFS() and VIDIOC_CREATE_BUFS() handlers before memory allocation. It can be called twice: if the original number of requested buffers could not be allocated, then it will be called a second time with the actually allocated number of buffers to verify if that is OK. The driver should return the required number of buffers in *num_buffers, the required number of planes per buffer in *num_planes, the size of each plane should be set in the sizes[] array and optional per-plane allocator specific device in the alloc_devs[] array. When called from VIDIOC_REQBUFS(), *num_planes == 0, the driver has to use the currently configured format to determine the plane sizes and *num_buffers is the total number of buffers that are being allocated. When called from VIDIOC_CREATE_BUFS(), *num_planes != 0 and it describes the requested number of planes and sizes[] contains the requested plane sizes. In this case *num_buffers are being allocated additionally to q->num_buffers. If either *num_planes or the requested sizes are invalid callback must return -EINVAL.

wait_prepare release any locks taken while calling vb2 functions; it is called before an ioctl needs to wait for a new buffer to arrive; required to avoid a deadlock in blocking access type.

wait_finish reacquire all locks released in the previous callback; required to continue operation after sleeping while waiting for a new buffer to arrive.

buf_out_validate called when the output buffer is prepared or queued to a request; drivers can use this to validate userspace-provided information; this is required only for OUTPUT queues.

buf_init called once after allocating a buffer (in MMAP case) or after acquiring a new USERPTR buffer; drivers may perform additional buffer-related initialization; initialization failure (return ! = 0) will prevent queue setup from completing successfully; optional.

buf_prepare called every time the buffer is queued from userspace and from the VIDIOC_PREPARE_BUF() ioctl; drivers may perform any initialization required before each hardware operation in this callback; drivers can access/modify the buffer here as it is still synced for the CPU; drivers that support VIDIOC_CREATE_BUFS() must also validate the buffer size; if an error is returned, the buffer will not be queued in driver; optional.

buf_finish called before every dequeue of the buffer back to userspace; the buffer is synced for the CPU, so drivers can access/modify the buffer contents; drivers may perform any operations required before userspace accesses the buffer; optional. The buffer state can

2.2. Video4Linux devices
be one of the following: DONE and ERROR occur while streaming is in progress, and the
PREPARED state occurs when the queue has been canceled and all pending buffers are
being returned to their default DEQUEUED state. Typically you only have to do something
if the state is VB2_BUF_STATE_DONE, since in all other cases the buffer contents will be
ignored anyway.

**buf_cleanup** called once before the buffer is freed; drivers may perform any additional cleanup;
optional.

**start_streaming** called once to enter ‘streaming’ state; the driver may receive buffers with
**buf_queue** callback before **start_streaming** is called; the driver gets the number of al-
ready queued buffers in count parameter; driver can return an error if hardware fails,
in that case all buffers that have been already given by the **buf_queue** callback are to
be returned by the driver by calling **vb2_buffer_done()** with VB2_BUF_STATE_QUEUED.
If you need a minimum number of buffers before you can start streaming, then set
vb2_queue->min_buffers_needed. If that is non-zero then **start_streaming** won’t be
called until at least that many buffers have been queued up by userspace.

**stop_streaming** called when ‘streaming’ state must be disabled; driver should stop any
DMA transactions or wait until they finish and give back all buffers it got from
**buf_queue** callback by calling **vb2_buffer_done()** with either VB2_BUF_STATE_DONE or
VB2_BUF_STATE_ERROR; may use **vb2_wait_for_all_buffers()** function

**buf_queue** passes buffer vb to the driver; driver may start hardware operation on this buffer;
deriver should give the buffer back by calling **vb2_buffer_done()** function; it is always
called after calling VIDIOC_STREAMON() ioctl; might be called before **start_streaming**
callback if user pre-queued buffers before calling VIDIOC_STREAMON().

**buf_request_complete** a buffer that was never queued to the driver but is associated with
a queued request was canceled. The driver will have to mark associated objects in the
request as completed; required if requests are supported.

**Description**

These operations are not called from interrupt context except where mentioned specifically.

**struct vb2_buf_ops**

driver-specific callbacks.

**Definition**

```c
struct vb2_buf_ops {
    int (*verify_planes_array)(struct vb2_buffer *vb, const void *pb);
    void (*init_buffer)(struct vb2_buffer *vb);
    void (*fill_user_buffer)(struct vb2_buffer *vb, void *pb);
    int (*fill_vb2_buffer)(struct vb2_buffer *vb, struct vb2_plane *planes);
    void (*copy_timestamp)(struct vb2_buffer *vb, const void *pb);
};
```

**Members**

**verify_planes_array** Verify that a given user space structure contains enough planes for the
buffer. This is called for each dequeued buffer.

**init_buffer** given a vb2_buffer initialize the extra data after **struct vb2_buffer**. For V4L2
this is a **struct vb2_v4l2_buffer**.
fill_user_buffer  given a vb2_buffer fill in the userspace structure. For V4L2 this is a struct v4l2_buffer.

fill_vb2_buffer  given a userspace structure, fill in the vb2_buffer. If the userspace structure is invalid, then this op will return an error.

copy_timestamp  copy the timestamp from a userspace structure to the struct vb2_buffer. a videobuf queue.

Definition

    unsigned int buf_struct_size;
    u32 timestamp_flags;
    gfp_t gfp_flags;
    u32 min_buffers_needed;
    struct device *alloc_devs[VB2_MAX_PLANES];
};
```

Members

**type**  private buffer type whose content is defined by the vb2-core caller. For example, for V4L2, it should match the types defined on enum v4l2_buf_type.

**io_modes** supported io methods (see enum vb2_io_modes).

**dev** device to use for the default allocation context if the driver doesn’t fill in the alloc_devs array.

**dma_attrs** DMA attributes to use for the DMA.

**bidirectional** when this flag is set the DMA direction for the buffers of this queue will be overridden with DMA_BIDIRECTIONAL direction. This is useful in cases where the hardware (firmware) writes to a buffer which is mapped as read (DMA_TO_DEVICE), or reads from buffer which is mapped for write (DMA_FROM_DEVICE) in order to satisfy some internal hardware restrictions or adds a padding needed by the processing algorithm. In case the

2.2. Video4Linux devices
DMA mapping is not bidirectional but the hardware (firmware) trying to access the buffer (in the opposite direction) this could lead to an IOMMU protection faults.

`fileio_read_once` report EOF after reading the first buffer

`fileio_writeImmediately` queue buffer after each write() call

`allow_zero_bytesused` allow bytesused == 0 to be passed to the driver

`quirk_poll_must_check_waiting_for_buffers` Return EPOLLERR at poll when QBUF has not been called. This is a vb1 idiom that has been adopted also by vb2.

`supports_requests` this queue supports the Request API.

`requires_requests` this queue requires the Request API. If this is set to 1, then supports_requests must be set to 1 as well.

`uses_qbuf` qbuf was used directly for this queue. Set to 1 the first time this is called. Set to 0 when the queue is canceled. If this is 1, then you cannot queue buffers from a request.

`uses_requests` requests are used for this queue. Set to 1 the first time a request is queued. Set to 0 when the queue is canceled. If this is 1, then you cannot queue buffers directly.

`allow_cache_hints` when set user-space can pass cache management hints in order to skip cache flush/invalidation on `->prepare()` or/and `->finish()`.

`lock` pointer to a mutex that protects the `struct vb2_queue`. The driver can set this to a mutex to let the v4l2 core serialize the queuing ioctls. If the driver wants to handle locking itself, then this should be set to NULL. This lock is not used by the videobuf2 core API.

`owner` The filehandle that ‘owns’ the buffers, i.e. the filehandle that called reqbufs, create_buffers or started fileio. This field is not used by the videobuf2 core API, but it allows drivers to easily associate an owner filehandle with the queue.

`ops` driver-specific callbacks

`mem_ops` memory allocator specific callbacks

`buf_ops` callbacks to deliver buffer information. between user-space and kernel-space.

`drv_priv` driver private data.

`subsystem_flags` Flags specific to the subsystem (V4L2/DVB/etc.). Not used by the vb2 core.

`buf_struct_size` size of the driver-specific buffer structure; “0” indicates the driver doesn’t want to use a custom buffer structure type. In that case a subsystem-specific struct will be used (in the case of V4L2 that is `sizeof(struct vb2_v4l2_buffer)`). The first field of the driver-specific buffer structure must be the subsystem-specific struct (vb2_v4l2_buffer in the case of V4L2).

`timestamp_flags` Timestamp flags; `V4L2_BUF_FLAG_TIMESTAMP_*` and `V4L2_BUF_FLAG_TSTAMP_SRC_*`

`gfp_flags` additional gfp flags used when allocating the buffers. Typically this is 0, but it may be e.g. GFP_DMA or __GFP_DMA32 to force the buffer allocation to a specific memory zone.

`min_buffers_needed` the minimum number of buffers needed before `start_streaming` can be called. Used when a DMA engine cannot be started unless at least this number of buffers have been queued into the driver.

`alloc_devs` struct device memory type/allocator-specific per-plane device
bool vb2_queue_allows_cache_hints(struct vb2_queue *q)
    Return true if the queue allows cache and memory consistency hints.

Parameters
struct vb2_queue *q  pointer to struct vb2_queue with videobuf2 queue

void *vb2_plane_vaddr(struct vb2_buffer *vb, unsigned int plane_no)
    Return a kernel virtual address of a given plane.

Parameters
struct vb2_buffer *vb  pointer to struct vb2_buffer to which the plane in question belongs to.
unsigned int plane_no  plane number for which the address is to be returned.

Description
This function returns a kernel virtual address of a given plane if such a mapping exist, NULL otherwise.

void *vb2_plane_cookie(struct vb2_buffer *vb, unsigned int plane_no)
    Return allocator specific cookie for the given plane.

Parameters
struct vb2_buffer *vb  pointer to struct vb2_buffer to which the plane in question belongs to.
unsigned int plane_no  plane number for which the cookie is to be returned.

Description
This function returns an allocator specific cookie for a given plane if available, NULL otherwise. The allocator should provide some simple static inline function, which would convert this cookie to the allocator specific type that can be used directly by the driver to access the buffer. This can be for example physical address, pointer to scatter list or IOMMU mapping.

void vb2_buffer_done(struct vb2_buffer *vb, enum vb2_buffer_state state)
    inform videobuf that an operation on a buffer is finished.

Parameters
struct vb2_buffer *vb  pointer to struct vb2_buffer to be used.
enum vb2_buffer_state state  state of the buffer, as defined by enum vb2_buffer_state. Either VB2_BUF_STATE_DONE if the operation finished successfully, VB2_BUF_STATE_ERROR if the operation finished with an error or VB2_BUF_STATE_QUEUED.

Description
This function should be called by the driver after a hardware operation on a buffer is finished and the buffer may be returned to userspace. The driver cannot use this buffer anymore until it is queued back to it by videobuf by the means of vb2_ops->buf_queue callback. Only buffers previously queued to the driver by vb2_ops->buf_queue can be passed to this function.

While streaming a buffer can only be returned in state DONE or ERROR. The vb2_ops->start_streaming op can also return them in case the DMA engine cannot be started for some reason. In that case the buffers should be returned with state QUEUED to put them back into the queue.

2.2. Video4Linux devices
void \texttt{vb2\_discard\_done}(\texttt{struct vb2\_queue \*q})
\hspace{1em} discard all buffers marked as DONE.

**Parameters**

\texttt{struct vb2\_queue \*q} pointer to \texttt{struct vb2\_queue} with videobuf2 queue.

**Description**

This function is intended to be used with suspend/resume operations. It discards all ‘done’ buffers as they would be too old to be requested after resume.

Drivers must stop the hardware and synchronize with interrupt handlers and/or delayed works before calling this function to make sure no buffer will be touched by the driver and/or hardware.

int \texttt{vb2\_wait\_for\_all\_buffers}(\texttt{struct vb2\_queue \*q})
\hspace{1em} wait until all buffers are given back to vb2.

**Parameters**

\texttt{struct vb2\_queue \*q} pointer to \texttt{struct vb2\_queue} with videobuf2 queue.

**Description**

This function will wait until all buffers that have been given to the driver by \texttt{vb2\_ops->buf\_queue} are given back to vb2 with \texttt{vb2\_buffer\_done()}. It doesn’t call \texttt{vb2\_ops->wait\_prepare/vb2\_ops->wait\_finish} pair. It is intended to be called with all locks taken, for example from \texttt{vb2\_ops->stop\_streaming} callback.

void \texttt{vb2\_core\_querybuf}(\texttt{struct vb2\_queue \*q, unsigned int index, void \*pb})
\hspace{1em} query video buffer information.

**Parameters**

\texttt{struct vb2\_queue \*q} pointer to \texttt{struct vb2\_queue} with videobuf2 queue.

\texttt{unsigned int index} id number of the buffer.

\texttt{void \*pb} buffer struct passed from userspace.

**Description**

Videobuf2 core helper to implement VIDIOC_QUERYBUF() operation. It is called internally by VB2 by an API-specific handler, like videobuf2-v4l2.h.

The passed buffer should have been verified.

This function fills the relevant information for the userspace.

**Return**

returns zero on success; an error code otherwise.

int \texttt{vb2\_core\_reqbufs}(\texttt{struct vb2\_queue \*q, enum vb2\_memory memory, unsigned int \*count})
\hspace{1em} Initiate streaming.

**Parameters**

\texttt{struct vb2\_queue \*q} pointer to \texttt{struct vb2\_queue} with videobuf2 queue.

\texttt{enum vb2\_memory memory} memory type, as defined by \texttt{enum vb2\_memory}.
unsigned int *count requested buffer count.

**Description**

Videobuf2 core helper to implement VIDIOC_REQBUF() operation. It is called internally by VB2 by an API-specific handler, like videobuf2-v4l2.h.

This function:

1) verifies streaming parameters passed from the userspace;
2) sets up the queue;
3) negotiates number of buffers and planes per buffer with the driver to be used during streaming;
4) allocates internal buffer structures (struct vb2_buffer), according to the agreed parameters;
5) for MMAP memory type, allocates actual video memory, using the memory handling/allocation routines provided during queue initialization.

If req->count is 0, all the memory will be freed instead.

If the queue has been allocated previously by a previous vb2_core_reqbufs() call and the queue is not busy, memory will be reallocated.

**Return**

returns zero on success; an error code otherwise.

int vb2_core_create_bufs(struct vb2_queue *q, enum vb2_memory memory, unsigned int *count, unsigned int requested_planes, const unsigned int requested_sizes[])

Allocate buffers and any required auxiliary structs

**Parameters**

struct vb2_queue *q pointer to struct vb2_queue with videobuf2 queue.

enum vb2_memory memory memory type, as defined by enum vb2_memory.

unsigned int *count requested buffer count.

unsigned int requested_planes number of planes requested.

const unsigned int requested_sizes[] array with the size of the planes.

**Description**

Videobuf2 core helper to implement VIDIOC_CREATE_BUFS() operation. It is called internally by VB2 by an API-specific handler, like videobuf2-v4l2.h.

This function:

1) verifies parameter sanity;
2) calls the vb2_ops->queue_setup queue operation;
3) performs any necessary memory allocations.

**Return**

returns zero on success; an error code otherwise.
int vb2_core_prepare_buf(struct vb2_queue *q, unsigned int index, void *pb)

Pass ownership of a buffer from userspace to the kernel.

Parameters

struct vb2_queue *q pointer to struct vb2_queue with videobuf2 queue.

unsigned int index id number of the buffer.

void *pb buffer structure passed from userspace to v4l2_ioctl_ops->vidioc_prepare_buf handler in driver.

Description

Videobuf2 core helper to implement VIDIOC_PREPARE_BUF() operation. It is called internally by VB2 by an API-specific handler, like videobuf2-v4l2.h.

The passed buffer should have been verified.

This function calls vb2_ops->buf_prepare callback in the driver (if provided), in which driver-specific buffer initialization can be performed.

Return

returns zero on success; an error code otherwise.

int vb2_core_qbuf(struct vb2_queue *q, unsigned int index, void *pb, struct media_request *req)

Queue a buffer from userspace

Parameters

struct vb2_queue *q pointer to struct vb2_queue with videobuf2 queue.

unsigned int index id number of the buffer

void *pb buffer structure passed from userspace to v4l2_ioctl_ops->vidioc_qbuf handler in driver

struct media_request *req pointer to struct media_request, may be NULL.

Description

Videobuf2 core helper to implement VIDIOC_QBUF() operation. It is called internally by VB2 by an API-specific handler, like videobuf2-v4l2.h.

This function:

1) If req is non-NULL, then the buffer will be bound to this media request and it returns. The buffer will be prepared and queued to the driver (i.e. the next two steps) when the request itself is queued.

2) if necessary, calls vb2_ops->buf_prepare callback in the driver (if provided), in which driver-specific buffer initialization can be performed;

3) if streaming is on, queues the buffer in driver by the means of vb2_ops->buf_queue callback for processing.

Return

returns zero on success; an error code otherwise.
int vb2_core_dqbuf(struct vb2_queue *q, unsigned int *pindex, void *pb, bool nonblocking)
Dequeue a buffer to the userspace

Parameters

struct vb2_queue *q pointer to struct vb2_queue with videobuf2 queue
unsigned int *pindex pointer to the buffer index. May be NULL
void *pb buffer structure passed from userspace to v4l2_ioctl_ops->vidioc_dqbuf handler in driver.
bool nonblocking if true, this call will not sleep waiting for a buffer if no buffers ready for dequeuing are present. Normally the driver would be passing (file->f_flags & O_NONBLOCK) here.

Description

Videobuf2 core helper to implement VIDIOC_DQBUF() operation. It is called internally by VB2 by an API-specific handler, like videobuf2-v4l2.h.

This function:

1) calls buf_finish callback in the driver (if provided), in which driver can perform any additional operations that may be required before returning the buffer to userspace, such as cache sync,

2) the buffer struct members are filled with relevant information for the userspace.

Return

returns zero on success; an error code otherwise.

int vb2_core_streamon(struct vb2_queue *q, unsigned int type)
Implements VB2 stream ON logic

Parameters

struct vb2_queue *q pointer to struct vb2_queue with videobuf2 queue
unsigned int type type of the queue to be started. For V4L2, this is defined by enum v4l2_buf_type type.

Description

Videobuf2 core helper to implement VIDIOC_STREAMON() operation. It is called internally by VB2 by an API-specific handler, like videobuf2-v4l2.h.

Return

returns zero on success; an error code otherwise.

int vb2_core_streamoff(struct vb2_queue *q, unsigned int type)
Implements VB2 stream OFF logic

Parameters

struct vb2_queue *q pointer to struct vb2_queue with videobuf2 queue
unsigned int type type of the queue to be started. For V4L2, this is defined by enum v4l2_buf_type type.

2.2. Video4Linux devices
Description

Videobuf2 core helper to implement VIDIOC_STREAMOFF() operation. It is called internally by VB2 by an API-specific handler, like videobuf2-v4l2.h.

Return

returns zero on success; an error code otherwise.

```c
int vb2_core_expbuf(struct vb2_queue *q, int *fd, unsigned int type, unsigned int index,
                    unsigned int plane, unsigned int flags)
```

Export a buffer as a file descriptor.

Parameters

- `struct vb2_queue *q` pointer to `struct vb2_queue` with videobuf2 queue.
- `int *fd` pointer to the file descriptor associated with DMABUF (set by driver).
- `unsigned int type` buffer type.
- `unsigned int index` id number of the buffer.
- `unsigned int plane` index of the plane to be exported, 0 for single plane queues
- `unsigned int flags` file flags for newly created file, as defined at include/uapi/asm-generic/fcntl.h. Currently, the only used flag is O_CLOEXEC. is supported, refer to manual of open syscall for more details.

Description

Videobuf2 core helper to implement VIDIOC_EXPBUF() operation. It is called internally by VB2 by an API-specific handler, like videobuf2-v4l2.h.

Return

returns zero on success; an error code otherwise.

```c
int vb2_core_queue_init(struct vb2_queue *q)
```

initialize a videobuf2 queue

Parameters

- `struct vb2_queue *q` pointer to `struct vb2_queue` with videobuf2 queue. This structure should be allocated in driver

Description

The `vb2_queue` structure should be allocated by the driver. The driver is responsible of clearing it’s content and setting initial values for some required entries before calling this function.

Note: The following fields at `q` should be set before calling this function: `vb2_queue->ops, vb2_queue->mem_ops, vb2_queue->type`.

```c
void vb2_core_queue_release(struct vb2_queue *q)
```

stop streaming, release the queue and free memory

Parameters

- `struct vb2_queue *q` pointer to `struct vb2_queue` with videobuf2 queue.
Description

This function stops streaming and performs necessary clean ups, including freeing video buffer memory. The driver is responsible for freeing the `struct vb2_queue` itself.

```c
void vb2_queue_error(struct vb2_queue *q)
    signal a fatal error on the queue
```

Parameters

- `struct vb2_queue *q` pointer to `struct vb2_queue` with videobuf2 queue.

Description

Flag that a fatal unrecoverable error has occurred and wake up all processes waiting on the queue. Polling will now set EPOLLERR and queuing and dequeuing buffers will return -EIO.

The error flag will be cleared when canceling the queue, either from `vb2_streamoff()` or `vb2_queue_release()`. Drivers should thus not call this function before starting the stream, otherwise the error flag will remain set until the queue is released when closing the device node.

```c
int vb2_mmap(struct vb2_queue *q, struct vm_area_struct *vma)
    map video buffers into application address space.
```

Parameters

- `struct vb2_queue *q` pointer to `struct vb2_queue` with videobuf2 queue.
- `struct vm_area_struct *vma` pointer to `struct vm_area_struct` with the vma passed to the mmap file operation handler in the driver.

Description

Should be called from mmap file operation handler of a driver. This function maps one plane of one of the available video buffers to userspace. To map whole video memory allocated on reqbufs, this function has to be called once per each plane per each buffer previously allocated.

When the userspace application calls mmap, it passes to it an offset returned to it earlier by the means of `v4l2_ioctl_ops->vidioc_querybuf` handler. That offset acts as a “cookie”, which is then used to identify the plane to be mapped.

This function finds a plane with a matching offset and a mapping is performed by the means of a provided memory operation.

The return values from this function are intended to be directly returned from the mmap handler in driver.

```c
unsigned long vb2_get_unmapped_area(struct vb2_queue *q, unsigned long addr, unsigned long len, unsigned long pgoff, unsigned long flags)
    map video buffers into application address space.
```

Parameters

- `struct vb2_queue *q` pointer to `struct vb2_queue` with videobuf2 queue.
- `unsigned long addr` memory address.
- `unsigned long len` buffer size.
- `unsigned long pgoff` page offset.
**unsigned long flags** memory flags.

**Description**
This function is used in noMMU platforms to propose address mapping for a given buffer. It’s intended to be used as a handler for the file_operations->get_unmapped_area operation.

This is called by the mmap() syscall routines will call this to get a proposed address for the mapping, when !CONFIG_MMU.

```c
__poll_t vb2_core_poll(struct vb2_queue *q, struct file *file, poll_table *wait)
```

implements poll syscall() logic.

**Parameters**

- **struct vb2_queue *q** pointer to `struct vb2_queue` with videobuf2 queue.
- **struct file *file** struct file argument passed to the poll file operation handler.
- **poll_table *wait** poll_table wait argument passed to the poll file operation handler.

**Description**
This function implements poll file operation handler for a driver. For CAPTURE queues, if a buffer is ready to be dequeued, the userspace will be informed that the file descriptor of a video device is available for reading. For OUTPUT queues, if a buffer is ready to be dequeued, the file descriptor will be reported as available for writing.

The return values from this function are intended to be directly returned from poll handler in driver.

```c
size_t vb2_read(struct vb2_queue *q, char __user *data, size_t count, loff_t *ppos,
                int nonblock)
```

implements read() syscall logic.

**Parameters**

- **struct vb2_queue *q** pointer to `struct vb2_queue` with videobuf2 queue.
- **char __user *data** pointed to target userspace buffer
- **size_t count** number of bytes to read
- **loff_t *ppos** file handle position tracking pointer
- **int nonblock** mode selector (1 means blocking calls, 0 means nonblocking)

```c
size_t vb2_write(struct vb2_queue *q, const char __user *data, size_t count, loff_t *ppos,
                 int nonblock)
```

implements write() syscall logic.

**Parameters**

- **struct vb2_queue *q** pointer to `struct vb2_queue` with videobuf2 queue.
- **const char __user *data** pointed to target userspace buffer
- **size_t count** number of bytes to write
- **loff_t *ppos** file handle position tracking pointer
- **int nonblock** mode selector (1 means blocking calls, 0 means nonblocking)

**vb2_thread_fnc**

**Typedef:** callback function for use with vb2_thread.
Syntax

```c
int vb2_thread_fnc (struct vb2_buffer *vb, void *priv)
```

Parameters

- `struct vb2_buffer *vb` pointer to struct `vb2_buffer`.
- `void *priv` pointer to a private data.

Description

This is called whenever a buffer is dequeued in the thread.

```c
int vb2_thread_start(struct vb2_queue *q, vb2_thread_fnc fnc, void *priv, const char *thread_name)
```

start a thread for the given queue.

Parameters

- `struct vb2_queue *q` pointer to `struct vb2_queue` with videobuf2 queue.
- `vb2_thread_fnc fnc` `vb2_thread_fnc` callback function.
- `void *priv` priv pointer passed to the callback function.
- `const char *thread_name` the name of the thread. This will be prefixed with “vb2-”.

Description

This starts a thread that will queue and dequeue until an error occurs or `vb2_thread_stop()` is called.

**Attention:** This function should not be used for anything else but the videobuf2-dvb support. If you think you have another good use-case for this, then please contact the linux-media mailing list first.

```c
int vb2_thread_stop(struct vb2_queue *q)
```

stop the thread for the given queue.

Parameters

- `struct vb2_queue *q` pointer to `struct vb2_queue` with videobuf2 queue.

bool `vb2_is_streaming(struct vb2_queue *q)`

return streaming status of the queue.

Parameters

- `struct vb2_queue *q` pointer to `struct vb2_queue` with videobuf2 queue.

bool `vb2_fileio_is_active(struct vb2_queue *q)`

return true if fileio is active.

Parameters

- `struct vb2_queue *q` pointer to `struct vb2_queue` with videobuf2 queue.

Description

This returns true if read() or write() is used to stream the data as opposed to stream I/O. This is almost never an important distinction, except in rare cases. One such case is that using read()
or write() to stream a format using V4L2_FIELD_ALTERNATE is not allowed since there is no way you can pass the field information of each buffer to/from userspace. A driver that supports this field format should check for this in the `vb2_ops->queue_setup` op and reject it if this function returns true.

```c
bool vb2_is_busy(struct vb2_queue *q)
    return busy status of the queue.

Parameters
struct vb2_queue *q pointer to `struct vb2_queue` with videobuf2 queue.

Description
This function checks if queue has any buffers allocated.
```

```c
void *vb2_get_drv_priv(struct vb2_queue *q)
    return driver private data associated with the queue.

Parameters
struct vb2_queue *q pointer to `struct vb2_queue` with videobuf2 queue.
```

```c
void vb2_set_plane_payload(struct vb2_buffer *vb, unsigned int plane_no, unsigned long size)
    set bytes used for the plane `plane_no`.

Parameters
struct vb2_buffer *vb pointer to `struct vb2_buffer` to which the plane in question belongs to.
unsigned int plane_no plane number for which payload should be set.
unsigned long size payload in bytes.
```

```c
unsigned long vb2_get_plane_payload(struct vb2_buffer *vb, unsigned int plane_no)
    get bytes used for the plane `plane_no`.

Parameters
struct vb2_buffer *vb pointer to `struct vb2_buffer` to which the plane in question belongs to.
unsigned int plane_no plane number for which payload should be set.
```

```c
unsigned long vb2_plane_size(struct vb2_buffer *vb, unsigned int plane_no)
    return plane size in bytes.

Parameters
struct vb2_buffer *vb pointer to `struct vb2_buffer` to which the plane in question belongs to.
unsigned int plane_no plane number for which size should be returned.
```

```c
bool vb2_start_streaming_called(struct vb2_queue *q)
    return streaming status of driver.

Parameters
struct vb2_queue *q pointer to `struct vb2_queue` with videobuf2 queue.
```
void vb2_clear_last_buffer_dequeued(struct vb2_queue *q)
    clear last buffer dequeued flag of queue.

Parameters
struct vb2_queue *q pointer to struct vb2_queue with videobuf2 queue.

struct vb2_buffer *vb2_get_buffer(struct vb2_queue *q, unsigned int index)
    get a buffer from a queue

Parameters
struct vb2_queue *q pointer to struct vb2_queue with videobuf2 queue.
unsigned int index buffer index

Description
This function obtains a buffer from a queue, by its index. Keep in mind that there is no ref-
counting involved in this operation, so the buffer lifetime should be taken into consideration.

bool vb2_buffer_in_use(struct vb2_queue *q, struct vb2_buffer *vb)
    return true if the buffer is in use and the queue cannot be freed (by the means of VID-IOC_REQBUFS(0)) call.

Parameters
struct vb2_queue *q pointer to struct vb2_queue with videobuf2 queue.
struct vb2_buffer *vb buffer for which planes size should be returned.

int vb2_verify_memory_type(struct vb2_queue *q, enum vb2_memory memory, unsigned int type)
    Check whether the memory type and buffer type passed to a buffer operation are compat-
ible with the queue.

Parameters
struct vb2_queue *q pointer to struct vb2_queue with videobuf2 queue.
enum vb2_memory memory memory model, as defined by enum vb2_memory.
unsigned int type private buffer type whose content is defined by the vb2-core caller. For
example, for V4L2, it should match the types defined on enum v4l2_buf_type.

bool vb2_request_object_is_buffer(struct media_request_object *obj)
    return true if the object is a buffer

Parameters
struct media_request_object *obj the request object.

unsigned int vb2_request_buffer_cnt(struct media_request *req)
    return the number of buffers in the request

Parameters
struct media_request *req the request.

struct vb2_v4l2_buffer
    video buffer information for v4l2.

Definition
struct vb2_v4l2_buffer {
    struct vb2_buffer vb2_buf;
    __u32 flags;
    __u32 field;
    struct v4l2_timecode timecode;
    __u32 sequence;
    __s32 request_fd;
    bool is_held;
    struct vb2_plane planes[VB2_MAX_PLANES];
};

Members

vb2_buf embedded struct vb2_buffer.
flags buffer informational flags.
field field order of the image in the buffer, as defined by enum v4l2_field.
timecode frame timecode.
sequence sequence count of this frame.
request_fd the request_fd associated with this buffer
is_held if true, then this capture buffer was held
planes plane information (userptr/fd, length, bytesused, data_offset).

Description

Should contain enough information to be able to cover all the fields of struct v4l2_buffer at videodev2.h.

int vb2_find_timestamp(const struct vb2_queue *q, u64 timestamp, unsigned int start_idx)
    Find buffer with given timestamp in the queue

Parameters

const struct vb2_queue *q pointer to struct vb2_queue with videobuf2 queue.
u64 timestamp the timestamp to find.
unsigned int start_idx the start index (usually 0) in the buffer array to start searching from.
    Note that there may be multiple buffers with the same timestamp value, so you can restart
the search by setting start_idx to the previously found index + 1.

Description

Returns the buffer index of the buffer with the given timestamp, or -1 if no buffer with timestamp was found.

int vb2_reqbufs(struct vb2_queue *q, struct v4l2_requestbuffers *req)
    Wrapper for vb2_core_reqbufs() that also verifies the memory and type values.

Parameters

struct vb2_queue *q pointer to struct vb2_queue with videobuf2 queue.
struct v4l2_requestbuffers *req struct v4l2_requestbuffers passed from userspace to v4l2_ioctl_ops->vidioc_reqbufs handler in driver.
int vb2_create.bufs(struct vb2_queue *q, struct v4l2_create_buffers *create)
Wrapper for vb2_core_create_bufs() that also verifies the memory and type values.

Parameters

struct vb2_queue *q pointer to struct vb2_queue with videobuf2 queue.
struct v4l2_create_buffers *create creation parameters, passed from userspace to
v4l2_ioctl_ops->vidioc_create_bufs handler in driver

int vb2_prepare_buf(struct vb2_queue *q, struct media_device *mdev, struct
v4l2_buffer *b)
Pass ownership of a buffer from userspace to the kernel

Parameters

struct vb2_queue *q pointer to struct vb2_queue with videobuf2 queue.
struct media_device *mdev pointer to struct media_device, may be NULL.
struct v4l2_buffer *b buffer structure passed from userspace to
v4l2_ioctl_ops->vidioc_prepare_buf handler in driver

Description

Should be called from v4l2_ioctl_ops->vidioc_prepare_buf ioctl handler of a driver.

This function:

1) verifies the passed buffer;

2) calls vb2_ops->buf_prepare callback in the driver (if provided), in which driver-specific
buffer initialization can be performed.

3) if b->request_fd is non-zero and mdev->ops->req_queue is set, then bind the prepared
buffer to the request.

The return values from this function are intended to be directly returned from
v4l2_ioctl_ops->vidioc_prepare_buf handler in driver.

int vb2_qbuf(struct vb2_queue *q, struct media_device *mdev, struct v4l2_buffer *b)
Queue a buffer from userspace

Parameters

struct vb2_queue *q pointer to struct vb2_queue with videobuf2 queue.
struct media_device *mdev pointer to struct media_device, may be NULL.
struct v4l2_buffer *b buffer structure passed from userspace to
v4l2_ioctl_ops->vidioc_qbuf handler in driver

Description

Should be called from v4l2_ioctl_ops->vidioc_qbuf handler of a driver.

This function:

1) verifies the passed buffer;

2) if b->request_fd is non-zero and mdev->ops->req_queue is set, then bind the buffer to
the request.
3) if necessary, calls `vb2_ops->buf_prepare` callback in the driver (if provided), in which driver-specific buffer initialization can be performed;

4) if streaming is on, queues the buffer in driver by the means of `vb2_ops->buf_queue` callback for processing.

The return values from this function are intended to be directly returned from `v4l2_ioctl_ops->vidioc_qbuf` handler in driver.

```c
int vb2_expbuf(struct vb2_queue *q, struct v4l2_exportbuffer *eb)
    Export a buffer as a file descriptor
```

**Parameters**

- `struct vb2_queue *q`  pointer to `struct vb2_queue` with videobuf2 queue.
- `struct v4l2_exportbuffer *eb`  export buffer structure passed from userspace to `v4l2_ioctl_ops->vidioc_expbuf` handler in driver

**Description**

The return values from this function are intended to be directly returned from `v4l2_ioctl_ops->vidioc_expbuf` handler in driver.

```c
int vb2_dqbuf(struct vb2_queue *q, struct v4l2_buffer *b, bool nonblocking)
    Dequeue a buffer to the userspace
```

**Parameters**

- `struct vb2_queue *q`  pointer to `struct vb2_queue` with videobuf2 queue.
- `struct v4l2_buffer *b`  buffer structure passed from userspace to `v4l2_ioctl_ops->vidioc_dqbuf` handler in driver
- `bool nonblocking`  if true, this call will not sleep waiting for a buffer if no buffers ready for dequeuing are present. Normally the driver would be passing (`file->f_flags & O_NONBLOCK`) here

**Description**

Should be called from `v4l2_ioctl_ops->vidioc_dqbuf` ioctl handler of a driver.

This function:

1) verifies the passed buffer;

2) calls `vb2_ops->buf_finish` callback in the driver (if provided), in which driver can perform any additional operations that may be required before returning the buffer to userspace, such as cache sync;

3) the buffer struct members are filled with relevant information for the userspace.

The return values from this function are intended to be directly returned from `v4l2_ioctl_ops->vidioc_dqbuf` handler in driver.

```c
int vb2_streamon(struct vb2_queue *q, enum v4l2_buf_type type)
    start streaming
```

**Parameters**

- `struct vb2_queue *q`  pointer to `struct vb2_queue` with videobuf2 queue.
enum v4l2_buf_type type type argument passed from userspace to viodic_streamon handler, as defined by enum v4l2_buf_type.

**Description**

Should be called from `v4l2_ioctl_ops->vidioc_streamon` handler of a driver.

This function:

1) verifies current state
2) passes any previously queued buffers to the driver and starts streaming

The return values from this function are intended to be directly returned from `v4l2_ioctl_ops->vidioc_streamon` handler in the driver.

```c
int vb2_streamoff(struct vb2_queue *q, enum v4l2_buf_type type)
```

**Parameters**

- `struct vb2_queue *q` pointer to `struct vb2_queue` with videobuf2 queue.
- `enum v4l2_buf_type type` type argument passed from userspace to viodic_streamoff handler

**Description**

Should be called from viodic_streamoff handler of a driver.

This function:

1) verifies current state,
2) stop streaming and dequeues any queued buffers, including those previously passed to the driver (after waiting for the driver to finish).

This call can be used for pausing playback. The return values from this function are intended to be directly returned from viodic_streamoff handler in the driver.

```c
int vb2_queue_init(struct vb2_queue *q)
```

**Parameters**

- `struct vb2_queue *q` pointer to `struct vb2_queue` with videobuf2 queue.

**Description**

The vb2_queue structure should be allocated by the driver. The driver is responsible of clearing it’s content and setting initial values for some required entries before calling this function. `q->ops`, `q->mem_ops`, `q->type` and `q->io_modes` are mandatory. Please refer to the `struct vb2_queue` description in include/media/videobuf2-core.h for more information.

```c
int vb2_queue_init_name(struct vb2_queue *q, const char *name)
```

**Parameters**

- `struct vb2_queue *q` pointer to `struct vb2_queue` with videobuf2 queue.
- `const char *name` the queue name

**Description**

2.2. Video4Linux devices
This function initializes the vb2_queue exactly like `vb2_queue_init()`, and additionally sets
the queue name. The queue name is used for logging purpose, and should uniquely identify
the queue within the context of the device it belongs to. This is useful to attribute kernel log
messages to the right queue for m2m devices or other devices that handle multiple queues.

```c
void vb2_queue_release(struct vb2_queue *q)
    stop streaming, release the queue and free memory
```

**Parameters**

- `struct vb2_queue *q` pointer to `struct vb2_queue` with videobuf2 queue.

**Description**

This function stops streaming and performs necessary clean ups, including freeing video buffer
memory. The driver is responsible for freeing the vb2_queue structure itself.

```c
int vb2_queue_change_type(struct vb2_queue *q, unsigned int type)
    change the type of an inactive vb2_queue
```

**Parameters**

- `struct vb2_queue *q` pointer to `struct vb2_queue` with videobuf2 queue.
- `unsigned int type` the type to change to (V4L2_BUF_TYPE_VIDEO_*)

**Description**

This function changes the type of the vb2_queue. This is only possible if the queue is not busy
(i.e. no buffers have been allocated).

`vb2_queue_change_type()` can be used to support multiple buffer types using the same queue.
The driver can implement `v4l2_ioctl_ops.vidioc_reqbufs` and `v4l2_ioctl_ops.vidioc_create.bufs`
functions and call `vb2_queue_change_type()` before calling `vb2_ioctl_reqbufs()` or
`vb2_ioctl_create.bufs()`, and thus “lock” the buffer type until the buffers have been released.

```c
__poll_t vb2_poll(struct vb2_queue *q, struct file *file, poll_table *wait)
    implements poll userspace operation
```

**Parameters**

- `struct vb2_queue *q` pointer to `struct vb2_queue` with videobuf2 queue.
- `struct file *file` file argument passed to the poll file operation handler
- `poll_table *wait` wait argument passed to the poll file operation handler

**Description**

This function implements poll file operation handler for a driver. For CAPTURE queues, if a
buffer is ready to be dequeued, the userspace will be informed that the file descriptor of a
video device is available for reading. For OUTPUT queues, if a buffer is ready to be dequeued,
the file descriptor will be reported as available for writing.

If the driver uses `struct v4l2_fh`, then `vb2_poll()` will also check for any pending events.

The return values from this function are intended to be directly returned from poll handler in
driver.

```c
void vb2_video_unregister_device(struct video_device *vdev)
    unregister the video device and release queue
```

**Parameters**

struct video_device *vdev pointer to struct video_device

Description
If the driver uses vb2_fop_release()/vb2_fop_release(), then it should use
vb2_video_unregister_device() instead of video_unregister_device()

This function will call video_unregister_device() and then release the vb2_queue if streaming is in progress. This will stop streaming and this will simplify the unbind sequence since after this call all subdevs will have stopped streaming as well.

void vb2_ops_wait_prepare(struct vb2_queue *vq)
    helper function to lock a struct vb2_queue

Parameters
struct vb2_queue *vq pointer to struct vb2_queue

Description
..note:: only use if vq->lock is non-NULL.

void vb2_ops_wait_finish(struct vb2_queue *vq)
    helper function to unlock a struct vb2_queue

Parameters
struct vb2_queue *vq pointer to struct vb2_queue

Description
..note:: only use if vq->lock is non-NULL.

struct vb2_vmarea_handler
    common vma refcount tracking handler.

Definition
struct vb2_vmarea_handler {
    refcount_t *refcount;
    void (*put)(void *arg);
    void *arg;
};

Members
refcount pointer to refcount_t entry in the buffer.
put callback to function that decreases buffer refcount.
arg argument for put callback.
2.2.16 V4L2 DV Timings functions

```c
struct v4l2_fract v4l2_calc_timeperframe(const struct v4l2_dv_timings *t)
    helper function to calculate timeperframe based v4l2_dv_timings fields.
```

**Parameters**

```c
const struct v4l2_dv_timings *t Timings for the video mode.
```

**Description**

Calculates the expected timeperframe using the pixel clock value and horizontal/vertical measures. This means that v4l2_dv_timings structure must be correctly and fully filled.

```c
v4l2_check_dv_timings_fnc
    Typedef: timings check callback
```

**Syntax**

```c
bool v4l2_check_dv_timings_fnc (const struct v4l2_dv_timings *t, void *handle)
```

**Parameters**

```c
const struct v4l2_dv_timings *t the v4l2_dv_timings struct.
void *handle a handle from the driver.
```

**Description**

Returns true if the given timings are valid.

```c
bool v4l2_valid_dv_timings(const struct v4l2_dv_timings *t, const struct v4l2_dv_timings_cap *cap, v4l2_check_dv_timings_fnc fnc, void *fnc_handle)
    are these timings valid?
```

**Parameters**

```c
const struct v4l2_dv_timings *t the v4l2_dv_timings struct.
const struct v4l2_dv_timings_cap *cap the v4l2_dv_timings_cap capabilities.
v4l2_check_dv_timings_fnc fnc callback to check if this timing is OK. May be NULL.
void *fnc_handle a handle that is passed on to fnc.
```

**Description**

Returns true if the given dv_timings struct is supported by the hardware capabilities and the callback function (if non-NULL), returns false otherwise.

```c
int v4l2_enum_dv_timings_cap(struct v4l2_enum_dv_timings *t, const struct v4l2_dv_timings_cap *cap, v4l2_check_dv_timings_fnc fnc, void *fnc_handle)
    Helper function to enumerate possible DV timings based on capabilities
```

**Parameters**

```c
struct v4l2_enum_dv_timings *t the v4l2_enum_dv_timings struct.
const struct v4l2_dv_timings_cap *cap the v4l2_dv_timings_cap capabilities.
v4l2_check_dv_timings_fnc fnc callback to check if this timing is OK. May be NULL.
```
void *fnc_handle a handle that is passed on to fnc.

Description

This enumerates dv_timings using the full list of possible CEA-861 and DMT timings, filtering out any timings that are not supported based on the hardware capabilities and the callback function (if non-NULL).

If a valid timing for the given index is found, it will fill in t and return 0, otherwise it returns -EINVAL.

bool v4l2_find_dv_timings_cap(struct v4l2_dv_timings *t, const struct v4l2_dv_timings_cap *cap, unsigned pclock_delta, v4l2_check_dv_timings_fnc fnc, void *fnc_handle)

Find the closest timings struct

Parameters

struct v4l2_dv_timings *t the v4l2_enum_dv_timings struct.
const struct v4l2_dv_timings_cap *cap the v4l2_dv_timings_cap capabilities.
unsigned pclock_delta maximum delta between t->pixelclock and the timing struct under consideration.
v4l2_check_dv_timings_fnc fnc callback to check if a given timings struct is OK. May be NULL.
void *fnc_handle a handle that is passed on to fnc.

Description

This function tries to map the given timings to an entry in the full list of possible CEA-861 and DMT timings, filtering out any timings that are not supported based on the hardware capabilities and the callback function (if non-NULL).

On success it will fill in t with the found timings and it returns true. On failure it will return false.

bool v4l2_find_dv_timings_cea861_vic(struct v4l2_dv_timings *t, u8 vic)

find timings based on CEA-861 VIC

Parameters

struct v4l2_dv_timings *t the timings data.
u8 vic CEA-861 VIC code

Description

On success it will fill in t with the found timings and it returns true. On failure it will return false.

bool v4l2_match_dv_timings(const struct v4l2_dv_timings *measured, const struct v4l2_dv_timings *standard, unsigned pclock_delta, bool match_reduced_fps)

do two timings match?

Parameters

const struct v4l2_dv_timings *measured the measured timings data.
const struct v4l2_dv_timings *standard the timings according to the standard.
**unsigned pclock_delta** maximum delta in Hz between standard->pixelclock and the measured timings.

**bool match_reduced_fps** if true, then fail if V4L2_DV_FL_REDEUCED_FPS does not match.

**Description**

Returns true if the two timings match, returns false otherwise.

**void v4l2_print_dv_timings(const char *dev_prefix, const char *prefix, const struct v4l2_dv_timings *t, bool detailed)**

log the contents of a dv_timings struct

**Parameters**

**const char *dev_prefix** device prefix for each log line.

**const char *prefix** additional prefix for each log line, may be NULL.

**const struct v4l2_dv_timings *t** the timings data.

**bool detailed** if true, give a detailed log.

**bool v4l2_detect_cvt(unsigned frame_height, unsigned hfreq, unsigned vsync, unsigned active_width, u32 polarities, bool interlaced, struct v4l2_dv_timings *fmt)**

detect if the given timings follow the CVT standard

**Parameters**

**unsigned frame_height** the total height of the frame (including blanking) in lines.

**unsigned hfreq** the horizontal frequency in Hz.

**unsigned vsync** the height of the vertical sync in lines.

**unsigned active_width** active width of image (does not include blanking). This information is needed only in case of version 2 of reduced blanking. In other cases, this parameter does not have any effect on timings.

**u32 polarities** the horizontal and vertical polarities (same as struct v4l2_bt_timings polarities).

**bool interlaced** if this flag is true, it indicates interlaced format

**struct v4l2_dv_timings *fmt** the resulting timings.

**Description**

This function will attempt to detect if the given values correspond to a valid CVT format. If so, then it will return true, and fmt will be filled in with the found CVT timings.

**bool v4l2_detect_gtf(unsigned frame_height, unsigned hfreq, unsigned vsync, u32 polarities, bool interlaced, struct v4l2_fract aspect, struct v4l2_dv_timings *fmt)**

detect if the given timings follow the GTF standard

**Parameters**

**unsigned frame_height** the total height of the frame (including blanking) in lines.

**unsigned hfreq** the horizontal frequency in Hz.

**unsigned vsync** the height of the vertical sync in lines.
**u32 polarities** the horizontal and vertical polarities (same as struct v4l2_bt_timings polarities).

**bool interlaced** if this flag is true, it indicates interlaced format

**struct v4l2_fract aspect** preferred aspect ratio. GTF has no method of determining the aspect ratio in order to derive the image width from the image height, so it has to be passed explicitly. Usually the native screen aspect ratio is used for this. If it is not filled in correctly, then 16:9 will be assumed.

**struct v4l2_dv_timings *fmt** the resulting timings.

**Description**
This function will attempt to detect if the given values correspond to a valid GTF format. If so, then it will return true, and fmt will be filled in with the found GTF timings.

```
struct v4l2_fract v4l2_calc_aspect_ratio(u8 hor_landscape, u8 vert_portrait)
```
calculate the aspect ratio based on bytes 0x15 and 0x16 from the EDID.

**Parameters**
- **u8 hor_landscape** byte 0x15 from the EDID.
- **u8 vert_portrait** byte 0x16 from the EDID.

**Description**
Determines the aspect ratio from the EDID. See VESA Enhanced EDID standard, release A, rev 2, section 3.6.2: “Horizontal and Vertical Screen Size or Aspect Ratio”

```
struct v4l2_fract v4l2_dv_timings_aspect_ratio(const struct v4l2_dv_timings *t)
```
calculate the aspect ratio based on the v4l2_dv_timings information.

**Parameters**
- **const struct v4l2_dv_timings *t** the timings data.

```
bool can_reduce_fps(struct v4l2_bt_timings *bt)
```
check if conditions for reduced fps are true.

**Parameters**
- **struct v4l2_bt_timings *bt** v4l2 timing structure

**Description**
For different timings reduced fps is allowed if the following conditions are met:
- For CVT timings: if reduced blanking v2 (vsync == 8) is true.
- For CEA861 timings: if V4L2_DV_FL_CAN_REDUCE_FPS flag is true.

**struct v4l2_hdmi_colorimetry** describes the HDMI colorimetry information

**Definition**

```
struct v4l2_hdmi_colorimetry {
  enum v4l2_colorspace colorspace;
  enum v4l2_ycbcr_encoding ycbcr_enc;
  enum v4l2_quantization quantization;
```

---

**2.2. Video4Linux devices**

369
enum v4l2_xfer_func xfer_func;
}

Members

colorspace enum v4l2_colorspace, the colorspace
ycbcr_enc enum v4l2_ycbcr_encoding, Y’CbCr encoding
quantization enum v4l2_quantization, colorspace quantization
xfer_func enum v4l2_xfer_func, colorspace transfer function

2.2.17 V4L2 flash functions and data structures

struct v4l2_flash_ctrl_data
flash control initialization data, filled basing on the features declared by the LED flash
class driver in the v4l2_flash_config

Definition

def struct v4l2_flash_ctrl_data {
    struct v4l2_ctrl_config config;
    u32 cid;
};

Members

cconfig initialization data for a control
cid contains v4l2 flash control id if the config field was initialized, 0 otherwise

struct v4l2_flash_ops
V4L2 flash operations

Definition

def struct v4l2_flash_ops {
    int (*external_strobe_set)(struct v4l2_flash *v4l2_flash, bool enable);
    enum led_brightness (*intensity_to_led_brightness) (struct v4l2_flash *v4l2_flash,
        s32 intensity);
    s32 (*led_brightness_to_intensity) (struct v4l2_flash *v4l2_flash, enum led_        
        brightness);
};

Members

external_strobe_set Setup strobing the flash by hardware pin state assertion.

intensity_to_led_brightness Convert intensity to brightness in a device specific manner

led_brightness_to_intensity convert brightness to intensity in a device specific manner.

struct v4l2_flash_config
V4L2 Flash sub-device initialization data

Definition
struct v4l2_flash_config {
    char dev_name[32];
    struct led_flash_setting intensity;
    u32 flash_faults;
    unsigned int has_external_strobe:1;
};

**Members**

*dev_name* the name of the media entity, unique in the system

*intensity* non-flash strobe constraints for the LED

*flash_faults* bitmask of flash faults that the LED flash class device can report; corresponding LED_FAULT* bit definitions are available in the header file <linux/led-class-flash.h>

*has_external_strobe* external strobe capability

struct v4l2_flash
    Flash sub-device context

**Definition**

struct v4l2_flash {
    struct led_classdev_flash *fled_cdev;
    struct led_classdev *iled_cdev;
    const struct v4l2_flash_ops *ops;
    struct v4l2_subdev sd;
    struct v4l2_ctrl_handler hdl;
    struct v4l2_ctrl **ctrls;
};

**Members**

*fled_cdev* LED flash class device controlled by this sub-device

*iled_cdev* LED class device representing indicator LED associated with the LED flash class device

*ops* V4L2 specific flash ops

*sd* V4L2 sub-device

*hdl* flash controls handler

*ctrls* array of pointers to controls, whose values define the sub-device state

struct v4l2_flash *v4l2_subdev_to_v4l2_flash(struct v4l2_subdev *sd)
    Returns a *struct v4l2_flash* from the *struct v4l2_subdev* embedded on it.

**Parameters**

*struct v4l2_subdev *sd* pointer to *struct v4l2_subdev*

struct v4l2_flash *v4l2_ctrl_to_v4l2_flash(struct v4l2_ctrl *c)
    Returns a *struct v4l2_flash* from the *struct v4l2_ctrl* embedded on it.

**Parameters**

*struct v4l2_ctrl *c* pointer to *struct v4l2_ctrl*
struct \texttt{v4l2\_flash} *\texttt{v4l2\_flash\_init}(struct device *\texttt{dev}, struct fwnode\_handle *\texttt{fwn},
\texttt{struct led\_classdev\_flash *\texttt{fled\_cdev},
const struct v4l2\_flash\_ops *\texttt{ops}, struct v4l2\_flash\_config *\texttt{config})
initialize V4L2 flash led sub-device

**Parameters**

- **struct device *\texttt{dev}** flash device, e.g. an I2C device
- **struct fwnode\_handle *\texttt{fwn}** fwnode\_handle of the LED, may be NULL if the same as device’s
- **struct led\_classdev\_flash *\texttt{fled\_cdev}** LED flash class device to wrap
- **const struct v4l2\_flash\_ops *\texttt{ops}** V4L2 Flash device ops
- **struct v4l2\_flash\_config *\texttt{config}** initialization data for V4L2 Flash sub-device

**Description**
Create V4L2 Flash sub-device wrapping given LED subsystem device. The ops pointer is stored by the V4L2 flash framework. No references are held to config nor its contents once this function has returned.

**Return**
A valid pointer, or, when an error occurs, the return value is encoded using ERR_PTR(). Use IS\_ERR() to check and PTR\_ERR() to obtain the numeric return value.

struct \texttt{v4l2\_flash} *\texttt{v4l2\_flash\_indicator\_init}(struct device *\texttt{dev}, struct fwnode\_handle *\texttt{fwn},
\texttt{struct led\_classdev *\texttt{iled\_cdev},
struct v4l2\_flash\_config *\texttt{config})
initialize V4L2 indicator sub-device

**Parameters**

- **struct device *\texttt{dev}** flash device, e.g. an I2C device
- **struct fwnode\_handle *\texttt{fwn}** fwnode\_handle of the LED, may be NULL if the same as device’s
- **struct led\_classdev *\texttt{iled\_cdev}** LED flash class device representing the indicator LED
- **struct v4l2\_flash\_config *\texttt{config}** initialization data for V4L2 Flash sub-device

**Description**
Create V4L2 Flash sub-device wrapping given LED subsystem device. The ops pointer is stored by the V4L2 flash framework. No references are held to config nor its contents once this function has returned.

**Return**
A valid pointer, or, when an error occurs, the return value is encoded using ERR_PTR(). Use IS\_ERR() to check and PTR\_ERR() to obtain the numeric return value.

void \texttt{v4l2\_flash\_release}(struct v4l2\_flash *\texttt{v4l2\_flash})
release V4L2 Flash sub-device

**Parameters**

- **struct v4l2\_flash *\texttt{v4l2\_flash}** the V4L2 Flash sub-device to release
Description
Release V4L2 Flash sub-device.

2.2.18 V4L2 Media Controller functions and data structures

int v4l2_mc_create_media_graph(struct media_device *mdev)
create Media Controller links at the graph.

Parameters
struct media_device *mdev pointer to the media_device struct.

Description
Add links between the entities commonly found on PC customer’s hardware at the V4L2 side: camera sensors, audio and video PLL-IF decoders, tuners, analog TV decoder and I/O entities (video, VBI and Software Defined Radio).

Note: Webcams are modelled on a very simple way: the sensor is connected directly to the I/O entity. All dirty details, like scaler and crop HW are hidden. While such mapping is enough for v4l2 interface centric PC-consumer’s hardware, V4L2 subdev centric camera hardware should not use this routine, as it will not build the right graph.

int v4l_enable_media_source(struct video_device *vdev)
Hold media source for exclusive use if free

Parameters
struct video_device *vdev pointer to struct video_device

Description
This interface calls enable_source handler to determine if media source is free for use. The enable_source handler is responsible for checking if the media source is free and start a pipeline between the media source and the media entity associated with the video device. This interface should be called from v4l2-core and dvb-core interfaces that change the source configuration.

Return
returns zero on success or a negative error code.

void v4l_disable_media_source(struct video_device *vdev)
Release media source

Parameters
struct video_device *vdev pointer to struct video_device

Description
This interface calls disable_source handler to release the media source. The disable_source handler stops the active media pipeline between the media source and the media entity associated with the video device.

Return
returns zero on success or a negative error code.
int v4l2_create_fwnode_links_to_pad(struct v4l2_subdev *src_sd, struct media_pad *sink, u32 flags)

Create fwnode-based links from a source subdev to a sink subdev pad.

**Parameters**

- *src_sd*: pointer to a source subdev
- *sink*: pointer to a subdev sink pad
- *flags*: the link flags

**Description**

This function searches for fwnode endpoint connections from a source subdevice to a single sink pad, and if suitable connections are found, translates them into media links to that pad. The function can be called by the sink subdevice, in its v4l2-async notifier subdev bound callback, to create links from a bound source subdevice.

The *flags* argument specifies the link flags. The caller shall ensure that the flags are valid regardless of the number of links that may be created. For instance, setting the MEDIA_LNK_FL_ENABLED flag will cause all created links to be enabled, which isn’t valid if more than one link is created.

**Note:** Any sink subdevice that calls this function must implement the .get_fwnode_pad media operation in order to verify endpoints passed to the sink are owned by the sink.

Return 0 on success or a negative error code on failure.

int v4l2_create_fwnode_links(struct v4l2_subdev *src_sd, struct v4l2_subdev *sink_sd)

Create fwnode-based links from a source subdev to a sink subdev.

**Parameters**

- *src_sd*: pointer to a source subdevice
- *sink_sd*: pointer to a sink subdevice

**Description**

This function searches for any and all fwnode endpoint connections between source and sink subdevices, and translates them into media links. The function can be called by the sink subdevice, in its v4l2-async notifier subdev bound callback, to create all links from a bound source subdevice.

**Note:** Any sink subdevice that calls this function must implement the .get_fwnode_pad media operation in order to verify endpoints passed to the sink are owned by the sink.

Return 0 on success or a negative error code on failure.

int v4l2_pipeline_pm_get(struct media_entity *entity)

Increase the use count of a pipeline

**Parameters**

- *entity*: The root entity of a pipeline
Description

Update the use count of all entities in the pipeline and power entities on.

This function is intended to be called in video node open. It uses `struct media_entity`.use_count to track the power status. The use of this function should be paired with `v4l2_pipeline_link_notify()`.

Return 0 on success or a negative error code on failure.

```c
void v4l2_pipeline_pm_put(struct media_entity *entity)
    Decrease the use count of a pipeline
```

**Parameters**

- **struct media_entity *entity** The root entity of a pipeline

Description

Update the use count of all entities in the pipeline and power entities off.

This function is intended to be called in video node release. It uses `struct media_entity`.use_count to track the power status. The use of this function should be paired with `v4l2_pipeline_link_notify()`.

```c
int v4l2_pipeline_link_notify(struct media_link *link, u32 flags, unsigned int notification)
    Link management notification callback
```

**Parameters**

- **struct media_link *link** The link
- **u32 flags** New link flags that will be applied
- **unsigned int notification** The link’s state change notification type (MEDIA_DEV_NOTIFY_*)

Description

React to link management on powered pipelines by updating the use count of all entities in the source and sink sides of the link. Entities are powered on or off accordingly. The use of this function should be paired with `v4l2_pipeline_pm_{get,put}()`.

Return 0 on success or a negative error code on failure. Powering entities off is assumed to never fail. This function will not fail for disconnection events.

### 2.2.19 V4L2 Media Bus functions and data structures

**enum v4l2_mbus_type**

- media bus type

**Constants**

- **V4L2_MBUS_UNKNOWN** unknown bus type, no V4L2 mediabus configuration
- **V4L2_MBUS_PARALLEL** parallel interface with hsync and vsync
- **V4L2_MBUS_BT656** parallel interface with embedded synchronisation, can also be used for BT.1120
- **V4L2_MBUS_CSI1** MIPI CSI-1 serial interface

### 2.2. Video4Linux devices
struct v4l2_mbus_config
    media bus configuration

Members

type in: interface type
flags in / out: configuration flags, depending on type

void v4l2_fill_pix_format(struct v4l2_pix_format *pix_fmt, const struct v4l2_mbus_framefmt *mbus_fmt)
Ancillary routine that fills a struct v4l2_pix_format fields from a struct v4l2_mbus_framefmt.

Parameters

struct v4l2_pix_format *pix_fmt pointer to struct v4l2_pix_format to be filled
const struct v4l2_mbus_framefmt *mbus_fmt pointer to struct v4l2_mbus_framefmt to be used as model

void v4l2_fill_mbus_format(struct v4l2_mbus_framefmt *mbus_fmt, const struct v4l2_pix_format *pix_fmt, u32 code)
Ancillary routine that fills a struct v4l2_mbus_framefmt from a struct v4l2_pix_format and a data format code.

Parameters

struct v4l2_mbus_framefmt *mbus_fmt pointer to struct v4l2_mbus_framefmt to be filled
const struct v4l2_pix_format *pix_fmt pointer to struct v4l2_pix_format to be used as model
u32 code data format code (from enum v4l2_mbus_pixelcode)

void v4l2_fill_pix_format_mplane(struct v4l2_pix_format_mplane *pix_mp_fmt, const struct v4l2_mbus_framefmt *mbus_fmt)
Ancillary routine that fills a struct v4l2_pix_format_mplane fields from a media bus structure.

Parameters

struct v4l2_pix_format_mplane *pix_mp_fmt pointer to struct v4l2_pix_format_mplane to be filled
const struct v4l2_mbus_framefmt *mbus_fmt pointer to struct v4l2_mbus_framefmt to be used as model
void v4l2_fill_mbus_format_mplane(struct v4l2_mbus_framefmt *mbus_fmt, const struct v4l2_pix_format_mplane *pix_mp_fmt)

Ancillary routine that fills a struct v4l2_mbus_framefmt from a struct v4l2_pix_format_mplane.

Parameters

struct v4l2_mbus_framefmt *mbus_fmt pointer to struct v4l2_mbus_framefmt to be filled
const struct v4l2_pix_format_mplane *pix_mp_fmt pointer to struct v4l2_pix_format_mplane to be used as model

2.2.20 V4L2 Memory to Memory functions and data structures

struct v4l2_m2m_ops
  mem-to-mem device driver callbacks

Definition

struct v4l2_m2m_ops {
  void (*device_run)(void *priv);
  int (*job_ready)(void *priv);
  void (*job_abort)(void *priv);
};

Members

device_run required. Begin the actual job (transaction) inside this callback. The job does NOT have to end before this callback returns (and it will be the usual case). When the job finishes, v4l2_m2m_job_finish() or v4l2_m2m_buf_done_and_job_finish() has to be called.

job_ready optional. Should return 0 if the driver does not have a job fully prepared to run yet (i.e. it will not be able to finish a transaction without sleeping). If not provided, it will be assumed that one source and one destination buffer are all that is required for the driver to perform one full transaction. This method may not sleep.

job_abort optional. Informs the driver that it has to abort the currently running transaction as soon as possible (i.e. as soon as it can stop the device safely; e.g. in the next interrupt handler), even if the transaction would not have been finished by then. After the driver performs the necessary steps, it has to call v4l2_m2m_job_finish() or v4l2_m2m_buf_done_and_job_finish() as if the transaction ended normally. This function does not have to (and will usually not) wait until the device enters a state when it can be stopped.

struct v4l2_m2m_queue_ctx
  represents a queue for buffers ready to be processed

Definition

struct v4l2_m2m_queue_ctx {
  struct vb2_queue q;
  struct list_head rdy_queue;
  spinlock_t rdy_spinlock;
  u8 num_rdy;
  bool buffered;
};

2.2. Video4Linux devices
Members

q  pointer to struct `vb2_queue`
rdy_queue  List of V4L2 mem-to-mem queues
rdy_spinlock  spin lock to protect the struct usage
num_rdy  number of buffers ready to be processed
buffered  is the queue buffered?

Description
Queue for buffers ready to be processed as soon as this instance receives access to the device.

struct `v4l2_m2m_ctx`
Memory to memory context structure

Definition

```c
struct v4l2_m2m_ctx {
    struct mutex *q_lock;
    bool new_frame;
    bool is_draining;
    struct vb2_v4l2_buffer *last_src_buf;
    bool next_buf_last;
    bool has_stopped;
    struct v4l2_m2m_dev *m2m_dev;
    struct v4l2_m2m_queue_ctx cap_q_ctx;
    struct v4l2_m2m_queue_ctx out_q_ctx;
    struct list_head queue;
    unsigned long job_flags;
    wait_queue_head_t finished;
    void *priv;
};
```

Members

q_lock  struct mutex lock

new_frame  valid in the device_run callback: if true, then this starts a new frame; if false, then this is a new slice for an existing frame. This is always true unless V4L2_BUF_CAP_SUPPORTS_M2M_HOLD_CAPTURE_BUF is set, which indicates slicing support.

is_draining  indicates device is in draining phase

last_src_buf  indicate the last source buffer for draining

next_buf_last  next capture queued buffer will be tagged as last

has_stopped  indicate the device has been stopped

m2m_dev  opaque pointer to the internal data to handle M2M context

cap_q_ctx  Capture (output to memory) queue context

out_q_ctx  Output (input from memory) queue context

queue  List of memory to memory contexts
**job_flags** Job queue flags, used internally by v4l2-mem2mem.c: `TRANS_QUEUE`, `TRANS_RUNNING` and `TRANS_ABORT`.

**finished** Wait queue used to signalize when a job queue finished.

**priv** Instance private data

**Description**

The memory to memory context is specific to a file handle, NOT to e.g. a device.

**struct v4l2_m2m_buffer**

Memory to memory buffer

**Definition**

```c
define struct v4l2_m2m_buffer {
    struct vb2_v4l2_buffer vb;
    struct list_head list;
};
```

**Members**

- **vb** pointer to struct `vb2_v4l2_buffer`
- **list** list of m2m buffers

**void *v4l2_m2m_get_curr_priv** (struct v4l2_m2m_dev *m2m_dev)

return driver private data for the currently running instance or NULL if no instance is running

**Parameters**

- **struct v4l2_m2m_dev *m2m_dev** opaque pointer to the internal data to handle M2M context

**struct vb2_queue *v4l2_m2m_get_vq** (struct v4l2_m2m_ctx *m2m_ctx, enum v4l2_buf_type type)

return vb2_queue for the given type

**Parameters**

- **struct v4l2_m2m_ctx *m2m_ctx** m2m context assigned to the instance given by struct `v4l2_m2m_ctx`
- **enum v4l2_buf_type type** type of the V4L2 buffer, as defined by enum `v4l2_buf_type`

**void v4l2_m2m_try_schedule** (struct v4l2_m2m_ctx *m2m_ctx)

check whether an instance is ready to be added to the pending job queue and add it if so.

**Parameters**

- **struct v4l2_m2m_ctx *m2m_ctx** m2m context assigned to the instance given by struct `v4l2_m2m_ctx`

**Description**

There are three basic requirements an instance has to meet to be able to run: 1) at least one source buffer has to be queued, 2) at least one destination buffer has to be queued, 3) streaming has to be on.

If a queue is buffered (for example a decoder hardware ringbuffer that has to be drained before doing streamoff), allow scheduling without v4l2 buffers on that queue.

### 2.2. Video4Linux devices

379
There may also be additional, custom requirements. In such case the driver should supply a custom callback (job_ready in v4l2_m2m_ops) that should return 1 if the instance is ready. An example of the above could be an instance that requires more than one src/dst buffer per transaction.

```c
void v4l2_m2m_job_finish(struct v4l2_m2m_dev *m2m_dev, struct v4l2_m2m_ctx *m2m_ctx)
```

inform the framework that a job has been finished and have it clean up

**Parameters**

- `struct v4l2_m2m_dev *m2m_dev` opaque pointer to the internal data to handle M2M context
- `struct v4l2_m2m_ctx *m2m_ctx` m2m context assigned to the instance given by struct `v4l2_m2m_ctx`

**Description**

Called by a driver to yield back the device after it has finished with it. Should be called as soon as possible after reaching a state which allows other instances to take control of the device.

This function has to be called only after `v4l2_m2m_ops->device_run` callback has been called on the driver. To prevent recursion, it should not be called directly from the `v4l2_m2m_ops->device_run` callback though.

```c
void v4l2_m2m_buf_done_and_job_finish(struct v4l2_m2m_dev *m2m_dev, struct v4l2_m2m_ctx *m2m_ctx, enum vb2_buffer_state state)
```

return source/destination buffers with state and inform the framework that a job has been finished and have it clean up

**Parameters**

- `struct v4l2_m2m_dev *m2m_dev` opaque pointer to the internal data to handle M2M context
- `struct v4l2_m2m_ctx *m2m_ctx` m2m context assigned to the instance given by struct `v4l2_m2m_ctx`
- `enum vb2_buffer_state state` vb2 buffer state passed to v4l2_m2m_buf_done().

**Description**

Drivers that set V4L2_BUF_CAP_SUPPORTS_M2M_HOLD_CAPTURE_BUF must use this function instead of job_finish() to take held buffers into account. It is optional for other drivers.

This function removes the source buffer from the ready list and returns it with the given state. The same is done for the destination buffer, unless it is marked ‘held’. In that case the buffer is kept on the ready list.

After that the job is finished (see job_finish()).

This allows for multiple output buffers to be used to fill in a single capture buffer. This is typically used by stateless decoders where multiple e.g. H.264 slices contribute to a single decoded frame.

```c
void v4l2_m2m_clear_state(struct v4l2_m2m_ctx *m2m_ctx)
```

clear encoding/decoding state

**Parameters**
struct v4l2_m2m_ctx *m2m_ctx m2m context assigned to the instance given by struct v4l2_m2m_ctx

void v4l2_m2m_mark_stopped(struct v4l2_m2m_ctx *m2m_ctx)
set current encoding/decoding state as stopped

Parameters

struct v4l2_m2m_ctx *m2m_ctx m2m context assigned to the instance given by struct v4l2_m2m_ctx

bool v4l2_m2m_dst_buf_is_last(struct v4l2_m2m_ctx *m2m_ctx)
return the current encoding/decoding session draining management state of next queued capture buffer

Parameters

struct v4l2_m2m_ctx *m2m_ctx m2m context assigned to the instance given by struct v4l2_m2m_ctx

Description

This last capture buffer should be tagged with V4L2_BUF_FLAG_LAST to notify the end of the capture session.

bool v4l2_m2m_has_stopped(struct v4l2_m2m_ctx *m2m_ctx)
return the current encoding/decoding session stopped state

Parameters

struct v4l2_m2m_ctx *m2m_ctx m2m context assigned to the instance given by struct v4l2_m2m_ctx

bool v4l2_m2m_is_last_draining_src_buf(struct v4l2_m2m_ctx *m2m_ctx, struct vb2_v4l2_buffer *vbuf)
return the output buffer draining state in the current encoding/decoding session

Parameters

struct v4l2_m2m_ctx *m2m_ctx m2m context assigned to the instance given by struct v4l2_m2m_ctx

struct vb2_v4l2_buffer *vbuf pointer to struct v4l2_buffer

Description

This will identify the last output buffer queued before a session stop was required, leading to an actual encoding/decoding session stop state in the encoding/decoding process after being processed.

void v4l2_m2m_last_buffer_done(struct v4l2_m2m_ctx *m2m_ctx, struct vb2_v4l2_buffer *vbuf)
marks the buffer with LAST flag and DONE

Parameters

struct v4l2_m2m_ctx *m2m_ctx m2m context assigned to the instance given by struct v4l2_m2m_ctx

struct vb2_v4l2_buffer *vbuf pointer to struct v4l2_buffer

2.2. Video4Linux devices
void v4l2_m2m_suspend(struct v4l2_m2m_dev *m2m_dev)
    stop new jobs from being run and wait for current job to finish

Parameters
struct v4l2_m2m_dev *m2m_dev opaque pointer to the internal data to handle M2M context

Description
Called by a driver in the suspend hook. Stop new jobs from being run, and wait for current running job to finish.

void v4l2_m2m_resume(struct v4l2_m2m_dev *m2m_dev)
    resume job running and try to run a queued job

Parameters
struct v4l2_m2m_dev *m2m_dev opaque pointer to the internal data to handle M2M context

Description
Called by a driver in the resume hook. This reverts the operation of v4l2_m2m_suspend() and allows job to be run. Also try to run a queued job if there is any.

int v4l2_m2m_reqbufs(struct file *file, struct v4l2_m2m_ctx *m2m_ctx, struct v4l2_requestbuffers *reqbufs)
    multi-queue-aware REQBUFS multiplexer

Parameters
struct file *file pointer to struct file
struct v4l2_m2m_ctx *m2m_ctx m2m context assigned to the instance given by struct v4l2_m2m_ctx
struct v4l2_requestbuffers *reqbufs pointer to struct v4l2_requestbuffers

int v4l2_m2m_querybuf(struct file *file, struct v4l2_m2m_ctx *m2m_ctx, struct v4l2_buffer *buf)
    multi-queue-aware QUERYBUF multiplexer

Parameters
struct file *file pointer to struct file
struct v4l2_m2m_ctx *m2m_ctx m2m context assigned to the instance given by struct v4l2_m2m_ctx
struct v4l2_buffer *buf pointer to struct v4l2_buffer

Description
See v4l2_m2m_mmap() documentation for details.

int v4l2_m2m_qbuf(struct file *file, struct v4l2_m2m_ctx *m2m_ctx, struct v4l2_buffer *buf)
    enqueue a source or destination buffer, depending on the type

Parameters
struct file *file pointer to struct file
struct v4l2_m2m_ctx *m2m_ctx m2m context assigned to the instance given by struct v4l2_m2m_ctx
struct v4l2_buffer *buf  pointer to struct v4l2_buffer

int v4l2_m2m_dqbuf(struct file *file, struct v4l2_m2m_ctx *m2m_ctx, struct v4l2_buffer *buf)
    dequeue a source or destination buffer, depending on the type

Parameters
struct file *file  pointer to struct file
struct v4l2_m2m_ctx *m2m_ctx  m2m context assigned to the instance given by struct v4l2_m2m_ctx
struct v4l2_buffer *buf  pointer to struct v4l2_buffer

int v4l2_m2m_prepare_buf(struct file *file, struct v4l2_m2m_ctx *m2m_ctx, struct v4l2_buffer *buf)
    prepare a source or destination buffer, depending on the type

Parameters
struct file *file  pointer to struct file
struct v4l2_m2m_ctx *m2m_ctx  m2m context assigned to the instance given by struct v4l2_m2m_ctx
struct v4l2_buffer *buf  pointer to struct v4l2_buffer

int v4l2_m2m_create_bufs(struct file *file, struct v4l2_m2m_ctx *m2m_ctx, struct v4l2_create_buffers *create)
    create a source or destination buffer, depending on the type

Parameters
struct file *file  pointer to struct file
struct v4l2_m2m_ctx *m2m_ctx  m2m context assigned to the instance given by struct v4l2_m2m_ctx
struct v4l2_create_buffers *create  pointer to struct v4l2_create_buffers

int v4l2_m2m_expbuf(struct file *file, struct v4l2_m2m_ctx *m2m_ctx, struct v4l2_exportbuffer *eb)
    export a source or destination buffer, depending on the type

Parameters
struct file *file  pointer to struct file
struct v4l2_m2m_ctx *m2m_ctx  m2m context assigned to the instance given by struct v4l2_m2m_ctx
struct v4l2_exportbuffer *eb  pointer to struct v4l2_exportbuffer

int v4l2_m2m_streamon(struct file *file, struct v4l2_m2m_ctx *m2m_ctx, enum v4l2_buf_type type)
    turn on streaming for a video queue

Parameters
struct file *file  pointer to struct file
struct v4l2_m2m_ctx *m2m_ctx  m2m context assigned to the instance given by struct v4l2_m2m_ctx

2.2. Video4Linux devices
enum v4l2_buf_type type
type of the V4L2 buffer, as defined by enum v4l2_buf_type

int v4l2_m2m_streamoff(struct file *file, struct v4l2_m2m_ctx *m2m_ctx, enum v4l2_buf_type type)

turn off streaming for a video queue

Parameters
struct file *file pointer to struct file
struct v4l2_m2m_ctx *m2m_ctx m2m context assigned to the instance given by struct v4l2_m2m_ctx

enum v4l2_buf_type type
type of the V4L2 buffer, as defined by enum v4l2_buf_type

void v4l2_m2m_update_start_streaming_state(struct v4l2_m2m_ctx *m2m_ctx, struct vb2_queue *q)

update the encoding/decoding session state when a start of streaming of a video queue is requested

Parameters
struct v4l2_m2m_ctx *m2m_ctx m2m context assigned to the instance given by struct v4l2_m2m_ctx
struct vb2_queue *q queue

void v4l2_m2m_update_stop_streaming_state(struct v4l2_m2m_ctx *m2m_ctx, struct vb2_queue *q)

update the encoding/decoding session state when a stop of streaming of a video queue is requested

Parameters
struct v4l2_m2m_ctx *m2m_ctx m2m context assigned to the instance given by struct v4l2_m2m_ctx
struct vb2_queue *q queue

int v4l2_m2m_encoder_cmd(struct file *file, struct v4l2_m2m_ctx *m2m_ctx, struct v4l2_encoder_cmd *ec)

execute an encoder command

Parameters
struct file *file pointer to struct file
struct v4l2_m2m_ctx *m2m_ctx m2m context assigned to the instance given by struct v4l2_m2m_ctx
struct v4l2_encoder_cmd *ec pointer to the encoder command

int v4l2_m2m_decoder_cmd(struct file *file, struct v4l2_m2m_ctx *m2m_ctx, struct v4l2_decoder_cmd *dc)

execute a decoder command

Parameters
struct file *file pointer to struct file
struct v4l2_m2m_ctx *m2m_ctx m2m context assigned to the instance given by struct v4l2_m2m_ctx
struct v4l2_decoder_cmd *dc  pointer to the decoder command
__poll_t v4l2_m2m_poll(struct file *file, struct v4l2_m2m_ctx *m2m_ctx, struct poll_table_struct *wait)
    poll replacement, for destination buffers only

Parameters
struct file *file  pointer to struct file
struct v4l2_m2m_ctx *m2m_ctx  m2m context assigned to the instance given by struct v4l2_m2m_ctx
struct poll_table_struct *wait  pointer to struct poll_table_struct

Description
Call from the driver’s poll() function. Will poll both queues. If a buffer is available to dequeue (with dqbuf) from the source queue, this will indicate that a non-blocking write can be performed, while read will be returned in case of the destination queue.

int v4l2_m2m_mmap(struct file *file, struct v4l2_m2m_ctx *m2m_ctx, struct vm_area_struct *vma)
    source and destination queues-aware mmap multiplexer

Parameters
struct file *file  pointer to struct file
struct v4l2_m2m_ctx *m2m_ctx  m2m context assigned to the instance given by struct v4l2_m2m_ctx
struct vm_area_struct *vma  pointer to struct vm_area_struct

Description
Call from driver’s mmap() function. Will handle mmap() for both queues seamlessly for videobuffer, which will receive normal per-queue offsets and proper videobuf queue pointers. The differentiation is made outside videobuf by adding a predefined offset to buffers from one of the queues and subtracting it before passing it back to videobuf. Only drivers (and thus applications) receive modified offsets.

struct v4l2_m2m_dev *v4l2_m2m_init(const struct v4l2_m2m_ops *m2m_ops)
    initialize per-driver m2m data

Parameters
const struct v4l2_m2m_ops *m2m_ops  pointer to struct v4l2_m2m_ops

Description
Usually called from driver’s probe() function.

Return
returns an opaque pointer to the internal data to handle M2M context

void v4l2_m2m_release(struct v4l2_m2m_dev *m2m_dev)
    cleans up and frees a m2m_dev structure

Parameters
struct v4l2_m2m_dev *m2m_dev  opaque pointer to the internal data to handle M2M context

2.2. Video4Linux devices
Description

Usually called from driver’s remove() function.

```c
struct v4l2_m2m_ctx * v4l2_m2m_ctx_init(struct v4l2_m2m_dev *m2m_dev, void *drv_priv, int (*queue_init)(void *priv, struct vb2_queue *src_vq, struct vb2_queue *dst_vq))
```

allocate and initialize a m2m context

Parameters

- `struct v4l2_m2m_dev *m2m_dev` opaque pointer to the internal data to handle M2M context
- `void *drv_priv` driver’s instance private data
- `int (*queue_init)(void *priv, struct vb2_queue *src_vq, struct vb2_queue *dst_vq)` a callback for queue type-specific initialization function to be used for initializing videobuf_queues

Description

Usually called from driver’s open() function.

```c
void v4l2_m2m_ctx_release(struct v4l2_m2m_ctx *m2m_ctx)
```

release m2m context

Parameters

- `struct v4l2_m2m_ctx *m2m_ctx` m2m context assigned to the instance given by struct `v4l2_m2m_ctx`

Description

Usually called from driver’s release() function.

```c
void v4l2_m2m_buf_queue(struct v4l2_m2m_ctx *m2m_ctx, struct vb2_v4l2_buffer *vbuf)
```

add a buffer to the proper ready buffers list.

Parameters

- `struct v4l2_m2m_ctx *m2m_ctx` m2m context assigned to the instance given by struct `v4l2_m2m_ctx`
- `struct vb2_v4l2_buffer *vbuf` pointer to struct `vb2_v4l2_buffer`

Description

Call from videobuf_queue_ops->ops->buf_queue, videobuf_queue_ops callback.

```c
unsigned int v4l2_m2m_num_src_bufs_ready(struct v4l2_m2m_ctx *m2m_ctx)
```

return the number of source buffers ready for use

Parameters

- `struct v4l2_m2m_ctx *m2m_ctx` m2m context assigned to the instance given by struct `v4l2_m2m_ctx`

unsigned int v4l2_m2m_num_dst_bufs_ready(struct v4l2_m2m_ctx *m2m_ctx)

return the number of destination buffers ready for use

Parameters
struct v4l2_m2m_ctx *m2m_ctx m2m context assigned to the instance given by struct v4l2_m2m_ctx

struct vb2_v4l2_buffer * v4l2_m2m_next_buf(struct v4l2_m2m_queue_ctx *q_ctx)
return next buffer from the list of ready buffers

Parameters

struct v4l2_m2m_queue_ctx *q_ctx pointer to struct v4l2_m2m_queue_ctx

struct vb2_v4l2_buffer * v4l2_m2m_next_src_buf(struct v4l2_m2m_ctx *m2m_ctx)
return next source buffer from the list of ready buffers

Parameters

struct v4l2_m2m_ctx *m2m_ctx m2m context assigned to the instance given by struct v4l2_m2m_ctx

struct vb2_v4l2_buffer * v4l2_m2m_next_dst_buf(struct v4l2_m2m_ctx *m2m_ctx)
return next destination buffer from the list of ready buffers

Parameters

struct v4l2_m2m_queue_ctx *q_ctx pointer to struct v4l2_m2m_queue_ctx

struct vb2_v4l2_buffer * v4l2_m2m_last_buf(struct v4l2_m2m_queue_ctx *q_ctx)
return last buffer from the list of ready buffers

Parameters

struct v4l2_m2m_queue_ctx *q_ctx pointer to struct v4l2_m2m_queue_ctx

struct vb2_v4l2_buffer * v4l2_m2m_last_src_buf(struct v4l2_m2m_ctx *m2m_ctx)
return last destination buffer from the list of ready buffers

Parameters

struct v4l2_m2m_ctx *m2m_ctx m2m context assigned to the instance given by struct v4l2_m2m_ctx

struct vb2_v4l2_buffer * v4l2_m2m_last_dst_buf(struct v4l2_m2m_ctx *m2m_ctx)
return last destination buffer from the list of ready buffers

Parameters

struct v4l2_m2m_ctx *m2m_ctx m2m context assigned to the instance given by struct v4l2_m2m_ctx

v4l2_m2m_for_each_dst_buf(m2m_ctx, b)
iterate over a list of destination ready buffers

Parameters

m2m_ctx m2m context assigned to the instance given by struct v4l2_m2m_ctx
b current buffer of type struct v4l2_m2m_buffer

v4l2_m2m_for_each_src_buf(m2m_ctx, b)
iterate over a list of source ready buffers

Parameters

m2m_ctx m2m context assigned to the instance given by struct v4l2_m2m_ctx

2.2. Video4Linux devices
**v4l2_m2m_for_each_dst_buf_safe**

```c
v4l2_m2m_for_each_dst_buf_safe(m2m_ctx, b, n)
```

iterate over a list of destination ready buffers safely

**Parameters**

- `m2m_ctx`: m2m context assigned to the instance given by struct `v4l2_m2m_ctx`
- `b`: current buffer of type `struct v4l2_m2m_buffer`
- `n`: used as temporary storage

**v4l2_m2m_for_each_src_buf_safe**

```c
v4l2_m2m_for_each_src_buf_safe(m2m_ctx, b, n)
```

iterate over a list of source ready buffers safely

**Parameters**

- `m2m_ctx`: m2m context assigned to the instance given by struct `v4l2_m2m_ctx`
- `b`: current buffer of type `struct v4l2_m2m_buffer`
- `n`: used as temporary storage

**v4l2_m2m_get_src_vq**

```c
struct vb2_queue *v4l2_m2m_get_src_vq(struct v4l2_m2m_ctx *m2m_ctx)
```

return vb2_queue for source buffers

**Parameters**

- `struct v4l2_m2m_ctx *m2m_ctx`: m2m context assigned to the instance given by struct `v4l2_m2m_ctx`

**v4l2_m2m_get_dst_vq**

```c
struct vb2_queue *v4l2_m2m_get_dst_vq(struct v4l2_m2m_ctx *m2m_ctx)
```

return vb2_queue for destination buffers

**Parameters**

- `struct v4l2_m2m_ctx *m2m_ctx`: m2m context assigned to the instance given by struct `v4l2_m2m_ctx`

**v4l2_m2m_buf_remove**

```c
struct vb2_v4l2_buffer *v4l2_m2m_buf_remove(struct v4l2_m2m_queue_ctx *q_ctx)
```

take off a buffer from the list of ready buffers and return it

**Parameters**

- `struct v4l2_m2m_queue_ctx *q_ctx`: pointer to struct `v4l2_m2m_queue_ctx`

**v4l2_m2m_src_buf_remove**

```c
struct vb2_v4l2_buffer *v4l2_m2m_src_buf_remove(struct v4l2_m2m_ctx *m2m_ctx)
```

take off a source buffer from the list of ready buffers and return it

**Parameters**

- `struct v4l2_m2m_ctx *m2m_ctx`: m2m context assigned to the instance given by struct `v4l2_m2m_ctx`

**v4l2_m2m_dst_buf_remove**

```c
struct vb2_v4l2_buffer *v4l2_m2m_dst_buf_remove(struct v4l2_m2m_ctx *m2m_ctx)
```

take off a destination buffer from the list of ready buffers and return it

**Parameters**

- `struct v4l2_m2m_ctx *m2m_ctx`: m2m context assigned to the instance given by struct `v4l2_m2m_ctx`
void v4l2_m2m_buf_remove_by_buf(struct v4l2_m2m_ctx *q_ctx, struct vb2_v4l2_buffer *vbuf)
    take off exact buffer from the list of ready buffers

Parameters
struct v4l2_m2m_queue_ctx *q_ctx  pointer to struct v4l2_m2m_queue_ctx
struct vb2_v4l2_buffer *vbuf  the buffer to be removed

void v4l2_m2m_src_buf_remove_by_buf(struct v4l2_m2m_ctx *m2m_ctx, struct vb2_v4l2_buffer *vbuf)
    take off exact source buffer from the list of ready buffers

Parameters
struct v4l2_m2m_ctx *m2m_ctx  m2m context assigned to the instance given by struct v4l2_m2m_ctx
struct vb2_v4l2_buffer *vbuf  the buffer to be removed

void v4l2_m2m_dst_buf_remove_by_buf(struct v4l2_m2m_ctx *m2m_ctx, struct vb2_v4l2_buffer *vbuf)
    take off exact destination buffer from the list of ready buffers

Parameters
struct v4l2_m2m_ctx *m2m_ctx  m2m context assigned to the instance given by struct v4l2_m2m_ctx
struct vb2_v4l2_buffer *vbuf  the buffer to be removed

void v4l2_m2m_buf_copy_metadata(const struct vb2_v4l2_buffer *out_vb, struct vb2_v4l2_buffer *cap_vb, bool copy_frame_flags)
    copy buffer metadata from the output buffer to the capture buffer

Parameters
const struct vb2_v4l2_buffer *out_vb  the output buffer that is the source of the metadata.
struct vb2_v4l2_buffer *cap_vb  the capture buffer that will receive the metadata.
bool copy_frame_flags  copy the KEY/B/PFRAME flags as well.

Description
This helper function copies the timestamp, timecode (if the TIMECODE buffer flag was set), field and the TIMECODE, KEYFRAME, BFRAME, PFRAME and TSTAMP_SRC_MASK flags from out_vb to cap_vb.

If copy_frame_flags is false, then the KEYFRAME, BFRAME and PFRAME flags are not copied. This is typically needed for encoders that set this bits explicitly.
2.2.21 V4L2 async kAPI

enum v4l2_async_match_type
    type of asynchronous subdevice logic to be used in order to identify a match

Constants

V4L2_ASYNC_MATCH_I2C Match will check for I2C adapter ID and address
V4L2_ASYNC_MATCH_FWNODE Match will use firmware node

Description

This enum is used by the asynchronous sub-device logic to define the algorithm that will be used to match an asynchronous device.

struct v4l2_async_subdev
    sub-device descriptor, as known to a bridge

Definition

struct v4l2_async_subdev {
    enum v4l2_async_match_type match_type;
    union {
        struct fwnode_handle *fwnode;
        struct {
            int adapter_id;
            unsigned short address;
        } i2c;
    } match;
    struct list_head list;
    struct list_head asd_list;
};

Members

match_type type of match that will be used
match union of per-bus type matching data sets
match.fwnode
    pointer to struct fwnode_handle to be matched. Used if match_type is V4L2_ASYNC_MATCH_FWNODE.
match.i2c embedded struct with I2C parameters to be matched. Both match.i2c.adapter_id and match.i2c.address should be matched. Used if match_type is V4L2_ASYNC_MATCH_I2C.
match.i2c.adapter_id
    I2C adapter ID to be matched. Used if match_type is V4L2_ASYNC_MATCH_I2C.
match.i2c.address
    I2C address to be matched. Used if match_type is V4L2_ASYNC_MATCH_I2C.
list used to link struct v4l2_async_subdev objects, waiting to be probed, to a notifier->waiting list
asd_list used to add struct v4l2_async_subdev objects to the master notifier asd_list
Description

When this struct is used as a member in a driver specific struct, the driver specific struct shall contain the `struct v4l2_async_subdev` as its first member.

**struct v4l2_async_notifier_operations**

Asynchronous V4L2 notifier operations

**Definition**

```c
struct v4l2_async_notifier_operations {
    int (*bound)(struct v4l2_async_notifier *notifier, struct v4l2_subdev *subdev, struct v4l2_async_subdev *asd);
    int (*complete)(struct v4l2_async_notifier *notifier);
    void (*unbind)(struct v4l2_async_notifier *notifier, struct v4l2_subdev *subdev, struct v4l2_async_subdev *asd);
};
```

**Members**

- **bound** a subdevice driver has successfully probed one of the subdevices
- **complete** All subdevices have been probed successfully. The complete callback is only executed for the root notifier.
- **unbind** a subdevice is leaving

**struct v4l2_async_notifier**

v4l2_device notifier data

**Definition**

```c
struct v4l2_async_notifier {
    const struct v4l2_async_notifier_operations *ops;
    struct v4l2_device *v4l2_dev;
    struct v4l2_subdev *sd;
    struct v4l2_async_notifier *parent;
    struct list_head asd_list;
    struct list_head waiting;
    struct list_head done;
    struct list_head list;
};
```

**Members**

- **ops** notifier operations
- **v4l2_dev** v4l2_device of the root notifier, NULL otherwise
- **sd** sub-device that registered the notifier, NULL otherwise
- **parent** parent notifier
- **asd_list** master list of `struct v4l2_async_subdev`
- **waiting** list of `struct v4l2_async_subdev`, waiting for their drivers
- **done** list of `struct v4l2_subdev`, already probed
- **list** member in a global list of notifiers

2.2. Video4Linux devices
void v4l2_async_debug_init(struct dentry *debugfs_dir)
    Initialize debugging tools.

Parameters
struct dentry *debugfs_dir  pointer to the parent debugfs struct dentry

void v4l2_async_notifier_init(struct v4l2_async_notifier *notifier)
    Initialize a notifier.

Parameters
struct v4l2_async_notifier *notifier  pointer to struct v4l2_async_notifier

Description
This function initializes the notifier asd_list. It must be called before adding a subdevice to a notifier, using one of: v4l2_async_notifier_add_fwnode_remote_subdev(), v4l2_async_notifier_add_fwnode_subdev(), v4l2_async_notifier_add_i2c_subdev(), __v4l2_async_notifier_add_subdev() or v4l2_async_notifier_parse_fwnode_endpoints().

int __v4l2_async_notifier_add_subdev(struct v4l2_async_notifier *notifier, struct v4l2_async_subdev *asd)
    Add an async subdev to the notifier’s master asd list.

Parameters
struct v4l2_async_notifier *notifier  pointer to struct v4l2_async_notifier
struct v4l2_async_subdev *asd  pointer to struct v4l2_async_subdev

Description
warning: Drivers should avoid using this function and instead use one of: v4l2_async_notifier_add_fwnode_subdev(), v4l2_async_notifier_add_fwnode_remote_subdev() or v4l2_async_notifier_add_i2c_subdev().

Call this function before registering a notifier to link the provided asd to the notifiers master asd_list. The asd must be allocated with k*alloc() as it will be freed by the framework when the notifier is destroyed.

v4l2_async_notifier_add_fwnode_subdev(notifier, fwnode, type)
    Allocate and add a fwnode async subdev to the notifier’s master asd list.

Parameters
notifier  pointer to struct v4l2_async_notifier
fwnode  fwnode handle of the sub-device to be matched, pointer to struct fwnode_handle
type  Type of the driver’s async sub-device struct. The struct v4l2_async_subdev shall be the first member of the driver’s async sub-device struct, i.e. both begin at the same memory address.

Description
Allocate a fwnode-matched asd of size asd_struct_size, and add it to the notifiers asd_list. The function also gets a reference of the fwnode which is released later at notifier cleanup time.

v4l2_async_notifier_add_fwnode_remote_subdev(notifier, ep, type)
    Allocate and add a fwnode remote async subdev to the notifier’s master asd list.
Parameters

**notifier** pointer to `struct v4l2_async_notifier`

**ep** local endpoint pointing to the remote sub-device to be matched, pointer to `struct fwnode_handle`

**type** Type of the driver’s async sub-device struct. The `struct v4l2_async_subdev` shall be the first member of the driver’s async sub-device struct, i.e. both begin at the same memory address.

Description

Gets the remote endpoint of a given local endpoint, set it up for fwnode matching and adds the async sub-device to the notifier’s `asd_list`. The function also gets a reference of the fwnode which is released later at notifier cleanup time.

This is just like `v4l2_async_notifier_add_fwnode_subdev()`, but with the exception that the fwnode refers to a local endpoint, not the remote one.

`v4l2_async_notifier_add_i2c_subdev(notifier, adapter, address, type)`

Allocate and add an i2c async subdev to the notifier’s master `asd_list`.

Parameters

**notifier** pointer to `struct v4l2_async_notifier`

**adapter** I2C adapter ID to be matched

**address** I2C address of sub-device to be matched

**type** Type of the driver’s async sub-device struct. The `struct v4l2_async_subdev` shall be the first member of the driver’s async sub-device struct, i.e. both begin at the same memory address.

Description

Same as `v4l2_async_notifier_add_fwnode_subdev()` but for I2C matched sub-devices.

```c
int v4l2_async_notifier_register(struct v4l2_device *v4l2_dev, struct v4l2_async_notifier *notifier)
```

registers a subdevice asynchronous notifier

Parameters

**struct v4l2_device *v4l2_dev** pointer to `struct v4l2_device`

**struct v4l2_async_notifier *notifier** pointer to `struct v4l2_async_notifier`

```c
int v4l2_async_subdev_notifier_register(struct v4l2_subdev *sd, struct v4l2_async_notifier *notifier)
```

registers a subdevice asynchronous notifier for a sub-device

Parameters

**struct v4l2_subdev *sd** pointer to `struct v4l2_subdev`

**struct v4l2_async_notifier *notifier** pointer to `struct v4l2_async_notifier`

```c
void v4l2_async_notifier_unregister(struct v4l2_async_notifier *notifier)
```

unregisters a subdevice asynchronous notifier

Parameters

2.2. Video4Linux devices
**struct v4l2_async_notifier** *notifier* pointer to **struct v4l2_async_notifier**

**void v4l2_async_notifier_cleanup**(struct **v4l2_async_notifier** *notifier*)

cleanup notifier resources

**Parameters**

**struct v4l2_async_notifier** *notifier* the notifier the resources of which are to be cleaned up

**Description**

Release memory resources related to a notifier, including the async sub-devices allocated for the purposes of the notifier but not the notifier itself. The user is responsible for calling this function to clean up the notifier after calling

**v4l2_async_notifier_add_fwnode_remote_subdev()**,  
**v4l2_async_notifier_add_fwnode_subdev()**,  
**v4l2_async_notifier_add_i2c_subdev()**,  
**v4l2_async_notifier_add_subdev()** or **v4l2_async_notifier_parse_fwnode_endpoints()**.

There is no harm from calling **v4l2_async_notifier_cleanup()** in other cases as long as its memory has been zeroed after it has been allocated.

**int v4l2_async_register_subdev**(struct **v4l2_subdev** *sd*)

registers a sub-device to the asynchronous subdevice framework

**Parameters**

**struct v4l2_subdev** *sd* pointer to **struct v4l2_subdev**

**int v4l2_async_register_subdev_sensor**(struct **v4l2_subdev** *sd*)

registers a sensor sub-device to the asynchronous sub-device framework and parse set up common sensor related devices

**Parameters**

**struct v4l2_subdev** *sd* pointer to **struct v4l2_subdev**

**Description**

This function is just like **v4l2_async_register_subdev()** with the exception that calling it will also parse firmware interfaces for remote references using **v4l2_async_notifier_parse_fwnode_sensor()** and registers the async sub-devices. The sub-device is similarly unregistered by calling **v4l2_async_unregister_subdev()**.

While registered, the subdev module is marked as in-use.

An error is returned if the module is no longer loaded on any attempts to register it.

**void v4l2_async_unregister_subdev**(struct **v4l2_subdev** *sd*)

unregisters a sub-device to the asynchronous subdevice framework

**Parameters**

**struct v4l2_subdev** *sd* pointer to **struct v4l2_subdev**
2.2.22 V4L2 fwnode kAPI

**struct v4l2_fwnode_bus_mipi_csi2**

MIPI CSI-2 bus data structure

**Definition**

```c
struct v4l2_fwnode_bus_mipi_csi2 {
    unsigned int flags;
    unsigned char data_lanes[V4L2_FWNODE_CSI2_MAX_DATA_LANES];
    unsigned char clock_lane;
    unsigned char num_data_lanes;
    bool lane_polarities[1 + V4L2_FWNODE_CSI2_MAX_DATA_LANES];
};
```

**Members**

- **flags** media bus (V4L2_MBUS_*) flags
- **data_lanes** an array of physical data lane indexes
- **clock_lane** physical lane index of the clock lane
- **num_data_lanes** number of data lanes
- **lane_polarities** polarity of the lanes. The order is the same of the physical lanes.

**struct v4l2_fwnode_bus_parallel**

parallel data bus data structure

**Definition**

```c
struct v4l2_fwnode_bus_parallel {
    unsigned int flags;
    unsigned char bus_width;
    unsigned char data_shift;
};
```

**Members**

- **flags** media bus (V4L2_MBUS_*) flags
- **bus_width** bus width in bits
- **data_shift** data shift in bits

**struct v4l2_fwnode_bus_mipi_csi1**

CSI-1/CCP2 data bus structure

**Definition**

```c
struct v4l2_fwnode_bus_mipi_csi1 {
    unsigned char clock_inv:1;
    unsigned char strobe:1;
    bool lane_polarity[2];
    unsigned char data_lane;
    unsigned char clock_lane;
};
```

**Members**
**clock_inv** polarity of clock/strobe signal false - not inverted, true - inverted

**strobe** false - data/clock, true - data/strobe

**lane_polarity** the polarities of the clock (index 0) and data lanes index (1)

**data_lane** the number of the data lane

**clock_lane** the number of the clock lane

**struct v4l2_fwnode_endpoint**
the endpoint data structure

**Definition**

```c
struct v4l2_fwnode_endpoint {
    struct fwnode_endpoint base;
    enum v4l2_mbus_type bus_type;
    struct {
        struct v4l2_fwnode_bus_parallel parallel;
        struct v4l2_fwnode_bus_mipi_csi1 mipi_csi1;
        struct v4l2_fwnode_bus_mipi_csi2 mipi_csi2;
    } bus;
    u64 *link_frequencies;
    unsigned int nr_of_link_frequencies;
};
```

**Members**

**base** fwnode endpoint of the v4l2_fwnode

**bus_type** bus type

**bus** bus configuration data structure

**bus.parallel** embedded **struct v4l2_fwnode_bus_parallel**. Used if the bus is parallel.

**bus.mipi_csi1** embedded **struct v4l2_fwnode_bus_mipi_csi1**. Used if the bus is MIPI Alliance’s Camera Serial Interface version 1 (MIPI CSI1) or Standard Mobile Imaging Architecture’s Compact Camera Port 2 (SMIA CCP2).

**bus.mipi_csi2** embedded **struct v4l2_fwnode_bus_mipi_csi2**. Used if the bus is MIPI Alliance’s Camera Serial Interface version 2 (MIPI CSI2).

**link_frequencies** array of supported link frequencies

**nr_of_link_frequencies** number of elements in link_frequencies array

**V4L2_FWNODE_PROPERTY_UNSET()**
identify a non initialized property

**Parameters**

**Description**

All properties in **struct v4l2_fwnode_device_properties** are initialized to this value.

**enum v4l2_fwnode_orientation**
possible device orientation

**Constants**

**V4L2_FWNODE_ORIENTATION_FRONT** device installed on the front side
**V4L2_FWNODE_ORIENTATION_BACK** device installed on the back side

**V4L2_FWNODE_ORIENTATION_EXTERNAL** device externally located

```c
struct v4l2_fwnode_device_properties
    fwnode device properties

Definition
```
```
struct v4l2_fwnode_device_properties {
    enum v4l2_fwnode_orientation orientation;
    unsigned int rotation;
};
```

**Members**

**orientation** device orientation. See `enum v4l2_fwnode_orientation`

**rotation** device rotation

```c
struct v4l2_fwnode_link
    a link between two endpoints

Definition
```
```
struct v4l2_fwnode_link {
    struct fwnode_handle *local_node;
    unsigned int local_port;
    unsigned int local_id;
    struct fwnode_handle *remote_node;
    unsigned int remote_port;
    unsigned int remote_id;
};
```

**Members**

**local_node** pointer to device_node of this endpoint

**local_port** identifier of the port this endpoint belongs to

**local_id** identifier of the id this endpoint belongs to

**remote_node** pointer to device_node of the remote endpoint

**remote_port** identifier of the port the remote endpoint belongs to

**remote_id** identifier of the id the remote endpoint belongs to

**enum v4l2_connector_type**
    connector type

**Constants**

**V4L2_CONN_UNKNOWN** unknown connector type, no V4L2 connector configuration

**V4L2_CONN_COMPOSITE** analog composite connector

**V4L2_CONN_SVIDEO** analog svideo connector

```c
struct v4l2_connector_link
    connector link data structure

Definition
```
**struct v4l2_connector_link**

```c
struct v4l2_connector_link {
    struct list_head head;
    struct v4l2_fwnode_link fwnode_link;
};
```

**Members**

**head** structure to be used to add the link to the `struct v4l2_fwnode_connector`

**fwnode_link** `struct v4l2_fwnode_link` link between the connector and the device the connector belongs to.

**struct v4l2_fwnode_connector_analog** analog connector data structure

**Definition**

```c
struct v4l2_fwnode_connector_analog {
    v4l2_std_id sdtv_stds;
};
```

**Members**

**sdtv_stds** sdtv standards this connector supports, set to V4L2_STD_ALL if no restrictions are specified.

**struct v4l2_fwnode_connector** the connector data structure

**Definition**

```c
struct v4l2_fwnode_connector {
    const char *name;
    const char *label;
    enum v4l2_connector_type type;
    struct list_head links;
    unsigned int nr_of_links;
    union {
        struct v4l2_fwnode_connector_analog analog;
    } connector;
};
```

**Members**

**name** the connector device name

**label** optional connector label

**type** connector type

**links** list of all connector `struct v4l2_connector_link` links

**nr_of_links** total number of links

**connector** connector configuration

**connector.analog** analog connector configuration `struct v4l2_fwnode_connector_analog`

**enum v4l2_fwnode_bus_type** Video bus types defined by firmware properties
Constants

V4L2_FWNODE_BUS_TYPE_GUESS Default value if no bus-type fwnode property
V4L2_FWNODE_BUS_TYPE_CSI2_CPHY MIPI CSI-2 bus, C-PHY physical layer
V4L2_FWNODE_BUS_TYPE_CSI1 MIPI CSI-1 bus
V4L2_FWNODE_BUS_TYPE_CCP2 SMIA Compact Camera Port 2 bus
V4L2_FWNODE_BUS_TYPE_CSI2_DPHY MIPI CSI-2 bus, D-PHY physical layer
V4L2_FWNODE_BUS_TYPE_PARALLEL Camera Parallel Interface bus
V4L2_FWNODE_BUS_TYPE_BT656 BT.656 video format bus-type
NR_OF_V4L2_FWNODE_BUS_TYPE Number of bus-types

int v4l2_fwnode_endpoint_parse(struct fwnode_handle *fwnode, struct v4l2_fwnode_endpoint *vep)
parse all fwnode node properties

Parameters

struct fwnode_handle *fwnode pointer to the endpoint’s fwnode handle
struct v4l2_fwnode_endpoint *vep pointer to the V4L2 fwnode data structure

Description

This function parses the V4L2 fwnode endpoint specific parameters from the firmware. There are two ways to use this function, either by letting it obtain the type of the bus (by setting the vep.bus_type field to V4L2_MBUS_UNKNOWN) or specifying the bus type explicitly to one of the enum v4l2_mbus_type types.

When vep.bus_type is V4L2_MBUS_UNKNOWN, the function will use the “bus-type” property to determine the type when it is available. The caller is responsible for validating the contents of vep.bus_type field after the call returns.

As a deprecated functionality to support older DT bindings without “bus-type” property for devices that support multiple types, if the “bus-type” property does not exist, the function will attempt to guess the type based on the endpoint properties available. NEVER RELY ON GUESS-ING THE BUS TYPE IN NEW DRIVERS OR BINDINGS.

It is also possible to set vep.bus_type corresponding to an actual bus. In this case the function will only attempt to parse properties related to this bus, and it will return an error if the value of the “bus-type” property corresponds to a different bus.

The caller is required to initialise all fields of vep, either with explicitly values, or by zeroing them.

The function does not change the V4L2 fwnode endpoint state if it fails.

NOTE

This function does not parse “link-frequencies” property as its size is not known in advance. Please use v4l2_fwnode_endpoint_alloc_parse() if you need properties of variable size.

Return

0 on success or a negative error code on failure: -ENOMEM on memory allocation failure
-EINVAL on parsing failure -ENXIO on mismatching bus types
void v4l2_fwnode_endpoint_free(struct v4l2_fwnode_endpoint *vep)
    free the V4L2 fwnode acquired by v4l2_fwnode_endpoint_alloc_parse()

Parameters
struct v4l2_fwnode_endpoint *vep the V4L2 fwnode the resources of which are to be re-
leased

Description
It is safe to call this function with NULL argument or on a V4L2 fwnode the parsing of which
failed.

int v4l2_fwnode_endpoint_alloc_parse(struct fwnode_handle *fwnode, struct
    v4l2_fwnode_endpoint *vep)
    parse all fwnode node properties

Parameters
struct fwnode_handle *fwnode pointer to the endpoint’s fwnode handle
struct v4l2_fwnode_endpoint *vep pointer to the V4L2 fwnode data structure

Description
This function parses the V4L2 fwnode endpoint specific parameters from the firmware. There
are two ways to use this function, either by letting it obtain the type of the bus (by setting the
vep.bus_type field to V4L2_MBUS_UNKNOWN) or specifying the bus type explicitly to one of
the enum v4l2_mbus_type types.

When vep.bus_type is V4L2_MBUS_UNKNOWN, the function will use the “bus-type” property
to determine the type when it is available. The caller is responsible for validating the contents
of vep.bus_type field after the call returns.

As a deprecated functionality to support older DT bindings without “bus-type” property for
devices that support multiple types, if the “bus-type” property does not exist, the function will
attempt to guess the type based on the endpoint properties available. NEVER RELY ON GUESS-
ING THE BUS TYPE IN NEW DRIVERS OR BINDINGS.

It is also possible to set vep.bus_type corresponding to an actual bus. In this case the function
will only attempt to parse properties related to this bus, and it will return an error if the value
of the “bus-type” property corresponds to a different bus.

The caller is required to initialise all fields of vep, either with explicitly values, or by zeroing
them.

The function does not change the V4L2 fwnode endpoint state if it fails.

v4l2_fwnode_endpoint_alloc_parse() has two important differences to
v4l2_fwnode_endpoint_parse():

1. It also parses variable size data.

2. The memory it has allocated to store the variable size data must be freed using
   v4l2_fwnode_endpoint_free() when no longer needed.

Return
0 on success or a negative error code on failure: -ENOMEM on memory allocation failure
   -EINVAL on parsing failure -ENXIO on mismatching bus types
int v4l2_fwnode_parse_link(struct fwnode_handle *fwnode, struct v4l2_fwnode_link *link)

parse a link between two endpoints

Parameters

struct fwnode_handle *fwnode pointer to the endpoint’s fwnode at the local end of the link
struct v4l2_fwnode_link *link pointer to the V4L2 fwnode link data structure

Description

Fill the link structure with the local and remote nodes and port numbers. The local_node and remote_node fields are set to point to the local and remote port’s parent nodes respectively (the port parent node being the parent node of the port node if that node isn’t a ‘ports’ node, or the grand-parent node of the port node otherwise).

A reference is taken to both the local and remote nodes, the caller must use v4l2_fwnode_put_link() to drop the references when done with the link.

Return

0 on success, or -ENOLINK if the remote endpoint fwnode can’t be found.

void v4l2_fwnode_put_link(struct v4l2_fwnode_link *link)

drop references to nodes in a link

Parameters

struct v4l2_fwnode_link *link pointer to the V4L2 fwnode link data structure

Description

Drop references to the local and remote nodes in the link. This function must be called on every link parsed with v4l2_fwnode_parse_link().

void v4l2_fwnode_connector_free(struct v4l2_fwnode_connector *connector)

free the V4L2 connector acquired memory

Parameters

struct v4l2_fwnode_connector *connector the V4L2 connector resources of which are to be released

Description

Free all allocated memory and put all links acquired by v4l2_fwnode_connector_parse() and v4l2_fwnode_connector_add_link().

It is safe to call this function with NULL argument or on a V4L2 connector the parsing of which failed.

int v4l2_fwnode_connector_parse(struct fwnode_handle *fwnode, struct v4l2_fwnode_connector *connector)

initialize the ‘struct v4l2_fwnode_connector’

Parameters

struct fwnode_handle *fwnode pointer to the subdev endpoint’s fwnode handle where the connector is connected to or to the connector endpoint fwnode handle.

struct v4l2_fwnode_connector *connector pointer to the V4L2 fwnode connector data structure
Description

Fill the `struct v4l2_fwnode_connector` with the connector type, label and all `enum v4l2_connector_type` specific connector data. The label is optional so it is set to NULL if no one was found. The function initialize the links to zero. Adding links to the connector is done by calling `v4l2_fwnode_connector_add_link()`.

The memory allocated for the label must be freed when no longer needed. Freeing the memory is done by `v4l2_fwnode_connector_free()`.

Return

- 0 on success or a negative error code on failure:
  -EINVAL if `fwnode` is invalid
  -ENOTCONN if connector type is unknown or connector device can’t be found

```c
int v4l2_fwnode_connector_add_link(struct fwnode_handle *fwnode, struct v4l2_fwnode_connector *connector)

add a link between a connector node and a v4l2-subdev node.
```

Parameters

- `struct fwnode_handle *fwnode` pointer to the subdev endpoint’s fwnode handle where the connector is connected to
- `struct v4l2_fwnode_connector *connector` pointer to the V4L2 fwnode connector data structure

Description

Add a new `struct v4l2_connector_link` link to the `struct v4l2_fwnode_connector` connector links list. The link `local_node` points to the connector node, the `remote_node` to the host v4l2 (sub)dev.

The taken references to remote_node and local_node must be dropped and the allocated memory must be freed when no longer needed. Both is done by calling `v4l2_fwnode_connector_free()`.

Return

- 0 on success or a negative error code on failure:
  -EINVAL if `fwnode` or `connector` is invalid or `connector` type is unknown
  -ENOMEM on link memory allocation failure
  -ENOTCONN if remote connector device can’t be found
  -ENOLINK if link parsing between v4l2 (sub)dev and connector fails

```c
int v4l2_fwnode_device_parse(struct device *dev, struct v4l2_fwnode_device_properties *props)

parse fwnode device properties
```

Parameters

- `struct device *dev` pointer to `struct device`
- `struct v4l2_fwnode_device_properties *props` pointer to `struct v4l2_fwnode_device_properties` where to store the parsed properties values
Description

This function parses and validates the V4L2 fwnode device properties from the firmware interface, and fills the \texttt{struct v4l2_fwnode_device_properties} provided by the caller.

Return

- \% 0 on success
- \texttt{-EINVAL} if a parsed property value is not valid

\textbf{parse_endpoint_func}

\textit{Typedef:} Driver's callback function to be called on each V4L2 fwnode endpoint.

\textbf{Syntax}

\begin{verbatim}
int parse_endpoint_func (struct device *dev, struct v4l2_fwnode_endpoint *vep, struct v4l2_async_subdev *asd)
\end{verbatim}

\textbf{Parameters}

- \texttt{struct device *dev} pointer to \texttt{struct device}
- \texttt{struct v4l2_fwnode_endpoint *vep} pointer to \texttt{struct v4l2_fwnode_endpoint}
- \texttt{struct v4l2_async_subdev *asd} pointer to \texttt{struct v4l2_async_subdev}

\textbf{Return}

- 0 on success
- \texttt{-ENOTCONN} if the endpoint is to be skipped but this should not be considered as an error
- \texttt{-EINVAL} if the endpoint configuration is invalid

\begin{verbatim}
int v4l2_async_notifier_parse_fwnode_endpoints(struct device *dev, struct v4l2_async_notifier *notifier, size_t asd_struct_size, parse_endpoint_func parse_endpoint)
\end{verbatim}

Parse V4L2 fwnode endpoints in a device node

\textbf{Parameters}

- \texttt{struct device *dev} the device the endpoints of which are to be parsed
- \texttt{struct v4l2_async_notifier *notifier} notifier for \texttt{dev}
- \texttt{size_t asd_struct_size} size of the driver's async sub-device struct, including sizeof(\texttt{struct v4l2_async_subdev}). The \texttt{struct v4l2_async_subdev} shall be the first member of the driver's async sub-device struct, i.e. both begin at the same memory address.

- \texttt{parse_endpoint_func parse_endpoint} Driver's callback function called on each V4L2 fwnode endpoint. Optional.

\textbf{Description}

DEPRECATED! This function is deprecated. Don’t use it in new drivers. Instead see an example in \texttt{cio2_parse_firmware()} function in \texttt{drivers/media/pci/intel/ipu3/ipu3-cio2.c}.

Parse the fwnode endpoints of the \texttt{dev} device and populate the async sub-devices list in the notifier. The \texttt{parse_endpoint} callback function is called for each endpoint with the corresponding async sub-device pointer to let the caller initialize the driver-specific part of the async sub-device structure.

The notifier memory shall be zeroed before this function is called on the notifier.

2.2. Video4Linux devices
This function may not be called on a registered notifier and may be called on a notifier only once.

The `struct v4l2_fwnode_endpoint` passed to the callback function `parse_endpoint` is released once the function is finished. If there is a need to retain that configuration, the user needs to allocate memory for it.

Any notifier populated using this function must be released with a call to `v4l2_async_notifier_cleanup()` after it has been unregistered and the async sub-devices are no longer in use, even if the function returned an error.

**Return**

0 on success, including when no async sub-devices are found  
-ENOMEM if memory allocation failed  
-EINVAL if graph or endpoint parsing failed  
Other error codes as returned by `parse_endpoint`

### 2.2.23 V4L2 rect helper functions

**void v4l2_rect_set_size_to**(`struct v4l2_rect *r`, `const struct v4l2_rect *size`)

Copy the width/height values.

**Parameters**

- `struct v4l2_rect *r` rect whose width and height fields will be set
- `const struct v4l2_rect *size` rect containing the width and height fields you need.

**void v4l2_rect_set_min_size**(`struct v4l2_rect *r`, `const struct v4l2_rect *min_size`)

Width and height of r should be \(\geq\) min_size.

**Parameters**

- `struct v4l2_rect *r` rect whose width and height will be modified
- `const struct v4l2_rect *min_size` rect containing the minimal width and height

**void v4l2_rect_set_max_size**(`struct v4l2_rect *r`, `const struct v4l2_rect *max_size`)

Width and height of r should be \(\leq\) max_size.

**Parameters**

- `struct v4l2_rect *r` rect whose width and height will be modified
- `const struct v4l2_rect *max_size` rect containing the maximum width and height

**void v4l2_rect_map_inside**(`struct v4l2_rect *r`, `const struct v4l2_rect *boundary`)

R should be inside boundary.

**Parameters**

- `struct v4l2_rect *r` rect that will be modified
- `const struct v4l2_rect *boundary` rect containing the boundary for r

**bool v4l2_rect_same_size**(`const struct v4l2_rect *r1`, `const struct v4l2_rect *r2`)

Return true if r1 has the same size as r2

**Parameters**

- `const struct v4l2_rect *r1` rectangle.
const struct v4l2_rect *r2 rectangle.

Description
Return true if both rectangles have the same size.

bool v4l2_rect_same_position(const struct v4l2_rect *r1, const struct v4l2_rect *r2)
  return true if r1 has the same position as r2

Parameters
const struct v4l2_rect *r1 rectangle.
const struct v4l2_rect *r2 rectangle.

Description
Return true if both rectangles have the same position.

bool v4l2_rect_equal(const struct v4l2_rect *r1, const struct v4l2_rect *r2)
  return true if r1 equals r2

Parameters
const struct v4l2_rect *r1 rectangle.
const struct v4l2_rect *r2 rectangle.

Description
Return true if both rectangles have the same size and position.

void v4l2_rect_intersect(struct v4l2_rect *r, const struct v4l2_rect *r1, const struct v4l2_rect *r2)
  calculate the intersection of two rects.

Parameters
struct v4l2_rect *r intersection of r1 and r2.
const struct v4l2_rect *r1 rectangle.
const struct v4l2_rect *r2 rectangle.

void v4l2_rect_scale(struct v4l2_rect *r, const struct v4l2_rect *from, const struct v4l2_rect *to)
  scale rect r by to/from

Parameters
struct v4l2_rect *r rect to be scaled.
const struct v4l2_rect *from from rectangle.
const struct v4l2_rect *to to rectangle.

Description
This scales rectangle r horizontally by to->width / from->width and vertically by to->height / from->height.

Typically r is a rectangle inside from and you want the rectangle as it would appear after scaling from to to. So the resulting r will be the scaled rectangle inside to.
bool v4l2_rect_overlap(const struct v4l2_rect *r1, const struct v4l2_rect *r2)
    do r1 and r2 overlap?

Parameters
const struct v4l2_rect *r1 rectangle.
const struct v4l2_rect *r2 rectangle.

Description
Returns true if r1 and r2 overlap.

bool v4l2_rect_enclosed(struct v4l2_rect *r1, struct v4l2_rect *r2)
is r1 enclosed in r2?

Parameters
struct v4l2_rect *r1 rectangle.
struct v4l2_rect *r2 rectangle.

Description
Returns true if r1 is enclosed in r2.

2.2.24 Tuner functions and data structures

enum tuner_mode
    Mode of the tuner

Constants
T_RADIO Tuner core will work in radio mode
T_ANALOG_TV Tuner core will work in analog TV mode

Description
Older boards only had a single tuner device, but some devices have a separate tuner for radio. In any case, the tuner-core needs to know if the tuner chip(s) will be used in radio mode or analog TV mode, as, on radio mode, frequencies are specified on a different range than on TV mode. This enum is used by the tuner core in order to work with the proper tuner range and eventually use a different tuner chip while in radio mode.

struct tuner_setup
    setup the tuner chipsets

Definition

struct tuner_setup {
    unsigned short addr;
    unsigned int type;
    unsigned int mode_mask;
    void *config;
    int (*tuner_callback)(void *dev, int component, int cmd, int arg);
};

Members
addr I2C address used to control the tuner device/chipset
**type** Type of the tuner, as defined at the TUNER_* macros. Each different tuner model should have an unique identifier.

**mode_mask** Mask with the allowed tuner modes: V4L2_TUNER_RADIO, V4L2_TUNER_ANALOG_TV and/or V4L2_TUNER_DIGITAL_TV, describing if the tuner should be used to support Radio, analog TV and/or digital TV.

**config** Used to send tuner-specific configuration for complex tuners that require extra parameters to be set. Only a very few tuners require it and its usage on newer tuners should be avoided.

**tuner_callback** Some tuners require to call back the bridge driver, in order to do some tasks like rising a GPIO at the bridge chipset, in order to do things like resetting the device.

**Description**

Older boards only had a single tuner device. Nowadays multiple tuner devices may be present on a single board. Using TUNER_SET_TYPE_ADDR to pass the tuner_setup structure it is possible to setup each tuner device in turn.

Since multiple devices may be present it is no longer sufficient to send a command to a single i2c device. Instead you should broadcast the command to all i2c devices.

By setting the mode_mask correctly you can select which commands are accepted by a specific tuner device. For example, set mode_mask to T_RADIO if the device is a radio-only tuner. That specific tuner will only accept commands when the tuner is in radio mode and ignore them when the tuner is set to TV mode.

enum **param_type**

- type of the tuner parameters

**Constants**

- **TUNER_PARAM_TYPE_RADIO** Tuner params are for FM and/or AM radio
- **TUNER_PARAM_TYPE_PAL** Tuner params are for PAL color TV standard
- **TUNER_PARAM_TYPE_SECAM** Tuner params are for SECAM color TV standard
- **TUNER_PARAM_TYPE_NTSC** Tuner params are for NTSC color TV standard
- **TUNER_PARAM_TYPE_DIGITAL** Tuner params are for digital TV

**struct tuner_range**

- define the frequencies supported by the tuner

**Definition**

```c
struct tuner_range {
    unsigned short limit;
    unsigned char config;
    unsigned char cb;
};
```

**Members**

- **limit** Max frequency supported by that range, in 62.5 kHz (TV) or 62.5 Hz (Radio), as defined by V4L2_TUNER_CAP_LOW.
- **config** Value of the band switch byte (BB) to setup this mode.
- **cb** Value of the CB byte to setup this mode.

---

2.2. Video4Linux devices
Description

Please notice that digital tuners like xc3028/xc4000/xc5000 don’t use those ranges, as they’re defined inside the driver. This is used by analog tuners that are compatible with the “Philips way” to setup the tuners. On those devices, the tuner set is done via 4 bytes:

1) divider byte1 (DB1)
2) divider byte 2 (DB2)
3) Control byte (CB)
4) band switch byte (BB)

Some tuners also have an additional optional Auxiliary byte (AB).

struct tuner_params

Parameters to be used to setup the tuner. Those are used by drivers/media/tuners/tuner-types.c in order to specify the tuner properties. Most of the parameters are for tuners based on tda9887 IF-PLL multi-standard analog TV/Radio demodulator, with is very common on legacy analog tuners.

Definition

```c
struct tuner_params {
    enum param_type type;
    unsigned int cb_first_if_lower_freq:1;
    unsigned int has_tda9887:1;
    unsigned int port1_fm_high_sensitivity:1;
    unsigned int port2_fm_high_sensitivity:1;
    unsigned int fm_gain_normal:1;
    unsigned int intercarrier_mode:1;
    unsigned int port1_active:1;
    unsigned int port2_active:1;
    unsigned int port1_invert_for_secam_lc:1;
    unsigned int port2_invert_for_secam_lc:1;
    unsigned int port1_set_for_fm_mono:1;
    unsigned int default_pll_gating_18:1;
    unsigned int radio_if:2;
    signed int default_top_low:5;
    signed int default_top_mid:5;
    signed int default_top_high:5;
    signed int default_top_secam_low:5;
    signed int default_top_secam_mid:5;
    signed int default_top_secam_high:5;
    u16 iffreq;
    unsigned int count;
    struct tuner_range *ranges;
};
```

Members

type Type of the tuner parameters, as defined at enum param_type. If the tuner supports multiple standards, an array should be used, with one row per different standard.

cb_first_if_lower_freq Many Philips-based tuners have a comment in their datasheet like “For channel selection involving band switching, and to ensure smooth tuning to the desired channel without causing unnecessary charge pump action, it is recommended to consider the difference between wanted channel frequency and the current channel fre-
frequency. Unnecessary charge pump action will result in very low tuning voltage which may drive the oscillator to extreme conditions”. Set cb_first_if_lower_freq to 1, if this check is required for this tuner. I tested this for PAL by first setting the TV frequency to 203 MHz and then switching to 96.6 MHz FM radio. The result was static unless the control byte was sent first.

has_tda9887 Set to 1 if this tuner uses a tda9887

port1_fm_high_sensitivity Many Philips tuners use tda9887 PORT1 to select the FM radio sensitivity. If this setting is 1, then set PORT1 to 1 to get proper FM reception.

port2_fm_high_sensitivity Some Philips tuners use tda9887 PORT2 to select the FM radio sensitivity. If this setting is 1, then set PORT2 to 1 to get proper FM reception.

fm_gain_normal Some Philips tuners use tda9887 cGainNormal to select the FM radio sensitivity. If this setting is 1, e register will use cGainNormal instead of cGainLow.

intercarrier_mode Most tuners with a tda9887 use QSS mode. Some (cheaper) tuners use Intercarrier mode. If this setting is 1, then the tuner needs to be set to intercarrier mode.

port1_active This setting sets the default value for PORT1. 0 means inactive, 1 means active. Note: the actual bit value written to the tda9887 is inverted. So a 0 here means a 1 in the B6 bit.

port2_active This setting sets the default value for PORT2. 0 means inactive, 1 means active. Note: the actual bit value written to the tda9887 is inverted. So a 0 here means a 1 in the B7 bit.

port1_invert_for_secam_lc Sometimes PORT1 is inverted when the SECAM-L’ standard is selected. Set this bit to 1 if this is needed.

port2_invert_for_secam_lc Sometimes PORT2 is inverted when the SECAM-L’ standard is selected. Set this bit to 1 if this is needed.

port1_set_for_fm_mono Some cards require PORT1 to be 1 for mono Radio FM and 0 for stereo.

default_pll_gating_18 Select 18% (or according to datasheet 0%) L standard PLL gating, vs the driver default of 36%.

radio_if IF to use in radio mode. Tuners with a separate radio IF filter seem to use 10.7, while those without use 33.3 for PAL/SECAM tuners and 41.3 for NTSC tuners. 0 = 10.7, 1 = 33.3, 2 = 41.3

default_top_low Default tda9887 TOP value in dB for the low band. Default is 0. Range: -16:+15

default_top_mid Default tda9887 TOP value in dB for the mid band. Default is 0. Range: -16:+15

default_top_high Default tda9887 TOP value in dB for the high band. Default is 0. Range: -16:+15

default_top_secam_low Default tda9887 TOP value in dB for SECAM-L/L’ for the low band. Default is 0. Several tuners require a different TOP value for the SECAM-L/L’ standards. Range: -16:+15

default_top_secam_mid Default tda9887 TOP value in dB for SECAM-L/L’ for the mid band. Default is 0. Several tuners require a different TOP value for the SECAM-L/L’ standards. Range: -16:+15

2.2. Video4Linux devices
**default_top_secam_high**  Default tda9887 TOP value in dB for SECAM-L/L' for the high band. Default is 0. Several tuners require a different TOP value for the SECAM-L/L' standards. Range: -16:+15

**iffreq**  Intermediate frequency (IF) used by the tuner on digital mode.

**count**  Size of the ranges array.

**ranges**  Array with the frequency ranges supported by the tuner.

**struct tunertype**  
Describes the known tuners.

**Definition**

```c
struct tunertype {
    char *name;
    unsigned int count;
    struct tuner_params *params;
    u16 min;
    u16 max;
    u32 stepsize;
    u8 *initdata;
    u8 *sleepdata;
};
```

**Members**

- **name**  String with the tuner’s name.
- **count**  Size of **struct tuner_params** array.
- **params**  Pointer to **struct tuner_params** array.
- **min**  Minimal tuner frequency, in 62.5 kHz step. Should be multiplied to 16 to convert to MHz.
- **max**  Minimal tuner frequency, in 62.5 kHz step. Should be multiplied to 16 to convert to MHz.
- **stepsize**  Frequency step, in Hz.
- **initdata**  Optional byte sequence to initialize the tuner.
- **sleepdata**  Optional byte sequence to power down the tuner.

### 2.2.25 V4L2 common functions and data structures

**int v4l2_ctrl_query_fill**(struct **v4l2_queryctrl** *qctrl, s32 min, s32 max, s32 step, s32 def)

Fill in a **struct v4l2_queryctrl**

**Parameters**

- **struct v4l2_queryctrl** *qctrl*  Pointer to the **struct v4l2_queryctrl** to be filled
- **s32 min**  Minimum value for the control
- **s32 max**  Maximum value for the control
- **s32 step**  Control step
- **s32 def**  Default value for the control
Description

Fills the struct v4l2_queryctrl fields for the query control.

**Note:** This function assumes that the qctrl->id field is filled.

Returns -EINVAL if the control is not known by the V4L2 core, 0 on success.

enum v4l2_i2c_tuner_type

specifies the range of tuner address that should be used when seeking for I2C devices.

**Constants**

ADDRS_RADIO Radio tuner addresses. Represent the following I2C addresses: 0x10 (if compiled with tea5761 support) and 0x60.

ADDRS_DEMOD Demod tuner addresses. Represent the following I2C addresses: 0x42, 0x43, 0x4a and 0x4b.

ADDRS_TV TV tuner addresses. Represent the following I2C addresses: 0x42, 0x43, 0x4a, 0x4b, 0x60, 0x61, 0x62, 0x63 and 0x64.

ADDRS_TV_WITH_DEMOD TV tuner addresses if demod is present, this excludes addresses used by the demodulator from the list of candidates. Represent the following I2C addresses: 0x60, 0x61, 0x62, 0x63 and 0x64.

**NOTE**

All I2C addresses above use the 7-bit notation.

struct v4l2_subdev * v4l2_i2c_new_subdev (struct v4l2_device *v4l2_dev,
struct i2c_adapter *adapter,
const char *client_type,
u8 addr,
const unsigned short *probe_addrs)

Load an i2c module and return an initialized struct v4l2_subdev.

**Parameters**

struct v4l2_device *v4l2_dev pointer to struct v4l2_device

struct i2c_adapter *adapter pointer to struct i2c_adapter

const char *client_type name of the chip that’s on the adapter.

u8 addr I2C address. If zero, it will use probe_addr

const unsigned short *probe_addrs array with a list of address. The last entry at such array should be I2C_CLIENT_END.

Description

returns a struct v4l2_subdev pointer.

struct v4l2_subdev * v4l2_i2c_new_subdev_board (struct v4l2_device *v4l2_dev,
struct i2c_adapter *adapter,
struct i2c_board_info *info,
const unsigned short *probe_addrs)

Load an i2c module and return an initialized struct v4l2_subdev.

**Parameters**
struct v4l2_device *v4l2_dev  pointer to struct v4l2_device
struct i2c_adapter *adapter  pointer to struct i2c_adapter
struct i2c_board_info *info  pointer to struct i2c_board_info used to replace the irq, plat-
form-data and addr arguments.
const unsigned short *probe_addrs  array with a list of address. The last entry at such array
should be I2C_CLIENT_END.

Description
returns a struct v4l2_subdev pointer.

void v4l2_i2c_subdev_set_name(struct v4l2_subdev *sd, struct i2c_client *client, const
char *devname, const char *postfix)
    Set name for an I2C sub-device

Parameters
struct v4l2_subdev *sd  pointer to struct v4l2_subdev
struct i2c_client *client  pointer to struct i2c_client
const char *devname  the name of the device; if NULL, the I2C device’s name will be used
const char *postfix  sub-device specific string to put right after the I2C device name; may
be NULL

void v4l2_i2c_subdev_init(struct v4l2_subdev *sd, struct i2c_client *client, const struct
v4l2_subdev_ops *ops)
    Initializes a struct v4l2_subdev with data from an i2c_client struct.

Parameters
struct v4l2_subdev *sd  pointer to struct v4l2_subdev
struct i2c_client *client  pointer to struct i2c_client
const struct v4l2_subdev_ops *ops  pointer to struct v4l2_subdev_ops

unsigned short v4l2_i2c_subdev_addr(struct v4l2_subdev *sd)
    returns i2c client address of struct v4l2_subdev.

Parameters
struct v4l2_subdev *sd  pointer to struct v4l2_subdev

Description
Returns the address of an I2C sub-device

const unsigned short *v4l2_i2c_tuner_addrs(enum v4l2_i2c_tuner_type type)
    Return a list of I2C tuner addresses to probe.

Parameters
enum v4l2_i2c_tuner_type type  type of the tuner to seek, as defined by enum
v4l2_i2c_tuner_type.

NOTE
Use only if the tuner addresses are unknown.
void v4l2_i2c_subdev_unregister(struct v4l2_subdev *sd)

Unregister a v4l2_subdev

Parameters

struct v4l2_subdev *sd pointer to struct v4l2_subdev

struct v4l2_subdev * v4l2_spi_new_subdev(struct v4l2_device *v4l2_dev, struct spi_master *master, struct spi_board_info *info)

Load an spi module and return an initialized struct v4l2_subdev.

Parameters

struct v4l2_device *v4l2_dev pointer to struct v4l2_device.
struct spi_master *master pointer to struct spi_master.
struct spi_board_info *info pointer to struct spi_board_info.

Description

returns a struct v4l2_subdev pointer.

void v4l2_spi_subdev_init(struct v4l2_subdev *sd, struct spi_device *spi, const struct v4l2_subdev_ops *ops)

Initialize a v4l2_subdev with data from an spi_device struct.

Parameters

struct v4l2_subdev *sd pointer to struct v4l2_subdev
struct spi_device *spi pointer to struct spi_device.
const struct v4l2_subdev_ops *ops pointer to struct v4l2_subdev_ops

void v4l2_spi_subdev_unregister(struct v4l2_subdev *sd)

Unregister a v4l2_subdev

Parameters

struct v4l2_subdev *sd pointer to struct v4l2_subdev

void v4l_bound_align_image(unsigned int *width, unsigned int wmin, unsigned int wmax, unsigned int walign, unsigned int *height, unsigned int hmin, unsigned int hmax, unsigned int halign, unsigned int salign)

adjust video dimensions according to a given constraints.

Parameters

unsigned int *width pointer to width that will be adjusted if needed.
unsigned int wmin minimum width.
unsigned int wmax maximum width.
unsigned int walign least significant bit on width.
unsigned int *height pointer to height that will be adjusted if needed.
unsigned int hmin minimum height.
unsigned int hmax maximum height.

2.2. Video4Linux devices
unsigned int halign  least significant bit on height.
unsigned int salign  least significant bit for the image size (e.g. width * height).

Description
Clip an image to have width between \( \text{wmin} \) and \( \text{wmax} \), and height between \( \text{hmin} \) and \( \text{hmax} \), inclusive.

Additionally, the width will be a multiple of \( 2^{\text{walign}} \), the height will be a multiple of \( 2^{\text{halign}} \), and the overall size \( \text{width} \times \text{height} \) will be a multiple of \( 2^{\text{salign}} \).

Note:
1. The clipping rectangle may be shrunk or enlarged to fit the alignment constraints.
2. \( \text{wmax} \) must not be smaller than \( \text{wmin} \).
3. \( \text{hmax} \) must not be smaller than \( \text{hmin} \).
4. The alignments must not be so high there are no possible image sizes within the allowed bounds.
5. \( \text{wmin} \) and \( \text{hmin} \) must be at least 1 (don’t use 0).
6. For \( \text{walign} \), \( \text{halign} \) and \( \text{salign} \), if you don’t care about a certain alignment, specify 0, as \( 2^{0} = 1 \) and one byte alignment is equivalent to no alignment.
7. If you only want to adjust downward, specify a maximum that’s the same as the initial value.

\[ \textit{v4l2\_find\_nearest\_size}(\textit{array}, \textit{array\_size}, \textit{width\_field}, \textit{height\_field}, \textit{width}, \textit{height}) ]\]

Find the nearest size among a discrete set of resolutions contained in an array of a driver specific struct.

Parameters
\( \textit{array} \) a driver specific array of image sizes
\( \textit{array\_size} \) the length of the driver specific array of image sizes
\( \textit{width\_field} \) the name of the width field in the driver specific struct
\( \textit{height\_field} \) the name of the height field in the driver specific struct
\( \textit{width} \) desired width.
\( \textit{height} \) desired height.

Description
Finds the closest resolution to minimize the width and height differences between what requested and the supported resolutions. The size of the width and height fields in the driver specific must equal to that of u32, i.e. four bytes.

Returns the best match or NULL if the length of the array is zero.

\[ \text{int \textit{v4l2\_g\_parm\_cap}(\textit{struct \ v4l2\_subdev \*sd}, \textit{struct \ v4l2\_streamparm \*a})} \]

helper routine for \textit{vidioc\_g\_parm} to fill this in by calling the \texttt{g\_frame\_interval} op of the given
subdev. It only works for V4L2_BUF_TYPE_VIDEO_CAPTURE(_MPLANE), hence the _cap in the function name.

Parameters

struct video_device *vdev the struct video_device pointer. Used to determine the device caps.

struct v4l2_subdev *sd the sub-device pointer.

struct v4l2_streamparm *a the VIDIOC_G_PARM argument.

int v4l2_s_parm_cap(struct video_device *vdev, struct v4l2_subdev *sd, struct v4l2_streamparm *a)

deprecated helper routine for vidioc_s_parm to fill this in by calling the s_frame_interval op of the given subdev. It only works for V4L2_BUF_TYPE_VIDEO_CAPTURE(_MPLANE), hence the _cap in the function name.

Parameters

struct video_device *vdev the struct video_device pointer. Used to determine the device caps.

struct v4l2_subdev *sd the sub-device pointer.

struct v4l2_streamparm *a the VIDIOC_S_PARM argument.

enum v4l2_pixel_encoding specifies the pixel encoding value

Constants

V4L2_PIXEL_ENC_UNKNOWN Pixel encoding is unknown/un-initialized

V4L2_PIXEL_ENC_YUV Pixel encoding is YUV

V4L2_PIXEL_ENC_RGB Pixel encoding is RGB

V4L2_PIXEL_ENC_BAYER Pixel encoding is Bayer

struct v4l2_format_info information about a V4L2 format

Definition

struct v4l2_format_info {
    u32 format;
    u8 pixel_enc;
    u8 mem_planes;
    u8 comp_planes;
    u8 bpp[4];
    u8 hdiv;
    u8 vdiv;
    u8 block_w[4];
    u8 block_h[4];
};

Members

format 4CC format identifier (V4L2_PIX_FMT_*)

pixel_enc Pixel encoding (see enum v4l2_pixel_encoding above)
mem_planes  Number of memory planes, which includes the alpha plane (1 to 4).
comp_planes  Number of component planes, which includes the alpha plane (1 to 4).
bpp  Array of per-plane bytes per pixel
hdiv  Horizontal chroma subsampling factor
vdiv  Vertical chroma subsampling factor
block_w  Per-plane macroblock pixel width (optional)
block_h  Per-plane macroblock pixel height (optional)

s64 v4l2_get_link_freq(struct v4l2_ctrl_handler *handler, unsigned int mul, unsigned int div)
Get link rate from transmitter

Parameters
struct v4l2_ctrl_handler *handler  The transmitter’s control handler
unsigned int mul  The multiplier between pixel rate and link frequency. Bits per pixel on D-PHY, samples per clock on parallel. 0 otherwise.
unsigned int div  The divisor between pixel rate and link frequency. Number of data lanes times two on D-PHY, 1 on parallel. 0 otherwise.

Description
This function is intended for obtaining the link frequency from the transmitter sub-devices. It returns the link rate, either from the V4L2_CID_LINK_FREQ control implemented by the transmitter, or value calculated based on the V4L2_CID_PIXEL_RATE implemented by the transmitter.

Returns link frequency on success, otherwise a negative error code: -ENOENT: Link frequency or pixel rate control not found -EINVAL: Invalid link frequency value

struct v4l2_ioctl_ops
describe operations for each V4L2 ioctl

Definition

```c
struct v4l2_ioctl_ops {
    int (*vidioc_querycap)(struct file *file, void *fh, struct v4l2_capability *cap);
    int (*vidioc_enum_fmt_vid_cap)(struct file *file, void *fh, struct v4l2_fmtdesc *f);
    int (*vidioc_enum_fmt_vid_overlay)(struct file *file, void *fh, struct v4l2_fmtdesc *f);
    int (*vidioc_enum_fmt_vid_out)(struct file *file, void *fh, struct v4l2_fmtdesc *f);
    int (*vidioc_enum_fmt_sdr_cap)(struct file *file, void *fh, struct v4l2_fmtdesc *f);
    int (*vidioc_enum_fmt_sdr_out)(struct file *file, void *fh, struct v4l2_fmtdesc *f);
    int (*vidioc_enum_fmt_meta_cap)(struct file *file, void *fh, struct v4l2_fmtdesc *f);
    int (*vidioc_enum_fmt_meta_out)(struct file *file, void *fh, struct v4l2_fmtdesc *f);
    int (*vidioc_g_fmt_vid_cap)(struct file *file, void *fh, struct v4l2_format *f);
    int (*vidioc_g_fmt_vid_overlay)(struct file *file, void *fh, struct v4l2_format *f);
    int (*vidioc_g_fmt_vid_out)(struct file *file, void *fh, struct v4l2_format *f);
    int (*vidioc_g_fmt_vbi_cap)(struct file *file, void *fh, struct v4l2_format *f);
    int (*vidioc_g_fmt_vbi_out)(struct file *file, void *fh, struct v4l2_format *f);
    int (*vidioc_g_fmt_sliced_vbi_cap)(struct file *file, void *fh, struct v4l2_format *f);
};
```
int (*vidioc_g_fmt_sliced_vbi_out)(struct file *file, void *fh, struct v4l2_format *f);

vidioc_s_tuner pointer to the function that implements VIDIOC_S_TUNER ioctl
vidioc_g_frequency pointer to the function that implements VIDIOC_G_FREQUENCY ioctl
vidioc_s_frequency pointer to the function that implements VIDIOC_S_FREQUENCY ioctl
vidioc_enum_freq_bands pointer to the function that implements VIDIOC_ENUM_FREQ_BANDS ioctl
vidioc_g_sliced_vbi_cap pointer to the function that implements VIDIOC_G_SLICED_VBI_CAP ioctl
vidioc_log_status pointer to the function that implements VIDIOC_LOG_STATUS ioctl
vidioc_s_hw_freq_seek pointer to the function that implements VIDIOC_S_HW_FREQ_SEEK ioctl
vidioc_g_register pointer to the function that implements VIDIOC_DBG_G_REGISTER ioctl
vidioc_s_register pointer to the function that implements VIDIOC_DBG_S_REGISTER ioctl
vidioc_g_chip_info pointer to the function that implements VIDIOC_DBG_G_CHIP_INFO ioctl

vidioc_enum_framesizes pointer to the function that implements VIDIOC_ENUM_FRAMESIZES ioctl

vidioc_enum_frameintervals pointer to the function that implements VIDIOC_ENUM_FRAMEINTERVALS ioctl

vidioc_s_dv_timings pointer to the function that implements VIDIOC_S_DV_TIMINGS ioctl

vidioc_g_dv_timings pointer to the function that implements VIDIOC_G_DV_TIMINGS ioctl

vidioc_query_dv_timings pointer to the function that implements VIDIOC_QUERY_DV_TIMINGS ioctl

vidioc_enum_dv_timings pointer to the function that implements VIDIOC_ENUM_DV_TIMINGS ioctl

vidioc_dv_timings_cap pointer to the function that implements VIDIOC_DV_TIMINGS_CAP ioctl

vidioc_g_edid pointer to the function that implements VIDIOC_G_EDID ioctl

vidioc_s_edid pointer to the function that implements VIDIOC_S_EDID ioctl

vidioc_subscribe_event pointer to the function that implements VIDIOC_SUBSCRIBE_EVENT ioctl

vidioc_unsubscribe_event pointer to the function that implements VIDIOC_UNSUBSCRIBE_EVENT ioctl

vidioc_default pointed used to allow other ioctls

const char *v4l2_norm_to_name(v4l2_std_id id)
Ancillary routine to analog TV standard name from its ID.

Parameters
v4l2_std_id id analog TV standard ID.

Return
returns a string with the name of the analog TV standard. If the standard is not found or if id points to multiple standard, it returns "Unknown".

void v4l2_video_std_frame_period(int id, struct v4l2_fract *frameperiod)
Ancillary routine that fills a struct v4l2_fract pointer with the default framerate fraction.

Parameters
int id analog TV standard ID.

struct v4l2_fract *frameperiod struct v4l2_fract pointer to be filled

int v4l2_video_std_construct(struct v4l2_standard *vs, int id, const char *name)
Ancillary routine that fills in the fields of a v4l2_standard structure according to the id parameter.

Parameters
struct v4l2_standard *vs struct v4l2_standard pointer to be filled
int id analog TV standard ID.
const char *name name of the standard to be used

**Description**

**Note:** This ancillary routine is obsolete. Shouldn’t be used on newer drivers.

```c
int v4l_video_std_enumstd(struct v4l2_standard *vs, v4l2_std_id id)
```
Ancillary routine that fills in the fields of a `v4l2_standard` structure according to the `id` and `vs->index` parameters.

**Parameters**
- `struct v4l2_standard *vs` struct `v4l2_standard` pointer to be filled.
- `v4l2_std_id id` analog TV standard ID.

```c
void v4l_printk_ioctl(const char *prefix, unsigned int cmd)
```
Ancillary routine that prints the ioctl in a human-readable format.

**Parameters**
- `const char *prefix` prefix to be added at the ioctl prints.
- `unsigned int cmd` ioctl name

**Description**

**Note:** If prefix != NULL, then it will issue a printk(KERN_DEBUG ``s : `, prefix)`` first.

```c
long int v4l2_compat_ioctl32(struct file *file, unsigned int cmd, unsigned long arg)
```
32 Bits compatibility layer for 64 bits processors

**Parameters**
- `struct file *file` Pointer to struct `file`.
- `unsigned int cmd`_IOCTL name.
- `unsigned long arg`_IOCTL argument.

`v4l2_kioctl`

**Typedef:** Typedef used to pass an ioctl handler.

**Syntax**

```c
long v4l2_kioctl (struct file *file, unsigned int cmd, void *arg)
```

**Parameters**
- `struct file *file` Pointer to struct `file`.
- `unsigned int cmd`_IOCTL name.
- `void *arg`_IOCTL argument.

```c
long int video_usercopy(struct file *file, unsigned int cmd, unsigned long int arg, v4l2_kioctl func)
```
copies data from/to userspace memory when an ioctl is issued.

**Parameters**

---

**2.2. Video4Linux devices**
struct file *file Pointer to struct file.
unsigned int cmd Ioclt name.
unsigned long int arg Ioclt argument.
v4l2_kioctl func function that will handle the ioctl

**Description**

**Note:** This routine should be used only inside the V4L2 core.

long int video_ioctl2(struct file *file, unsigned int cmd, unsigned long int arg)
Handles a V4L2 ioctl.

**Parameters**

struct file *file Pointer to struct file.
unsigned int cmd Ioclt name.
unsigned long int arg Ioclt argument.

**Description**

Method used to handle an ioctl. Should be used to fill the v4l2_ioctl_ops.unlocked_ioctl on all V4L2 drivers.

### 2.2.26 Hauppauge TV EEPROM functions and data structures

enum tveeprom_audio_processor
    Specifies the type of audio processor used on a Hauppauge device.

**Constants**

TVEEPROM_AUDPROC_NONE No audio processor present
TVEEPROM_AUDPROC_INTERNAL The audio processor is internal to the video processor
TVEEPROM_AUDPROC_MSP The audio processor is a MSPXXXX device
TVEEPROM_AUDPROC_OTHER The audio processor is another device

struct tveeprom
    Contains the fields parsed from Hauppauge eeproms

**Definition**

```c
struct tveeprom {
    u32 has_radio;
    u32 has_ir;
    u32 has_MAC_address;
    u32 tuner_type;
    u32 tuner_formats;
    u32 tuner_hauppauge_model;
    u32 tuner2_type;
    u32 tuner2_formats;
    u32 tuner2_hauppauge_model;
    u32 audio_processor;
};
```
u32 decoder_processor;
u32 model;
u32 revision;
u32 serial_number;
char rev_str[5];
u8 MAC_address[ETH_ALEN];
);

Members

has_radio 1 if the device has radio; 0 otherwise.

has_ir If has_ir == 0, then it is unknown what the IR capabilities are. Otherwise: bit 0) 1 (= IR capabilities are known); bit 1) IR receiver present; bit 2) IR transmitter (blaster) present.

has_MAC_address 0: no MAC, 1: MAC present, 2: unknown.

tuner_type type of the tuner (TUNER_*, as defined at include/media/tuner.h).

tuner_formats Supported analog TV standards (V4L2_STD_*)

tuner_hauppauge_model Hauppauge’s code for the device model number.

tuner2_type type of the second tuner (TUNER_*, as defined at include/media/tuner.h).

tuner2_formats Tuner 2 supported analog TV standards (V4L2_STD_*)

tuner2_hauppauge_model tuner 2 Hauppauge’s code for the device model number.

audio_processor analog audio decoder, as defined by enum tveeprom_audio_processor.

decoder_processor Hauppauge’s code for the decoder chipset. Unused by the drivers, as they probe the decoder based on the PCI or USB ID.

model Hauppauge’s model number

revision Card revision number

serial_number Card’s serial number

rev_str Card revision converted to number

MAC_address MAC address for the network interface

void tveeprom_hauppauge_analog(struct tveeprom *tvee, unsigned char *eeprom_data)

Fill struct tveeprom using the contents of the eeprom previously filled at eeprom_data field.

Parameters

struct tveeprom *tvee Struct to where the eeprom parsed data will be filled;

unsigned char *eeprom_data Array with the contents of the eeprom_data. It should contain 256 bytes filled with the contents of the eeprom read from the Hauppauge device.

int tveeprom_read(struct i2c_client *c, unsigned char *eedata, int len)

Reads the contents of the eeprom found at the Hauppauge devices.

Parameters

struct i2c_client *c I2C client struct

unsigned char *eedata Array where the eeprom content will be stored.
int len Size of eedata array. If the eeprom content will be latter be parsed by tveeprom_hauppauge_analog(), len should be, at least, 256.

2.3 Digital TV (DVB) devices

Digital TV devices are implemented by several different drivers:

- A bridge driver that is responsible to talk with the bus where the other devices are connected (PCI, USB, SPI), bind to the other drivers and implement the digital demux logic (either in software or in hardware);

- Frontend drivers that are usually implemented as two separate drivers:
  
  - A tuner driver that implements the logic which commands the part of the hardware responsible for tuning into a digital TV transponder or physical channel. The output of a tuner is usually a baseband or Intermediate Frequency (IF) signal;

  - A demodulator driver (a.k.a “demod”) that implements the logic which commands the digital TV decoding hardware. The output of a demod is a digital stream, with multiple audio, video and data channels typically multiplexed using MPEG Transport Stream\(^1\).

On most hardware, the frontend drivers talk with the bridge driver using an I2C bus.

2.3.1 Digital TV Common functions

2.3.1.1 Math functions

Provide some commonly-used math functions, usually required in order to estimate signal strength and signal to noise measurements in dB.

unsigned int intlog2(u32 value)

computes log2 of a value; the result is shifted left by 24 bits

Parameters

u32 value The value (must be != 0)

Description

to use rational values you can use the following method:

\[
\text{intlog2(value)} = \text{intlog2(value} * 2^x) - x * 2^{24}
\]

Some usecase examples:

\[
\text{intlog2(8)} \text{ will give } 3 << 24 = 3 \times 2^{24} \\
\text{intlog2(9)} \text{ will give } 3 << 24 + \ldots = 3.16\ldots \times 2^{24} \\
\text{intlog2(1.5)} = \text{intlog2(3)} - 2^{24} = 0.584\ldots \times 2^{24}
\]

Return

log2(value) * 2^{24}

---

\(^1\) Some standards use TCP/IP for multiplexing data, like DVB-H (an abandoned standard, not used anymore) and ATSC version 3.0 current proposals. Currently, the DVB subsystem doesn’t implement those standards.
unsigned int **int**log10**(u32** value)\n    \ncomputes log10 of a value; the result is shifted left by 24 bits

**Parameters**

**u32** value  The value (must be != 0)

**Description**

to use rational values you can use the following method:

\[ \text{intlog10}(\text{value}) = \text{intlog10}(\text{value} \times 10^x) - x \times 2^24 \]

An usecase example:

\[ \text{intlog10}(1000) \text{ will give } 3 \ll 24 = 3 \times 2^24 \]

due to the implementation intlog10(1000) might be not exactly \( 3 \times 2^{24} \)

look at intlog2 for similar examples

**Return**

\( \text{log10(\text{value})} \times 2^{24} \)

### 2.3.1.2 DVB devices

Those functions are responsible for handling the DVB device nodes.

**enum dvb_device_type**

type of the Digital TV device

**Constants**

**DVB_DEVICE_SEC**  Digital TV standalone Common Interface (CI)

**DVB_DEVICE_FRONTEND**  Digital TV frontend.

**DVB_DEVICE_DEMUX**  Digital TV demux.

**DVB_DEVICE_DVR**  Digital TV digital video record (DVR).

**DVB_DEVICE_CA**  Digital TV Conditional Access (CA).

**DVB_DEVICE_NET**  Digital TV network.

**DVB_DEVICE_VIDEO**  Digital TV video decoder. Deprecated. Used only on av7110-av.

**DVB_DEVICE_AUDIO**  Digital TV audio decoder. Deprecated. Used only on av7110-av.

**DVB_DEVICE_OSD**  Digital TV On Screen Display (OSD). Deprecated. Used only on av7110.

**struct dvb_adapter**

represents a Digital TV adapter using Linux DVB API

**Definition**

```c
struct dvb_adapter {
    int num;
    struct list_head list_head;
    struct list_head device_list;
    const char *name;
    u8 proposed_mac [6];
}
```
```c
void* priv;
struct device *device;
struct module *module;
int mfe_shared;
struct dvb_device *mfe_dvbdev;
struct mutex mfe_lock;
#if defined(CONFIG_MEDIA_CONTROLLER_DVB);
struct mutex mdev_lock;
struct media_device *mdev;
struct media_entity *conn;
struct media_pad *conn_pads;
#endif;
};
```

**Members**

- `num` Number of the adapter
- `list_head` List with the DVB adapters
- `device_list` List with the DVB devices
- `name` Name of the adapter
- `proposed_mac` proposed MAC address for the adapter
- `priv` private data
- `device` pointer to struct device
- `module` pointer to struct module
- `mfe_shared` indicates mutually exclusive frontends. Use of this flag is currently deprecated.
- `mfe_dvbdev` Frontend device in use, in the case of MFE
- `mfe_lock` Lock to prevent using the other frontends when MFE is used.
- `mdev_lock` Protect access to the mdev pointer.
- `mdev` pointer to `struct media_device`, used when the media controller is used.
- `conn` RF connector. Used only if the device has no separate tuner.
- `conn_pads` pointer to `struct media_pad` associated with `conn`;
- `struct dvb_device` represents a DVB device node

**Definition**

```c
struct dvb_device {
    struct list_head list_head;
    const struct file_operations *fops;
    struct dvb_adapter *adapter;
    enum dvb_device_type type;
    int minor;
    u32 id;
    int readers;
    int writers;
    int users;
    wait_queue_head_t wait_queue;
};
```
```c
int (*kernel_ioctl)(struct file *file, unsigned int cmd, void *arg);
#if defined(CONFIG_MEDIA_CONTROLLER_DVB);
  const char *name;
  struct media_intf_devnode *intf_devnode;
  unsigned tsout_num_entities;
  struct media_entity *entity, *tsout_entity;
  struct media_pad *pads, *tsout_pads;
#endif;
void *priv;
};
```

Members

- **list_head** List head with all DVB devices
- **fops** pointer to struct file_operations
- **adapter** pointer to the adapter that holds this device node
- **type** type of the device, as defined by *enum dvb_device_type*.
- **minor** devnode minor number. Major number is always DVB MAJOR.
- **id** device ID number, inside the adapter
- **writers** Initialized by the caller. Each call to open() in Read/Write mode decreases this counter by one.
- **readers** Initialized by the caller. Each call to open() in Read Only mode decreases this counter by one.
- **users** Initialized by the caller. Each call to open() in any mode decreases this counter by one.
- **wait_queue** wait queue, used to wait for certain events inside one of the DVB API callers
- **kernel_ioctl** callback function used to handle ioctl calls from userspace.
- **name** Name to be used for the device at the Media Controller
- **intf_devnode** Pointer to media_intf_devnode. Used by the dvbdev core to store the MC device node interface
- **tsout_num_entities** Number of Transport Stream output entities
- **entity** pointer to *struct media_entity* associated with the device node
- **tsout_entity** array with MC entities associated to each TS output node
- **pads** pointer to *struct media_pad* associated with **entity**;
- **tsout_pads** array with the source pads for each **tsout_entity**
- **priv** private data

Description

This structure is used by the DVB core (frontend, CA, net, demux) in order to create the device nodes. Usually, driver should not initialize this struct directly.

```c
int dvb_register_adapter(struct dvb_adapter *adap, const char *name, struct module *module, struct device *device, short *adapter_nums)
```

Registers a new DVB adapter

### 2.3. Digital TV (DVB) devices

---
Parameters

struct dvb_adapter *adap pointer to struct dvb_adapter
const char *name Adapter’s name
struct module *module initialized with THIS_MODULE at the caller
struct device *device pointer to struct device that corresponds to the device driver
short *adapter_nums Array with a list of the numbers for dvb_register_adapter; to select among them. Typically, initialized with: DVB_DEFINE_MOD_OPT_ADAPTER_NR(adapter_nums)

int dvb_unregister_adapter(struct dvb_adapter *adap)
Unregisters a DVB adapter

Parameters

struct dvb_adapter *adap pointer to struct dvb_adapter
int dvb_register_device(struct dvb_adapter *adap, struct dvb_device **pdvbdev,
const struct dvb_device *template, void *priv, enum dvb_device_type type, int demux_sink_pads)
Registers a new DVB device

Parameters

struct dvb_adapter *adap pointer to struct dvb_adapter
struct dvb_device **pdvbdev pointer to the place where the new struct dvb_device will be stored
const struct dvb_device *template Template used to create pdvbdev;
void *priv private data
enum dvb_device_type type type of the device, as defined by enum dvb_device_type.
int demux_sink_pads Number of demux outputs, to be used to create the TS outputs via the Media Controller.

void dvb_remove_device(struct dvb_device *dvbdev)
Remove a registered DVB device

Parameters

struct dvb_device *dvbdev pointer to struct dvb_device
Description
This does not free memory. To do that, call dvb_free_device().

void dvb_free_device(struct dvb_device *dvbdev)
Free memory occupied by a DVB device.

Parameters

struct dvb_device *dvbdev pointer to struct dvb_device
Description
Call dvb_unregister_device() before calling this function.

void dvb_unregister_device(struct dvb_device *dvbdev)
Unregisters a DVB device
Parameters

struct dvb_device *dvbdev pointer to struct dvb_device

Description
This is a combination of \texttt{dvb_remove_device()} and \texttt{dvb_free_device()}. Using this function is usually a mistake, and is often an indicator for a use-after-free bug (when a userspace process keeps a file handle to a detached device).

\begin{verbatim}
int dvb_create_media_graph(struct dvb_adapter *adap, bool create_rf_connector)

  Creates media graph for the Digital TV part of the device.
\end{verbatim}

Parameters

struct dvb_adapter *adap pointer to struct dvb_adapter

bool create_rf_connector if true, it creates the RF connector too

Description
This function checks all DVB-related functions at the media controller entities and creates the needed links for the media graph. It is capable of working with multiple tuners or multiple frontends, but it won’t create links if the device has multiple tuners and multiple frontends or if the device has multiple muxes. In such case, the caller driver should manually create the remaining links.

\begin{verbatim}
void dvb_register_media_controller(struct dvb_adapter *adap, struct media_device *mdev)

  registers a media controller at DVB adapter
\end{verbatim}

Parameters

struct dvb_adapter *adap pointer to struct dvb_adapter

struct media_device *mdev pointer to struct media_device

\begin{verbatim}
struct media_device * dvb_get_media_controller(struct dvb_adapter *adap)

  gets the associated media controller
\end{verbatim}

Parameters

struct dvb_adapter *adap pointer to struct dvb_adapter

int dvb_generic_open(struct inode *inode, struct file *file)

  Digital TV open function, used by DVB devices

Parameters

struct inode *inode pointer to struct inode.

struct file *file pointer to struct file.

Description
Checks if a DVB devnode is still valid, and if the permissions are OK and increment negative use count.

\begin{verbatim}
int dvb_generic_release(struct inode *inode, struct file *file)

  Digital TV close function, used by DVB devices
\end{verbatim}

Parameters

struct inode *inode pointer to struct inode.
struct file *file  pointer to struct file.

Description
Checks if a DVB devnode is still valid, and if the permissions are OK and decrement negative use count.

long dvb_generic_ioctl(struct file *file, unsigned int cmd, unsigned long arg)
    Digital TV close function, used by DVB devices

Parameters
struct file *file  pointer to struct file.
unsigned int cmd  Ioctl name.
unsigned long arg  Ioctl argument.

Description
Checks if a DVB devnode and struct dvbdev.kernel_ioctl is still valid. If so, calls dvb_usercopy().

int dvb_usercopy(struct file *file, unsigned int cmd, unsigned long arg, int (*func)(struct file *file, unsigned int cmd, void *arg))
    copies data from/to userspace memory when an ioctl is issued.

Parameters
struct file *file  Pointer to struct file.
unsigned int cmd  Ioctl name.
unsigned long arg  Ioctl argument.
int (*func)(struct file *file, unsigned int cmd, void *arg) function that will actu-
               ally handle the ioctl

Description
Ancillary function that uses ioctl direction and size to copy from userspace. Then, it calls func, and, if needed, data is copied back to userspace.

struct i2c_client *dvb_module_probe(const char *module_name, const char *name,
                                      struct i2c_adapter *adap, unsigned char addr,
                                      void *platform_data)
    helper routine to probe an I2C module

Parameters
const char *module_name
    Name of the I2C module to be probed

const char *name
    Optional name for the I2C module. Used for debug purposes. If NULL, defaults to module_name.

struct i2c_adapter *adap
    pointer to struct i2c_adapter that describes the I2C adapter where the module will be bound.
unsigned char addr
    I2C address of the adapter, in 7-bit notation.

void *platform_data
    Platform data to be passed to the I2C module probed.

**Description**

This function binds an I2C device into the DVB core. Should be used by all drivers that
use I2C bus to control the hardware. A module bound with `dvb_module_probe()` should use
`dvb_module_release()` to unbind.

---

**Note:** In the past, DVB modules (mainly, frontends) were bound via `dvb_attach()` macro, with
does an ugly hack, using I2C low level functions. Such usage is deprecated and will be removed
soon. Instead, use this routine.

**Return**

On success, return an `struct i2c_client`, pointing to the bound I2C device. NULL
otherwise.

```c
void dvb_module_release(struct i2c_client *client)
    releases an I2C device allocated with `dvb_module_probe()`.
```

**Parameters**

`struct i2c_client *client` pointer to `struct i2c_client` with the I2C client to be released.
can be NULL.

**Description**

This function should be used to free all resources reserved by `dvb_module_probe()` and un-
binding the I2C hardware.

```c
dvb_attach(FUNCTION, ARGS...)
    attaches a DVB frontend into the DVB core.
```

**Parameters**

`FUNCTION` function on a frontend module to be called.

`ARGS...` `FUNCTION` arguments.

**Description**

This ancillary function loads a frontend module in runtime and runs the `FUNCTION` function
there, with `ARGS`. As it increments symbol usage cont, at unregister, `dvb_detach()` should be
called.

---

**Note:** In the past, DVB modules (mainly, frontends) were bound via `dvb_attach()` macro, with
does an ugly hack, using I2C low level functions. Such usage is deprecated and will be removed
soon. Instead, you should use `dvb_module_probe()`.

```c
dvb_detach(FUNC)
    detaches a DVB frontend loaded via `dvb_attach()`
```

2.3. Digital TV (DVB) devices
Parameters

**FUNC** attach function

Description

Decrement usage count for a function previously called via `dvb_attach()`.

### 2.3.1.3 Digital TV Ring buffer

Those routines implement ring buffers used to handle digital TV data and copy it from/to userspace.

Note:

1) For performance reasons read and write routines don’t check buffer sizes and/or number of bytes free/available. This has to be done before these routines are called. For example:

```c
/* write @buflen: bytes */
free = dvb_ringbuffer_free(rbuf);
if (free >= buflen)
    count = dvb_ringbuffer_write(rbuf, buffer, buflen);
else
    /* do something */

/* read min. 1000, max. @bufsize: bytes */
avail = dvb_ringbuffer_avail(rbuf);
if (avail >= 1000)
    count = dvb_ringbuffer_read(rbuf, buffer, min(avail, bufsize));
else
    /* do something */
```

2) If there is exactly one reader and one writer, there is no need to lock read or write operations. Two or more readers must be locked against each other. Flushing the buffer counts as a read operation. Resetting the buffer counts as a read and write operation. Two or more writers must be locked against each other.

```c
struct dvb_ringbuffer
    Describes a ring buffer used at DVB framework

Definition

```c
struct dvb_ringbuffer {
    u8 *data;
    ssize_t size;
    ssize_t pread;
    ssize_t pwrite;
    int error;
    wait_queue_head_t queue;
    spinlock_t lock;
};
```

Members

data Area were the ringbuffer data is written
size  size of the ringbuffer
pread  next position to read
pwrite  next position to write
error  used by ringbuffer clients to indicate that an error happened.
queue  Wait queue used by ringbuffer clients to indicate when buffer was filled
lock  Spinlock used to protect the ringbuffer

void dvb_ringbuffer_init(struct dvb_ringbuffer *rbuf, void *data, size_t len)
   initialize ring buffer, lock and queue

Parameters

struct dvb_ringbuffer *rbuf  pointer to struct dvb_ringbuffer
void *data  pointer to the buffer where the data will be stored
size_t len  bytes from ring buffer into buf

int dvb_ringbuffer_empty(struct dvb_ringbuffer *rbuf)
   test whether buffer is empty

Parameters

struct dvb_ringbuffer *rbuf  pointer to struct dvb_ringbuffer

ssize_t dvb_ringbuffer_free(struct dvb_ringbuffer *rbuf)
   returns the number of free bytes in the buffer

Parameters

struct dvb_ringbuffer *rbuf  pointer to struct dvb_ringbuffer
Return
   number of free bytes in the buffer

ssize_t dvb_ringbuffer_avail(struct dvb_ringbuffer *rbuf)
   returns the number of bytes waiting in the buffer

Parameters

struct dvb_ringbuffer *rbuf  pointer to struct dvb_ringbuffer
Return
   number of bytes waiting in the buffer

void dvb_ringbuffer_reset(struct dvb_ringbuffer *rbuf)
   resets the ringbuffer to initial state

Parameters

struct dvb_ringbuffer *rbuf  pointer to struct dvb_ringbuffer
Description
   Resets the read and write pointers to zero and flush the buffer.
   This counts as a read and write operation

2.3. Digital TV (DVB) devices
void \texttt{dvb\_ringbuffer\_flush}(\texttt{struct dvb\_ringbuffer }*\texttt{rbuf})
\hspace*{1em}flush buffer

\textbf{Parameters}

\texttt{struct dvb\_ringbuffer }*\texttt{rbuf} pointer to \texttt{struct dvb\_ringbuffer}

void \texttt{dvb\_ringbuffer\_flush\_spinlock\_wakeup}(\texttt{struct dvb\_ringbuffer }*\texttt{rbuf})
\hspace*{1em}flush buffer protected by spinlock and wake-up waiting task(s)

\textbf{Parameters}

\texttt{struct dvb\_ringbuffer }*\texttt{rbuf} pointer to \texttt{struct dvb\_ringbuffer}

\texttt{DVB\_RINGBUFFER\_PEEK}() \hspace*{1em}peek at byte \texttt{offs} in the buffer

\textbf{Parameters}

\texttt{rbuf} pointer to \texttt{struct dvb\_ringbuffer}
\texttt{offs} offset inside the ringbuffer

\texttt{DVB\_RINGBUFFER\_SKIP}() \hspace*{1em}advance read ptr by \texttt{num} bytes

\textbf{Parameters}

\texttt{rbuf} pointer to \texttt{struct dvb\_ringbuffer}
\texttt{num} number of bytes to advance

\texttt{ssize\_t dvb\_ringbuffer\_read\_user}(\texttt{struct dvb\_ringbuffer }*\texttt{rbuf}, \texttt{u8 }\_\_user \*\texttt{buf}, \texttt{size\_t len}) \hspace*{1em}Reads a buffer into a user pointer

\textbf{Parameters}

\texttt{struct dvb\_ringbuffer }*\texttt{rbuf} pointer to \texttt{struct dvb\_ringbuffer}
\texttt{u8 }\_\_user \*\texttt{buf} pointer to the buffer where the data will be stored
\texttt{size\_t len} bytes from ring buffer into \texttt{buf}

\textbf{Description}

This variant assumes that the buffer is a memory at the userspace. So, it will internally call copy\_to\_user().

\textbf{Return}

number of bytes transferred or -EFAULT

void \texttt{dvb\_ringbuffer\_read}(\texttt{struct dvb\_ringbuffer }*\texttt{rbuf}, \texttt{u8 }\*\texttt{buf}, \texttt{size\_t len}) \hspace*{1em}Reads a buffer into a pointer

\textbf{Parameters}

\texttt{struct dvb\_ringbuffer }*\texttt{rbuf} pointer to \texttt{struct dvb\_ringbuffer}
\texttt{u8 }\*\texttt{buf} pointer to the buffer where the data will be stored
\texttt{size\_t len} bytes from ring buffer into \texttt{buf}
Description
This variant assumes that the buffer is a memory at the Kernel space

Return
number of bytes transferred or -EFAULT

DVB_RINGBUFFER_WRITE_BYTE(rbuf, byte)
write single byte to ring buffer

Parameters
rbuf pointer to struct dvb_ringbuffer
byte byte to write

ssize_t dvb_ringbuffer_write(struct dvb_ringbuffer *rbuf, const u8 *buf, size_t len)
Writes a buffer into the ringbuffer

Parameters
struct dvb_ringbuffer *rbuf pointer to struct dvb_ringbuffer
cost u8 *buf pointer to the buffer where the data will be read
size_t len bytes from ring buffer into buf

Description
This variant assumes that the buffer is a memory at the Kernel space

Return
number of bytes transferred or -EFAULT

ssize_t dvb_ringbuffer_write_user(struct dvb_ringbuffer *rbuf, const u8 __user *buf, size_t len)
Writes a buffer received via a user pointer

Parameters
struct dvb_ringbuffer *rbuf pointer to struct dvb_ringbuffer
cost u8 __user *buf pointer to the buffer where the data will be read
size_t len bytes from ring buffer into buf

Description
This variant assumes that the buffer is a memory at the userspace. So, it will internally call copy_from_user().

Return
number of bytes transferred or -EFAULT

ssize_t dvb_ringbuffer_pkt_write(struct dvb_ringbuffer *rbuf, u8 *buf, size_t len)
Write a packet into the ringbuffer.

Parameters
struct dvb_ringbuffer *rbuf Ringbuffer to write to.
u8 *buf Buffer to write.
size_t len  Length of buffer (currently limited to 65535 bytes max).

Return
Number of bytes written, or -EFAULT, -ENOMEM, -EVINAL.

ssize_t dvb_ringbuffer_pkt_read_user(struct dvb_ringbuffer *rbuf, size_t idx, int offset, u8 __user *buf, size_t len)

   Read from a packet in the ringbuffer.

Parameters
struct dvb_ringbuffer *rbuf  Ringbuffer concerned.
size_t idx  Packet index as returned by dvb_ringbuffer_pkt_next().
int offset  Offset into packet to read from.
u8 __user *buf  Destination buffer for data.
size_t len  Size of destination buffer.

Return
Number of bytes read, or -EFAULT.

Description

Note:  unlike dvb_ringbuffer_read(), this does NOT update the read pointer in the ringbuffer. You must use dvb_ringbuffer_pkt_dispose() to mark a packet as no longer required.

ssize_t dvb_ringbuffer_pkt_read(struct dvb_ringbuffer *rbuf, size_t idx, int offset, u8 *buf, size_t len)

   Read from a packet in the ringbuffer.

Parameters
struct dvb_ringbuffer *rbuf  Ringbuffer concerned.
size_t idx  Packet index as returned by dvb_ringbuffer_pkt_next().
int offset  Offset into packet to read from.
u8 *buf  Destination buffer for data.
size_t len  Size of destination buffer.

Note
unlike dvb_ringbuffer_read_user(), this DOES update the read pointer in the ringbuffer.

Return
Number of bytes read, or -EFAULT.

void dvb_ringbuffer_pkt_dispose(struct dvb_ringbuffer *rbuf, size_t idx)

   Dispose of a packet in the ring buffer.

Parameters
struct dvb_ringbuffer *rbuf  Ring buffer concerned.
size_t idx  Packet index as returned by dvb_ringbuffer_pkt_next().
ssize_t \texttt{dvb\_ringbuffer\_pkt\_next}(\texttt{struct dvb\_ringbuffer *}rbuf, size\_t idx, size\_t *pktlen)

Get the index of the next packet in a ringbuffer.

**Parameters**

- \texttt{struct dvb\_ringbuffer *}\texttt{rbuf} Ringbuffer concerned.
- \texttt{size\_t} \texttt{idx} Previous packet index, or -1 to return the first packet index.
- \texttt{size\_t *}\texttt{pktlen} On success, will be updated to contain the length of the packet in bytes. returns Packet index (if >=0), or -1 if no packets available.

### 2.3.1.4 Digital TV VB2 handler

- \texttt{enum dvb\_buf\_type} types of Digital TV memory-mapped buffers

**Constants**

- \texttt{DVB\_BUF\_TYPE\_CAPTURE} buffer is filled by the Kernel, with a received Digital TV stream

- \texttt{enum dvb\_vb2\_states} states to control VB2 state machine

**Constants**

- \texttt{DVB\_VB2\_STATE\_NONE} VB2 engine not initialized yet, init failed or VB2 was released.

- \texttt{DVB\_VB2\_STATE\_INIT} VB2 engine initialized.

- \texttt{DVB\_VB2\_STATE\_REQBUFS} Buffers were requested

- \texttt{DVB\_VB2\_STATE\_STREAMON} VB2 is streaming. Callers should not check it directly. Instead, they should use \texttt{dvb\_vb2\_is\_streaming()}.

**Note**

**Description**

Callers should not touch at the state machine directly. This is handled inside \texttt{dvb\_vb2.c}.

- \texttt{struct dvb\_buffer} video buffer information for v4l2.

**Definition**

```c
struct dvb_buffer {
    struct vb2_buffer vb;
    struct list_head list;
};
```

**Members**

- \texttt{vb} embedded struct \texttt{vb2\_buffer}.

### 2.3. Digital TV (DVB) devices
**list** list of *struct dvb_buffer*.

**struct dvb_vb2_ctx**

control struct for VB2 handler

**Definition**

```c
struct dvb_vb2_ctx {
    struct vb2_queue vb_q;
    struct mutex mutex;
    spinlock_t slock;
    struct list_head dvb_q;
    struct dvb_buffer *buf;
    int offset;
    int remain;
    int state;
    int buf_siz;
    int buf_cnt;
    int nonblocking;
    enum dmx_buffer_flags flags;
    u32 count;
    char name[DVB_VB2_NAME_MAX + 1];
};
```

**Members**

- **vb_q** pointer to *struct vb2_queue* with videobuf2 queue.
- **mutex** mutex to serialize vb2 operations. Used by vb2 core wait_prepare and wait_finish operations.
- **slock** spin lock used to protect buffer filling at dvb_vb2.c.
- **dvb_q** List of buffers that are not filled yet.
- **buf** Pointer to the buffer that are currently being filled.
- **offset** index to the next position at the **buf** to be filled.
- **remain** How many bytes are left to be filled at **buf**.
- **state** bitmask of buffer states as defined by *enum dvb_vb2_states*.
- **buf_siz** size of each VB2 buffer.
- **buf_cnt** number of VB2 buffers.
- **nonblocking**
  
  If different than zero, device is operating on non-blocking mode.
- **flags** buffer flags as defined by *enum dmx_buffer_flags*. Filled only at DMX_DQBUF. DMX_QBUF should zero this field.
- **count** monotonic counter for filled buffers. Helps to identify data stream loses. Filled only at DMX_DQBUF. DMX_QBUF should zero this field.
- **name** name of the device type. Currently, it can either be “dvr” or “demux_filter”.

**int dvb_vb2_init**(struct *dvb_vb2_ctx* *ctx*, const char **name**, int **non_blocking**)

initializes VB2 handler

**Parameters**
struct dvb_vb2_ctx *ctx  control struct for VB2 handler

const char *name  name for the VB2 handler

int non_blocking
    if not zero, it means that the device is at non-blocking mode

int dvb_vb2_release(struct dvb_vb2_ctx *ctx)
    Releases the VB2 handler allocated resources and put ctx at DVB_VB2_STATE_NONE state.

Parameters
struct dvb_vb2_ctx *ctx  control struct for VB2 handler

int dvb_vb2_is_streaming(struct dvb_vb2_ctx *ctx)
    checks if the VB2 handler is streaming

Parameters
struct dvb_vb2_ctx *ctx  control struct for VB2 handler

Return
0 if not streaming, 1 otherwise.

int dvb_vb2_fill_buffer(struct dvb_vb2_ctx *ctx, const unsigned char *src, int len,
        enum dmx_buffer_flags *buffer_flags)
    fills a VB2 buffer

Parameters
struct dvb_vb2_ctx *ctx  control struct for VB2 handler
const unsigned char *src  place where the data is stored
int len  number of bytes to be copied from src
enum dmx_buffer_flags *buffer_flags
    pointer to buffer flags as defined by enum dmx_buffer_flags. can be NULL.

__poll_t dvb_vb2_poll(struct dvb_vb2_ctx *ctx, struct file *file, poll_table *wait)
    Wrapper to vb2_core_streamon() for Digital TV buffer handling.

Parameters
struct dvb_vb2_ctx *ctx  control struct for VB2 handler
struct file *file  struct file argument passed to the poll file operation handler.
poll_table *wait  poll_table wait argument passed to the poll file operation handler.

Description
Implements poll syscall() logic.

int dvb_vb2_stream_on(struct dvb_vb2_ctx *ctx)
    Wrapper to vb2_core_streamon() for Digital TV buffer handling.

Parameters
struct dvb_vb2_ctx *ctx  control struct for VB2 handler

2.3. Digital TV (DVB) devices
Description
Starts dvb streaming

```c
int dvb_vb2_stream_off(struct dvb_vb2_ctx *ctx)
```
Wrapper to `vb2_core_streamoff()` for Digital TV buffer handling.

Parameters
- `struct dvb_vb2_ctx *ctx` control struct for VB2 handler

Description
Stops dvb streaming

```c
int dvb_vb2_reqbufs(struct dvb_vb2_ctx *ctx, struct dmx_requestbuffers *req)
```
Wrapper to `vb2_core_reqbufs()` for Digital TV buffer handling.

Parameters
- `struct dvb_vb2_ctx *ctx` control struct for VB2 handler
- `struct dmx_requestbuffers *req` passed from userspace in order to handle DMX_REQBUFS.

Description
Initiate streaming by requesting a number of buffers. Also used to free previously requested buffers, if `req->count` is zero.

```c
int dvb_vb2_querybuf(struct dvb_vb2_ctx *ctx, struct dmx_buffer *b)
```
Wrapper to `vb2_core_querybuf()` for Digital TV buffer handling.

Parameters
- `struct dvb_vb2_ctx *ctx` control struct for VB2 handler
- `struct dmx_buffer *b` passed from userspace in order to handle DMX_QUERYBUF.

```c
int dvb_vb2_expbuf(struct dvb_vb2_ctx *ctx, struct dmx_exportbuffer *exp)
```
Wrapper to `vb2_core_expbuf()` for Digital TV buffer handling.

Parameters
- `struct dvb_vb2_ctx *ctx` control struct for VB2 handler
- `struct dmx_exportbuffer *exp` passed from userspace in order to handle DMX_EXPBUF.

Description
Export a buffer as a file descriptor.

```c
int dvb_vb2_qbuf(struct dvb_vb2_ctx *ctx, struct dmx_buffer *b)
```
Wrapper to `vb2_core_qbuf()` for Digital TV buffer handling.

Parameters
- `struct dvb_vb2_ctx *ctx` control struct for VB2 handler
- `struct dmx_buffer *b` passed from userspace in order to handle DMX_QBUF.
Description

Queue a Digital TV buffer as requested by userspace

```c
int dvb_vb2_dqbuf(struct dvb_vb2_ctx *ctx, struct dmx_buffer *b)
```

Wrapper to `vb2_core_dqbuf()` for Digital TV buffer handling.

Parameters

- `struct dvb_vb2_ctx *ctx` control struct for VB2 handler
- `struct dmx_buffer *b` `struct dmx_buffer` passed from userspace in order to handle DMX_DQBUF.

Description

Dequeue a Digital TV buffer to the userspace

```c
int dvb_vb2_mmap(struct dvb_vb2_ctx *ctx, struct vm_area_struct *vma)
```

Wrapper to `vb2_mmap()` for Digital TV buffer handling.

Parameters

- `struct dvb_vb2_ctx *ctx` control struct for VB2 handler
- `struct vm_area_struct *vma` pointer to `struct vm_area_struct` with the vma passed to the mmap file operation handler in the driver.

Description

map Digital TV video buffers into application address space.

2.3.2 Digital TV Frontend kABI

2.3.2.1 Digital TV Frontend

The Digital TV Frontend kABI defines a driver-internal interface for registering low-level, hardware specific driver to a hardware independent frontend layer. It is only of interest for Digital TV device driver writers. The header file for this API is named `dvb_frontend.h` and located in `include/media/`.

Demodulator driver

The demodulator driver is responsible for talking with the decoding part of the hardware. Such driver should implement `dvb_frontend_ops`, which tells what type of digital TV standards are supported, and points to a series of functions that allow the DVB core to command the hardware via the code under `include/media/dvb_frontend.c`.

A typical example of such struct in a driver foo is:

```c
static struct dvb_frontend_ops foo_ops = {
    .delsys = { SYS_DVBT, SYS_DVBT2, SYS_DVBC_ANNEX_A },
    .info = {
        .name = "foo DVB-T/T2/C driver",
        .caps = FE_CAN_FEC_1_2 |
                FE_CAN_FEC_2_3 |
                FE_CAN_FEC_3_4 |
```

2.3. Digital TV (DVB) devices
A typical example of such struct in a driver bar meant to be used on Satellite TV reception is:

```c
static const struct dvb_frontend_ops bar_ops = {
    .delsys = { SYS_DVBS, SYS_DVBS2 },
    .info = {
        .name = "Bar DVB-S/S2 demodulator",
        .frequency_min = 5000000, /* KHz */
        .frequency_max = 25000000, /* KHz */
        .frequency_stepsize = 0,
        .symbol_rate_min = 10000000,
        .symbol_rate_max = 45000000000,
        .symbol_rate_tolerance = 500,
        .caps = FE_CAN_INVERSION_AUTO |
               FE_CAN_FEC_AUTO |
               FE_CAN_QPSK,
    ),
    .init = bar_init,
    .sleep = bar_sleep,
    .release = bar_release,
    .set_frontend = bar_set_frontend,
    .get_frontend = bar_get_frontend,
    .read_status = bar_get_status_and_stats,
    .tune = bar_tune,
    .i2c_gate_ctrl = bar_i2c_gate_ctrl,
    .get_frontend_algo = bar_get_algo,
};
```
Note:

1) For satellite digital TV standards (DVB-S, DVB-S2, ISDB-S), the frequencies are specified in kHz, while, for terrestrial and cable standards, they’re specified in Hz. Due to that, if the same frontend supports both types, you’ll need to have two separate `dvb_frontend_ops` structures, one for each standard.

2) The `.i2c_gate_ctrl` field is present only when the hardware has allows controlling an I2C gate (either directly or via some GPIO pin), in order to remove the tuner from the I2C bus after a channel is tuned.

3) All new drivers should implement the `DVBv5 statistics` via `.read_status`. Yet, there are a number of callbacks meant to get statistics for signal strength, S/N and UCB. Those are there to provide backward compatibility with legacy applications that don’t support the DVBv5 API. Implementing those callbacks are optional. Those callbacks may be removed in the future, after we have all existing drivers supporting DVBv5 stats.

4) Other callbacks are required for satellite TV standards, in order to control LNBf and DiSEqC: `.diseqc_send_master_cmd`, `.diseqc_send_burst`, `.set_tone`, `.set_voltage`.

The include/media/dvb_frontend.c has a kernel thread which is responsible for tuning the device. It supports multiple algorithms to detect a channel, as defined at enum `dvbfe_algo()`. The algorithm to be used is obtained via `.get_frontend_algo`. If the driver doesn’t fill its field at `struct dvb_frontend.ops`, it will default to `DVBF_E_ALGO_SW`, meaning that the dvb-core will do a zigzag when tuning, e. g. it will try first to use the specified center frequency `f`, then, it will do `f + Δ`, `f - Δ`, `f + 2 x Δ`, `f - 2 x Δ` and so on.

If the hardware has internally a some sort of zigzag algorithm, you should define a `.get_frontend_algo` function that would return `DVBF_E_ALGO_HW`.

Note: The core frontend support also supports a third type (`DVBF_E_ALGO_CUSTOM`), in order to allow the driver to define its own hardware-assisted algorithm. Very few hardware need to use it nowadays. Using `DVBF_E_ALGO_CUSTOM` require to provide other function callbacks at `struct dvb_frontend_ops`.

2.3. Digital TV (DVB) devices

447
Attaching frontend driver to the bridge driver

Before using the Digital TV frontend core, the bridge driver should attach the frontend demod, tuner and SEC devices and call `dvb_register_frontend()`, in order to register the new frontend at the subsystem. At device detach/removal, the bridge driver should call `dvb_unregister_frontend()` to remove the frontend from the core and then `dvb_frontend_detach()` to free the memory allocated by the frontend drivers.

The drivers should also call `dvb_frontend_suspend()` as part of their handler for the `device_driver.suspend()`, and `dvb_frontend_resume()` as part of their handler for `device_driver.resume()`.

A few other optional functions are provided to handle some special cases.

2.3.2.2 Digital TV Frontend statistics

Introduction

Digital TV frontends provide a range of statistics meant to help tuning the device and measuring the quality of service.

For each statistics measurement, the driver should set the type of scale used, or `FE_SCALE_NOT_AVAILABLE` if the statistics is not available on a given time. Drivers should also provide the number of statistics for each type. that’s usually 1 for most video standards\(^1\).

Drivers should initialize each statistic counters with length and scale at its init code. For example, if the frontend provides signal strength, it should have, on its init code:

```c
struct dtv_frontend_properties *c = &state->fe.dtv_property_cache;

// Initialize signal strength
c->strength.len = 1;
// Use FE_SCALE_NOT_AVAILABLE for signal strength
// This is preferred for signal strength and CNR measurements.\(^1\)
// However, for ISDB-T, both global and per-layer statistics are supported.
// For such cases, the length should be 4.
// For example, the following is for ISDB-T:
// - `c->cnr.stat[0]` is for global S/N carrier ratio
// - `c->cnr.stat[1]` is for Layer A S/N carrier ratio
// - `c->cnr.stat[2]` is for Layer B S/N carrier ratio
// - `c->cnr.stat[3]` is for Layer C S/N carrier ratio

c->strength.stat[0].scale = FE_SCALE_NOT_AVAILABLE;

c->strength.stat[0].uvalue = strength;
```

Note: Please prefer to use `FE_SCALE_DECIBEL` instead of `FE_SCALE_RELATIVE` for signal strength and CNR measurements.

\(^1\) For ISDB-T, it may provide both a global statistics and a per-layer set of statistics. On such cases, len should be equal to 4. The first value corresponds to the global stat; the other ones to each layer, e. g.:

- `c->cnr.stat[0]` for global S/N carrier ratio,
- `c->cnr.stat[1]` for Layer A S/N carrier ratio,
- `c->cnr.stat[2]` for layer B S/N carrier ratio,
Groups of statistics

There are several groups of statistics currently supported:

**Signal strength** (**DTV_STAT_SIGNAL_STRENGTH**)  
- Measures the signal strength level at the analog part of the tuner or demod.
- Typically obtained from the gain applied to the tuner and/or frontend in order to detect the carrier. When no carrier is detected, the gain is at the maximum value (so, strength is on its minimal).
- As the gain is visible through the set of registers that adjust the gain, typically, this statistics is always available.\(^2\)
- Drivers should try to make it available all the times, as these statistics can be used when adjusting an antenna position and to check for troubles at the cabling.

**Carrier Signal to Noise ratio** (**DTV_STAT_CNR**)  
- Signal to Noise ratio for the main carrier.
- Signal to Noise measurement depends on the device. On some hardware, it is available when the main carrier is detected. On those hardware, CNR measurement usually comes from the tuner (e. g. after FE_HAS_CARRIER, see fe_status).

  On other devices, it requires inner FEC decoding, as the frontend measures it indirectly from other parameters (e. g. after FE_HAS_VITERBI, see fe_status).

  Having it available after inner FEC is more common.

**Bit counts post-FEC** (**DTV_STAT_POST_ERROR_BIT_COUNT** and **DTV_STAT_POST_TOTAL_BIT_COUNT**)  
- Those counters measure the number of bits and bit errors after the forward error correction (FEC) on the inner coding block (after Viterbi, LDPC or other inner code).
- Due to its nature, those statistics depend on full coding lock (e. g. after FE_HAS_SYNC or after FE_HAS_LOCK, see fe_status).

**Bit counts pre-FEC** (**DTV_STAT_PRE_ERROR_BIT_COUNT** and **DTV_STAT_PRE_TOTAL_BIT_COUNT**)  
- Those counters measure the number of bits and bit errors before the forward error correction (FEC) on the inner coding block (before Viterbi, LDPC or other inner code).
- Not all frontends provide this kind of statistics.
- Due to its nature, those statistics depend on inner coding lock (e. g. after FE_HAS_VITERBI, see fe_status).

**Block counts** (**DTV_STAT_ERROR_BLOCK_COUNT** and **DTV-STAT_TOTAL_BLOCK_COUNT**)  
- Those counters measure the number of blocks and block errors after the forward error correction (FEC) on the inner coding block (before Viterbi, LDPC or other inner code).

\(^2\) On a few devices, the gain keeps floating if there is no carrier. On such devices, strength report should check first if carrier is detected at the tuner (FE_HAS_CARRIER, see fe_status), and otherwise return the lowest possible value.
Due to its nature, those statistics depend on full coding lock (e.g. after FE_HAS_SYNC or after FE_HAS_LOCK, see fe_status).

**Note:** All counters should be monotonically increased as they're collected from the hardware.

A typical example of the logic that handle status and statistics is:

```c
static int foo_get_status_and_stats(struct dvb_frontend *fe)
{
    struct foo_state *state = fe->demodulator_priv;
    struct dtv_frontend_properties *c = &fe->dtv_property_cache;

    int rc;
    enum fe_status *status;

    /* Both status and strength are always available */
    rc = foo_read_status(fe, &status);
    if (rc < 0)
        return rc;

    rc = foo_read_strength(fe);
    if (rc < 0)
        return rc;

    /* Check if CNR is available */
    if (!(fe->status & FE_HAS_CARRIER))
        return 0;

    rc = foo_read_cnr(fe);
    if (rc < 0)
        return rc;

    /* Check if pre-BER stats are available */
    if (!(fe->status & FE_HAS_VITERBI))
        return 0;

    rc = foo_get_pre_ber(fe);
    if (rc < 0)
        return rc;

    /* Check if post-BER stats are available */
    if (!(fe->status & FE_HAS_SYNC))
        return 0;

    rc = foo_get_post_ber(fe);
    if (rc < 0)
        return rc;
}

static const struct dvb_frontend_ops ops = {
    /* ... */
    .read_status = foo_get_status_and_stats,
};
```
Statistics collection

On almost all frontend hardware, the bit and byte counts are stored by the hardware after a certain amount of time or after the total bit/block counter reaches a certain value (usually programmable), for example, on every 1000 ms or after receiving 1,000,000 bits.

So, if you read the registers too soon, you’ll end by reading the same value as in the previous reading, causing the monotonic value to be incremented too often.

Drivers should take the responsibility to avoid too often reads. That can be done using two approaches:

if the driver have a bit that indicates when a collected data is ready

Driver should check such bit before making the statistics available.

An example of such behavior can be found at this code snippet (adapted from mb86a20s driver’s logic):

```c
static int foo_get_pre_ber(struct dvb_frontend *fe)
{
    struct foo_state *state = fe->demodulator_priv;
    struct dtv_frontend_properties *c = &fe->dtv_property_cache;
    int rc, bit_error;

    /* Check if the BER measures are already available */
    rc = foo_read_u8(state, 0x54);
    if (rc < 0)
        return rc;
    if (!rc)
        return 0;

    /* Read Bit Error Count */
    bit_error = foo_read_u32(state, 0x55);
    if (bit_error < 0)
        return bit_error;

    /* Read Total Bit Count */
    rc = foo_read_u32(state, 0x51);
    if (rc < 0)
        return rc;

    c->pre_bit_error.stat[0].scale = FE_SCALE_COUNTER;
    c->pre_bit_error.stat[0].uvalue += bit_error;
    c->pre_bit_count.stat[0].scale = FE_SCALE_COUNTER;
    c->pre_bit_count.stat[0].uvalue += rc;

    return 0;
}
```
If the driver doesn’t provide a statistics available check bit

A few devices, however, may not provide a way to check if the stats are available (or the way to check it is unknown). They may not even provide a way to directly read the total number of bits or blocks.

On those devices, the driver need to ensure that it won’t be reading from the register too often and/or estimate the total number of bits/blocks.

On such drivers, a typical routine to get statistics would be like (adapted from dib8000 driver’s logic):

```c
struct foo_state {
    /* ... */
    unsigned long per_jiffies_stats;
};
static int foo_get_pre_ber(struct dvb_frontend *fe) {
    struct foo_state *state = fe->demodulator_priv;
    struct dtv_frontend_properties *c = &fe->dtv_property_cache;
    int rc, bit_error;
    u64 bits;

    /* Check if time for stats was elapsed */
    if (!time_after(jiffies, state->per_jiffies_stats))
        return 0;

    /* Next stat should be collected in 1000 ms */
    state->per_jiffies_stats = jiffies + msecs_to_jiffies(1000);

    /* Read Bit Error Count */
    bit_error = foo_read_u32(state, 0x55);
    if (bit_error < 0)
        return bit_error;

    /* On this particular frontend, there’s no register that
    * would provide the number of bits per 1000ms sample. So,
    * some function would calculate it based on DTV properties
    */
    bits = get_number_of_bits_per_1000ms(fe);

    c->pre_bit_error.stat[0].scale = FE_SCALE_COUNTER;
    c->pre_bit_error.stat[0].uvalue += bit_error;
    c->pre_bit_count.stat[0].scale = FE_SCALE_COUNTER;
    c->pre_bit_count.stat[0].uvalue += bits;

    return 0;
}
```

Please notice that, on both cases, we’re getting the statistics using the `dvb_frontend_ops` read_status callback. The rationale is that the frontend core will automatically call this function periodically (usually, 3 times per second, when the frontend is locked).

That warrants that we won’t miss to collect a counter and increment the monotonic stats at the
right time.

### 2.3.2.3 Digital TV Frontend functions and types

**struct** `dvb_frontend_tune_settings`
parameters to adjust frontend tuning

**Definition**

```c
struct dvb_frontend_tune_settings {
    int min_delay_ms;
    int step_size;
    int max_drift;
};
```

**Members**

- **min_delay_ms** minimum delay for tuning, in ms
- **step_size** step size between two consecutive frequencies
- **max_drift** maximum drift

**NOTE**

`step_size` is in Hz, for terrestrial/cable or kHz for satellite

**struct** `dvb_tuner_info`
Frontend name and min/max ranges/bandwidths

**Definition**

```c
struct dvb_tuner_info {
    char name[128];
    u32 frequency_min_hz;
    u32 frequency_max_hz;
    u32 frequency_step_hz;
    u32 bandwidth_min;
    u32 bandwidth_max;
    u32 bandwidth_step;
};
```

**Members**

- **name** name of the Frontend
- **frequency_min_hz** minimal frequency supported in Hz
- **frequency_max_hz** maximum frequency supported in Hz
- **frequency_step_hz** frequency step in Hz
- **bandwidth_min** minimal frontend bandwidth supported
- **bandwidth_max** maximum frontend bandwidth supported
- **bandwidth_step** frontend bandwidth step

**struct** `analog_parameters`
Parameters to tune into an analog/radio channel
Definition

```c
struct analog_parameters {
    unsigned int frequency;
    unsigned int mode;
    unsigned int audmode;
    u64 std;
};
```

Members

- **frequency**: Frequency used by analog TV tuner (either in 62.5 kHz step, for TV, or 62.5 Hz for radio)
- **mode**: Tuner mode, as defined on enum v4l2_tuner_type
- **audmode**: Audio mode as defined for the rxsubchans field at videodev2.h, e.g. V4L2_TUNER_MODE_ *
- **std**: TV standard bitmap as defined at videodev2.h, e.g. V4L2_STD_ *

Description

Hybrid tuners should be supported by both V4L2 and DVB APIs. This struct contains the data that are used by the V4L2 side. To avoid dependencies from V4L2 headers, all enums here are declared as integers.

- **enum dvbfe_algo**
  - defines the algorithm used to tune into a channel

Constants

- **DVBFE_ALGO_HW**: Hardware Algorithm - Devices that support this algorithm do everything in hardware and no software support is needed to handle them. Requesting these devices to LOCK is the only thing required, device is supposed to do everything in the hardware.
- **DVBFE_ALGO_SW**: Software Algorithm - These are dumb devices, that require software to do everything
- **DVBFE_ALGO_CUSTOM**: Customizable Algorithm - Devices having this algorithm can be customized to have specific algorithms in the frontend driver, rather than simply doing a software zigzag. In this case the zigzag maybe hardware assisted or it maybe completely done in hardware. In all cases, usage of this algorithm, in conjunction with the search and track callbacks, utilizes the driver specific algorithm.
- **DVBFE_ALGO_RECOVERY**: Recovery Algorithm - These devices have AUTO recovery capabilities from LOCK failure

- **enum dvbfe_search**
  - search callback possible return status

Constants

- **DVBFE_ALGO_SEARCH_SUCCESS**: The frontend search algorithm completed and returned successfully
- **DVBFE_ALGO_SEARCH_ASLEEP**: The frontend search algorithm is sleeping
- **DVBFE_ALGO_SEARCH_FAILED**
The frontend search for a signal failed

DVBFE_ALGO_SEARCH_INVALID

The frontend search algorithm was probably supplied with invalid parameters and
the search is an invalid one

DVBFE_ALGO_SEARCH_AGAIN

The frontend search algorithm was requested to search again

DVBFE_ALGO_SEARCH_ERROR

The frontend search algorithm failed due to some error

struct dvb_tuner_ops

Tuner information and callbacks

Definition

```c
struct dvb_tuner_ops {
    struct dvb_tuner_info info;
    void (*release)(struct dvb_frontend *fe);
    int (*init)(struct dvb_frontend *fe);
    int (*sleep)(struct dvb_frontend *fe);
    int (*suspend)(struct dvb_frontend *fe);
    int (*resume)(struct dvb_frontend *fe);
    int (*set_params)(struct dvb_frontend *fe);
    int (*set_analog_params)(struct dvb_frontend *fe, struct analog_parameters *p);
    int (*set_config)(struct dvb_frontend *fe, void *priv_cfg);
    int (*get_frequency)(struct dvb_frontend *fe, u32 *frequency);
    int (*get_bandwidth)(struct dvb_frontend *fe, u32 *bandwidth);
    int (*get_if_frequency)(struct dvb_frontend *fe, u32 *frequency);
    #define TUNER_STATUS_LOCKED 1;
    #define TUNER_STATUS_STEREO 2;
    int (*get_status)(struct dvb_frontend *fe, u32 *status);
    int (*get_rf_strength)(struct dvb_frontend *fe, u16 *strength);
    int (*getafc)(struct dvb_frontend *fe, s32 *afc);
    int (*calc_regs)(struct dvb_frontend *fe, u8 *buf, int buf_len);
    int (*set_frequency)(struct dvb_frontend *fe, u32 frequency);
    int (*set_bandwidth)(struct dvb_frontend *fe, u32 bandwidth);
};
```

Members

- **info**: embedded `struct dvb_tuner_info` with tuner properties
- **release**: callback function called when frontend is detached. drivers should free any allocated memory.
- **init**: callback function used to initialize the tuner device.
- **sleep**: callback function used to put the tuner to sleep.
- **suspend**: callback function used to inform that the Kernel will suspend.
- **resume**: callback function used to inform that the Kernel is resuming from suspend.
- **set_params**: callback function used to inform the tuner to tune into a digital TV channel. The properties to be used are stored at `struct dvb_frontend.dtv_property_cache`. The tuner demod can change the parameters to reflect the changes needed for the channel to be

2.3. Digital TV (DVB) devices
set_analog_params callback function used to tune into an analog TV channel on hybrid tuners. It passes analog_parameters to the driver.

set_config callback function used to send some tuner-specific parameters.

get_frequency get the actual tuned frequency

get_bandwidth get the bandwidth used by the low pass filters

get_if_frequency get the Intermediate Frequency, in Hz. For baseband, should return 0.

get_status returns the frontend lock status

get_rf_strength returns the RF signal strength. Used mostly to support analog TV and radio. Digital TV should report, instead, via DVBv5 API (struct dvb_frontend.dtv_property_cache).

get_afc Used only by analog TV core. Reports the frequency drift due to AFC.

calc_regs callback function used to pass register data settings for simple tuners. Shouldn’t be used on newer drivers.

set_frequency Set a new frequency. Shouldn’t be used on newer drivers.

set_bandwidth Set a new frequency. Shouldn’t be used on newer drivers.

NOTE

frequencies used on get_frequency and set_frequency are in Hz for terrestrial/cable or kHz for satellite.

struct analog_demod_info

Information struct for analog TV part of the demod

Definition

```c
struct analog_demod_info {
    char *name;
};
```

Members

name Name of the analog TV demodulator

struct analog_demod_ops

Demodulation information and callbacks for analog TV and radio

Definition

```c
struct analog_demod_ops {
    struct analog_demod_info info;
    void (*set_params)(struct dvb_frontend *fe, struct analog_parameters *params);
    int (*has_signal)(struct dvb_frontend *fe, u16 *signal);
    int (*get_afc)(struct dvb_frontend *fe, s32 *afc);
    void (*tuner_status)(struct dvb_frontend *fe);
    void (*standby)(struct dvb_frontend *fe);
    void (*release)(struct dvb_frontend *fe);
    int (*i2c_gate_ctrl)(struct dvb_frontend *fe, int enable);
};
```
Members

**info** pointer to *struct analog_demod_info*

**set_params** callback function used to inform the demod to set the demodulator parameters needed to decode an analog or radio channel. The properties are passed via *struct analog_params*.

**has_signal** returns 0xffff if has signal, or 0 if it doesn’t.

**get AFC** Used only by analog TV core. Reports the frequency drift due to AFC.

**tuner_status** callback function that returns tuner status bits, e. g. TUNER_STATUS_LOCKED and TUNER_STATUS_STEREO.

**standby** set the tuner to standby mode.

**release** callback function called when frontend is detached. drivers should free any allocated memory.

**i2c_gate_ctrl** controls the I2C gate. Newer drivers should use I2C mux support instead.

**set_config** callback function used to send some tuner-specific parameters.

---

**struct dvb_frontend_internal_info**

Frontend properties and capabilities

**Definition**

```c
struct dvb_frontend_internal_info {
    char name[128];
    u32 frequency_min_hz;
    u32 frequency_max_hz;
    u32 frequency_stepsize_hz;
    u32 frequency_tolerance_hz;
    u32 symbol_rate_min;
    u32 symbol_rate_max;
    u32 symbol_rate_tolerance;
    enum fe_caps caps;
};
```

Members

**name** Name of the frontend

**frequency_min_hz** Minimal frequency supported by the frontend.

**frequency_max_hz** Minimal frequency supported by the frontend.

**frequency_stepsize_hz** All frequencies are multiple of this value.

**frequency_tolerance_hz** Frequency tolerance.

**symbol_rate_min** Minimal symbol rate, in bauds (for Cable/Satellite systems).

**symbol_rate_max** Maximal symbol rate, in bauds (for Cable/Satellite systems).

**symbol_rate_tolerance** Maximal symbol rate tolerance, in ppm (for Cable/Satellite systems).
caps  Capabilities supported by the frontend, as specified in enum fe_caps.

struct dvb_frontend_ops
  Demodulation information and callbacks for ditialt TV

Definition

```c
struct dvb_frontend_ops {
    struct dvb_frontend_internal_info info;
    u8 delsys[MAX_DELSYS];
    void (*detach)(struct dvb_frontend *fe);
    void (*release)(struct dvb_frontend* fe);
    void (*release_sec)(struct dvb_frontend* fe);
    int (*init)(struct dvb_frontend* fe);
    int (*sleep)(struct dvb_frontend* fe);
    int (*write)(struct dvb_frontend* fe, const u8 buf[], int len);
    int (*tune)(struct dvb_frontend* fe,bool re_tune, unsigned int mode_flags, unsigned u
    int *delay, enum fe_status *status);
    enum dvbfe_algo (*get_frontend_algo)(struct dvb_frontend *fe);
    int (*set_frontend)(struct dvb_frontend *fe);
    int (*get_tune_settings)(struct dvb_frontend* fe, struct dvb_frontend_tune_settings* u
    settings);
    int (*get_frontend)(struct dvb_frontend *fe, struct dtv_frontend_properties *props);
    int (*read_status)(struct dvb_frontend *fe, enum fe_status *status);
    int (*read_ber)(struct dvb_frontend* fe, u32* ber);
    int (*read_signal_strength)(struct dvb_frontend* fe, u16* strength);
    int (*read_snr)(struct dvb_frontend* fe, u16* snr);
    int (*read_ucblocks)(struct dvb_frontend* fe, u32* ucblocks);
    int (*diseqc_reset_overload)(struct dvb_frontend* fe);
    int (*diseqc_send_master_cmd)(struct dvb_frontend* fe, struct dvb_diseqc_master_cmd* u
    cmd);
    int (*diseqc_recv_slave_reply)(struct dvb_frontend* fe, struct dvb_diseqc_slave_ u
    reply* reply);
    int (*diseqc_send_burst)(struct dvb_frontend* fe, enum fe_sec_mini_cmd minicmd);
    int (*set_voltage)(struct dvb_frontend* fe, enum fe_sec_voltage voltage);
    int (*enable_high_lnb_voltage)(struct dvb_frontend* fe, long arg);
    int (*dishnetwork_send_legacy_command)(struct dvb_frontend* fe, unsigned long cmd);
    int (*i2c_gate_ctrl)(struct dvb_frontend* fe, int enable);
    int (*set_lna)(struct dvb_frontend *);
    enum dvbfe_search (*search)(struct dvb_frontend *fe);
    struct dvb_tuner_ops tuner_ops;
    struct analog_demod_ops analog_ops;
};
```

Members

- **info** embedded `struct dvb_tuner_info` with tuner properties
- **delsys** Delivery systems supported by the frontend
- **detach** callback function called when frontend is detached. drivers should clean up, but not yet free the `struct dvb_frontend` allocation.
- **release** callback function called when frontend is ready to be freed. drivers should free any allocated memory.
- **release_sec** callback function requesting that the Satellite Equipment Control (SEC) driver to
release and free any memory allocated by the driver.

**init** callback function used to initialize the tuner device.

**sleep** callback function used to put the tuner to sleep.

**write** callback function used by some demod legacy drivers to allow other drivers to write data into their registers. Should not be used on new drivers.

**tune** callback function used by demod drivers that use **DVBFE_ALGO_HW** to tune into a frequency.

**get_frontend_algo** returns the desired hardware algorithm.

**set_frontend** callback function used to inform the demod to set the parameters for demodulating a digital TV channel. The properties to be used are stored at **struct dvb_frontend.dtv_property_cache**. The demod can change the parameters to reflect the changes needed for the channel to be decoded, and update statistics.

**get_tune_settings** callback function

**get_frontend** callback function used to inform the parameters actually in use. The properties to be used are stored at **struct dvb_frontend.dtv_property_cache** and update statistics. Please notice that it should not return an error code if the statistics are not available because the demog is not locked.

**read_status** returns the locking status of the frontend.

**read_ber** legacy callback function to return the bit error rate. Newer drivers should provide such info via DVBv5 API, e. g. **set_frontend;/get_frontend**, implementing this callback only if DVBv3 API compatibility is wanted.

**read_signal_strength** legacy callback function to return the signal strength. Newer drivers should provide such info via DVBv5 API, e. g. **set_frontend;/get_frontend**, implementing this callback only if DVBv3 API compatibility is wanted.

**read_snr** legacy callback function to return the Signal/Noise rate. Newer drivers should provide such info via DVBv5 API, e. g. **set_frontend;/get_frontend**, implementing this callback only if DVBv3 API compatibility is wanted.

**read_ucblocks** legacy callback function to return the Uncorrected Error Blocks. Newer drivers should provide such info via DVBv5 API, e. g. **set_frontend;/get_frontend**, implementing this callback only if DVBv3 API compatibility is wanted.

**diseqc_reset_overload** callback function to implement the **FE_DISEQC_RESET_OVERLOAD() ioctl** (only Satellite)

**diseqc_send_master_cmd** callback function to implement the **FE_DISEQC_SEND_MASTER_CMD() ioctl** (only Satellite).

**diseqc_recv_slave_reply** callback function to implement the **FE_DISEQC_RECV_SLAVE_REPLY() ioctl** (only Satellite)

**diseqc_send_burst** callback function to implement the **FE_DISEQC_SEND_BURST() ioctl** (only Satellite).

**set_tone** callback function to implement the **FE_SET_TONE() ioctl** (only Satellite).

**set_voltage** callback function to implement the **FE_SET_VOLTAGE() ioctl** (only Satellite).
enable_high_lnb_voltage callback function to implement the FE_ENABLE_HIGH_LNB_VOLTAGE() ioctl (only Satellite).

dishnetwork_send_legacy_command callback function to implement the FE_DISHNETWORK_SEND_LEGACY_CMD() ioctl (only Satellite). Drivers should not use this, except when the DVB core emulation fails to provide proper support (e.g. if set_voltage takes more than 8ms to work), and when backward compatibility with this legacy API is required.

i2c_gate_ctrl controls the I2C gate. Newer drivers should use I2C mux support instead.

ts_bus_ctrl callback function used to take control of the TS bus.

set_lna callback function to power on/off/auto the LNA.

search callback function used on some custom algo search algos.

tuner_ops pointer to struct dvb_tuner_ops

analog_ops pointer to struct analog_demod_ops

struct dtv_frontend_properties contains a list of properties that are specific to a digital TV standard.

Definition

```
struct dtv_frontend_properties {

atscmh_rs_code_mode_sec  RS code mode sec (only ATSC-M/H)
atscmh_sccc_block_mode  Series Concatenated Convolutional Code (SCCC) Block Mode (only ATSC-M/H)
atscmh_sccc_code_mode_a  SCCC code mode A (only ATSC-M/H)
atscmh_sccc_code_mode_b  SCCC code mode B (only ATSC-M/H)
atscmh_sccc_code_mode_c  SCCC code mode C (only ATSC-M/H)
atscmh_sccc_code_mode_d  SCCC code mode D (only ATSC-M/H)
lna  Power ON/OFF/AUTO the Linear Now-noise Amplifier (LNA)
strength  DVBv5 API statistics: Signal Strength
cnr  DVBv5 API statistics: Signal to Noise ratio of the (main) carrier
pre_bit_error  DVBv5 API statistics: pre-Viterbi bit error count
pre_bit_count  DVBv5 API statistics: pre-Viterbi bit count
post_bit_error DVBv5 API statistics: post-Viterbi bit error count
post_bit_count DVBv5 API statistics: post-Viterbi bit count
block_error DVBv5 API statistics: block error count
block_count DVBv5 API statistics: block count

NOTE

 derived statistics like Uncorrected Error blocks (UCE) are calculated on userspace.

Description

Only a subset of the properties are needed for a given delivery system. For more info, consult
the media_api.html with the documentation of the Userspace API.

```c
struct dvb_frontend
{
    struct kref refcount;
    struct dvb_frontend_ops ops;
    struct dvb_adapter *dvb;
    void *demodulator_priv;
    void *tuner_priv;
    void *frontend_priv;
    void *sec_priv;
    void *analog_demod_priv;
    struct dtv_frontend_properties dtv_property_cache;

    #define DVB_FRONTEND_COMPONENT_TUNER 0;
    #define DVB_FRONTEND_COMPONENT_DEMOD 1;
    int (*callback)(void *adapter_priv, int component, int cmd, int arg);
    int id;
    unsigned int exit;
};
```

Members

refcount refcount to keep track of `struct dvb_frontend` references
ops embedded `struct dvb_frontend_ops`
dvb pointer to `struct dvb_adapter`
demodulator_priv demod private data
tuner_priv tuner private data
frontend_priv frontend private data
sec_priv SEC private data
analog_demod_priv Analog demod private data
dtv_property_cache embedded `struct dtv_frontend_properties`
callback callback function used on some drivers to call either the tuner or the demodulator.
id Frontend ID

2.3. Digital TV (DVB) devices
exit  Used to inform the DVB core that the frontend thread should exit (usually, means that the hardware got disconnected.

```c
int dvb_register_frontend(struct dvb_adapter *dvb, struct dvb_frontend *fe)
    Registers a DVB frontend at the adapter
```

**Parameters**
- *dvb* pointer to `struct dvb_adapter`
- *fe* pointer to `struct dvb_frontend`

**Description**
Allocate and initialize the private data needed by the frontend core to manage the frontend and calls `dvb_register_device()` to register a new frontend. It also cleans the property cache that stores the frontend parameters and selects the first available delivery system.

```c
int dvb_unregister_frontend(struct dvb_frontend *fe)
    Unregisters a DVB frontend
```

**Parameters**
- *fe* pointer to `struct dvb_frontend`

**Description**
Stops the frontend kthread, calls `dvb_unregister_device()` and frees the private frontend data allocated by `dvb_register_frontend()`.

**NOTE**
This function doesn’t frees the memory allocated by the demod, by the SEC driver and by the tuner. In order to free it, an explicit call to `dvb_frontend_detach()` is needed, after calling this function.

```c
void dvb_frontend_detach(struct dvb_frontend *fe)
    Detaches and frees frontend specific data
```

**Parameters**
- *fe* pointer to `struct dvb_frontend`

**Description**
This function should be called after `dvb_unregister_frontend()`. It calls the SEC, tuner and demod release functions: `dvb_frontend_ops.release_sec`, `dvb_frontend_ops.tuner_ops.release`, `dvb_frontend_ops.analog_ops.release` and `dvb_frontend_ops.release`. If the driver is compiled with `CONFIG_MEDIA_ATTACH`, it also decreases the module reference count, needed to allow userspace to remove the previously used DVB frontend modules.

```c
int dvb_frontend_suspend(struct dvb_frontend *fe)
    Suspends a Digital TV frontend
```

**Parameters**
- *fe* pointer to `struct dvb_frontend`

**Description**
This function prepares a Digital TV frontend to suspend.
In order to prepare the tuner to suspend, if `dvb_frontend_ops.tuner_ops.suspend()` is available, it calls it. Otherwise, it will call `dvb_frontend_ops.tuner_ops.sleep()`, if available.

It will also call `dvb_frontend_ops.sleep()` to put the demod to suspend.

The drivers should also call `dvb_frontend_suspend()` as part of their handler for the `device_driver.suspend()`.

```c
int dvb_frontend_resume(struct dvb_frontend *fe)
    Resumes a Digital TV frontend
```

**Parameters**

- `struct dvb_frontend *fe` pointer to `struct dvb_frontend`

**Description**

This function resumes the usual operation of the tuner after resume.

In order to resume the frontend, it calls the demod `dvb_frontend_ops.init()`.

If `dvb_frontend_ops.tuner_ops.resume()` is available, it calls it. Otherwise, it will call `dvb_frontend_ops.tuner_ops.init()`, if available.

Once tuner and demods are resumed, it will enforce that the SEC voltage and tone are restored to their previous values and wake up the frontend’s kthread in order to retune the frontend.

The drivers should also call `dvb_frontend_resume()` as part of their handler for the `device_driver.resume()`.

```c
void dvb_frontend_reinitialise(struct dvb_frontend *fe)
    forces a reinitialisation at the frontend
```

**Parameters**

- `struct dvb_frontend *fe` pointer to `struct dvb_frontend`

**Description**

Calls `dvb_frontend_ops.init()` and `dvb_frontend_ops.tuner_ops.init()`, and resets SEC tone and voltage (for Satellite systems).

**NOTE**

Currently, this function is used only by one driver (budget-av). It seems to be due to address some special issue with that specific frontend.

```c
void dvb_frontend_sleep_until(ktime_t *waketime, u32 add_usec)
    Sleep for the amount of time given by add_usec parameter
```

**Parameters**

- `ktime_t *waketime` pointer to `struct ktime_t`
- `u32 add_usec` time to sleep, in microseconds

**Description**

This function is used to measure the time required for the `FE_DISHNETWORK_SEND_LEGACY_CMD()` ioctl to work. It needs to be as precise as possible, as it affects the detection of the dish tone command at the satellite subsystem.

2.3. Digital TV (DVB) devices
Its used internally by the DVB frontend core, in order to emulate FE_DISHNETWORK_SEND_LEGACY_CMD() using the `dvb_frontend_ops.set_voltage()` callback.

**NOTE**

It should not be used at the drivers, as the emulation for the legacy callback is provided by the Kernel. The only situation where this should be at the drivers is when there are some bugs at the hardware that would prevent the core emulation to work. On such cases, the driver would be writing a `dvb_frontend_ops.dishnetwork_send_legacy_command()` and calling this function directly.

### 2.3.3 Digital TV Demux kABI

#### 2.3.3.1 Digital TV Demux

The Kernel Digital TV Demux kABI defines a driver-internal interface for registering low-level, hardware specific driver to a hardware independent demux layer. It is only of interest for Digital TV device driver writers. The header file for this kABI is named `demux.h` and located in `include/media`.

The demux kABI should be implemented for each demux in the system. It is used to select the TS source of a demux and to manage the demux resources. When the demux client allocates a resource via the demux kABI, it receives a pointer to the kABI of that resource.

Each demux receives its TS input from a DVB front-end or from memory, as set via this demux kABI. In a system with more than one front-end, the kABI can be used to select one of the DVB front-ends as a TS source for a demux, unless this is fixed in the HW platform.

The demux kABI only controls front-ends regarding to their connections with demuxes; the kABI used to set the other front-end parameters, such as tuning, are defined via the Digital TV Frontend kABI.

The functions that implement the abstract interface demux should be defined static or module private and registered to the Demux core for external access. It is not necessary to implement every function in the struct `dmx_demux`. For example, a demux interface might support Section filtering, but not PES filtering. The kABI client is expected to check the value of any function pointer before calling the function: the value of NULL means that the function is not available.

Whenever the functions of the demux API modify shared data, the possibilities of lost update and race condition problems should be addressed, e.g. by protecting parts of code with mutexes.

Note that functions called from a bottom half context must not sleep. Even a simple memory allocation without using GFP_ATOMIC can result in a kernel thread being put to sleep if swapping is needed. For example, the Linux Kernel calls the functions of a network device interface from a bottom half context. Thus, if a demux kABI function is called from network device code, the function must not sleep.
2.3.3.2 Demux Callback API

This kernel-space API comprises the callback functions that deliver filtered data to the demux client. Unlike the other DVB kABIs, these functions are provided by the client and called from the demux code.

The function pointers of this abstract interface are not packed into a structure as in the other demux APIs, because the callback functions are registered and used independent of each other. As an example, it is possible for the API client to provide several callback functions for receiving TS packets and no callbacks for PES packets or sections.

The functions that implement the callback API need not be re-entrant: when a demux driver calls one of these functions, the driver is not allowed to call the function again before the original call returns. If a callback is triggered by a hardware interrupt, it is recommended to use the Linux bottom half mechanism or start a tasklet instead of making the callback function call directly from a hardware interrupt.

This mechanism is implemented by `dmx_ts_cb()` and `dmx_section_cb()` callbacks.

2.3.3.3 Digital TV Demux device registration functions and data structures

```c
enum dmxdev_type
    type of demux filter type.

Constants

DMXDEV_TYPE_NONE  no filter set.
DMXDEV_TYPE_SEC  section filter.
DMXDEV_TYPE_PES  Program Elementary Stream (PES) filter.

enum dmxdev_state
    state machine for the dmxdev.

Constants

DMXDEV_STATE_FREE  indicates that the filter is freed.
DMXDEV_STATE_ALLOCATED  indicates that the filter was allocated to be used.
DMXDEV_STATE_SET  indicates that the filter parameters are set.
DMXDEV_STATE_GO  indicates that the filter is running.
DMXDEV_STATE_DONE  indicates that a packet was already filtered and the filter is now disabled.
    Set only if DMX_ONESHOT. See dmx_sct_filter_params.
DMXDEV_STATE_TIMEDOUT  Indicates a timeout condition.

struct dmxdev_feed
    digital TV dmxdev feed

Definition

struct dmxdev_feed {
    u16 pid;
    struct dmx_ts_feed *ts;
    struct list_head next;
};
```

    struct dvb\_ringbuffer dvr\_buffer;
    #define DVR\_BUFFER\_SIZE (10*188*1024);
    struct dvb\_vb2\_ctx dvr\_vb2\_ctx;
    struct mutex mutex;
    spinlock_t lock;
};
\end{verbatim}

\textbf{Members}

\textbf{dvbdev} pointer to \textit{struct dvb\_device} associated with the demux device node.

\textbf{dvr\_dvbdev} pointer to \textit{struct dvb\_device} associated with the dvr device node.

\textbf{filter} pointer to \textit{struct dmxdev\_filter}.

\textbf{demux} pointer to \textit{struct dmx\_demux}.

\textbf{filternum} number of filters.

\textbf{capabilities} demux capabilities as defined by \textit{enum dmx\_demux\_caps}.

\textbf{may\_do\_mmap} flag used to indicate if the device may do mmap.

\textbf{exit} flag to indicate that the demux is being released.

\textbf{dvr\_orig\_fe} pointer to \textit{struct dmx\_frontend}.

\textbf{dvr\_buffer} embedded \textit{struct dvb\_ringbuffer} for DVB output.

\textbf{dvr\_vb2\_ctx} control struct for VB2 handler

\textbf{mutex} protects the usage of this structure.

\section*{2.3. Digital TV (DVB) devices} 469
lock protects access to \texttt{dmxdev->filter->data}.

\textbf{Parameters}

\texttt{struct dmxdev *dmxdev} pointer to \texttt{struct dmxdev}.

\texttt{struct dvb_adapter *adap} pointer to \texttt{struct dvb_adapter}.

\textbf{void} \texttt{dvb_dmxdev_release(struct dmxdev *dmxdev)}

releases a digital TV demux and unregisters it.

\textbf{Parameters}

\texttt{struct dmxdev *dmxdev} pointer to \texttt{struct dmxdev}.

### 2.3.3.4 High-level Digital TV demux interface

\textbf{enum} \texttt{dvb_dmx_filter_type}

\begin{itemize}
  \item type of demux feed.
\end{itemize}

\textbf{Constants}

\texttt{DMX_TYPE_TS} feed is in TS mode.

\texttt{DMX_TYPE_SEC} feed is in Section mode.

\textbf{enum} \texttt{dvb_dmx_state}

\begin{itemize}
  \item state machine for a demux filter.
\end{itemize}

\textbf{Constants}

\texttt{DMX_STATE_FREE} indicates that the filter is freed.

\texttt{DMX_STATE_ALLOCATED} indicates that the filter was allocated to be used.

\texttt{DMX_STATE_READY} indicates that the filter is ready to be used.

\texttt{DMX_STATE_GO} indicates that the filter is running.

\textbf{struct} \texttt{dvb_demux_filter}

\begin{itemize}
  \item Describes a DVB demux section filter.
\end{itemize}

\textbf{Definition}

\begin{verbatim}
struct dvb_demux_filter {
    struct dmx_section_filter filter;
    u8 maskandmode[DMX_MAX_FILTER_SIZE];
    u8 maskandnotmode[DMX_MAX_FILTER_SIZE];
    bool doneq;
    struct dvb_demux_filter *next;
    struct dvb_demux_feed *feed;
    int index;
    enum dvb_dmx_state state;
    enum dvb_dmx_filter_type type;
};
\end{verbatim}

\textbf{Members}

\texttt{filter} Section filter as defined by \texttt{struct dmx_section_filter}.
maskandmode  logical and bit mask.

maskandnotmode  logical and not bit mask.

donq  flag that indicates when a filter is ready.

next  pointer to the next section filter.

feed struct dvb_demux_feed pointer.

index  index of the used demux filter.

state  state of the filter as described by enum dvb_dmx_state.

type  type of the filter as described by enum dvb_dmx_filter_type.

struct dvb_demux_feed
    describes a DVB field

Definition

struct dvb_demux_feed {
    union {
        struct dmx_ts_feed ts;
        struct dmx_section_feed sec;
    } feed;

};

Members

feed  a union describing a digital TV feed. Depending on the feed type, it can be either feed.ts or feed.sec.

feed.ts  a struct dmx_ts_feed pointer. For TS feed only.

feed.sec  a struct dmx_section_feed pointer. For section feed only.

cb  a union describing digital TV callbacks. Depending on the feed type, it can be either cb.ts or cb.sec.

cb.ts  a dmx_ts_cb() callback function pointer. For TS feed only.

cb.sec  a dmx_section_cb() callback function pointer. For section feed only.

2.3. Digital TV (DVB) devices
demux pointer to *struct dvb_demux*.

priv private data that can optionally be used by a DVB driver.

type type of the filter, as defined by *enum dvb_dmx_filter_type*.

state state of the filter as defined by *enum dvb_dmx_state*.

pid PID to be filtered.

timeout feed timeout.

filter pointer to *struct dvb_demux_filter*.

buffer_flags Buffer flags used to report discontinuity users via DVB memory mapped API, as defined by *enum dmx_buffer_flags*.

ts_type type of TS, as defined by *enum ts_filter_type*.

pes_type type of PES, as defined by *enum dmx_ts_pes*.

cc MPEG-TS packet continuity counter

pusi_seen if true, indicates that a discontinuity was detected. it is used to prevent feeding of garbage from previous section.

peslen length of the PES (Packet Elementary Stream).

list_head head for the list of digital TV demux feeds.

index a unique index for each feed. Can be used as hardware pid filter index.

struct dvb_demux represents a digital TV demux

Parameters

- `struct dvb_demux *demux`: `struct dvb_demux` to be initialized.

Description

2.3. Digital TV (DVB) devices
Before being able to register a digital TV demux struct, drivers should call this routine. On its typical usage, some fields should be initialized at the driver before calling it.

A typical usecase is:

```c
dvb->demux.dmx.capabilities =
    DMX_TS_FILTERING | DMX_SECTION_FILTERING |
    DMX_MEMORY_BASED_FILTERING;
dvb->demux.priv = dvb;
dvb->demux.filternum = 256;
dvb->demux.feednum = 256;
dvb->demux.start_feed = driver_start_feed;
dvb->demux.stop_feed = driver_stop_feed;
ret = dvb_dmx_init(&dvb->demux);
if (ret < 0)
    return ret;
```

```c
void dvb_dmx_release(struct dvb_demux *demux)
    releases a digital TV demux internal buffers.

Parameters
struct dvb_demux *demux struct dvb_demux to be released.

Description
The DVB core internally allocates data at demux. This routine releases those data. Please notice that the struct itself is not released, as it can be embedded on other structs.

void dvb_dmx_swfilter_packets(struct dvb_demux *demux, const u8 *buf, size_t count)
    use dvb software filter for a buffer with multiple MPEG-TS packets with 188 bytes each.

Parameters
struct dvb_demux *demux pointer to struct dvb_demux
const u8 *buf buffer with data to be filtered
size_t count number of MPEG-TS packets with size of 188.

Description
The routine will discard a DVB packet that don’t start with 0x47.
Use this routine if the DVB demux fills MPEG-TS buffers that are already aligned.

NOTE
The buf size should have size equal to count * 188.

void dvb_dmx_swfilter(struct dvb_demux *demux, const u8 *buf, size_t count)
    use dvb software filter for a buffer with multiple MPEG-TS packets with 188 bytes each.

Parameters
struct dvb_demux *demux pointer to struct dvb_demux
const u8 *buf buffer with data to be filtered
size_t count number of MPEG-TS packets with size of 188.

Description
If a DVB packet doesn’t start with 0x47, it will seek for the first byte that starts with 0x47.
Use this routine if the DVB demux fill buffers that may not start with a packet start mark (0x47).

NOTE
The **buf** size should have size equal to count * 188.

void **dvb_dmx_swfilter_204**(struct **dvb_demux** *demux, const u8 *buf, size_t **count**)

use vb software filter for a buffer with multiple MPEG-TS packets with 204 bytes each.

**Parameters**

struct dvb_demux *demux  pointer to struct dvb_demux
const u8 *buf  buffer with data to be filtered
size_t count  number of MPEG-TS packets with size of 204.

**Description**

If a DVB packet doesn’t start with 0x47, it will seek for the first byte that starts with 0x47.
Use this routine if the DVB demux fill buffers that may not start with a packet start mark (0x47).

NOTE
The **buf** size should have size equal to count * 204.

void **dvb_dmx_swfilter_raw**(struct **dvb_demux** *demux, const u8 *buf, size_t **count**)

make the raw data available to userspace without filtering

**Parameters**

struct dvb_demux *demux  pointer to struct dvb_demux
const u8 *buf  buffer with data
size_t count  number of packets to be passed. The actual size of each packet depends on the

**Description**

Use it if the driver needs to deliver the raw payload to userspace without passing through the
kernel demux. That is meant to support some delivery systems that aren’t based on MPEG-TS.
This function relies on **dvb_demux->feed->cb.ts** logic.

2.3.3.5 Driver-internal low-level hardware specific driver demux interface

enum ts_filter_type

filter type bitmap for dmx_ts_feed.set()

**Constants**

**TS_PACKET**  Send TS packets (188 bytes) to callback (default).

**TS_PAYLOAD_ONLY**  In case **TS PACKET** is set, only send the TS payload (<=184 bytes per
packet) to callback

**TS_DECODER**  Send stream to built-in decoder (if present).

**TS_DEMUX**  In case **TS_PACKET** is set, send the TS to the demux device, not to the dvr device

struct dmx_ts_feed

Structure that contains a TS feed filter

2.3. Digital TV (DVB) devices
Definition

```c
struct dmx_ts_feed {
    int is_filtering;
    struct dmx_demux *parent;
    void *priv;
    int (*set)(struct dmx_ts_feed *feed, u16 pid, int type, enum dmx_ts_pes pes_type, ktime_t timeout);
    int (*start_filtering)(struct dmx_ts_feed *feed);
    int (*stop_filtering)(struct dmx_ts_feed *feed);
};
```

Members

- **is_filtering**: Set to non-zero when filtering in progress
- **parent**: Pointer to `struct dmx_demux`
- **priv**: Pointer to private data of the API client
- **set**: Sets the TS filter
- **start_filtering**: Starts TS filtering
- **stop_filtering**: Stops TS filtering

Description

A TS feed is typically mapped to a hardware PID filter on the demux chip. Using this API, the client can set the filtering properties to start/stop filtering TS packets on a particular TS feed.

```c
struct dmx_section_filter {
    u8 filter_value[DMX_MAX_FILTER_SIZE];
    u8 filter_mask[DMX_MAX_FILTER_SIZE];
    u8 filter_mode[DMX_MAX_FILTER_SIZE];
    struct dmx_section_feed *parent;
    void *priv;
};
```

Members

- **filter_value**: Contains up to 16 bytes (128 bits) of the TS section header that will be matched by the section filter
- **filter_mask**: Contains a 16 bytes (128 bits) filter mask with the bits specified by `filter_value` that will be used on the filter match logic.
- **filter_mode**: Contains a 16 bytes (128 bits) filter mode.
- **parent**: Back-pointer to `struct dmx_section_feed`
- **priv**: Pointer to private data of the API client.

Description
The `filter_mask` controls which bits of `filter_value` are compared with the section headers/payload. On a binary value of 1 in `filter_mask`, the corresponding bits are compared. The filter only accepts sections that are equal to `filter_value` in all the tested bit positions.

```c
struct dmx_section_feed
    Structure that contains a section feed filter

Definition

struct dmx_section_feed {
    int is_filtering;
    struct dmx_demux *parent;
    void *priv;
    int check_crc;
    int (*set)(struct dmx_section_feed *feed, u16 pid, int check_crc);
    int (*allocate_filter)(struct dmx_section_feed *feed, struct dmx_section_filter *, **filter);
    int (*release_filter)(struct dmx_section_feed *feed, struct dmx_section_filter *, *filter);
    int (*start_filtering)(struct dmx_section_feed *feed);
    int (*stop_filtering)(struct dmx_section_feed *feed);
};
```

**Members**

- **is_filtering**: Set to non-zero when filtering in progress
- **parent**: pointer to `struct dmx_demux`
- **priv**: pointer to private data of the API client
- **check_crc**: If non-zero, check the CRC values of filtered sections.
- **set**: sets the section filter
- **allocate_filter**: This function is used to allocate a section filter on the demux. It should only be called when no filtering is in progress on this section feed. If a filter cannot be allocated, the function fails with -ENOSPC.
- **release_filter**: This function releases all the resources of a previously allocated section filter. The function should not be called while filtering is in progress on this section feed. After calling this function, the caller should not try to dereference the filter pointer.
- **start_filtering**: starts section filtering
- **stop_filtering**: stops section filtering

**Description**

A TS feed is typically mapped to a hardware PID filter on the demux chip. Using this API, the client can set the filtering properties to start/stop filtering TS packets on a particular TS feed.

**dmx_ts_cb**

**Typedef**: DVB demux TS filter callback function prototype

**Syntax**

```c
int dmx_ts_cb (const u8 *buffer1, size_t buffer1_length, const u8 *buffer2, size_t buffer2_length, struct dmx_ts_feed *source, u32 *buffer_flags)
```
Parameters

const u8 *buffer1 Pointer to the start of the filtered TS packets.

size_t buffer1_length Length of the TS data in buffer1.

const u8 *buffer2 Pointer to the tail of the filtered TS packets, or NULL.

size_t buffer2_length Length of the TS data in buffer2.

struct dmx_ts_feed *source Indicates which TS feed is the source of the callback.

u32 *buffer_flags Address where buffer flags are stored. Those are used to report discontinuity users via DVB memory mapped API, as defined by enum dmx_buffer_flags.

Description

This function callback prototype, provided by the client of the demux API, is called from the demux code. The function is only called when filtering on a TS feed has been enabled using the start_filtering() function at the dmx_demux. Any TS packets that match the filter settings are copied to a circular buffer. The filtered TS packets are delivered to the client using this callback function. It is expected that the buffer1 and buffer2 callback parameters point to addresses within the circular buffer, but other implementations are also possible. Note that the called party should not try to free the memory the buffer1 and buffer2 parameters point to.

When this function is called, the buffer1 parameter typically points to the start of the first undelivered TS packet within a circular buffer. The buffer2 buffer parameter is normally NULL, except when the received TS packets have crossed the last address of the circular buffer and “wrapped” to the beginning of the buffer. In the latter case the buffer1 parameter would contain an address within the circular buffer, while the buffer2 parameter would contain the first address of the circular buffer. The number of bytes delivered with this function (i.e. buffer1_length + buffer2_length) is usually equal to the value of callback_length parameter given in the set() function, with one exception: if a timeout occurs before receiving callback_length bytes of TS data, any undelivered packets are immediately delivered to the client by calling this function. The timeout duration is controlled by the set() function in the TS Feed API.

If a TS packet is received with errors that could not be fixed by the TS-level forward error correction (FEC), the Transport_error_indicator flag of the TS packet header should be set. The TS packet should not be discarded, as the error can possibly be corrected by a higher layer protocol. If the called party is slow in processing the callback, it is possible that the circular buffer eventually fills up. If this happens, the demux driver should discard any TS packets received while the buffer is full and return -EOVERFLOW.

The type of data returned to the callback can be selected by the dmx_ts_feed.*set** function. The type parameter decides if the raw TS packet (TS_PACKET) or just the payload (TS_PACKET|TS_PAYLOAD_ONLY) should be returned. If additionally the TS_DECODER bit is set the stream will also be sent to the hardware MPEG decoder.

- 0, on success;
- -EOVERFLOW, on buffer overflow.

Return

dmx_section_cb

**Typedef**: DVB demux TS filter callback function prototype

Syntax
int dmx_section_cb (const u8 *buffer1, size_t buffer1_len, const u8 *buffer2, size_t buffer2_len, struct dmx_section_filter *source, u32 *buffer_flags)

Parameters

const u8 *buffer1  Pointer to the start of the filtered section, e.g. within the circular buffer of the demux driver.

size_t buffer1_len  Length of the filtered section data in buffer1, including headers and CRC.

const u8 *buffer2  Pointer to the tail of the filtered section data, or NULL. Useful to handle the wrapping of a circular buffer.

size_t buffer2_len  Length of the filtered section data in buffer2, including headers and CRC.

struct dmx_section_filter *source  Indicates which section feed is the source of the callback.

u32 *buffer_flags  Address where buffer flags are stored. Those are used to report discontinuity users via DVB memory mapped API, as defined by enum dmx_buffer_flags.

Description

This function callback prototype, provided by the client of the demux API, is called from the demux code. The function is only called when filtering of sections has been enabled using the function dmx_ts_feed.**start_filtering**. When the demux driver has received a complete section that matches at least one section filter, the client is notified via this callback function. Normally this function is called for each received section; however, it is also possible to deliver multiple sections with one callback, for example when the system load is high. If an error occurs while receiving a section, this function should be called with the corresponding error type set in the success field, whether or not there is data to deliver. The Section Feed implementation should maintain a circular buffer for received sections. However, this is not necessary if the Section Feed API is implemented as a client of the TS Feed API, because the TS Feed implementation then buffers the received data. The size of the circular buffer can be configured using the dmx_ts_feed.**set** function in the Section Feed API. If there is no room in the circular buffer when a new section is received, the section must be discarded. If this happens, the value of the success parameter should be DMX_OVERRUN_ERROR on the next callback.

enum dmx_frontend_source
    Used to identify the type of frontend

Constants

DMX_MEMORY_FE  The source of the demux is memory. It means that the MPEG-TS to be filtered comes from userspace, via write() syscall.

DMX_FRONTEND_0  The source of the demux is a frontend connected to the demux.

struct dmx_frontend
    Structure that lists the frontends associated with a demux

Definition

```c
struct dmx_frontend {
    struct list_head connectivity_list;
};
```
enum dmx_frontend_source source;
};

Members

connectivity_list List of front-ends that can be connected to a particular demux;
source Type of the frontend.

Description

FIXME: this structure should likely be replaced soon by some media-controller based logic.

enum dmx_demux_caps
    MPEG-2 TS Demux capabilities bitmap

Constants

DMX_TS_FILTERING set if TS filtering is supported;
DMX_SECTION_FILTERING set if section filtering is supported;
DMX_MEMORY_BASED_FILTERING set if write() available.

Description

Those flags are OR'ed in the dmx_demux.capabilities field

DMX_FE_ENTRY(list)
    Casts elements in the list of registered front-ends from the generic type struct list_head to the type *struct dmx_frontend

Parameters

list list of struct dmx_frontend
struct dmx_demux
    Structure that contains the demux capabilities and callbacks.

Definition

struct dmx_demux {
    enum dmx_demux_caps capabilities;
    struct dmx_frontend *frontend;
    void *priv;
    int (*open)(struct dmx_demux *demux);
    int (*close)(struct dmx_demux *demux);
    int (*write)(struct dmx_demux *demux, const char __user *buf, size_t count);
    int (*allocate_ts_feed)(struct dmx_demux *demux,struct dmx_ts_feed **feed, dmx_ts_cb callback);
    int (*release_ts_feed)(struct dmx_demux *demux, struct dmx_ts_feed *feed);
    int (*allocate_section_feed)(struct dmx_demux *demux,struct dmx_section_feed **feed, dmx_section_cb callback);

Members

capabilities Bitfield of capability flags.

frontend Front-end connected to the demux

priv Pointer to private data of the API client

open This function reserves the demux for use by the caller and, if necessary, initializes the demux. When the demux is no longer needed, the function close should be called. It should be possible for multiple clients to access the demux at the same time. Thus, the function implementation should increment the demux usage count when open is called and decrement it when close is called. The demux function parameter contains a pointer to the demux API and instance data. It returns: 0 on success; -EUSERS, if maximum usage count was reached; -EINVAL, on bad parameter.

close This function reserves the demux for use by the caller and, if necessary, initializes the demux. When the demux is no longer needed, the function close should be called. It should be possible for multiple clients to access the demux at the same time. Thus, the function implementation should increment the demux usage count when open is called and decrement it when close is called. The demux function parameter contains a pointer to the demux API and instance data. It returns: 0 on success; -ENODEV, if demux was not in use (e.g. no users); -EINVAL, on bad parameter.

write This function provides the demux driver with a memory buffer containing TS packets. Instead of receiving TS packets from the DVB front-end, the demux driver software will read packets from memory. Any clients of this demux with active TS, PES or Section filters will receive filtered data via the Demux callback API (see 0). The function returns when all the data in the buffer has been consumed by the demux. Demux hardware typically cannot read TS from memory. If this is the case, memory-based filtering has to be implemented entirely in software. The demux function parameter contains a pointer to the demux API and instance data. The buf function parameter contains a pointer to the TS data in kernel-space memory. The count function parameter contains the length of the TS data. It returns: 0 on success; -ERESTARTSYS, if mutex lock was interrupted; -EINTR, if a signal handling is pending; -ENODEV, if demux was removed; -EINVAL, on bad parameter.

allocate_ts_feed Allocates a new TS feed, which is used to filter the TS packets carrying a certain PID. The TS feed normally corresponds to a hardware PID filter on the demux chip. The demux function parameter contains a pointer to the demux API and instance data. The feed function parameter contains a pointer to the TS feed API and instance data. The callback function parameter contains a pointer to the callback function for passing received TS packet. It returns: 0 on success; -ERESTARTSYS, if mutex lock was interrupted; -EBUSY, if no more TS feeds is available; -EINVAL, on bad parameter.

release_ts_feed Releases the resources allocated with allocate_ts_feed. Any filtering in progress on the TS feed should be stopped before calling this function. The demux function parameter contains a pointer to the demux API and instance data. The feed function parameter contains a pointer to the TS feed API and instance data. It returns: 0 on success; -EINVAL on bad parameter.

allocate_section_feed Allocates a new section feed, i.e. a demux resource for filtering and receiving sections. On platforms with hardware support for section filtering, a section feed
is directly mapped to the demux HW. On other platforms, TS packets are first PID filtered in hardware and a hardware section filter then emulated in software. The caller obtains an API pointer of type dmx_section_feed_t as an out parameter. Using this API the caller can set filtering parameters and start receiving sections. The demux function parameter contains a pointer to the demux API and instance data. The feed function parameter contains a pointer to the TS feed API and instance data. The callback function parameter contains a pointer to the callback function for passing received TS packet. It returns: 0 on success; -EBUSY, if no more TS feeds is available; -EINVAL, on bad parameter.

release_section_feed Releasestheresourcesallocatedwithallocate_section_feed, including allocated filters. Any filtering in progress on the section feed should be stopped before calling this function. The demux function parameter contains a pointer to the demux API and instance data. The feed function parameter contains a pointer to the TS feed API and instance data. It returns: 0 on success; -EINVAL, on bad parameter.

add_frontend Registers a connectivity between a demux and a front-end, i.e., indicates that the demux can be connected via a call to connect_frontend to use the given front-end as a TS source. The client of this function has to allocate dynamic or static memory for the frontend structure and initialize its fields before calling this function. This function is normally called during the driver initialization. The caller must not free the memory of the frontend struct before successfully calling remove_frontend. The demux function parameter contains a pointer to the demux API and instance data. The frontend function parameter contains a pointer to the front-end instance data. It returns: 0 on success; -EINVAL, on bad parameter.

remove_frontend Indicates that the given front-end, registered by a call to add_frontend, can no longer be connected as a TS source by this demux. The function should be called when a front-end driver or a demux driver is removed from the system. If the front-end is in use, the function fails with the return value of -EBUSY. After successfully calling this function, the caller can free the memory of the frontend struct if it was dynamically allocated before the add_frontend operation. The demux function parameter contains a pointer to the demux API and instance data. The frontend function parameter contains a pointer to the front-end instance data. It returns: 0 on success; -ENODEV, if the front-end was not found, -EINVAL, on bad parameter.

get_frontends Provides the APIs of the front-ends that have been registered for this demux. Any of the front-ends obtained with this call can be used as a parameter for connect_frontend. The include file demux.h contains the macro DMX_FE_ENTRY() for converting an element of the generic type struct list_head * to the type struct dmx_frontend. The caller must not free the memory of any of the elements obtained via this function call. The **demux* function parameter contains a pointer to the demux API and instance data. It returns a struct list_head pointer to the list of front-end interfaces, or NULL in the case of an empty list.

connect_frontend Connects the TS output of the front-end to the input of the demux. A demux can only be connected to a front-end registered to the demux with the function add_frontend. It may or may not be possible to connect multiple demuxes to the same front-end, depending on the capabilities of the HW platform. When not used, the front-end should be released by calling disconnect_frontend. The demux function parameter contains a pointer to the demux API and instance data. The frontend function parameter contains a pointer to the front-end instance data. It returns: 0 on success; -EINVAL, on bad parameter.

disconnect_frontend Disconnects the demux and a front-end previously connected by a con-
**nect_frontend** call. The **demux** function parameter contains a pointer to the demux API and instance data. It returns: 0 on success; -EINVAL on bad parameter.

**get_pes_pids** Get the PIDs for DMX_PES_AUDIO0, DMX_PES_VIDEO0, DMX_PES_TELETEXT0, DMX_PES_SUBTITLE0 and DMX_PES_PCR0. The **demux** function parameter contains a pointer to the demux API and instance data. The **pids** function parameter contains an array with five u16 elements where the PIDs will be stored. It returns: 0 on success; -EINVAL on bad parameter.

### 2.3.4 Digital TV Conditional Access kABI

**struct dvb_ca_en50221**

Structure describing a CA interface

**Definition**

```c
struct dvb_ca_en50221 {
    struct module *owner;
    int (*read_attribute_mem)(struct dvb_ca_en50221 *ca, int slot, int address);
    int (*write_attribute_mem)(struct dvb_ca_en50221 *ca, int slot, int address, u8, ...value);
    int (*read_cam_control)(struct dvb_ca_en50221 *ca, int slot, u8 address);
    int (*write_cam_control)(struct dvb_ca_en50221 *ca, int slot, u8 address, u8 value);
    int (*read_data)(struct dvb_ca_en50221 *ca, int slot, u8 *ebuf, int ecount);
    int (*write_data)(struct dvb_ca_en50221 *ca, int slot, u8 *ebuf, int ecount);
    int (*slot_reset)(struct dvb_ca_en50221 *ca, int slot);
    int (*slot_shutdown)(struct dvb_ca_en50221 *ca, int slot);
    int (*slot_ts_enable)(struct dvb_ca_en50221 *ca, int slot);
    int (*poll_slot_status)(struct dvb_ca_en50221 *ca, int slot, int open);
    void *data;
    void *private;
};
```

**Members**

- **owner** the module owning this structure
- **read_attribute_mem** function for reading attribute memory on the CAM
- **write_attribute_mem** function for writing attribute memory on the CAM
- **read_cam_control** function for reading the control interface on the CAM
- **write_cam_control** function for reading the control interface on the CAM
- **read_data** function for reading data (block mode)
- **write_data** function for writing data (block mode)
- **slot_reset** function to reset the CAM slot
- **slot_shutdown** function to shutdown a CAM slot
- **slot_ts_enable** function to enable the Transport Stream on a CAM slot
- **poll_slot_status** function to poll slot status. Only necessary if DVB_CA_FLAG_EN50221_IRQ_CAMCHANGE is not set.
- **data** private data, used by caller.
private  Opaque data used by the dvb_ca core. Do not modify!

NOTE
the read *, write * and poll_slot_status functions will be called for different slots concurrently
and need to use locks where and if appropriate. There will be no concurrent access to one slot.

```c
void dvb_ca_en50221_camchange_irq(struct dvb_ca_en50221 *pubca, int slot, int change_type)
A CAMCHANGE IRQ has occurred.
```

Parameters
struct dvb_ca_en50221 *pubca  CA instance.
int slot  Slot concerned.
int change_type  One of the DVB_CA_CAMCHANGE_* values

```c
void dvb_ca_en50221_camready_irq(struct dvb_ca_en50221 *pubca, int slot)
A CAMREADY IRQ has occurred.
```

Parameters
struct dvb_ca_en50221 *pubca  CA instance.
int slot  Slot concerned.

```c
void dvb_ca_en50221_frda_irq(struct dvb_ca_en50221 *ca, int slot)
An FR or a DA IRQ has occurred.
```

Parameters
struct dvb_ca_en50221 *ca  CA instance.
int slot  Slot concerned.

```c
int dvb_ca_en50221_init(struct dvb_adapter *dbv_adapter, struct dvb_ca_en50221 *ca, int flags, int slot_count)
Initialise a new DVB CA device.
```

Parameters
struct dvb_adapter *dbv_adapter  DVB adapter to attach the new CA device to.
struct dvb_ca_en50221 *ca  The dvb_ca instance.
int flags  Flags describing the CA device (DVB_CA_EN50221_FLAG_*).
int slot_count  Number of slots supported.

Description
return 0 on success, nonzero on failure

```c
void dvb_ca_en50221_release(struct dvb_ca_en50221 *ca)
Release a DVB CA device.
```

Parameters
struct dvb_ca_en50221 *ca  The associated dvb_ca instance.
2.3.5 Digital TV Network kABI

struct **dvb_net**  
    describes a DVB network interface

**Definition**

```c
struct dvb_net {
    struct dvb_device *dvbdev;
    struct net_device *device[DVB_NET_DEVICES_MAX];
    int state[DVB_NET_DEVICES_MAX];
    unsigned int exit:1;
    struct dmx_demux *demux;
    struct mutex ioctl_mutex;
};
```

**Members**

- **dvbdev** pointer to `struct dvb_device`.
- **device** array of pointers to `struct net_device`.
- **state** array of integers to each net device. A value different than zero means that the interface is in usage.
- **exit** flag to indicate when the device is being removed.
- **demux** pointer to `struct dmx_demux`.
- **ioctl_mutex** protect access to this struct.

**Description**

Currently, the core supports up to DVB_NET_DEVICES_MAX (10) network devices.

```c
int dvb_net_init(struct dvb_adapter *adap, struct dvb_net *dvbnet, struct dmx_demux *dmxdemux)
```

initialize a digital TV network device and registers it.

**Parameters**

- **struct dvb_adapter *adap** pointer to `struct dvb_adapter`.
- **struct dvb_net *dvbnet** pointer to `struct dvb_net`.
- **struct dmx_demux *dmxdemux** pointer to `struct dmx_demux`.

```c
void dvb_net_release(struct dvb_net *dvbnet)
```

releases a digital TV network device and unregisters it.

**Parameters**

- **struct dvb_net *dvbnet** pointer to `struct dvb_net`.

2.3. Digital TV (DVB) devices
2.4 Remote Controller devices

2.4.1 Remote Controller core

The remote controller core implements infrastructure to receive and send remote controller keyboard keystrokes and mouse events.

Every time a key is pressed on a remote controller, a scan code is produced. Also, on most hardware, keeping a key pressed for more than a few dozens of milliseconds produce a repeat key event. That’s somewhat similar to what a normal keyboard or mouse is handled internally on Linux\(^1\). So, the remote controller core is implemented on the top of the linux input/evdev interface.

However, most of the remote controllers use infrared (IR) to transmit signals. As there are several protocols used to modulate infrared signals, one important part of the core is dedicated to adjust the driver and the core system to support the infrared protocol used by the emitter.

The infrared transmission is done by blinking a infrared emitter using a carrier. The carrier can be switched on or off by the IR transmitter hardware. When the carrier is switched on, it is called `PULSE`. When the carrier is switched off, it is called `SPACE`.

In other words, a typical IR transmission can be viewed as a sequence of `PULSE` and `SPACE` events, each with a given duration.

The carrier parameters (frequency, duty cycle) and the intervals for `PULSE` and `SPACE` events depend on the protocol. For example, the NEC protocol uses a carrier of 38kHz, and transmissions start with a 9ms `PULSE` and a 4.5ms `SPACE`. It then transmits 16 bits of scan code, being 8 bits for address (usually it is a fixed number for a given remote controller), followed by 8 bits of code. A bit “1” is modulated with 560µs `PULSE` followed by 1690µs `SPACE` and a bit “0” is modulated with 560µs `PULSE` followed by 560µs `SPACE`.

At receiver, a simple low-pass filter can be used to convert the received signal in a sequence of `PULSE/SPACE` events, filtering out the carrier frequency. Due to that, the receiver doesn’t care about the carrier’s actual frequency parameters: all it has to do is to measure the amount of time it receives `PULSE/SPACE` events. So, a simple IR receiver hardware will just provide a sequence of timings for those events to the Kernel. The drivers for hardware with such kind of receivers are identified by `RC_DRIVER_IR_RAW`, as defined by `rc_driver_type\(^2\)`. Other hardware come with a microcontroller that decode the `PULSE/SPACE` sequence and return scan codes to the Kernel. Such kind of receivers are identified by `RC_DRIVER_SCANCODE`.

When the RC core receives events produced by `RC_DRIVER_IR_RAW` IR receivers, it needs to decode the IR protocol, in order to obtain the corresponding scan code. The protocols supported by the RC core are defined at `enum rc_proto`.

When the RC code receives a scan code (either directly, by a driver of the type `RC_DRIVER_SCANCODE`, or via its IR decoders), it needs to convert into a Linux input event code. This is done via a mapping table.

The Kernel has support for mapping tables available on most media devices. It also supports loading a table in runtime, via some sysfs nodes. See the `RC userspace API` for more details.

---

\(^1\) The main difference is that, on keyboard events, the keyboard controller produces one event for a key press and another one for key release. On infrared-based remote controllers, there’s no key release event. Instead, an extra code is produced to indicate key repeats.

\(^2\) The RC core also supports devices that have just IR emitters, without any receivers. Right now, all such devices work only in raw TX mode. Such kind of hardware is identified as `RC_DRIVER_IR_RAW_TX`.
2.4.1.1 Remote controller data structures and functions

enum rc_driver_type
    type of the RC driver.

Constants

RC_DRIVER_SCANCODE  Driver or hardware generates a scancode.
RC_DRIVER_IR_RAW    Driver or hardware generates pulse/space sequences. It needs a Infra-Red pulse/space decoder
RC_DRIVER_IR_RAW_TX Device transmitter only, driver requires pulse/space data sequence.

struct rc_scancode_filter
    Filter scan codes.

Definition

struct rc_scancode_filter {
    u32 data;
    u32 mask;
};

Members

data  Scancode data to match.
mask  Mask of bits of scancode to compare.

enum rc_filter_type
    Filter type constants.

Constants

RC_FILTER_NORMAL  Filter for normal operation.
RC_FILTER_WAKEUP  Filter for waking from suspend.
RC_FILTER_MAX     Number of filter types.

struct lirc_fh
    represents an open lirc file

Definition

struct lirc_fh {
    struct list_head list;
    struct rc_dev *rc;
    int carrier_low;
    bool send_timeout_reports;
    unsigned int *rawir;
    struct lirc_scancode *scancodes;
    wait_queue_head_t wait_poll;
    u8 send_mode;
    u8 rec_mode;
};

Members

list  list of open file handles

2.4. Remote Controller devices
**rc** `rcdev` for this lirc chardev

**carrier_low** when setting the carrier range, first the low end must be set with an ioctl and then the high end with another ioctl

**send_timeout_reports** report timeouts in lirc raw IR.

**rawir** queue for incoming raw IR

**scancodes** queue for incoming decoded scancodes

**wait_poll** poll struct for lirc device

**send_mode** lirc mode for sending, either LIRC_MODE_SCANCODE or LIRC_MODE_PULSE

**rec_mode** lirc mode for receiving, either LIRC_MODE_SCANCODE or LIRC_MODE_MODE2

**struct rc_dev**

represents a remote control device

### Definition

```c
struct rc_dev {
    struct device dev;
    bool managed_alloc;
    const struct attribute_group *sysfs_groups[5];
    const char *device_name;
    const char *input_phys;
    struct input_id input_id;
    const char *driver_name;
    const char *map_name;
    struct rc_map rc_map;
    struct mutex lock;
    unsigned int minor;
    struct ir_raw_event_ctrl *raw;
    struct input_dev *input_dev;
    enum rc_driver_type driver_type;
    bool idle;
    bool encode_wakeup;
    u64 allowed_protocols;
    u64 enabled_protocols;
    u64 allowed_wakeup_protocols;
    enum rc_proto wakeup_protocol;
    struct rc_scancode_filter scancode_filter;
    struct rc_scancode_filter scancode_wakeup_filter;
    u32 scancode_mask;
    u32 users;
    void *priv;
    spinlock_t keylock;
    bool keypressed;
    unsigned long keyup_jiffies;
    struct timer_list timer_keyup;
    struct timer_list timer_repeat;
    u32 last_keycode;
    enum rc_proto last_protocol;
    u32 last_scancode;
    u8 last_toggle;
    u32 timeout;
    u32 min_timeout;
    u32 max_timeout;
}
```
Members

dev  driver model's view of this device
managed_alloc  devm_rc_allocate_device was used to create rc_dev
sysfs_groups  sysfs attribute groups
device_name  name of the rc child device
input_phys  physical path to the input child device
input_id  id of the input child device (struct input_id)
driver_name  name of the hardware driver which registered this device
map_name  name of the default keymap
rc_map  current scan/key table
lock  used to ensure we've filled in all protocol details before anyone can call show_protocols
or store_protocols
minor  unique minor remote control device number
raw  additional data for raw pulse/space devices
input_dev  the input child device used to communicate events to userspace
driver_type  specifies if protocol decoding is done in hardware or software
idle  used to keep track of RX state

2.4. Remote Controller devices
encode_wakeup  wakeup filtering uses IR encode API, therefore the allowed wakeup protocols
is the set of all raw encoders

allowed_protocols  bitmask with the supported RCPROTO_BIT_* protocols

enabled_protocols  bitmask with the enabled RCPROTO_BIT_* protocols

allowed_wakeup_protocols  bitmask with the supported RCPROTO_BIT_* wakeup protocols

wakeup_protocol  the enabled RCPROTO_* wakeup protocol or RCPROTO_UNKNOWN if dis-
abled.

scancode_filter  scancode filter

scancode_wakeup_filter  scancode wakeup filters

scancode_mask  some hardware decoders are not capable of providing the full scancode to the
application. As this is a hardware limit, we can’t do anything with it. Yet, as the same
keycode table can be used with other devices, a mask is provided to allow its usage. Drivers
should generally leave this field in blank

users  number of current users of the device

priv  driver-specific data

keylock  protects the remaining members of the struct

keypressed  whether a key is currently pressed

keyup_jiffies  time (in jiffies) when the current keypress should be released

timer_keyup  timer for releasing a keypress

timer_repeat  timer for autorepeat events. This is needed for CEC, which has non-standard
repeats.

last_keycode  keycode of last keypress

last_protocol  protocol of last keypress

last_scancode  scancode of last keypress

last_toggle  toggle value of last command

timeout  optional time after which device stops sending data

min_timeout  minimum timeout supported by device

max_timeout  maximum timeout supported by device

rx_resolution  resolution (in us) of input sampler

tx_resolution  resolution (in us) of output sampler

lirc_dev  lirc device

lirc_cdev  lirc char cdev

gap_start  time when gap starts

gap_duration  duration of initial gap

gap  true if we’re in a gap

lirc_fh_lock  protects lirc_fh list
lirc_fh  list of open files
registered  set to true by `rc_register_device()`, false by `rc_unregister_device`
change_protocol  allow changing the protocol used on hardware decoders
open  callback to allow drivers to enable polling/irq when IR input device is opened.
close  callback to allow drivers to disable polling/irq when IR input device is opened.
s_tx_mask  set transmitter mask (for devices with multiple tx outputs)
s_tx_carrier  set transmit carrier frequency
s_tx_duty_cycle  set transmit duty cycle (0% - 100%)
s_rx_carrier_range  inform driver about carrier it is expected to handle
tx_ir  transmit IR
s_idle  enable/disable hardware idle mode, upon which, device doesn’t interrupt host until it sees IR pulses
s_wideband_receiver  enable wide band receiver used for learning
s_carrier_report  enable carrier reports
s_filter  set the scancode filter
s_wakeup_filter  set the wakeup scancode filter. If the mask is zero then wakeup should be disabled. `wakeup_protocol` will be set to a valid protocol if mask is nonzero.
s_timeout  set hardware timeout in us

```c
struct rc_dev * rc_allocate_device(enum rc_driver_type)
    Allocates a RC device
```

**Parameters**

- `enum rc_driver_type` specifies the type of the RC output to be allocated returns a pointer to `struct rc_dev`.

```c
struct rc_dev * devm_rc_allocate_device(struct device *dev, enum rc_driver_type)
    Managed RC device allocation
```

**Parameters**

- `struct device *dev` pointer to struct device
- `enum rc_driver_type` specifies the type of the RC output to be allocated returns a pointer to `struct rc_dev`.

```c
void rc_free_device(struct rc_dev *dev)
    Frees a RC device
```

**Parameters**

- `struct rc_dev *dev` pointer to `struct rc_dev`
- `int rc_register_device(struct rc_dev *dev)`
    Registers a RC device

**Parameters**

- `struct rc_dev *dev` pointer to `struct rc_dev`
int `devm_rc_register_device`(struct device *parent, struct `rc_dev` *dev)
  Manageded registering of a RC device

Parameters

**struct device ** *parent**  pointer to struct device.

**struct rc_dev ** *dev**  pointer to `struct rc_dev`.

void `rc_unregister_device`(struct `rc_dev` *dev)
  Unregisters a RC device

Parameters

**struct rc_dev ** *dev**  pointer to `struct rc_dev`.

**struct rc_map_table**  represents a scancode/keycode pair

Definition

```
struct rc_map_table {
  u64 scancode;
  u32 keycode;
};
```

**Members**

*scancode*  scan code (u64)

*keycode*  Linux input keycode

**struct rc_map**  represents a keycode map table

Definition

```
struct rc_map {
  struct rc_map_table *scan;
  unsigned int size;
  unsigned int len;
  unsigned int alloc;
  enum rc_proto rc_proto;
  const char *name;
  spinlock_t lock;
};
```

**Members**

*scan*  pointer to struct `rc_map_table`

*size*  Max number of entries

*len*  Number of entries that are in use

*alloc*  size of *scan, in bytes

*rc_proto*  type of the remote controller protocol, as defined at enum `rc_proto`

*name*  name of the key map table

*lock*  lock to protect access to this structure
struct \texttt{rc\_map\_list}
    list of the registered \texttt{rc\_map} maps

\textbf{Definition}

\begin{verbatim}
struct rc_map_list {
    struct list_head list;
    struct rc_map map;
};
\end{verbatim}

\textbf{Members}

\begin{itemize}
    \item \texttt{list} pointer to \texttt{struct list\_head}
    \item \texttt{map} pointer to \texttt{struct rc\_map}
\end{itemize}

\textbf{int rc\_map\_register} (\texttt{struct rc\_map\_list *map})
    Registers a Remote Controller scancode map

\textbf{Parameters}

\begin{itemize}
    \item \texttt{struct rc\_map\_list *map} pointer to \texttt{struct rc\_map\_list}
\end{itemize}

\textbf{void rc\_map\_unregister} (\texttt{struct rc\_map\_list *map})
    Unregisters a Remote Controller scancode map

\textbf{Parameters}

\begin{itemize}
    \item \texttt{struct rc\_map\_list *map} pointer to \texttt{struct rc\_map\_list}
\end{itemize}

\textbf{struct rc\_map *rc\_map\_get} (\texttt{const char *name})
    gets an RC map from its name

\textbf{Parameters}

\begin{itemize}
    \item \texttt{const char *name} name of the RC scancode map
\end{itemize}

\section*{2.5 Media Controller devices}

\subsection*{2.5.1 Media Controller}

The media controller userspace API is documented in \textit{the Media Controller uAPI book}. This document focus on the kernel-side implementation of the media framework.

\subsubsection*{2.5.1.1 Abstract media device model}

Discovering a device internal topology, and configuring it at runtime, is one of the goals of the media framework. To achieve this, hardware devices are modelled as an oriented graph of building blocks called entities connected through pads.

An entity is a basic media hardware building block. It can correspond to a large variety of logical blocks such as physical hardware devices (CMOS sensor for instance), logical hardware devices (a building block in a System-on-Chip image processing pipeline), DMA channels or physical connectors.
A pad is a connection endpoint through which an entity can interact with other entities. Data (not restricted to video) produced by an entity flows from the entity’s output to one or more entity inputs. Pads should not be confused with physical pins at chip boundaries.

A link is a point-to-point oriented connection between two pads, either on the same entity or on different entities. Data flows from a source pad to a sink pad.

### 2.5.1.2 Media device

A media device is represented by a `struct media_device` instance, defined in `include/media/media-device.h`. Allocation of the structure is handled by the media device driver, usually by embedding the `media_device` instance in a larger driver-specific structure.

Drivers register media device instances by calling `__media_device_register()` via the macro `media_device_register()` and unregistered by calling `media_device_unregister()`.

### 2.5.1.3 Entities

Entities are represented by a `struct media_entity` instance, defined in `include/media/media-entity.h`. The structure is usually embedded into a higher-level structure, such as `v4l2_subdev` or `video_device` instances, although drivers can allocate entities directly.

Drivers initialize entity pads by calling `media_entity_pads_init()`.

Drivers register entities with a media device by calling `media_device_register_entity()` and unregistered by calling `media_device_unregister_entity()`.

### 2.5.1.4 Interfaces

Interfaces are represented by a `struct media_interface` instance, defined in `include/media/media-entity.h`. Currently, only one type of interface is defined: a device node. Such interfaces are represented by a `struct media_intf_devnode`.

Drivers initialize and create device node interfaces by calling `media_devnode_create()` and remove them by calling: `media_devnode_remove()`.

### 2.5.1.5 Pads

Pads are represented by a `struct media_pad` instance, defined in `include/media/media-entity.h`. Each entity stores its pads in a pads array managed by the entity driver. Drivers usually embed the array in a driver-specific structure.

Pads are identified by their entity and their 0-based index in the pads array.

Both information are stored in the `struct media_pad`, making the `struct media_pad` pointer the canonical way to store and pass link references.

Pads have flags that describe the pad capabilities and state.

`MEDIA_PAD_FL_SINK` indicates that the pad supports sinking data. `MEDIA_PAD_FL_SOURCE` indicates that the pad supports sourcing data.
2.5.1.6 Links

Links are represented by a `struct media_link` instance, defined in `include/media/media-entity.h`. There are two types of links:

1. **pad to pad links:**
   
   Associate two entities via their PADS. Each entity has a list that points to all links originating at or targeting any of its pads. A given link is thus stored twice, once in the source entity and once in the target entity.

   Drivers create pad to pad links by calling: `media_create_pad_link()` and remove with `media_entity_remove_links()`.

2. **interface to entity links:**
   
   Associate one interface to a Link.

   Drivers create interface to entity links by calling: `media_create_intf_link()` and remove with `media_remove_intf_links()`.

**Note:** Links can only be created after having both ends already created.

Links have flags that describe the link capabilities and state. The valid values are described at `media_create_pad_link()` and `media_create_intf_link()`.

2.5.1.7 Graph traversal

The media framework provides APIs to iterate over entities in a graph.

To iterate over all entities belonging to a media device, drivers can use the `media_device_for_each_entity` macro, defined in `include/media/media-device.h`.

```c
struct media_entity *entity;

media_device_for_each_entity(entity, mdev) {
    // entity will point to each entity in turn
    ...
}
```

Drivers might also need to iterate over all entities in a graph that can be reached only through enabled links starting at a given entity. The media framework provides a depth-first graph traversal API for that purpose.

**Note:** Graphs with cycles (whether directed or undirected) are NOT supported by the graph traversal API. To prevent infinite loops, the graph traversal code limits the maximum depth to `MEDIA_ENTITY_ENUM_MAX_DEPTH`, currently defined as 16.

2.5. Media Controller devices
Drivers initiate a graph traversal by calling `media_graph_walk_start()`.

The graph structure, provided by the caller, is initialized to start graph traversal at the given entity.

Drivers can then retrieve the next entity by calling `media_graph_walk_next()`.

When the graph traversal is complete the function will return `NULL`.

Graph traversal can be interrupted at any moment. No cleanup function call is required and the graph structure can be freed normally.

Helper functions can be used to find a link between two given pads, or a pad connected to another pad through an enabled link `media_entity_find_link()` and `media_entity_remote_pad()`.

### 2.5.1.8 Use count and power handling

Due to the wide differences between drivers regarding power management needs, the media controller does not implement power management. However, the `struct media_entity` includes a `use_count` field that media drivers can use to track the number of users of every entity for power management needs.

The `media_entity.use_count` field is owned by media drivers and must not be touched by entity drivers. Access to the field must be protected by the `media_device.graph_mutex` lock.

### 2.5.1.9 Links setup

Link properties can be modified at runtime by calling `media_entity_setup_link()`.

### 2.5.1.10 Pipelines and media streams

When starting streaming, drivers must notify all entities in the pipeline to prevent link states from being modified during streaming by calling `media_pipeline_start()`.

The function will mark all entities connected to the given entity through enabled links, either directly or indirectly, as streaming.

The `struct media_pipeline` instance pointed to by the pipe argument will be stored in every entity in the pipeline. Drivers should embed the `struct media_pipeline` in higher-level pipeline structures and can then access the pipeline through the `struct media_entity` pipe field.

Calls to `media_pipeline_start()` can be nested. The pipeline pointer must be identical for all nested calls to the function.

`media_pipeline_start()` may return an error. In that case, it will clean up any of the changes it did by itself.

When stopping the stream, drivers must notify the entities with `media_pipeline_stop()`.

If multiple calls to `media_pipeline_start()` have been made the same number of `media_pipeline_stop()` calls are required to stop streaming. The `media_entity.pipe` field is reset to `NULL` on the last nested stop call.
Link configuration will fail with -EBUSY by default if either end of the link is a streaming entity. Links that can be modified while streaming must be marked with the MEDIA_LNK_FL_DYNAMIC flag.

If other operations need to be disallowed on streaming entities (such as changing entities configuration parameters) drivers can explicitly check the media_entity_stream_count field to find out if an entity is streaming. This operation must be done with the media_device_graph_mutex held.

### 2.5.1.11 Link validation

Link validation is performed by `media_pipeline_start()` for any entity which has sink pads in the pipeline. The `media_entity.link_validate()` callback is used for that purpose. In `link_validate()` callback, entity driver should check that the properties of the source pad of the connected entity and its own sink pad match. It is up to the type of the entity (and in the end, the properties of the hardware) what matching actually means.

Subsystems should facilitate link validation by providing subsystem specific helper functions to provide easy access for commonly needed information, and in the end provide a way to use driver-specific callbacks.

### 2.5.1.12 Media Controller Device Allocator API

When the media device belongs to more than one driver, the shared media device is allocated with the shared struct device as the key for look ups.

The shared media device should stay in registered state until the last driver unregisters it. In addition, the media device should be released when all the references are released. Each driver gets a reference to the media device during probe, when it allocates the media device. If media device is already allocated, the allocate API bumps up the refcount and returns the existing media device. The driver puts the reference back in its disconnect routine when it calls `media_device_delete()`.

The media device is unregistered and cleaned up from the kref put handler to ensure that the media device stays in registered state until the last driver unregisters the media device.

**Driver Usage**

Drivers should use the appropriate media-core routines to manage the shared media device life-time handling the two states: 1. allocate -> register -> delete 2. get reference to already registered device -> delete
call `media_device_delete()` routine to make sure the shared media device delete is handled correctly.

**driver probe:** Call `media_device_usb_allocate()` to allocate or get a reference Call `media_device_register()`, if media devnode isn't registered

**driver disconnect:** Call `media_device_delete()` to free the media_device. Freeing is handled by the kref put handler.
2.5.1.13 API Definitions

**struct media_entity_notify**

**Media Entity Notify**

**Definition**

```c
struct media_entity_notify {
    struct list_head list;
    void *notify_data;
    void (*notify)(struct media_entity *entity, void *notify_data);
};
```

**Members**

- **list** List head
- **notify_data** Input data to invoke the callback
- **notify** Callback function pointer

**Description**

Drivers may register a callback to take action when new entities get registered with the media device. This handler is intended for creating links between existing entities and should not create entities and register them.

**struct media_device_ops**

**Media device operations**

**Definition**

```c
struct media_device_ops {
    int (*link_notify)(struct media_link *link, u32 flags, unsigned int notification);
    struct media_request *(*req_alloc)(struct media_device *mdev);
    void (*req_free)(struct media_request *req);
    int (*req_validate)(struct media_request *req);
    void (*req_queue)(struct media_request *req);
};
```

**Members**

- **link_notify** Link state change notification callback. This callback is called with the graph_mutex held.
- **req_alloc** Allocate a request. Set this if you need to allocate a struct larger than `struct media_request`. `req_alloc` and `req_free` must either both be set or both be NULL.
- **req_free** Free a request. Set this if `req_alloc` was set as well, leave to NULL otherwise.
- **req_validate** Validate a request, but do not queue yet. The `req_queue_mutex` lock is held when this op is called.
- **req_queue** Queue a validated request, cannot fail. If something goes wrong when queueing this request then it should be marked as such internally in the driver and any related buffers must eventually return to vb2 with state VB2_BUF_STATE_ERROR. The `req_queue_mutex` lock is held when this op is called. It is important that vb2 buffer objects are queued last after all other object types are queued: queueing a buffer kickstarts the request processing, so all other objects related to the request (and thus the buffer) must be available to
the driver. And once a buffer is queued, then the driver can complete or delete objects from the request before req_queue exits.

```c
struct media_device
  Media device

Definition

struct media_device {
  struct device *dev;
  struct media_devnode *devnode;
  char model[32];
  char driver_name[32];

};
```

Members

dev Parent device
devnode Media device node
model Device model name
driver_name Optional device driver name. If not set, calls to MEDIA_IOC_DEVICE_INFO will return dev->driver->name. This is needed for USB drivers for example, as otherwise they'll all appear as if the driver name was “usb”.
serial Device serial number (optional)
bus_info Unique and stable device location identifier
hw_revision Hardware device revision
topology_version Monotonic counter for storing the version of the graph topology. Should be incremented each time the topology changes.
id Unique ID used on the last registered graph object
entity_internal_idx Unique internal entity ID used by the graph traversal algorithms
entity_internal_idx_max Allocated internal entity indices
entities List of registered entities
interfaces List of registered interfaces
pads List of registered pads
links List of registered links
entity_notify List of registered entity_notify callbacks
graph_mutex Protects access to struct media_device data
pm_count_walk Graph walk for power state walk. Access serialised using graph_mutex.
source_priv Driver Private data for enable/disable source handlers
enable_source Enable Source Handler function pointer
disable_source Disable Source Handler function pointer
ops Operation handler callbacks
req_queue_mutex Serialise the MEDIA_REQUEST_IOC_QUEUE ioctl w.r.t. other operations that stop or start streaming.
request_id Used to generate unique request IDs

Description
This structure represents an abstract high-level media device. It allows easy access to entities and provides basic media device-level support. The structure can be allocated directly or embedded in a larger structure.

The parent dev is a physical device. It must be set before registering the media device.

model is a descriptive model name exported through sysfs. It doesn’t have to be unique.

enable_source is a handler to find source entity for the sink entity and activate the link between them if source entity is free. Drivers should call this handler before accessing the source.

disable_source is a handler to find source entity for the sink entity and deactivate the link between them. Drivers should call this handler to release the source.

Use-case: find tuner entity connected to the decoder entity and check if it is available, and activate the link between them from enable_source and deactivate from disable_source.

Note: Bridge driver is expected to implement and set the handler when media_device is registered or when bridge driver finds the media_device during probe. Bridge driver sets source_priv with information necessary to run enable_source and disable_source handlers. Callers should hold graph_mutex to access and call enable_source and disable_source handlers.

```
int media_entity_enum_init(struct media_entity_enum *ent_enum, struct media_device *mdev)
{
    Initialise an entity enumeration

Parameters
struct media_entity_enum *ent_enum Entity enumeration to be initialised
struct media_device *mdev The related media device
```
### Return

Zero on success or a negative error code.

```c
void media_device_init(struct media_device *mdev)
```

Initializes a media device element

### Parameters

- **struct media_device *mdev** pointer to struct media_device

### Description

This function initializes the media device prior to its registration. The media device initialization and registration is split into two functions to avoid race conditions and make the media device available to user-space before the media graph has been completed.

So drivers need to first initialize the media device, register any entity within the media device, create pad to pad links and then finally register the media device by calling `media_device_register()` as a final step.

```c
void media_device_cleanup(struct media_device *mdev)
```

Cleanups a media device element

### Parameters

- **struct media_device *mdev** pointer to struct media_device

### Description

This function that will destroy the graph_mutex that is initialized in `media_device_init()`.

```c
int __media_device_register(struct media_device *mdev, struct module *owner)
```

Registers a media device element

### Parameters

- **struct media_device *mdev** pointer to struct media_device
- **struct module *owner** should be filled with THIS_MODULE

### Description

Users, should, instead, call the `media_device_register()` macro.

The caller is responsible for initializing the media_device structure before registration. The following fields of media_device must be set:

- **media_entity.dev** must point to the parent device (usually a pci_dev, usb_interface or platform_device instance).
- **media_entity.model** must be filled with the device model name as a NUL-terminated UTF-8 string. The device/model revision must not be stored in this field.

The following fields are optional:

- **media_entity.serial** is a unique serial number stored as a NUL-terminated ASCII string. The field is big enough to store a GUID in text form. If the hardware doesn’t provide a unique serial number this field must be left empty.
- **media_entity.bus_info** represents the location of the device in the system as a NUL-terminated ASCII string. For PCI/PCIe devices **media_entity.bus_info** must be set to “PCI:” (or “PCle:”) followed by the value of pci_name(). For USB devices, the
usb_make_path() function must be used. This field is used by applications to distinguish between otherwise identical devices that don’t provide a serial number.

- media_entity.hw_revision is the hardware device revision in a driver-specific format. When possible the revision should be formatted with the KERNEL_VERSION() macro.

**Note:**

1) Upon successful registration a character device named media[0-9]+ is created. The device major and minor numbers are dynamic. The model name is exported as a sysfs attribute.

2) Unregistering a media device that hasn’t been registered is **NOT** safe.

**Return**

returns zero on success or a negative error code.

```c
media_device_register(mdev)
```

Registers a media device element

**Parameters**

- `mdev` pointer to struct `media_device`

**Description**

This macro calls `__media_device_register()` passing `THIS_MODULE` as the second argument (`owner`).

```c
void media_device_unregister(struct media_device *mdev)
```

Unregisters a media device element

**Parameters**

- `struct media_device *mdev` pointer to struct `media_device`

**Description**

It is safe to call this function on an unregistered (but initialised) media device.

```c
int media_device_register_entity(struct media_device *mdev, struct media_entity *entity)
```

registers a media entity inside a previously registered media device.

**Parameters**

- `struct media_device *mdev` pointer to struct `media_device`
- `struct media_entity *entity` pointer to struct `media_entity` to be registered

**Description**

Entities are identified by a unique positive integer ID. The media controller framework will such ID automatically. IDs are not guaranteed to be contiguous, and the ID number can change on newer Kernel versions. So, neither the driver nor userspace should hardcode ID numbers to refer to the entities, but, instead, use the framework to find the ID, when needed.

The media_entity name, type and flags fields should be initialized before calling `media_device_register_entity()`. Entities embedded in higher-level standard structures can have some of those fields set by the higher-level framework.
If the device has pads, `media_entity_pads_init()` should be called before this function. Otherwise, the `media_entity.pad` and `media_entity.num_pads` should be zeroed before calling this function.

Entities have flags that describe the entity capabilities and state:

`MEDIA_ENT_FL_DEFAULT` indicates the default entity for a given type. This can be used to report the default audio and video devices or the default camera sensor.

Note: Drivers should set the entity function before calling this function. Please notice that the values `MEDIA_ENT_F_V4L2_SUBDEV_UNKNOWN` and `MEDIA_ENT_F_UNKNOWN` should not be used by the drivers.

```c
void media_device_unregister_entity(struct media_entity *entity)
```
unregisters a media entity.

**Parameters**

- `struct media_entity *entity` pointer to `media_entity` to be unregistered

**Description**

All links associated with the entity and all PADs are automatically unregistered from the media_device when this function is called.

Unregistering an entity will not change the IDs of the other entities and the previously used ID will never be reused for a newly registered entities.

When a media device is unregistered, all its entities are unregistered automatically. No manual entities unregistration is then required.

Note: The media_entity instance itself must be freed explicitly by the driver if required.

```c
int media_device_register_entity_notify(struct media_device *mdev, struct media_entity_notify *nptr)
```
Registers a media_entity_notify callback

**Parameters**

- `struct media_device *mdev` The media device
- `struct media_entity_notify *nptr` The media_entity_notify

**Description**

Note: When a new entity is registered, all the registered media_entity_notify callbacks are invoked.

```c
void media_device_unregister_entity_notify(struct media_device *mdev, struct media_entity_notify *nptr)
```
Unregister a media entity notify callback

**Parameters**

- `struct media_device *mdev` The media device
struct media_entity_notify *nptr  The media_entity_notify

void media_device_pci_init (struct media_device *mdev, struct pci_dev *pci_dev, const char *name)
   create and initialize a struct media_device from a PCI device.

Parameters

struct media_device *mdev  pointer to struct media_device
struct pci_dev *pci_dev  pointer to struct pci_dev
const char *name  media device name. If NULL, the routine will use the default name for the
   pci device, given by pci_name() macro.

void __media_device_usb_init (struct media_device *mdev, struct usb_device *udev,
   const char *board_name, const char *driver_name)
   create and initialize a struct media_device from a PCI device.

Parameters

struct media_device *mdev  pointer to struct media_device
struct usb_device *udev  pointer to struct usb_device
const char *board_name  media device name. If NULL, the routine will use the usb product
   name, if available.

const char *driver_name  name of the driver. if NULL, the routine will use the name given by
   udev->dev->driver->name, with is usually the wrong thing to do.

Description

Note:  It is better to call media_device_usb_init() instead, as such macro fills driver_name
   with KBUILD_MODNAME.

media_device_usb_init (mdev, udev, name)
   create and initialize a struct media_device from a PCI device.

Parameters

mdev  pointer to struct media_device
udev  pointer to struct usb_device
name  media device name. If NULL, the routine will use the usb product name, if available.

Description

This macro calls media_device_usb_init() passing the media_device_usb_init()
   driver_name parameter filled with KBUILD_MODNAME.

struct media_file_operations
   Media device file operations

Definition

struct media_file_operations {
   struct module *owner;
   ssize_t (*read) (struct file *, char __user *, size_t, loff_t *);
   ssize_t (*write) (struct file *, const char __user *, size_t, loff_t *);
#include "media-private.h"

struct poll_table_struct {
  __poll_t (*poll) (struct file *, struct poll_table_struct *);
  long (*ioctl) (struct file *, unsigned int, unsigned long);
  long (*compat_ioctl) (struct file *, unsigned int, unsigned long);
  int (*open) (struct file *);
  int (*release) (struct file *);
};

Members

owner should be filled with THIS_MODULE

read pointer to the function that implements read() syscall

write pointer to the function that implements write() syscall

poll pointer to the function that implements poll() syscall

ioctl pointer to the function that implements ioctl() syscall

compat_ioctl pointer to the function that will handle 32 bits userspace calls to the ioctl() syscall on a Kernel compiled with 64 bits.

open pointer to the function that implements open() syscall

release pointer to the function that will release the resources allocated by the open function.

struct media_devnode
  Media device node

Definition

struct media_devnode {
  struct media_device *media_dev;
  const struct media_file_operations *fops;
  struct device dev;
  struct cdev cdev;
  struct device *parent;
  int minor;
  unsigned long flags;
  void (*release)(struct media_devnode *devnode);
};

Members

media_dev pointer to struct media_device

fops pointer to struct media_file_operations with media device ops

dev pointer to struct device containing the media controller device

cdev struct cdev pointer character device

parent parent device

minor device node minor number

flags flags, combination of the MEDIA_FLAG_* constants

release release callback called at the end of media_devnode_release() routine at media-device.c.

2.5. Media Controller devices
Linux Media Documentation

Description

This structure represents a media-related device node. The parent is a physical device. It must be set by core or device drivers before registering the node.

```c
int media_devnode_register(struct media_device *mdev, struct media_devnode *devnode, struct module *owner)
```

register a media device node

Parameters

- **struct media_device *mdev**  
  we want to register a device node
- **struct media_devnode *devnode**  
  media device node structure we want to register
- **struct module *owner**  
  should be filled with THIS_MODULE

Description

The registration code assigns minor numbers and registers the new device node with the kernel. An error is returned if no free minor number can be found, or if the registration of the device node fails.

Zero is returned on success.

Note that if the media_devnode_register call fails, the release() callback of the media_devnode structure is not called, so the caller is responsible for freeing any data.

```c
void media_devnode_unregister_prepare(struct media_devnode *devnode)
```

clear the media device node register bit

Parameters

- **struct media_devnode *devnode**  
  the device node to prepare for unregister

Description

This clears the passed device register bit. Future open calls will be met with errors. Should be called before media_devnode_unregister() to avoid races with unregister and device file open calls.

This function can safely be called if the device node has never been registered or has already been unregistered.

```c
void media_devnode_unregister(struct media_devnode *devnode)
```

unregister a media device node

Parameters

- **struct media_devnode *devnode**  
  the device node to unregister

Description

This unregisters the passed device. Future open calls will be met with errors.

Should be called after media_devnode_unregister_prepare()

```c
struct media_devnode *media_devnode_data(struct file *filp)
```

returns a pointer to the media_devnode

Parameters
struct file *filp pointer to struct file

int media_devnode_is_registered(struct media_devnode *devnode)
    returns true if media_devnode is registered; false otherwise.

Parameters
struct media_devnode *devnode pointer to struct media_devnode.

Note
If mdev is NULL, it also returns false.

enum media_gobj_type
type of a graph object

Constants
MEDIA_GRAPH_ENTITY Identify a media entity
MEDIA_GRAPH_PAD Identify a media pad
MEDIA_GRAPH_LINK Identify a media link
MEDIA_GRAPH_INTF_DEVNODE Identify a media Kernel API interface via a device node

struct media_gobj
    Define a graph object.

Definition

struct media_gobj {
    struct media_device *mdev;
    u32 id;
    struct list_head list;
};

Members
mdev Pointer to the struct media_device that owns the object
id Non-zero object ID identifier. The ID should be unique inside a media_device, as it is com-
    posed by MEDIA_BITS_PER_TYPE to store the type plus MEDIA_BITS_PER_ID to store the ID
list List entry stored in one of the per-type mdev object lists

Description
All objects on the media graph should have this struct embedded

struct media_entity_enum
    An enumeration of media entities.

Definition

struct media_entity_enum {
    unsigned long *bmap;
    int idx_max;
};

Members

2.5. Media Controller devices
**bmap**  Bit map in which each bit represents one entity at `struct media_entity`-`internal_idx`.

**idx_max**  Number of bits in bmap

**struct media_graph**

Media graph traversal state

**Definition**

```c
struct media_graph {
    struct {
        struct media_entity *entity;
        struct list_head *link;
    } stack[MEDIA_ENTITY_ENUM_MAX_DEPTH];
    struct media_entity_enum ent_enum;
    int top;
};
```

**Members**

**stack**  Graph traversal stack; the stack contains information on the path the media entities to be walked and the links through which they were reached.

**stack.entity**  Pointer to `struct media_entity` at the graph.

**stack.link**  Pointer to `struct list_head`.

**ent_enum**  Visited entities

**top**  The top of the stack

**struct media_pipeline**

Media pipeline related information

**Definition**

```c
struct media_pipeline {
    int streaming_count;
    struct media_graph graph;
};
```

**Members**

**streaming_count**  Streaming start count - streaming stop count

**graph**  Media graph walk during pipeline start / stop

**struct media_link**

A link object part of a media graph.

**Definition**

```c
struct media_link {
    struct media_gobj graph_obj;
    struct list_head list;
    union {
        struct media_gobj *gobj0;
        struct media_pad *source;
        struct media_interface *intf;
    };
    union {
```
```c
struct media_gobj *gobj1;
struct media_pad *sink;
struct media_entity *entity;
};
struct media_link *reverse;
unsigned long flags;
bool is_backlink;
```
Contains an Intermediate Frequency analog signal from an audio sub-carrier or an audio bitstream. IF signals are provided by tuners and consumed by audio AM/FM decoders. Bitstream audio is provided by an audio decoder.

```c
struct media_pad
{
    struct media_gobj graph_obj;
    struct media_entity *entity;
    u16 index;
    enum media_pad_signal_type sig_type;
    unsigned long flags;
};
```

**Members**

- **graph_obj** Embedded structure containing the media object common data
- **entity** Entity this pad belongs to
- **index** Pad index in the entity pads array, numbered from 0 to n
- **sig_type** Type of the signal inside a media pad
- **flags** Pad flags, as defined in `include/uapi/linux/media.h` (seek for `MEDIA_PAD_FL_*`)

```c
struct media_entity_operations
{
    int (*get_fwnode_pad)(struct media_entity *entity, struct fwnode_endpoint *endpoint);
    int (*link_setup)(struct media_entity *entity, const struct media_pad *local, const struct media_pad *remote, u32 flags);
    int (*link_validate)(struct media_link *link);
};
```

**Members**

- **get_fwnode_pad** Return the pad number based on a fwnode endpoint or a negative value on error. This operation can be used to map a fwnode to a media pad number. Optional.
- **link_setup** Notify the entity of link changes. The operation can return an error, in which case link setup will be cancelled. Optional.
- **link_validate** Return whether a link is valid from the entity point of view. The `media_pipeline_start()` function validates all links by calling this operation. Optional.

**Description**

**Note:** Those these callbacks are called with struct `media_device.graph_mutex` mutex held.

```c
enum media_entity_type
{
    Media entity type
};
```
Constants

MEDIA_ENTITY_TYPE_BASE

The entity isn’t embedded in another subsystem structure.

MEDIA_ENTITY_TYPE_VIDEO_DEVICE

The entity is embedded in a `struct video_device` instance.

MEDIA_ENTITY_TYPE_V4L2_SUBDEV

The entity is embedded in a `struct v4l2_subdev` instance.

Description

Media entity objects are often not instantiated directly, but the media entity structure is inherited by (through embedding) other subsystem-specific structures. The media entity type identifies the type of the subclass structure that implements a media entity instance.

This allows runtime type identification of media entities and safe casting to the correct object type. For instance, a media entity structure instance embedded in a `v4l2_subdev` structure instance will have the type `MEDIA_ENTITY_TYPE_V4L2_SUBDEV` and can safely be cast to a `v4l2_subdev` structure using the `container_of()` macro.

```c
struct media_entity

A media entity graph object.
```

Definition

```c
struct media_entity {
    struct media_gobj graph_obj;
    const char *name;
    enum media_entity_type obj_type;
    u32 function;
    unsigned long flags;
    u16 num_pads;
    u16 num_links;
    u16 num_backlinks;
    int internal_idx;
    struct media_pad *pads;
    struct list_head links;
    const struct media_entity_operations *ops;
    int stream_count;
    int use_count;
    struct media_pipeline *pipe;
    union {
        struct {
            u32 major;
            u32 minor;
        } dev;
    } info;
};
```

Members

graph_obj  Embedded structure containing the media object common data.

name  Entity name.

obj_type  Type of the object that implements the media_entity.

2.5. Media Controller devices 511
**function** Entity main function, as defined in `include/uapi/linux/media.h` (seek for `MEDIA_ENT_F_*`)

**flags** Entity flags, as defined in `include/uapi/linux/media.h` (seek for `MEDIA_ENT_FL_*`)

**num_pads** Number of sink and source pads.

**num_links** Total number of links, forward and back, enabled and disabled.

**num_backlinks** Number of backlinks

**internal_idx** An unique internal entity specific number. The numbers are re-used if entities are unregistered or registered again.

**pads** Pads array with the size defined by `num_pads`.

**links** List of data links.

**ops** Entity operations.

**stream_count** Stream count for the entity.

**use_count** Use count for the entity.

**pipe** Pipeline this entity belongs to.

**info** Union with devnode information. Kept just for backward compatibility.

**info.dev** Contains device major and minor info.

**info.dev.major** device node major, if the device is a devnode.

**info.dev.minor** device node minor, if the device is a devnode.

**Description**

*Note:* `stream_count` and `use_count` reference counts must never be negative, but are signed integers on purpose: a simple `WARN_ON(<0)` check can be used to detect reference count bugs that would make them negative.

**struct media_interface**

A media interface graph object.

**Definition**

```c
struct media_interface {
    struct media_gobj graph_obj;
    struct list_head links;
    u32 type;
    u32 flags;
};
```

**Members**

**graph_obj** embedded graph object

**links** List of links pointing to graph entities

**type** Type of the interface as defined in `include/uapi/linux/media.h` (seek for `MEDIA_INTF_T_*`)

**flags** Interface flags as defined in `include/uapi/linux/media.h` (seek for `MEDIA_INTF_FL_*`)

---

512 Chapter 2. Media subsystem kernel internal API
Description

Note: Currently, no flags for media_interface is defined.

```c
struct media_intf_devnode
    A media interface via a device node.
```

Definition

```c
struct media_intf_devnode {
    struct media_interface intf;
    u32 major;
    u32 minor;
};
```

Members

**intf** embedded interface object

**major** Major number of a device node

**minor** Minor number of a device node

**u32 media_entity_id**(struct media_entity *entity)
    return the media entity graph object id

Parameters

**struct media_entity *entity** pointer to media_entity

**enum media_gobj_type media_type**(struct media_gobj *gobj)
    return the media object type

Parameters

**struct media_gobj *gobj** Pointer to the struct media_gobj graph object

**u32 media_id**(struct media_gobj *gobj)
    return the media object ID

Parameters

**struct media_gobj *gobj** Pointer to the struct media_gobj graph object

**u32 media_gobj_gen_id**(enum media_gobj_type type, u64 local_id)
    encapsulates type and ID on at the object ID

Parameters

**enum media_gobj_type type** object type as define at enum media_gobj_type.

**u64 local_id** next ID, from struct media_device.id.

**bool is_media_entity_v4l2_video_device**(struct media_entity *entity)
    Check if the entity is a video_device

Parameters

**struct media_entity *entity** pointer to entity

2.5. Media Controller devices
Return
true if the entity is an instance of a video_device object and can safely be cast to a struct
standard video_device using the container_of() macro, or false otherwise.

bool is_media_entity_v4l2_subdev(struct media_entity *entity)
   Check if the entity is a v4l2_subdev

Parameters
struct media_entity *entity pointer to entity

Return
true if the entity is an instance of a v4l2_subdev object and can safely be cast to a struct
v4l2_subdev using the container_of() macro, or false otherwise.

int __media_entity_enum_init(struct media_entity_enum *ent_enum, int idx_max)
   Initialise an entity enumeration

Parameters
struct media_entity_enum *ent_enum Entity enumeration to be initialised
int idx_max Maximum number of entities in the enumeration

Return
Returns zero on success or a negative error code.

void media_entity_enum_cleanup(struct media_entity_enum *ent_enum)
   Release resources of an entity enumeration

Parameters
struct media_entity_enum *ent_enum Entity enumeration to be released

void media_entity_enum_zero(struct media_entity_enum *ent_enum)
   Clear the entire enum

Parameters
struct media_entity_enum *ent_enum Entity enumeration to be cleared

void media_entity_enum_set(struct media_entity_enum *ent_enum, struct media_entity *entity)
   Mark a single entity in the enum

Parameters
struct media_entity_enum *ent_enum Entity enumeration
struct media_entity *entity Entity to be marked

void media_entity_enum_clear(struct media_entity_enum *ent_enum, struct media_entity *entity)
   Unmark a single entity in the enum

Parameters
struct media_entity_enum *ent_enum Entity enumeration
struct media_entity *entity Entity to be unmarked
bool media_entity_enum_test(struct media_entity_enum *ent_enum, struct media_entity *entity)

Test whether the entity is marked

Parameters

struct media_entity_enum *ent_enum Entity enumeration
struct media_entity *entity Entity to be tested

Description

Returns true if the entity was marked.

bool media_entity_enum_test_and_set(struct media_entity_enum *ent_enum, struct media_entity *entity)

Test whether the entity is marked, and mark it

Parameters

struct media_entity_enum *ent_enum Entity enumeration
struct media_entity *entity Entity to be tested

Description

Returns true if the entity was marked, and mark it before doing so.

bool media_entity_enum_empty(struct media_entity_enum *ent_enum)

Test whether the entire enum is empty

Parameters

struct media_entity_enum *ent_enum Entity enumeration

Return

ture if the entity was empty.

bool media_entity_enum_intersects(struct media_entity_enum *ent_enum1, struct media_entity_enum *ent_enum2)

Test whether two enums intersect

Parameters

struct media_entity_enum *ent_enum1 First entity enumeration
struct media_entity_enum *ent_enum2 Second entity enumeration

Return

ture if entity enumerations ent_enum1 and ent_enum2 intersect, otherwise false.

gobj_to_entity(gobj)

returns the struct media_entity pointer from the gobj contained on it.

Parameters

gobj Pointer to the struct media_gobj graph object

gobj_to_pad(gobj)

returns the struct media_pad pointer from the gobj contained on it.

Parameters

gobj Pointer to the struct media_gobj graph object

2.5. Media Controller devices 515
Linux Media Documentation

```c
void media_gobj_create(struct media_device *mdev, enum media_gobj_type type, struct media_gobj *gobj)
```

Parameters
- **struct media_device *mdev**  Pointer to the media_device that contains the object
- **enum media_gobj_type type** Type of the object
- **struct media_gobj *gobj**  Pointer to the struct media_gobj graph object

Description
This routine initializes the embedded struct media_gobj inside a media graph object. It is
called automatically if media_*_create function calls are used. However, if the object (entity,
link, pad, interface) is embedded on some other object, this function should be called before
registering the object at the media controller.

```c
void media_gobj_destroy(struct media_gobj *gobj)
```

Parameters
- **struct media_gobj *gobj**  Pointer to the struct media_gobj graph object

Description
This should be called by all routines like media_device_unregister() that remove/destroy
media graph objects.

```c
int media_entity_pads_init(struct media_entity *entity, u16 num_pads, struct media_pad *pads)
```

Parameters
- **struct media_entity *entity** entity where the pads belong
- **u16 num_pads** total number of sink and source pads
- **struct media_pad *pads** Array of num_pads pads.
**Description**

The pads array is managed by the entity driver and passed to `media_entity_pads_init()` where its pointer will be stored in the `media_entity` structure.

If no pads are needed, drivers could either directly fill `media_entity->num_pads` with 0 and `media_entity->pads` with `NULL` or call this function that will do the same.

As the number of pads is known in advance, the pads array is not allocated dynamically but is managed by the entity driver. Most drivers will embed the pads array in a driver-specific structure, avoiding dynamic allocation.

Drivers must set the direction of every pad in the pads array before calling `media_entity_pads_init()`. The function will initialize the other pads fields.

```c
void media_entity_cleanup(struct media_entity *entity)
```
free resources associated with an entity

**Parameters**

- `struct media_entity *entity` entity where the pads belong

**Description**

This function must be called during the cleanup phase after unregistering the entity (currently, it does nothing).

```c
int media_get_pad_index(struct media_entity *entity, bool is_sink, enum media_pad_signal_type sig_type)
```
retrieves a pad index from an entity

**Parameters**

- `struct media_entity *entity` entity where the pads belong
- `bool is_sink` true if the pad is a sink, false if it is a source
- `enum media_pad_signal_type sig_type` type of signal of the pad to be search

**Description**

This helper function finds the first pad index inside an entity that satisfies both `is_sink` and `sig_type` conditions.

On success, return the pad number. If the pad was not found or the media entity is a NULL pointer, return -EINVAL.

**Return**

```c
int media_create_pad_link(struct media_entity *source, u16 source_pad, struct media_entity *sink, u16 sink_pad, u32 flags)
```
creates a link between two entities.

**Parameters**

- `struct media_entity *source` pointer to `media_entity` of the source pad.
- `u16 source_pad` number of the source pad in the pads array
- `struct media_entity *sink` pointer to `media_entity` of the sink pad.
- `u16 sink_pad` number of the sink pad in the pads array.
- `u32 flags` Link flags, as defined in `include/uapi/linux/media.h` (seek for MEDIA_LNK_FL_*)
Description

Valid values for flags:

**MEDIA_LNK_FL_ENABLED** Indicates that the link is enabled and can be used to transfer media data. When two or more links target a sink pad, only one of them can be enabled at a time.

**MEDIA_LNK_FL_IMMUTABLE** Indicates that the link enabled state can’t be modified at runtime. If **MEDIA_LNK_FL_IMMUTABLE** is set, then **MEDIA_LNK_FL_ENABLED** must also be set, since an immutable link is always enabled.

**Note:** Before calling this function, **media_entity_pads_init()** and **media_device_register_entity()** should be called previously for both ends.

```c
int media_create_pad_links(const struct media_device *mdev, const u32 source_function, struct media_entity *source, const u16 source_pad, const u32 sink_function, struct media_entity *sink, const u16 sink_pad, u32 flags, const bool allow_both_undefined)
```

creates a link between two entities.

Parameters

- **const struct media_device *mdev** Pointer to the media_device that contains the object
- **const u32 source_function** Function of the source entities. Used only if source is NULL.
- **struct media_entity *source** pointer to media_entity of the source pad. If NULL, it will use all entities that matches the sink_function.
- **const u16 source_pad** number of the source pad in the pads array
- **const u32 sink_function** Function of the sink entities. Used only if sink is NULL.
- **struct media_entity *sink** pointer to media_entity of the sink pad. If NULL, it will use all entities that matches the sink_function.
- **const u16 sink_pad** number of the sink pad in the pads array.
- **u32 flags** Link flags, as defined in include/uapi/linux/media.h.
- **const bool allow_both_undefined** if true, then both source and sink can be NULL. In such case, it will create a crossbar between all entities that matches source_function to all entities that matches sink_function. If false, it will return 0 and won’t create any link if both source and sink are NULL.

Description

Valid values for flags:

**A MEDIA_LNK_FL_ENABLED flag indicates that the link is enabled and can be used to transfer media data.** If multiple links are created and this flag is passed as an argument, only the first created link will have this flag.

**A MEDIA_LNK_FL_IMMUTABLE flag indicates that the link enabled state can’t be modified at runtime.** If MEDIA_LNK_FL_IMMUTABLE is set, then MEDIA_LNK_FL_ENABLED must also be set since an immutable link is always enabled.
It is common for some devices to have multiple source and/or sink entities of the same type that should be linked. While `media_create_pad_link()` creates link by link, this function is meant to allow 1:n, n:1 and even cross-bar (n:n) links.

**Note:** Before calling this function, `media_entity_pads_init()` and `media_device_register_entity()` should be called previously for the entities to be linked.

```c
void media_entity_remove_links(struct media_entity *entity)
    remove all links associated with an entity
```

**Parameters**

- `struct media_entity *entity` pointer to `media_entity`

**Description**

**Note:** This is called automatically when an entity is unregistered via `media_device_register_entity()`.

```c
int __media_entity_setup_link(struct media_link *link, u32 flags)
    Configure a media link without locking
```

**Parameters**

- `struct media_link *link` The link being configured
- `u32 flags` Link configuration flags

**Description**

The bulk of link setup is handled by the two entities connected through the link. This function notifies both entities of the link configuration change.

If the link is immutable or if the current and new configuration are identical, return immediately.

The user is expected to hold `link->source->parent->mutex`. If not, `media_entity_setup_link()` should be used instead.

```c
int media_entity_setup_link(struct media_link *link, u32 flags)
    changes the link flags properties in runtime
```

**Parameters**

- `struct media_link *link` pointer to `media_link`
- `u32 flags` the requested new link flags

**Description**

The only configurable property is the `MEDIA_LNK_FL_ENABLED` link flag to enable/disable a link. Links marked with the `MEDIA_LNK_FL_IMMUTABLE` link flag cannot be enabled or disabled.

When a link is enabled or disabled, the media framework calls the `link_setup` operation for the two entities at the source and sink of the link, in that order. If the second `link_setup` call fails, another `link_setup` call is made on the first entity to restore the original link flags.
Media device drivers can be notified of link setup operations by setting the `media_device.link_notify` pointer to a callback function. If provided, the notification callback will be called before enabling and after disabling links.

Entity drivers must implement the link_setup operation if any of their links is non-immutable. The operation must either configure the hardware or store the configuration information to be applied later.

Link configuration must not have any side effect on other links. If an enabled link at a sink pad prevents another link at the same pad from being enabled, the link_setup operation must return `-EBUSY` and can’t implicitly disable the first enabled link.

**Note:** The valid values of the flags for the link is the same as described on `media_create_pad_link()`, for pad to pad links or the same as described on `media_create_intf_link()`, for interface to entity links.

```c
struct media_link *media_entity_find_link(struct media_pad *source, struct media_pad *sink)
```

Find a link between two pads

- **Parameters**
  - `struct media_pad *source` Source pad
  - `struct media_pad *sink` Sink pad

- **Return**
  returns a pointer to the link between the two entities. If no such link exists, return `NULL`.

```c
struct media_pad *media_entity_remote_pad(const struct media_pad *pad)
```

Find the pad at the remote end of a link

- **Parameters**
  - `const struct media_pad *pad` Pad at the local end of the link

- **Description**
  Search for a remote pad connected to the given pad by iterating over all links originating or terminating at that pad until an enabled link is found.

- **Return**
  returns a pointer to the pad at the remote end of the first found enabled link, or `NULL` if no enabled link has been found.

```c
int media_entity_get_fwnode_pad(struct media_entity *entity, struct fwnode_handle *fwnode, unsigned long direction_flags)
```

Get pad number from fwnode

- **Parameters**
  - `struct media_entity *entity` The entity
  - `struct fwnode_handle *fwnode` Pointer to the fwnode_handle which should be used to find the pad
  - `unsigned long direction_flags` Expected direction of the pad, as defined in `include/uapi/linux/media.h` (seek for MEDIA_PAD_FL_*)
Description

This function can be used to resolve the media pad number from a fwnode. This is useful for devices which use more complex mappings of media pads.

If the entity does not implement the get_fwnode_pad() operation then this function searches the entity for the first pad that matches the direction_flags.

Return

returns the pad number on success or a negative error code.

int media_graph_walk_init(struct media_graph *graph, struct media_device *mdev)

Allocate resources used by graph walk.

Parameters

struct media_graph *graph  Media graph structure that will be used to walk the graph
struct media_device *mdev  Pointer to the media_device that contains the object

Description

The caller is required to hold the media_device graph_mutex during the graph walk until the graph state is released.

Returns zero on success or a negative error code otherwise.

void media_graph_walk_cleanup(struct media_graph *graph)

Release resources used by graph walk.

Parameters

struct media_graph *graph  Media graph structure that will be used to walk the graph

void media_graph_walk_start(struct media_graph *graph, struct media_entity *entity)

Start walking the media graph at a given entity

Parameters

struct media_graph *graph  Media graph structure that will be used to walk the graph
struct media_entity *entity  Starting entity

Description

Before using this function, media_graph_walk_init() must be used to allocate resources used for walking the graph. This function initializes the graph traversal structure to walk the entities graph starting at the given entity. The traversal structure must not be modified by the caller during graph traversal. After the graph walk, the resources must be released using media_graph_walk_cleanup().

struct media_entity *media_graph_walk_next(struct media_graph *graph)

Get the next entity in the graph

Parameters

struct media_graph *graph  Media graph structure

Description

Perform a depth-first traversal of the given media entities graph.
The graph structure must have been previously initialized with a call to `media_graph_walk_start()`.

Return
returns the next entity in the graph or NULL if the whole graph have been traversed.

```c
int media_pipeline_start(struct media_entity *entity, struct media_pipeline *pipe)
```
Mark a pipeline as streaming

Parameters
- `struct media_entity *entity` Starting entity
- `struct media_pipeline *pipe` Media pipeline to be assigned to all entities in the pipeline.

Description
Mark all entities connected to a given entity through enabled links, either directly or indirectly, as streaming. The given pipeline object is assigned to every entity in the pipeline and stored in the `media_entity` pipe field.

Calls to this function can be nested, in which case the same number of `media_pipeline_stop()` calls will be required to stop streaming. The pipeline pointer must be identical for all nested calls to `media_pipeline_start()`.

```c
int __media_pipeline_start(struct media_entity *entity, struct media_pipeline *pipe)
```
Mark a pipeline as streaming

Parameters
- `struct media_entity *entity` Starting entity
- `struct media_pipeline *pipe` Media pipeline to be assigned to all entities in the pipeline.

Description
..note:: This is the non-locking version of `media_pipeline_start()`

```c
void media_pipeline_stop(struct media_entity *entity)
```
Mark a pipeline as not streaming

Parameters
- `struct media_entity *entity` Starting entity

Description
Mark all entities connected to a given entity through enabled links, either directly or indirectly, as not streaming. The `media_entity` pipe field is reset to NULL.

If multiple calls to `media_pipeline_start()` have been made, the same number of calls to this function are required to mark the pipeline as not streaming.

```c
void __media_pipeline_stop(struct media_entity *entity)
```
Mark a pipeline as not streaming

Parameters
- `struct media_entity *entity` Starting entity

Description
struct media_intf_devnode *media_devnode_create(struct media_device *mdev, u32 type, u32 flags, u32 major, u32 minor)

creates and initializes a device node interface

Parameters

struct media_device *mdev pointer to struct media_device

u32 type type of the interface, as given by include/uapi/linux/media.h (seek for MEDIA_INTF_T_*) macros.

u32 flags Interface flags, as defined in include/uapi/linux/media.h (seek for MEDIA_INTF_FL_*)

u32 major Device node major number.

u32 minor Device node minor number.

Return

if succeeded, returns a pointer to the newly allocated media_intf_devnode pointer.

Description

Note: Currently, no flags for media_interface is defined.

void media_devnode_remove(struct media_intf_devnode *devnode)

removes a device node interface

Parameters

struct media_intf_devnode *devnode pointer to media_intf_devnode to be freed.

Description

When a device node interface is removed, all links to it are automatically removed.

media_create_intf_link(struct media_entity *entity, struct media_interface *intf, u32 flags)

creates a link between an entity and an interface

Parameters

struct media_entity *entity pointer to media_entity

struct media_interface *intf pointer to media_interface

u32 flags Link flags, as defined in include/uapi/linux/media.h (seek for MEDIA_LNK_FL_*)

Description

Valid values for flags:

MEDIA_LNK_FL_ENABLED Indicates that the interface is connected to the entity hardware. That’s the default value for interfaces. An interface may be disabled if the hardware is busy due to the usage of some other interface that it is currently controlling the hardware.
A typical example is an hybrid TV device that handle only one type of stream on a given time. So, when the digital TV is streaming, the V4L2 interfaces won’t be enabled, as such device is not able to also stream analog TV or radio.

**Note:** Before calling this function, `media_devnode_create()` should be called for the interface and `media_device_register_entity()` should be called for the interface that will be part of the link.

```c
void __media_remove_intf_link(struct media_link *link)
        remove a single interface link
```

**Parameters**

- `struct media_link *link` pointer to `media_link`.

**Description**

**Note:** This is an unlocked version of `media_remove_intf_link()`.

```c
void media_remove_intf_link(struct media_link *link)
        remove a single interface link
```

**Parameters**

- `struct media_link *link` pointer to `media_link`.

**Description**

**Note:** Prefer to use this one, instead of `__media_remove_intf_link()`.

```c
void __media_remove_intf_links(struct media_interface *intf)
        remove all links associated with an interface
```

**Parameters**

- `struct media_interface *intf` pointer to `media_interface`

**Description**

**Note:** This is an unlocked version of `media_remove_intf_links()`.

```c
void media_remove_intf_links(struct media_interface *intf)
        remove all links associated with an interface
```

**Parameters**

- `struct media_interface *intf` pointer to `media_interface`

**Description**

**Note:**
1) This is called automatically when an entity is unregistered via
   *media_device_register_entity()* and by *media_devnode_remove()*.

2) Prefer to use this one, instead of *__media_remove_intf_links()*.

**media_entity_call**(entity, operation, args...)
---

Calls a *struct media_entity_operations* operation on an entity

**Parameters**

- **entity** entity where the **operation** will be called
- **operation** type of the operation. Should be the name of a member of struct
  *media_entity_operations*.
- **args...** variable arguments

**Description**

This helper function will check if **operation** is not NULL. On such case, it will issue a call to

**operation**(entity, args).

**enum media_request_state**
---

media request state

**Constants**

- **MEDIA_REQUEST_STATE_IDLE** Idle
- **MEDIA_REQUEST_STATE_VALIDATING** Validating the request, no state changes allowed
- **MEDIA_REQUEST_STATE_QUEUED** Queued
- **MEDIA_REQUEST_STATE_COMPLETE** Completed, the request is done
- **MEDIA_REQUEST_STATE_CLEANING** Cleaning, the request is being re-inited
- **MEDIA_REQUEST_STATE_UPDATING** The request is being updated, i.e. request objects are being added, modified or removed
- **NR_OF_MEDIA_REQUEST_STATE** The number of media request states, used internally for sanity check purposes

**struct media_request**
---

Media device request

**Definition**

```c
struct media_request {
    struct media_device *mdev;
    struct kref kref;
    char debug_str[TASK_COMM_LEN + 11];
    enum media_request_state state;
    unsigned int updating_count;
    unsigned int access_count;
    struct list_head objects;
    unsigned int num_incomplete_objects;
    wait_queue_head_t poll_wait;
    spinlock_t lock;
};
```
Members

mdev  Media device this request belongs to
kref  Reference count
debug_str  Prefix for debug messages (process name:fd)
state  The state of the request
updating_count  count the number of request updates that are in progress
access_count  count the number of request accesses that are in progress
objects  List of struct media_request_object request objects
numIncompleteObjects  The number of incomplete objects in the request
poll_wait  Wait queue for poll
lock  Serializes access to this struct

int media_request_lock_for_access(struct media_request *req)
   Lock the request to access its objects

Parameters
struct media_request *req  The media request

Description
Use before accessing a completed request. A reference to the request must be held during the access. This usually takes place automatically through a file handle. Use media_request_unlock_for_access when done.

void media_request_unlock_for_access(struct media_request *req)
   Unlock a request previously locked for access

Parameters
struct media_request *req  The media request

Description
Unlock a request that has previously been locked using media_request_lock_for_access.

int media_request_lock_for_update(struct media_request *req)
   Lock the request for updating its objects

Parameters
struct media_request *req  The media request

Description
Use before updating a request, i.e. adding, modifying or removing a request object in it. A reference to the request must be held during the update. This usually takes place automatically through a file handle. Use media_request_unlock_for_update when done.

void media_request_unlock_for_update(struct media_request *req)
   Unlock a request previously locked for update

Parameters
struct media_request *req  The media request
Description
Unlock a request that has previously been locked using `media_request_lock_for_update`.

```c
void media_request_get(struct media_request *req)
Get the media request
```

**Parameters**
- `struct media_request *req` The media request

**Description**
Get the media request.

```c
void media_request_put(struct media_request *req)
Put the media request
```

**Parameters**
- `struct media_request *req` The media request

**Description**
Put the media request. The media request will be released when the refcount reaches 0.

```c
struct media_request *media_request_get_by_fd(struct media_device *mdev, int request_fd)
Get a media request by fd
```

**Parameters**
- `struct media_device *mdev` Media device this request belongs to
- `int request_fd` The file descriptor of the request

**Description**
Get the request represented by `request_fd` that is owned by the media device.

Return a -EBADR error pointer if requests are not supported by this driver. Return -EINVAL if the request was not found. Return the pointer to the request if found: the caller will have to call `media_request_put` when it finished using the request.

```c
int media_request_alloc(struct media_device *mdev, int *alloc_fd)
Allocate the media request
```

**Parameters**
- `struct media_device *mdev` Media device this request belongs to
- `int *alloc_fd` Store the request’s file descriptor in this int

**Description**
Allocate the media request and put the fd in `alloc_fd`.

```c
struct media_request_object_ops
Media request object operations
```

**Definition**
```c
struct media_request_object_ops {
    int (*prepare)(struct media_request_object *object);
    void (*unprepare)(struct media_request_object *object);
    void (*queue)(struct media_request_object *object);
    void (*unbind)(struct media_request_object *object);
    void (*release)(struct media_request_object *object);
};
```

**Members**

*prepare* Validate and prepare the request object, optional.

*unprepare* Unprepare the request object, optional.

*queue* Queue the request object, optional.

*unbind* Unbind the request object, optional.

*release* Release the request object, required.

**struct media_request_object**

An opaque object that belongs to a media request.

**Definition**

```c
struct media_request_object {
    const struct media_request_object_ops *ops;
    void *priv;
    struct media_request *req;
    struct list_head list;
    struct kref kref;
    bool completed;
};
```

**Members**

*ops* object’s operations

*priv* object’s priv pointer

*req* the request this object belongs to (can be NULL)

*list* List entry of the object for struct media_request

*kref* Reference count of the object, acquire before releasing req->lock

*completed* If true, then this object was completed.

**Description**

An object related to the request. This struct is always embedded in another struct that contains the actual data for this request object.

```c
void media_request_object_get(struct media_request_object *obj)
    Get a media request object
```

**Parameters**

*struct media_request_object *obj* The object

**Description**

Get a media request object.
void media_request_object_put(struct media_request_object *obj)
    Put a media request object

Parameters
struct media_request_object *obj The object

Description
Put a media request object. Once all references are gone, the object’s memory is released.

struct media_request_object * media_request_object_find (struct media_request *req,
const struct media_request_object_ops *ops,
void *priv)

Find an object in a request

Parameters
struct media_request *req The media request
const struct media_request_object_ops *ops Find an object with this ops value
void *priv Find an object with this priv value

Description
Both ops and priv must be non-NULL.
Returns the object pointer or NULL if not found. The caller must call media_request_object_put() once it finished using the object.
Since this function needs to walk the list of objects it takes the req->lock spin lock to make this safe.

void media_request_object_init(struct media_request_object *obj)
    Initialise a media request object

Parameters
struct media_request_object *obj The object

Description
Initialise a media request object. The object will be released using the release callback of the ops once it has no references (this function initialises references to one).

int media_request_object_bind(struct media_request *req, const struct media_request_object_ops *ops, void *priv, bool is_buffer,
struct media_request_object *obj)

Bind a media request object to a request

Parameters
struct media_request *req The media request
const struct media_request_object_ops *ops The object ops for this object
void *priv A driver-specific priv pointer associated with this object
bool is_buffer Set to true if the object a buffer object.
struct media_request_object *obj The object

2.5.  Media Controller devices 529
Description

Bind this object to the request and set the ops and priv values of the object so it can be found later with `media_request_object_find()`.

Every bound object must be unbound or completed by the kernel at some point in time, otherwise the request will never complete. When the request is released all completed objects will be unbound by the request core code.

Buffer objects will be added to the end of the request’s object list, non-buffer objects will be added to the front of the list. This ensures that all buffer objects are at the end of the list and that all non-buffer objects that they depend on are processed first.

```c
void media_request_object_unbind(struct media_request_object *obj)

Unbind a media request object
```

**Parameters**

- `struct media_request_object *obj`: The object

**Description**

Unbind the media request object from the request.

```c
void media_request_object_complete(struct media_request_object *obj)

Mark the media request object as complete
```

**Parameters**

- `struct media_request_object *obj`: The object

**Description**

Mark the media request object as complete. Only bound objects can be completed.

```c
struct media_device *media_device_usb_allocate(struct usb_device *udev, const char *module_name, struct module *owner)

Allocate and return struct media device
```

**Parameters**

- `struct usb_device *udev`: struct usb_device pointer
- `const char *module_name`: should be filled with KBUILD_MODNAME
- `struct module *owner`: struct module pointer THIS_MODULE for the driver. THIS_MODULE is null for a built-in driver. It is safe even when THIS_MODULE is null.

**Description**

This interface should be called to allocate a Media Device when multiple drivers share usb_device and the media device. This interface allocates `media_device` structure and calls `media_device_usb_init()` to initialize it.

```c
void media_device_delete(struct media_device *mdev, const char *module_name, struct module *owner)

Release media device. Calls kref_put().
```

**Parameters**

- `struct media_device *mdev`: struct `media_device` pointer
- `const char *module_name`: should be filled with KBUILD_MODNAME
struct module *owner

struct module pointer THIS_MODULE for the driver. THIS_MODULE is null for a built-in driver. It is safe even when THIS_MODULE is null.

Description

This interface should be called to put Media Device Instance kref.

2.6 CEC Kernel Support

The CEC framework provides a unified kernel interface for use with HDMI CEC hardware. It is designed to handle a multiple types of hardware (receivers, transmitters, USB dongles). The framework also gives the option to decide what to do in the kernel driver and what should be handled by userspace applications. In addition it integrates the remote control passthrough feature into the kernel’s remote control framework.

2.6.1 The CEC Protocol

The CEC protocol enables consumer electronic devices to communicate with each other through the HDMI connection. The protocol uses logical addresses in the communication. The logical address is strictly connected with the functionality provided by the device. The TV acting as the communication hub is always assigned address 0. The physical address is determined by the physical connection between devices.

The CEC framework described here is up to date with the CEC 2.0 specification. It is documented in the HDMI 1.4 specification with the new 2.0 bits documented in the HDMI 2.0 specification. But for most of the features the freely available HDMI 1.3a specification is sufficient:

https://www.hdmi.org/spec/index

2.6.2 CEC Adapter Interface

The struct cec_adapter represents the CEC adapter hardware. It is created by calling cec_allocate_adapter() and deleted by calling cec_delete_adapter():

struct cec_adapter *cec_allocate_adapter(const struct cec_adap_ops *ops,
void cec_delete_adapter(struct cec_adapter *adap);

To create an adapter you need to pass the following information:

ops: adapter operations which are called by the CEC framework and that you have to implement.

priv: will be stored in adap->priv and can be used by the adapter ops. Use cec_get_drvdata(adap) to get the priv pointer.

name: the name of the CEC adapter. Note: this name will be copied.

caps: capabilities of the CEC adapter. These capabilities determine the capabilities of the hardware and which parts are to be handled by userspace and which parts are handled by kernelspace. The capabilities are returned by CEC_ADAP_G_CAPS.

available_las: the number of simultaneous logical addresses that this adapter can handle. Must be 1 <= available_las <= CEC_MAX_LOG_ADDRS.
To obtain the priv pointer use this helper function:

```c
void *cec_get_drvdata(const struct cec_adapter *adap);
```

To register the /dev/cecX device node and the remote control device (if CEC_CAP_RC is set) you call:

```c
int cec_register_adapter(struct cec_adapter *adap, struct device *parent);
```

where parent is the parent device.

To unregister the devices call:

```c
void cec_unregister_adapter(struct cec_adapter *adap);
```

Note: if cec_register_adapter() fails, then call cec_delete_adapter() to clean up. But if cec_register_adapter() succeeded, then only call cec_unregister_adapter() to clean up, never cec_delete_adapter(). The unregister function will delete the adapter automatically once the last user of that /dev/cecX device has closed its file handle.

### 2.6.3 Implementing the Low-Level CEC Adapter

The following low-level adapter operations have to be implemented in your driver:

```c
struct cec_adap_ops
{
    /* Low-level callbacks */
    int (*adap_enable)(struct cec_adapter *adap, bool enable);
    int (*adap_monitor_all_enable)(struct cec_adapter *adap, bool enable);
    int (*adap_monitor_pin_enable)(struct cec_adapter *adap, bool enable);
    int (*adap_log_addr)(struct cec_adapter *adap, u8 logical_addr);
    int (*adap_transmit)(struct cec_adapter *adap, u8 attempts,
                        u32 signal_free_time, struct cec_msg *msg);
    void (*adap_status)(struct cec_adapter *adap, struct seq_file *file);
    void (*adap_free)(struct cec_adapter *adap);

    /* Error injection callbacks */
    ...

    /* High-level callbacks */
    ...
};
```

The seven low-level ops deal with various aspects of controlling the CEC adapter hardware:

To enable/disable the hardware:

```c
int (*adap_enable)(struct cec_adapter *adap, bool enable);
```

This callback enables or disables the CEC hardware. Enabling the CEC hardware means powering it up in a state where no logical addresses are claimed. The physical address will always be valid if CEC_CAP_NEEDS_HPD is set. If that capability is not set, then the physical address can change while the CEC hardware is enabled. CEC drivers should not set CEC_CAP_NEEDS_HPD unless the hardware design requires that as this will make it impossible to wake up displays that pull the HPD low when in standby mode. The initial state of the CEC adapter after calling cec_allocate_adapter() is disabled.
Note that adap_enable must return 0 if enable is false.

To enable/disable the ‘monitor all’ mode:

```c
int (*adap_monitor_all_enable)(struct cec_adapter *adap, bool enable);
```

If enabled, then the adapter should be put in a mode to also monitor messages that are not for us. Not all hardware supports this and this function is only called if the CEC_CAP_MONITOR_ALL capability is set. This callback is optional (some hardware may always be in ‘monitor all’ mode).

Note that adap_monitor_all_enable must return 0 if enable is false.

To enable/disable the ‘monitor pin’ mode:

```c
int (*adap_monitor_pin_enable)(struct cec_adapter *adap, bool enable);
```

If enabled, then the adapter should be put in a mode to also monitor CEC pin changes. Not all hardware supports this and this function is only called if the CEC_CAP_MONITOR_PIN capability is set. This callback is optional (some hardware may always be in ‘monitor pin’ mode).

Note that adap_monitor_pin_enable must return 0 if enable is false.

To program a new logical address:

```c
int (*adap_log_addr)(struct cec_adapter *adap, u8 logical_addr);
```

If logical_addr == CEC_LOG_ADDR_INVALID then all programmed logical addresses are to be erased. Otherwise the given logical address should be programmed. If the maximum number of available logical addresses is exceeded, then it should return -ENXIO. Once a logical address is programmed the CEC hardware can receive directed messages to that address.

Note that adap_log_addr must return 0 if logical_addr is CEC_LOG_ADDR_INVALID.

To transmit a new message:

```c
int (*adap_transmit)(struct cec_adapter *adap, u8 attempts,
                    u32 signal_free_time, struct cec_msg *msg);
```

This transmits a new message. The attempts argument is the suggested number of attempts for the transmit.

The signal_free_time is the number of data bit periods that the adapter should wait when the line is free before attempting to send a message. This value depends on whether this transmit is a retry, a message from a new initiator or a new message for the same initiator. Most hardware will handle this automatically, but in some cases this information is needed.

The CEC_FREE_TIME_TO_USEC macro can be used to convert signal_free_time to microseconds (one data bit period is 2.4 ms).

To log the current CEC hardware status:

```c
void (*adap_status)(struct cec_adapter *adap, struct seq_file *file);
```

This optional callback can be used to show the status of the CEC hardware. The status is available through debugfs: cat /sys/kernel/debug/cec/cecX/status

To free any resources when the adapter is deleted:
void (*adap_free)(struct cec_adapter *adap);

This optional callback can be used to free any resources that might have been allocated by the driver. It’s called from cec_delete_adapter.

Your adapter driver will also have to react to events (typically interrupt driven) by calling into the framework in the following situations:

When a transmit finished (successfully or otherwise):

```c
void cec_transmit_done(struct cec_adapter *adap, u8 status,
                        u8 arb_lost_cnt, u8 nack_cnt, u8 low_drive_cnt,
                        u8 error_cnt);
```

or:

```c
void cec_transmit_attempt_done(struct cec_adapter *adap, u8 status);
```

The status can be one of:

- **CEC_TX_STATUS_OK**: the transmit was successful.
- **CEC_TX_STATUS_ARB_LOST**: arbitration was lost: another CEC initiator took control of the CEC line and you lost the arbitration.
- **CEC_TX_STATUS_NACK**: the message was nacked (for a directed message) or acked (for a broadcast message). A retransmission is needed.
- **CEC_TX_STATUS_LOW_DRIVE**: low drive was detected on the CEC bus. This indicates that a follower detected an error on the bus and requested a retransmission.
- **CEC_TX_STATUS_ERROR**: some unspecified error occurred: this can be one of ARB_LOST or LOW_DRIVE if the hardware cannot differentiate or something else entirely. Some hardware only supports OK and FAIL as the result of a transmit, i.e. there is no way to differentiate between the different possible errors. In that case map FAIL to CEC_TX_STATUS_NACK and not to CEC_TX_STATUS_ERROR.
- **CEC_TX_STATUS_MAX_RETRIES**: could not transmit the message after trying multiple times. Should only be set by the driver if it has hardware support for retrying messages. If set, then the framework assumes that it doesn’t have to make another attempt to transmit the message since the hardware did that already.

The hardware must be able to differentiate between OK, NACK and ‘something else’.

The *_cnt arguments are the number of error conditions that were seen. This may be 0 if no information is available. Drivers that do not support hardware retry can just set the counter corresponding to the transmit error to 1, if the hardware does support retry then either set these counters to 0 if the hardware provides no feedback of which errors occurred and how many times, or fill in the correct values as reported by the hardware.

Be aware that calling these functions can immediately start a new transmit if there is one pending in the queue. So make sure that the hardware is in a state where new transmits can be started before calling these functions.

The cec_transmit_attempt_done() function is a helper for cases where the hardware never retries, so the transmit is always for just a single attempt. It will call cec_transmit_done() in turn, filling in 1 for the count argument corresponding to the status. Or all 0 if the status was OK.
When a CEC message was received:

```c
void cec_received_msg(struct cec_adapter *adap, struct cec_msg *msg);
```

Speaks for itself.

### 2.6.4 Implementing the interrupt handler

Typically the CEC hardware provides interrupts that signal when a transmit finished and whether it was successful or not, and it provides an interrupt when a CEC message was received.

The CEC driver should always process the transmit interrupts first before handling the receive interrupt. The framework expects to see the `cec_transmit_done` call before the `cec_received_msg` call, otherwise it can get confused if the received message was in reply to the transmitted message.

### 2.6.5 Optional: Implementing Error Injection Support

If the CEC adapter supports Error Injection functionality, then that can be exposed through the Error Injection callbacks:

```c
struct cec_adap_ops {
    /* Low-level callbacks */
    ...

    /* Error injection callbacks */
    int (*error_inj_show)(struct cec_adapter *adap, struct seq_file *sf);
    bool (*error_inj_parse_line)(struct cec_adapter *adap, char *line);

    /* High-level CEC message callback */
    ...
};
```

If both callbacks are set, then an `error-inj` file will appear in `debugfs`. The basic syntax is as follows:

Leading spaces/tabs are ignored. If the next character is a `#` or the end of the line was reached, then the whole line is ignored. Otherwise a command is expected.

This basic parsing is done in the CEC Framework. It is up to the driver to decide what commands to implement. The only requirement is that the command `clear` without any arguments must be implemented and that it will remove all current error injection commands.

This ensures that you can always do `echo clear >error-inj` to clear any error injections without having to know the details of the driver-specific commands.

Note that the output of `error-inj` shall be valid as input to `error-inj`. So this must work:

```bash
$ cat error-inj >einj.txt
$ cat einj.txt >error-inj
```

The first callback is called when this file is read and it should show the current error injection state:
It is recommended that it starts with a comment block with basic usage information. It returns 0 for success and an error otherwise.

The second callback will parse commands written to the error-inj file:

```c
bool (*error_inj_parse_line)(struct cec_adapter *adap, char *line);
```

The line argument points to the start of the command. Any leading spaces or tabs have already been skipped. It is a single line only (so there are no embedded newlines) and it is 0-terminated. The callback is free to modify the contents of the buffer. It is only called for lines containing a command, so this callback is never called for empty lines or comment lines.

Return true if the command was valid or false if there were syntax errors.

### 2.6.6 Implementing the High-Level CEC Adapter

The low-level operations drive the hardware, the high-level operations are CEC protocol driven. The following high-level callbacks are available:

```c
struct cec_adap_ops {
    /* Low-level callbacks */
    ...

    /* Error injection callbacks */
    ...

    /* High-level CEC message callback */
    int (*received)(struct cec_adapter *adap, struct cec_msg *msg);
};
```

The received() callback allows the driver to optionally handle a newly received CEC message:

```c
int (*received)(struct cec_adapter *adap, struct cec_msg *msg);
```

If the driver wants to process a CEC message, then it can implement this callback. If it doesn’t want to handle this message, then it should return -ENOMSG, otherwise the CEC framework assumes it processed this message and it will not do anything with it.

### 2.6.7 CEC framework functions

CEC Adapter drivers can call the following CEC framework functions:

```c
int cec_transmit_msg(struct cec_adapter *adap, struct cec_msg *msg,

Transmit a CEC message. If block is true, then wait until the message has been transmitted, otherwise just queue it and return.

```c
void cec_s_phys_addr(struct cec_adapter *adap, u16 phys_addr, bool block);
```

Change the physical address. This function will set adap->phys_addr and send an event if it has changed. If cec_s_log_addrs() has been called and the physical address has become valid, then the CEC framework will start claiming the logical addresses. If block is true, then this function won’t return until this process has finished.
When the physical address is set to a valid value the CEC adapter will be enabled (see the adap_enable op). When it is set to CEC_PHYS_ADDR_INVALID, then the CEC adapter will be disabled. If you change a valid physical address to another valid physical address, then this function will first set the address to CEC_PHYS_ADDR_INVALID before enabling the new physical address.

```c
void cec_s_phys_addr_from_edid(struct cec_adapter *adap,
                          const struct edid *edid);
```

A helper function that extracts the physical address from the edid struct and calls cec_s_phys_addr() with that address, or CEC_PHYS_ADDR_INVALID if the EDID did not contain a physical address or edid was a NULL pointer.

```c
int cec_s_log_addrs(struct cec_adapter *adap,
                     struct cec_log_addrs *log_addrs,
                     bool block);
```

Claim the CEC logical addresses. Should never be called if CEC_CAP_LOG_ADDRS is set. If block is true, then wait until the logical addresses have been claimed, otherwise just queue it and return. To unconfigure all logical addresses call this function with log_addrs set to NULL or with log_addrs->num_log_addrs set to 0. The block argument is ignored when unconfiguring. This function will just return if the physical address is invalid. Once the physical address becomes valid, then the framework will attempt to claim these logical addresses.

### 2.6.8 CEC Pin framework

Most CEC hardware operates on full CEC messages where the software provides the message and the hardware handles the low-level CEC protocol. But some hardware only drives the CEC pin and software has to handle the low-level CEC protocol. The CEC pin framework was created to handle such devices.

Note that due to the close-to-realtime requirements it can never be guaranteed to work 100%. This framework uses highres timers internally, but if a timer goes off too late by more than 300 microseconds wrong results can occur. In reality it appears to be fairly reliable.

One advantage of this low-level implementation is that it can be used as a cheap CEC analyser, especially if interrupts can be used to detect CEC pin transitions from low to high or vice versa.

```c
struct cec_pin_ops {
    int (*read)(struct cec_adapter *adap);
    void (*low)(struct cec_adapter *adap);
    void (*high)(struct cec_adapter *adap);
    bool (*enable_irq)(struct cec_adapter *adap);
    void (*disable_irq)(struct cec_adapter *adap);
    void (*free)(struct cec_adapter *adap);
    void (*status)(struct cec_adapter *adap, struct seq_file *file);
    int (*read_hpd)(struct cec_adapter *adap);
    int (*read_5v)(struct cec_adapter *adap);
    int (*received)(struct cec_adapter *adap, struct cec_msg *msg);
};
```

#### Members

**read** read the CEC pin. Returns > 0 if high, 0 if low, or an error if negative.
low  drive the CEC pin low.

high  stop driving the CEC pin. The pull-up will drive the pin high, unless someone else is
driving the pin low.

enable_irq  optional, enable the interrupt to detect pin voltage changes.

disable_irq  optional, disable the interrupt.

free  optional. Free any allocated resources. Called when the adapter is deleted.

status  optional, log status information.

read_hpd  optional. Read the HPD pin. Returns > 0 if high, 0 if low or an error if negative.

read_5v  optional. Read the 5V pin. Returns > 0 if high, 0 if low or an error if negative.

received  optional. High-level CEC message callback. Allows the driver to process CEC mes-
sages.

Description

These operations (except for the received op) are used by the cec pin framework to manipulate
the CEC pin.

void cec_pin_changed(struct cec_adapter *adap, bool value)
    update pin state from interrupt

Parameters

struct cec_adapter *adap  pointer to the cec adapter

bool value  when true the pin is high, otherwise it is low

Description

If changes of the CEC voltage are detected via an interrupt, then cec_pin_changed is called
from the interrupt with the new value.

struct cec_adapter *cec_pin_allocate_adapter(const struct cec_pin_ops *pin_ops,
                                        void *priv,
                                        const char *name,
                                        u32 caps)
                                        allocate a pin-based cec adapter

Parameters

const struct cec_pin_ops *pin_ops  low-level pin operations

void *priv  will be stored in adap->priv and can be used by the adapter ops. Use
            cec_get_drvdata(adap) to get the priv pointer.

const char *name  the name of the CEC adapter. Note: this name will be copied.

u32 caps  capabilities of the CEC adapter. This will be ORed with CEC_CAP_MONITOR_ALL
            and CEC_CAP_MONITOR_PIN.

Description

Allocate a cec adapter using the cec pin framework.

Return

a pointer to the cec adapter or an error pointer
2.6.9 CEC Notifier framework

Most drm HDMI implementations have an integrated CEC implementation and no notifier support is needed. But some have independent CEC implementations that have their own driver. This could be an IP block for an SoC or a completely separate chip that deals with the CEC pin. For those cases a drm driver can install a notifier and use the notifier to inform the CEC driver about changes in the physical address.

```
struct cec_notifier * cec_notiﬁer_conn_register(struct device *hdmi_dev, const char *port_name, const struct cec_connector_info *conn_info)
```

find or create a new cec_notifier for the given HDMI device and connector tuple.

**Parameters**

- **struct device *hdmi_dev**  HDMI device that sends the events.
- **const char *port_name**  the connector name from which the event occurs. May be NULL if there is always only one HDMI connector created by the HDMI device.
- **const struct cec_connector_info *conn_info**  the connector info from which the event occurs (may be NULL)

**Description**

If a notifier for device *dev* and connector *port_name* already exists, then increase the refcount and return that notifier.

If it doesn’t exist, then allocate a new notifier struct and return a pointer to that new struct.

Return NULL if the memory could not be allocated.

```
void cec_notiﬁer_conn_unregister(struct cec_notifier *n)
```

decrease refcount and delete when the refcount reaches 0.

**Parameters**

- **struct cec_notifier *n** notifier. If NULL, then this function does nothing.

```
struct cec_notifier * cec_notiﬁer_cec_adap_register(struct device *hdmi_dev, const char *port_name, struct cec_adapter *adap)
```

find or create a new cec_notifier for the given device.

**Parameters**

- **struct device *hdmi_dev**  HDMI device that sends the events.
- **const char *port_name**  the connector name from which the event occurs. May be NULL if there is always only one HDMI connector created by the HDMI device.
- **struct cec_adapter *adap**  the cec adapter that registered this notifier.

**Description**

If a notifier for device *dev* and connector *port_name* already exists, then increase the refcount and return that notifier.

If it doesn’t exist, then allocate a new notifier struct and return a pointer to that new struct.

Return NULL if the memory could not be allocated.
void cec_notifier_cec_adap_unregister(struct cec_notifier *n, struct cec_adapter *adap)

decrease refcount and delete when the refcount reaches 0.

Parameters

struct cec_notifier *n notifier. If NULL, then this function does nothing.
struct cec_adapter *adap the cec adapter that registered this notifier.

void cec_notifier_set_phys_addr(struct cec_notifier *n, u16 pa)

set a new physical address.

Parameters

struct cec_notifier *n the CEC notifier
u16 pa the CEC physical address

Description

Set a new CEC physical address. Does nothing if n == NULL.

void cec_notifier_set_phys_addr_from_edid(struct cec_notifier *n, const struct edid *edid)

set parse the PA from the EDID.

Parameters

struct cec_notifier *n the CEC notifier
const struct edid *edid the struct edid pointer

Description

Parses the EDID to obtain the new CEC physical address and set it. Does nothing if n == NULL.

struct device *cec_notifier_parse_hdmi_phandle(struct device *dev)

find the hdmi device from “hdmi-phandle”

Parameters

struct device *dev the device with the “hdmi-phandle” device tree property

Description

Returns the device pointer referenced by the “hdmi-phandle” property. Note that the refcount of the returned device is not incremented. This device pointer is only used as a key value in the notifier list, but it is never accessed by the CEC driver.

void cec_notifier_phys_addr_invalidate(struct cec_notifier *n)

set the physical address to INVALID

Parameters

struct cec_notifier *n the CEC notifier

Description

This is a simple helper function to invalidate the physical address. Does nothing if n == NULL.
2.7 Pixel data transmitter and receiver drivers

V4L2 supports various devices that transmit and receive pixel data. Examples of these devices include a camera sensor, a TV tuner and a parallel or a CSI-2 receiver in an SoC.

2.7.1 Bus types

The following busses are the most common. This section discusses these two only.

2.7.1.1 MIPI CSI-2

CSI-2 is a data bus intended for transferring images from cameras to the host SoC. It is defined by the MIPI alliance.

2.7.1.2 Parallel

BT.601 and BT.656 are the most common parallel busses.

2.7.2 Transmitter drivers

Transmitter drivers generally need to provide the receiver drivers with the configuration of the transmitter. What is required depends on the type of the bus. These are common for both busses.

2.7.2.1 Media bus pixel code

See Media Bus Pixel Codes.

2.7.2.2 Link frequency

The V4L2_CID_LINK_FREQ control is used to tell the receiver the frequency of the bus (i.e. it is not the same as the symbol rate).

2.7.2.3 .s_stream() callback

The struct struct v4l2_subdev_video_ops->s_stream() callback is used by the receiver driver to control the transmitter driver’s streaming state.
2.7.3 CSI-2 transmitter drivers

2.7.3.1 Pixel rate

The pixel rate on the bus is calculated as follows:

\[
\text{pixel_rate} = \text{link_freq} \times 2 \times \text{nr_of_lanes} \times 16 / k / \text{bits_per_sample}
\]

where

<table>
<thead>
<tr>
<th>variable or constant</th>
<th>description</th>
</tr>
</thead>
<tbody>
<tr>
<td>link_freq</td>
<td>The value of the V4L2_CID_LINK_FREQ integer64 menu item.</td>
</tr>
<tr>
<td>nr_of_lanes</td>
<td>Number of data lanes used on the CSI-2 link. This can be obtained from the OF endpoint configuration.</td>
</tr>
<tr>
<td>2</td>
<td>Data is transferred on both rising and falling edge of the signal.</td>
</tr>
<tr>
<td>bits_per_sample</td>
<td>Number of bits per sample.</td>
</tr>
<tr>
<td>k</td>
<td>16 for D-PHY and 7 for C-PHY</td>
</tr>
</tbody>
</table>

Note: The pixel rate calculated this way is not the same thing as the pixel rate on the camera sensor’s pixel array which is indicated by the V4L2_CID_PIXEL_RATE control.

2.7.3.2 LP-11 and LP-111 modes

As part of transitioning to high speed mode, a CSI-2 transmitter typically briefly sets the bus to LP-11 or LP-111 state, depending on the PHY. This period may be as short as 100 μs, during which the receiver observes this state and proceeds its own part of high speed mode transition.

Most receivers are capable of autonomously handling this once the software has configured them to do so, but there are receivers which require software involvement in observing LP-11 or LP-111 state. 100 μs is a brief period to hit in software, especially when there is no interrupt telling something is happening.

One way to address this is to configure the transmitter side explicitly to LP-11 or LP-111 mode, which requires support from the transmitter hardware. This is not universally available. Many devices return to this state once streaming is stopped while the state after power-on is LP-00 or LP-000.

The .pre_streamon() callback may be used to prepare a transmitter for transitioning to streaming state, but not yet start streaming. Similarly, the .post_streamoff() callback is used to undo what was done by the .pre_streamon() callback. The caller of .pre_streamon() is thus required to call .post_streamoff() for each successful call of .pre_streamon().

In the context of CSI-2, the .pre_streamon() callback is used to transition the transmitter to the LP-11 or LP-111 mode. This also requires powering on the device, so this should be only done when it is needed.

Receiver drivers that do not need explicit LP-11 or LP-111 mode setup are waived from calling the two callbacks.
2.7.3.3 Stopping the transmitter

A transmitter stops sending the stream of images as a result of calling the .s_stream() callback. Some transmitters may stop the stream at a frame boundary whereas others stop immediately, effectively leaving the current frame unfinished. The receiver driver should not make assumptions either way, but function properly in both cases.

2.8 Writing camera sensor drivers

2.8.1 CSI-2 and parallel (BT.601 and BT.656) busses

Please see Pixel data transmitter and receiver drivers.

2.8.2 Handling clocks

Camera sensors have an internal clock tree including a PLL and a number of divisors. The clock tree is generally configured by the driver based on a few input parameters that are specific to the hardware: the external clock frequency and the link frequency. The two parameters generally are obtained from system firmware. No other frequencies should be used in any circumstances.

The reason why the clock frequencies are so important is that the clock signals come out of the SoC, and in many cases a specific frequency is designed to be used in the system. Using another frequency may cause harmful effects elsewhere. Therefore only the pre-determined frequencies are configurable by the user.

2.8.2.1 ACPI

Read the clock-frequency_DSD property to denote the frequency. The driver can rely on this frequency being used.

2.8.2.2 Devicetree

The currently preferred way to achieve this is using assigned-clocks, assigned-clock-parents and assigned-clock-rates properties. See Documentation/devicetree/bindings/clock/clock-bindings.txt for more information. The driver then gets the frequency using clk_get_rate().

This approach has the drawback that there’s no guarantee that the frequency hasn’t been modified directly or indirectly by another driver, or supported by the board’s clock tree to begin with. Changes to the Common Clock Framework API are required to ensure reliability.
2.8.3 Frame size

There are two distinct ways to configure the frame size produced by camera sensors.

2.8.3.1 Freely configurable camera sensor drivers

Freely configurable camera sensor drivers expose the device’s internal processing pipeline as one or more sub-devices with different cropping and scaling configurations. The output size of the device is the result of a series of cropping and scaling operations from the device’s pixel array’s size.

An example of such a driver is the CCS driver (see drivers/media/i2c/ccs).

2.8.3.2 Register list based drivers

Register list based drivers generally, instead of being able to configure the device they control based on user requests, are limited to a number of preset configurations that combine a number of different parameters that on hardware level are independent. How a driver picks such configuration is based on the format set on a source pad at the end of the device’s internal pipeline.

Most sensor drivers are implemented this way, see e.g. drivers/media/i2c/imx319.c for an example.

2.8.4 Frame interval configuration

There are two different methods for obtaining possibilities for different frame intervals as well as configuring the frame interval. Which one to implement depends on the type of the device.

2.8.4.1 Raw camera sensors

Instead of a high level parameter such as frame interval, the frame interval is a result of the configuration of a number of camera sensor implementation specific parameters. Luckily, these parameters tend to be the same for more or less all modern raw camera sensors.

The frame interval is calculated using the following equation:

\[
\text{frame interval} = \frac{(\text{analogue crop width} + \text{horizontal blanking}) \times (\text{analogue crop height} + \text{vertical blanking})}{\text{pixel rate}}
\]

The formula is bus independent and is applicable for raw timing parameters on large variety of devices beyond camera sensors. Devices that have no analogue crop, use the full source image size, i.e. pixel array size.

Horizontal and vertical blanking are specified by V4L2_CID_HBLANK and V4L2_CID_VBLANK, respectively. The unit of the V4L2_CID_HBLANK control is pixels and the unit of the V4L2_CID_VBLANK is lines. The pixel rate in the sensor’s pixel array is specified by V4L2_CID_PIXEL_RATE in the same sub-device. The unit of that control is pixels per second.

Register list based drivers need to implement read-only sub-device nodes for the purpose. Devices that are not register list based need these to configure the device’s internal processing pipeline.
The first entity in the linear pipeline is the pixel array. The pixel array may be followed by other entities that are there to allow configuring binning, skipping, scaling or digital crop *Selections: cropping, scaling and composition.*

### 2.8.4.2 USB cameras etc. devices

USB video class hardware, as well as many cameras offering a similar higher level interface natively, generally use the concept of frame interval (or frame rate) on device level in firmware or hardware. This means lower level controls implemented by raw cameras may not be used on uAPI (or even kAPI) to control the frame interval on these devices.

### 2.8.5 Power management

Always use runtime PM to manage the power states of your device. Camera sensor drivers are in no way special in this respect: they are responsible for controlling the power state of the device they otherwise control as well. In general, the device must be powered on at least when its registers are being accessed and when it is streaming.

Existing camera sensor drivers may rely on the old `struct v4l2_subdev_core_ops->s_power()` callback for bridge or ISP drivers to manage their power state. This is however *deprecated.* If you feel you need to begin calling an s_power from an ISP or a bridge driver, instead please add runtime PM support to the sensor driver you are using. Likewise, new drivers should not use s_power.

Please see examples in e.g. `drivers/media/i2c/ov8856.c` and `drivers/media/i2c/ccs/ccs-core.c`. The two drivers work in both ACPI and DT based systems.

### 2.8.5.1 Control framework

`v4l2_ctrl_handler_setup()` function may not be used in the device’s runtime PM runtime_resume callback, as it has no way to figure out the power state of the device. This is because the power state of the device is only changed after the power state transition has taken place. The s_ctrl callback can be used to obtain device’s power state after the power state transition:

```c
int pm_runtime_get_if_in_use(struct device *dev);
```

The function returns a non-zero value if it succeeded getting the power count or runtime PM was disabled, in either of which cases the driver may proceed to access the device.

### 2.9 Media driver-specific documentation

#### 2.9.1 Video4Linux (V4L) drivers

#### 2.9.1.1 The btvtv driver
bttv and sound mini howto

There are a lot of different bt848/849/878/879 based boards available. Making video work often is not a big deal, because this is handled completely by the bt8xx chip, which is common on all boards. But sound is handled in slightly different ways on each board.

To handle the grabber boards correctly, there is an array tvcards[] in bttv-cards.c, which holds the information required for each board. Sound will work only, if the correct entry is used (for video it often makes no difference). The bttv driver prints a line to the kernel log, telling which card type is used. Like this one:

```
[ 7] 0: model: BT848(Hauppauge old) [autodetected]
```

You should verify this is correct. If it isn’t, you have to pass the correct board type as insmod argument, insmod bttv card=2 for example. The file Documentation/admin-guide/media/bttv-cardlist.rst has a list of valid arguments for card.

If your card isn’t listed there, you might check the source code for new entries which are not listed yet. If there isn’t one for your card, you can check if one of the existing entries does work for you (just trial and error…).

Some boards have an extra processor for sound to do stereo decoding and other nice features. The msp34xx chips are used by Hauppauge for example. If your board has one, you might have to load a helper module like msp3400 to make sound work. If there isn’t one for the chip used on your board: Bad luck. Start writing a new one. Well, you might want to check the video4linux mailing list archive first…

Of course you need a correctly installed soundcard unless you have the speakers connected directly to the grabber board. Hint: check the mixer settings too. ALSA for example has everything muted by default.

How sound works in detail

Still doesn’t work? Looks like some driver hacking is required. Below is a do-it-yourself description for you.

The bt8xx chips have 32 general purpose pins, and registers to control these pins. One register is the output enable register (BT848_GPIO_OUT_EN), it says which pins are actively driven by the bt848 chip. Another one is the data register (BT848_GPIO_DATA), where you can get/set the status if these pins. They can be used for input and output.

Most grabber board vendors use these pins to control an external chip which does the sound routing. But every board is a little different. These pins are also used by some companies to drive remote control receiver chips. Some boards use the i2c bus instead of the gpio pins to connect the mux chip.

As mentioned above, there is a array which holds the required information for each known board. You basically have to create a new line for your board. The important fields are these two:

```
struct tvcard
{
    [ ... ]
    u32 gpiomask;
```

gpiomask specifies which pins are used to control the audio mux chip. The corresponding bits in the output enable register (BT848_GPIO_OUT_EN) will be set as these pins must be driven by the bt848 chip.

The audiomux[] array holds the data values for the different inputs (i.e. which pins must be high/low for tuner/mute/…). This will be written to the data register (BT848_GPIO_DATA) to switch the audio mux.

What you have to do is figure out the correct values for gpiomask and the audiomux array. If you have Windows and the drivers four your card installed, you might to check out if you can read these registers values used by the windows driver. A tool to do this is available from http://btwincap.sourceforge.net/download.html.

You might also dig around in the *.ini files of the Windows applications. You can have a look at the board to see which of the gpio pins are connected at all and then start trial-and-error ...

Starting with release 0.7.41 bttv has a number of insmod options to make the gpio debugging easier:

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>bttv_gpio=0/1</td>
<td>enable/disable gpio debug messages</td>
</tr>
<tr>
<td>gpiomask=n</td>
<td>set the gpiomask value</td>
</tr>
<tr>
<td>audiomux=i,j,…</td>
<td>set the values of the audiomux array</td>
</tr>
<tr>
<td>audioall=a</td>
<td>set the values of the audiomux array (one value for all array elements, useful to check out which effect the particular value has).</td>
</tr>
</tbody>
</table>

The messages printed with bttv_gpio=1 look like this:

```
bttv0: gpio: en=00000027, out=00000024 in=00ffffd8 [audio: off]
```

- **en** = output enable register (BT848_GPIO_OUT_EN)
- **out** = _out_put bits of the data register (BT848_GPIO_DATA), i.e. BT848_GPIO_DATA & BT848_GPIO_OUT_EN
- **in** = _in_put bits of the data register, i.e. BT848_GPIO_DATA & ~BT848_GPIO_OUT_EN
2.9.1.2 The cpia2 driver

Authors: Peter Pregler <Peter_Pregler@email.com>, Scott J. Bertin <scottbertin@yahoo.com>, and Jarl Totland <Jarl.Totland@bdc.no> for the original cpia driver, which this one was modelled from.

Notes to developers

• This is a driver version stripped of the 2.4 back compatibility and old MJPEG ioctl API. See cpia2.sf.net for 2.4 support.

Programmer’s overview of cpia2 driver

Cpia2 is the second generation video coprocessor from VLSI Vision Ltd (now a division of ST Microelectronics). There are two versions. The first is the STV0672, which is capable of up to 30 frames per second (fps) in frame sizes up to CIF, and 15 fps for VGA frames. The STV0676 is an improved version, which can handle up to 30 fps VGA. Both coprocessors can be attached to two CMOS sensors - the vvl6410 CIF sensor and the vvl6500 VGA sensor. These will be referred to as the 410 and the 500 sensors, or the CIF and VGA sensors.

The two chipsets operate almost identically. The core is an 8051 processor, running two different versions of firmware. The 672 runs the VP4 video processor code, the 676 runs VP5. There are a few differences in register mappings for the two chips. In these cases, the symbols defined in the header files are marked with VP4 or VP5 as part of the symbol name.

The cameras appear externally as three sets of registers. Setting register values is the only way to control the camera. Some settings are interdependent, such as the sequence required to power up the camera. I will try to make note of all of these cases.

The register sets are called blocks. Block 0 is the system block. This section is always powered on when the camera is plugged in. It contains registers that control housekeeping functions such as powering up the video processor. The video processor is the VP block. These registers control how the video from the sensor is processed. Examples are timing registers, user mode (vga, qvga), scaling, cropping, framerates, and so on. The last block is the video compressor (VC). The video stream sent from the camera is compressed as Motion JPEG (JPEGA). The VC controls all of the compression parameters. Looking at the file cpia2_registers.h, you can get a full view of these registers and the possible values for most of them.

One or more registers can be set or read by sending a usb control message to the camera. There are three modes for this. Block mode requests a number of contiguous registers. Random mode reads or writes random registers with a tuple structure containing address/value pairs. The repeat mode is only used by VP4 to load a firmware patch. It contains a starting address and a sequence of bytes to be written into a gpio port.
2.9.1.3 The cx2341x driver

Memory at cx2341x chips

This section describes the cx2341x memory map and documents some of the register space.

Note: the memory long words are little-endian ('intel format').

Warning: This information was figured out from searching through the memory and registers, this information may not be correct and is certainly not complete, and was not derived from anything more than searching through the memory space with commands like:

```
ivtvctl -O min=0x02000000,max=0x020000ff
```

So take this as is, I'm always searching for more stuff, it's a large register space :-).

Memory Map

The cx2341x exposes its entire 64M memory space to the PCI host via the PCI BAR0 (Base Address Register 0). The addresses here are offsets relative to the address held in BAR0.

<table>
<thead>
<tr>

</tr>
</tbody>
</table>

Registers

The registers occupy the 64k space starting at the 0x02000000 offset from BAR0. All of these registers are 32 bits wide.

DMA Registers 0x000-0xff:

- **0x00 - Control:**
  - 0=reset/cancel, 1=read, 2=write, 4=stop
- **0x04 - DMA status:**
  - 1=read busy, 2=write busy, 4=read error, 8=write error, 16=link list error
- **0x08 - pci DMA pointer for read link list**
- **0x0c - pci DMA pointer for write link list**
- **0x10 - read/write DMA enable:**
Memory locations for Encoder Buffers 0x700-0x7ff:
These registers show offsets of memory locations pertaining to each buffer area used for encoding, have to shift them by $<<1$ first.

- 0x07F8: Encoder SDRAM refresh
- 0x07FC: Encoder SDRAM pre-charge

Memory locations for Decoder Buffers 0x800-0x8ff:
These registers show offsets of memory locations pertaining to each buffer area used for decoding, have to shift them by $<<1$ first.

- 0x08F8: Decoder SDRAM refresh
- 0x08FC: Decoder SDRAM pre-charge

Other memory locations:
- 0x2800: Video Display Module control
- 0x2D00: AO (audio output?) control
- 0x2D24: Bytes Flushed
- 0x7000: LSB I2C write clock bit (inverted)
- 0x7004: LSB I2C write data bit (inverted)
- 0x7008: LSB I2C read clock bit
- 0x700c: LSB I2C read data bit
• 0x9008: GPIO get input state
• 0x900c: GPIO set output state
• 0x9020: GPIO direction (Bit7 (GPIO 0..7) - 0:input, 1:output)
• 0x9050: SPU control
• 0x9054: Reset HW blocks
• 0x9058: VPU control
• 0xA018: Bit6: interrupt pending?
• 0xA064: APU command

Interrupt Status Register

The definition of the bits in the interrupt status register 0x0040, and the interrupt mask 0x0048. If a bit is cleared in the mask, then we want our ISR to execute.

• bit 31 Encoder Start Capture
• bit 30 Encoder EOS
• bit 29 Encoder VBI capture
• bit 28 Encoder Video Input Module reset event
• bit 27 Encoder DMA complete
• bit 24 Decoder audio mode change detection event (through event notification)
• bit 22 Decoder data request
• bit 20 Decoder DMA complete
• bit 19 Decoder VBI re-insertion
• bit 18 Decoder DMA err (linked-list bad)

Missing documentation

• Encoder API post(?)
• Decoder API post(?)
• Decoder VTRACE event

The cx2341x firmware upload

This document describes how to upload the cx2341x firmware to the card.
**How to find**

See the web pages of the various projects that uses this chip for information on how to obtain the firmware.

The firmware stored in a Windows driver can be detected as follows:

- Each firmware image is 256k bytes.
- The 1st 32-bit word of the Encoder image is 0x0000da7
- The 1st 32-bit word of the Decoder image is 0x00003a7
- The 2nd 32-bit word of both images is 0xaa55bb66

**How to load**

- Issue the FWapi command to stop the encoder if it is running. Wait for the command to complete.
- Issue the FWapi command to stop the decoder if it is running. Wait for the command to complete.
- Issue the I2C command to the digitizer to stop emitting VSYNC events.
- Issue the FWapi command to halt the encoder’s firmware.
- Sleep for 10ms.
- Issue the FWapi command to halt the decoder’s firmware.
- Sleep for 10ms.
- Write 0x00000000 to register 0x2800 to stop the Video Display Module.
- Write 0x00000005 to register 0x2D00 to stop the AO (audio output?).
- Write 0x00000000 to register 0xA064 to ping? the APU.
- Write 0xFFFFFFFFFE to register 0x9058 to stop the VPU.
- Write 0xFFFFFFFFFF to register 0x9054 to reset the HW blocks.
- Write 0x00000001 to register 0x9050 to stop the SPU.
- Sleep for 10ms.
- Write 0x00000001A to register 0x07FC to init the Encoder SDRAM’s pre-charge.
- Write 0x80000640 to register 0x07F8 to init the Encoder SDRAM’s refresh to 1us.
- Write 0x0000001A to register 0x08FC to init the Decoder SDRAM’s pre-charge.
- Write 0x80000640 to register 0x08F8 to init the Decoder SDRAM’s refresh to 1us.
- Sleep for 512ms. (600ms is recommended)
- Transfer the encoder’s firmware image to offset 0 in Encoder memory space.
- Transfer the decoder’s firmware image to offset 0 in Decoder memory space.
- Use a read-modify-write operation to Clear bit 0 of register 0x9050 to re-enable the SPU.
• Sleep for 1 second.
• Use a read-modify-write operation to Clear bits 3 and 0 of register 0x9058 to re-enable the VPU.
• Sleep for 1 second.
• Issue status API commands to both firmware images to verify.

How to call the firmware API

The preferred calling convention is known as the firmware mailbox. The mailboxes are basically a fixed length array that serves as the call-stack.

Firmware mailboxes can be located by searching the encoder and decoder memory for a 16 byte signature. That signature will be located on a 256-byte boundary.
Signature:

0x78, 0x56, 0x34, 0x12, 0x12, 0x78, 0x56, 0x34, 0x34, 0x12, 0x78, 0x56, 0x56, 0x34, 0x12, 0x78

The firmware implements 20 mailboxes of 20 32-bit words. The first 10 are reserved for API calls. The second 10 are used by the firmware for event notification.

<table>
<thead>
<tr>
<th>Index</th>
<th>Name</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>Flags</td>
</tr>
<tr>
<td>1</td>
<td>Command</td>
</tr>
<tr>
<td>2</td>
<td>Return value</td>
</tr>
<tr>
<td>3</td>
<td>Timeout</td>
</tr>
<tr>
<td>4-19</td>
<td>Parameter/Result</td>
</tr>
</tbody>
</table>

The flags are defined in the following table. The direction is from the perspective of the firmware.

<table>
<thead>
<tr>
<th>Bit</th>
<th>Direction</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>2</td>
<td>O</td>
<td>Firmware has processed the command.</td>
</tr>
<tr>
<td>1</td>
<td>I</td>
<td>Driver has finished setting the parameters.</td>
</tr>
<tr>
<td>0</td>
<td>I</td>
<td>Driver is using this mailbox.</td>
</tr>
</tbody>
</table>

The command is a 32-bit enumerator. The API specifics may be found in this chapter.
The return value is a 32-bit enumerator. Only two values are currently defined:
• 0 = success
• -1 = command undefined.

There are 16 parameters/results 32-bit fields. The driver populates these fields with values for all the parameters required by the call. The driver overwrites these fields with result values returned by the call.
The timeout value protects the card from a hung driver thread. If the driver doesn’t handle the completed call within the timeout specified, the firmware will reset that mailbox.
To make an API call, the driver iterates over each mailbox looking for the first one available (bit 0 has been cleared). The driver sets that bit, fills in the command enumerator, the timeout value and any required parameters. The driver then sets the parameter ready bit (bit 1). The firmware scans the mailboxes for pending commands, processes them, sets the result code, populates the result value array with that call’s return values and sets the call complete bit (bit 2). Once bit 2 is set, the driver should retrieve the results and clear all the flags. If the driver does not perform this task within the time set in the timeout register, the firmware will reset that mailbox.

Event notifications are sent from the firmware to the host. The host tells the firmware which events it is interested in via an API call. That call tells the firmware which notification mailbox to use. The firmware signals the host via an interrupt. Only the 16 Results fields are used, the Flags, Command, Return value and Timeout words are not used.

**OSD firmware API description**

**Note:** this API is part of the decoder firmware, so it’s cx23415 only.

**CX2341X_OSD_GET_FRAMEBUFFER**

Enum: 65/0x41

**Description**

Return base and length of contiguous OSD memory.

**Result[0]**

OSD base address

**Result[1]**

OSD length

**CX2341X_OSD_GET_PIXEL_FORMAT**

Enum: 66/0x42
Description
Query OSD format

Result[0]

0=8bit index 1=16bit RGB 5:6:5 2=16bit ARGB 1:5:5:5 3=16bit ARGB 1:4:4:4 4=32bit ARGB 8:8:8:8

CX2341X_OSD_SET_PIXEL_FORMAT

Enum: 67/0x43

Description
Assign pixel format

Param[0]

- 0=8bit index
- 1=16bit RGB 5:6:5
- 2=16bit ARGB 1:5:5:5
- 3=16bit ARGB 1:4:4:4
- 4=32bit ARGB 8:8:8:8

CX2341X_OSD_GET_STATE

Enum: 68/0x44

Description
Query OSD state

Result[0]

- Bit 0 0=off, 1=on
- Bits 1:2 alpha control
- Bits 3:5 pixel format
**CX2341X_OSD_SET_STATE**

Enum: 69/0x45

**Description**

OSD switch

**Param[0]**

0=off, 1=on

**CX2341X_OSD_GET_OSD_COORDS**

Enum: 70/0x46

**Description**

Retrieve coordinates of OSD area blended with video

**Result[0]**

OSD buffer address

**Result[1]**

Stride in pixels

**Result[2]**

Lines in OSD buffer

**Result[3]**

Horizontal offset in buffer
Result[4]

buffer stride in pixels

**Param[2]**

lines in buffer

**Param[3]**

horizontal offset

**Param[4]**

vertical offset

**CX2341X_OSD_GET_SCREEN_COORDS**

Enum: 72/0x48
Description

Retrieve OSD screen area coordinates

Result[0]

top left horizontal offset

Result[1]

top left vertical offset

Result[2]

bottom right horizontal offset

Result[3]

bottom right vertical offset

**CX2341X_OSD_SET_SCREEN_COORDS**

Enum: 73/0x49

Description

Assign the coordinates of the screen area to blend with video

**Param[0]**

top left horizontal offset

**Param[1]**

top left vertical offset
**Param[2]**

bottom left horizontal offset

**Param[3]**

bottom left vertical offset

**CX2341X_OSD_GET_GLOBAL_ALPHA**

Enum: 74/0x4A

**Description**

Retrieve OSD global alpha

**Result[0]**

global alpha: 0=off, 1=on

**Result[1]**

bits 0:7 global alpha

**CX2341X_OSD_SET_GLOBAL_ALPHA**

Enum: 75/0x4B

**Description**

Update global alpha

**Param[0]**

global alpha: 0=off, 1=on
**Param[1]**

Global alpha (8 bits)

**Param[2]**

Local alpha: 0=on, 1=off

**CX2341X_OSD_SET_BLEND_COORDS**

Enum: 78/0x4C

**Description**

Move start of blending area within display buffer

**Param[0]**

Horizontal offset in buffer

**Param[1]**

Vertical offset in buffer

**CX2341X_OSD_GET_FLICKER_STATE**

Enum: 79/0x4F

**Description**

Retrieve flicker reduction module state

**Result[0]**

Flicker state: 0=off, 1=on
CX2341X_OSD_SET_FLICKER_STATE

Enum: 80/0x50

Description

Set flicker reduction module state

Param[0]

State: 0=off, 1=on

CX2341X_OSD_BLT_COPY

Enum: 82/0x52

Description

**CX2341X_OSD_SET_FRAMEBUFFER_WINDOW**

Enum: 86/0x56

**Description**

Positions the main output window on the screen. The coordinates must be such that the entire window fits on the screen.

**Param[0]**

window width

**Param[1]**

window height

**Param[2]**

top left window corner horizontal offset
Param[3]

top left window corner vertical offset

**CX2341X\_OSD\_SET\_CHROMA\_KEY**

Enum: 96/0x60

**Description**

Chroma key switch and color

**Param[0]**

state: 0=off, 1=on

**Param[1]**

color

**CX2341X\_OSD\_GET\_ALPHA\_CONTENT\_INDEX**

Enum: 97/0x61

**Description**

Retrieve alpha content index

**Result[0]**

alpha content index, Range 0:15

**CX2341X\_OSD\_SET\_ALPHA\_CONTENT\_INDEX**

Enum: 98/0x62
Description

Assign alpha content index

Param[0]

alpha content index, range 0:15

Encoder firmware API description

CX2341X_ENC_PING_FW

Enum: 128/0x80

Description

Does nothing. Can be used to check if the firmware is responding.

CX2341X_ENC_START_CAPTURE

Enum: 129/0x81

Description

Commences the capture of video, audio and/or VBI data. All encoding parameters must be initialized prior to this API call. Captures frames continuously or until a predefined number of frames have been captured.

Param[0]

Capture stream type:

- 0=MPEG
- 1=Raw
- 2=Raw passthrough
- 3=VBI
**Param[1]**

Bitmask:
- Bit 0 when set, captures YUV
- Bit 1 when set, captures PCM audio
- Bit 2 when set, captures VBI (same as param[0]=3)
- Bit 3 when set, the capture destination is the decoder (same as param[0]=2)
- Bit 4 when set, the capture destination is the host

**Note:** this parameter is only meaningful for RAW capture type.

---

**CX2341X_ENC_STOP_CAPTURE**

Enum: 130/0x82

**Description**

Ends a capture in progress

**Param[0]**

- 0=stop at end of GOP (generates IRQ)
- 1=stop immediate (no IRQ)

**Param[1]**

Stream type to stop, see param[0] of API 0x81

**Param[2]**

Subtype, see param[1] of API 0x81

---

**CX2341X_ENC_SET_AUDIO_ID**

Enum: 137/0x89
**Description**

Assigns the transport stream ID of the encoded audio stream

**Param[0]**

Audio Stream ID

**CX2341X_ENC_SET_VIDEO_ID**

Enum: 139/0x8B

**Description**

Set video transport stream ID

**Param[0]**

Video stream ID

**CX2341X_ENC_SET_PCR_ID**

Enum: 141/0x8D

**Description**

Assigns the transport stream ID for PCR packets

**Param[0]**

PCR Stream ID

**CX2341X_ENC_SET_FRAME_RATE**

Enum: 143/0x8F
**Description**

Set video frames per second. Change occurs at start of new GOP.

**Param[0]**

- 0=30fps
- 1=25fps

**CX2341X ENC_SET_FRAME_SIZE**

Enum: 145/0x91

**Description**

Select video stream encoding resolution.

**Param[0]**

Height in lines. Default 480

**Param[1]**

Width in pixels. Default 720

**CX2341X ENC_SET_BIT_RATE**

Enum: 149/0x95

**Description**

Assign average video stream bitrate.

**Param[0]**

0=variable bitrate, 1=constant bitrate
**Linux Media Documentation**

**Param[1]**

bitrate in bits per second

**Param[2]**

peak bitrate in bits per second, divided by 400

**Param[3]**

Mux bitrate in bits per second, divided by 400. May be 0 (default).

**Param[4]**

Rate Control VBR Padding

**Param[5]**

VBV Buffer used by encoder

**Note:**

1) Param[3] and Param[4] seem to be always 0
2) Param[5] doesn’t seem to be used.

**CX2341X_ENC_SET_GOP_PROPERTIES**

Enum: 151/0x97

**Description**

Setup the GOP structure

**Param[0]**

GOP size (maximum is 34)
**Param[1]**

Number of B frames between the I and P frame, plus 1. For example: IBBPBBPBBPBB -> GOP size: 12, number of B frames: 2+1 = 3

**Note:** GOP size must be a multiple of (B-frames + 1).

---

**CX2341X_ENC_SET_ASPECT_RATIO**

Enum: 153/0x99

**Description**

Sets the encoding aspect ratio. Changes in the aspect ratio take effect at the start of the next GOP.

**Param[0]**

- ‘0000’ forbidden
- ‘0001’ 1:1 square
- ‘0010’ 4:3
- ‘0011’ 16:9
- ‘0100’ 2.21:1
- ‘0101’ to ‘1111’ reserved

**CX2341X_ENC_SET_DNR_FILTER_MODE**

Enum: 155/0x9B

**Description**

Assign Dynamic Noise Reduction operating mode
**Param[0]**

Bit0: Spatial filter, set=auto, clear=manual  Bit1: Temporal filter, set=auto, clear=manual

**Param[1]**

Median filter:

- 0=Disabled
- 1=Horizontal
- 2=Vertical
- 3=Horiz/Vert
- 4=Diagonal

**CX2341X_ENC_SET_DNR_FILTER_PROPS**

Enum: 157/0x9D

**Description**

These Dynamic Noise Reduction filter values are only meaningful when the respective filter is set to “manual” (See API 0x9B)

**Param[0]**

Spatial filter: default 0, range 0:15

**Param[1]**

Temporal filter: default 0, range 0:31

**CX2341X_ENC_SET_CORING_LEVELS**

Enum: 159/0x9F
Description

Assign Dynamic Noise Reduction median filter properties.

Param[0]

Threshold above which the luminance median filter is enabled. Default: 0, range 0:255

Param[1]

Threshold below which the luminance median filter is enabled. Default: 255, range 0:255

Param[2]

Threshold above which the chrominance median filter is enabled. Default: 0, range 0:255

Param[3]

Threshold below which the chrominance median filter is enabled. Default: 255, range 0:255

**CX2341X_ENC_SET_SPATIAL_FILTER_TYPE**

Enum: 161/0xA1

Description

Assign spatial prefilter parameters

Param[0]

Luminance filter
  • 0=Off
  • 1=1D Horizontal
  • 2=1D Vertical
  • 3=2D H/V Separable (default)
  • 4=2D Symmetric non-separable
**Param[1]**

Chrominance filter
- 0=Off
- 1=1D Horizontal (default)

**CX2341X_ENC_SET_VBI_LINE**

Enum: 183/0xB7

**Description**

Selects VBI line number.

**Param[0]**

- Bits 0:4 line number
- Bit 31 0=top_field, 1=bottom_field
- Bits 0:31 all set specifies “all lines”

**Param[1]**

VBI line information features: 0=disabled, 1=enabled

**Param[2]**

Slicing: 0=None, 1=Closed Caption Almost certainly not implemented. Set to 0.

**Param[3]**

Luminance samples in this line. Almost certainly not implemented. Set to 0.

**Param[4]**

Chrominance samples in this line Almost certainly not implemented. Set to 0.
**CX2341X_ENC_SET_STREAM_TYPE**

Enum: 185/0xB9

**Description**

Assign stream type

**Note:** Transport stream is not working in recent firmwares. And in older firmwares the timestamps in the TS seem to be unreliable.

**Param[0]**

- 0=Program stream
- 1=Transport stream
- 2=MPEG1 stream
- 3=PES A/V stream
- 5=PES Video stream
- 7=PES Audio stream
- 10=DVD stream
- 11=VCD stream
- 12=SVCD stream
- 13=DVD_S1 stream
- 14=DVD_S2 stream

**CX2341X_ENC_SET_OUTPUT_PORT**

Enum: 187/0xBB

**Description**

Assign stream output port. Normally 0 when the data is copied through the PCI bus (DMA), and 1 when the data is streamed to another chip (pvrusb and cx88-blackbird).
**Param[0]**

- 0 = Memory (default)
- 1 = Streaming
- 2 = Serial

**Param[1]**

Unknown, but leaving this to 0 seems to work best. Indications are that this might have to do with USB support, although passing anything but 0 only breaks things.

**CX2341X_ENC_SET_AUDIO_PROPERTIES**

Enum: 189/0xBD

**Description**

Set audio stream properties, may be called while encoding is in progress.

**Note:** All bitfields are consistent with ISO11172 documentation except bits 2:3 which ISO docs define as:

- ‘11’ Layer I
- ‘10’ Layer II
- ‘01’ Layer III
- ‘00’ Undefined

This discrepancy may indicate a possible error in the documentation. Testing indicated that only Layer II is actually working, and that the minimum bitrate should be 192 kbps.

**Param[0]**

Bitmask:

**CX2341X_ENC_HALT_FW**

Enum: 195/0xC3

**Description**

The firmware is halted and no further API calls are serviced until the firmware is uploaded again.

**CX2341X_ENC_GET_VERSION**

Enum: 196/0xC4

**Description**

Returns the version of the encoder firmware.

**Result[0]**

Version bitmask: - Bits 0:15 build - Bits 16:23 minor - Bits 24:31 major

**CX2341X_ENC_SET_GOP_CLOSURE**

Enum: 197/0xC5

**Description**

Assigns the GOP open/close property.

**Param[0]**

- 0=Open
- 1=Closed

**CX2341X_ENC_GET_SEQ_END**

Enum: 198/0xC6
**Description**

Obtains the sequence end code of the encoder’s buffer. When a capture is started a number of interrupts are still generated, the last of which will have Result[0] set to 1 and Result[1] will contain the size of the buffer.

**Result[0]**

State of the transfer (1 if last buffer)

**Result[1]**

If Result[0] is 1, this contains the size of the last buffer, undefined otherwise.

**CX2341X_ENC_SET_PGM_INDEX_INFO**

Enum: 199/0xC7

**Description**

Sets the Program Index Information. The information is stored as follows:

```c
struct info {
    u32 length;               // Length of this frame
    u32 offset_low;           // Offset in the file of the
    u32 offset_high;          // start of this frame
    u32 mask1;                // Bits 0-2 are the type mask:
                              // 1=I, 2=P, 4=B
    u32 pts;                  // The PTS of the frame
    u32 mask2;                // Bit 0 is bit 32 of the pts.  
};

u32 table_ptr;
struct info index[400];
```

The table_ptr is the encoder memory address in the table were new entries will be written.

**Note:** This is a ringbuffer, so the table_ptr will wraparound.
**Param[0]**

Picture Mask: - 0=No index capture - 1=I frames - 3=I,P frames - 7=I,P,B frames
(Seems to be ignored, it always indexes I, P and B frames)

**Param[1]**

Elements requested (up to 400)

**Result[0]**

Offset in the encoder memory of the start of the table.

**Result[1]**

Number of allocated elements up to a maximum of Param[1]

**CX2341X_ENC_SET_VBI_CONFIG**

Enum: 200/0xC8

**Description**

Configure VBI settings

**Param[0]**

Bitmap:

<table>
<thead>
<tr>
<th>Mode</th>
<th>Insertion</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>'000' insert in extension &amp; user data</td>
</tr>
<tr>

<td>'001' insert in private packets</td>
</tr>
<tr>
<td></td>
<td>'010' separate stream and user data</td>
</tr>
<tr>
<td></td>
<td>'111' separate stream and private data</td>
</tr>
<tr>
<td>8:15</td>
<td>Stream ID (normally 0xBD)</td>
</tr>
</tbody>
</table>

582 Chapter 2. Media subsystem kernel internal API
**Param[1]**

Frames per interrupt (max 8). Only valid in raw mode.

**Param[2]**

Total raw VBI frames. Only valid in raw mode.

**Param[3]**

Start codes

**Param[4]**

Stop codes

**Param[5]**

Lines per frame

**Param[6]**

Byte per line

**Result[0]**

Observed frames per interrupt in raw mode only. Range 1 to Param[1]

**Result[1]**

Observed number of frames in raw mode. Range 1 to Param[2]

**Result[2]**

Memory offset to start or raw VBI data
**CX2341X_ENC_SET_DMA_BLOCK_SIZE**

Enum: 201/0xC9

**Description**

Set DMA transfer block size

**Param[0]**

DMA transfer block size in bytes or frames. When unit is bytes, supported block sizes are $2^7$, $2^8$ and $2^9$ bytes.

**Param[1]**

Unit: 0=bytes, 1=frames

---

**CX2341X_ENC_GET_PREV_DMA_INFO_MB_10**

Enum: 202/0xCA

**Description**

Returns information on the previous DMA transfer in conjunction with bit 27 of the interrupt mask. Uses mailbox 10.

**Result[0]**

Type of stream

**Result[1]**

Address Offset

**Result[2]**

Maximum size of transfer
CX2341X_ENC_GET_PREV_DMA_INFO_MB_9

Enum: 203/0xCB

**Description**

Returns information on the previous DMA transfer in conjunction with bit 27 or 18 of the interrupt mask. Uses mailbox 9.

**Result[0]**

Status bits: - 0 read completed - 1 write completed - 2 DMA read error - 3 DMA write error - 4 Scatter-Gather array error

**Result[1]**

DMA type

**Result[2]**

Presentation Time Stamp bits 0..31

**Result[3]**

Presentation Time Stamp bit 32

CX2341X_ENC_SCHED_DMA_TO_HOST

Enum: 204/0xCC

**Description**

Setup DMA to host operation

**Param[0]**

Memory address of link list
Param[1]

Length of link list (wtf: what units ???)

Param[2]

DMA type (0=MPEG)

**CX2341X_ENC_INITIALIZE_INPUT**

Enum: 205/0xCD

**Description**

Initializes the video input

**CX2341X_ENC_SET_FRAME_DROP_RATE**

Enum: 208/0xD0

**Description**

For each frame captured, skip specified number of frames.

Param[0]

Number of frames to skip

**CX2341X_ENC_PAUSE_ENCODER**

Enum: 210/0xD2

**Description**

During a pause condition, all frames are dropped instead of being encoded.
Param[0]

- 0=Pause encoding
- 1=Continue encoding

**CX2341X_ENC_REFRESH_INPUT**

Enum: 211/0xD3

**Description**

Refreshes the video input

**CX2341X_ENC_SET_COPYRIGHT**

Enum: 212/0xD4

**Description**

Sets stream copyright property

Param[0]

- 0=Stream is not copyrighted
- 1=Stream is copyrighted

**CX2341X_ENC_SET_EVENT_NOTIFICATION**

Enum: 213/0xD5

**Description**

Setup firmware to notify the host about a particular event. Host must unmask the interrupt bit.
**Param[0]**

Event (0=refresh encoder input)

**Param[1]**

Notification 0=disabled 1=enabled

**Param[2]**

Interrupt bit

**Param[3]**

Mailbox slot, -1 if no mailbox required.

**CX2341X_ENC_SET_NUM_VSYNC_LINES**

Enum: 214/0xD6

**Description**

Depending on the analog video decoder used, this assigns the number of lines for field 1 and 2.

**Param[0]**

Field 1 number of lines: -0x00EF for SAA7114 - 0x00F0 for SAA7115 - 0x0105 for Micronas

**Param[1]**

Field 2 number of lines: -0x00EF for SAA7114 - 0x00F0 for SAA7115 - 0x0106 for Micronas

**CX2341X_ENC_SET_PLACEHOLDER**

Enum: 215/0xD7
Description

Provides a mechanism of inserting custom user data in the MPEG stream.

**Param[0]**

- 0=extension & user data
- 1=private packet with stream ID 0xBD

**Param[1]**

Rate at which to insert data, in units of frames (for private packet) or GOPs (for ext. & user data)

**Param[2]**

Number of data DWORDs (below) to insert

**Param[3]**

Custom data 0

**Param[4]**

Custom data 1

**Param[5]**

Custom data 2

**Param[6]**

Custom data 3

**Param[7]**

Custom data 4
Param[8]
Custom data 5

Param[9]
Custom data 6

Param[10]
Custom data 7

Param[11]
Custom data 8

**CX2341X_ENC_MUTE_VIDEO**

Enum: 217/0xD9

**Description**

Video muting

**Param[0]**

Bit usage:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Usage</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>'0'=video not muted</td>
</tr>
<tr>
<td></td>
<td>'1'=video muted, creates frames with the YUV color defined below</td>
</tr>
<tr>
<td>1:7</td>
<td>Unused</td>
</tr>
<tr>
<td>8:15</td>
<td>V chrominance information</td>
</tr>
<tr>
<td>16:23</td>
<td>U chrominance information</td>
</tr>
<tr>
<td>24:31</td>
<td>Y luminance information</td>
</tr>
</tbody>
</table>

**CX2341X_ENC_MUTE_AUDIO**

Enum: 218/0xDA
Description

Audiomuting

Param[0]

- 0 = audio not muted
- 1 = audio muted (produces silent mpeg audio stream)

CX2341X_ENC_SET_VERT_CROP_LINE

Enum: 219/0xDB

Description

Something to do with ‘Vertical Crop Line’

Param[0]

If saa7114 and raw VBI capture and 60 Hz, then set to 10001. Else 0.

CX2341X_ENC_MISC

Enum: 220/0xDC

Description

Miscellaneous actions. Not known for 100% what it does. It’s really a sort of ioctl call. The first parameter is a command number, the second the value.

Param[0]

Command number:

1= set initial SCR value when starting encoding (works).
2= set quality mode (apparently some test setting).
3= setup advanced VIM protection handling.
   Always 1 for the cx23416 and 0 for cx23415.
4= generate DVD compatible PTS timestamps
5= USB flush mode
6= something to do with the quantization matrix
7= set navigation pack insertion for DVD: adds 0xbf (private stream 2) packets to the MPEG. The size of these packets is 2048 bytes (including the header of 6 bytes: 0x000001bf + length). The payload is zeroed and it is up to the application to fill them in. These packets are apparently
inserted every four frames.
8=enable scene change detection (seems to be a failure)
9=set history parameters of the video input module
10=set input field order of VIM
11=set quantization matrix
12=reset audio interface after channel change or input switch (has no argument).
   Needed for the cx2584x, not needed for the mspx4xx, but it doesn't seem to do any harm calling it regardless.
13=set audio volume delay
14=set audio delay

**Param[1]**

Command value.

**Decoder firmware API description**

**Note:** this API is part of the decoder firmware, so it's cx23415 only.

**CX2341X_DEC_PING_FW**

Enum: 0/0x00

**Description**

This API call does nothing. It may be used to check if the firmware is responding.

**CX2341X_DEC_START_PLAYBACK**

Enum: 1/0x01

**Description**

Begin or resume playback.
**Param[0]**

0 based frame number in GOP to begin playback from.

**Param[1]**

Specifies the number of muted audio frames to play before normal audio resumes. (This is not implemented in the firmware, leave at 0)

**CX2341X_DEC_STOP_PLAYBACK**

Enum: 2/0x02

**Description**

Ends playback and clears all decoder buffers. If PTS is not zero, playback stops at specified PTS.

**Param[0]**

Display 0=last frame, 1=black

**Note:** this takes effect immediately, so if you want to wait for a PTS, then use ‘0’, otherwise the screen goes to black at once. You can call this later (even if there is no playback) with a 1 value to set the screen to black.

**Param[1]**

PTS low

**Param[2]**

PTS high

**CX2341X_DEC_SET_PLAYBACK_SPEED**

Enum: 3/0x03
**Description**

Playback stream at speed other than normal. There are two modes of operation:

- **Smooth**: host transfers entire stream and firmware drops unused frames.
- **Coarse**: host drops frames based on indexing as required to achieve desired speed.

**Param[0]**

<table>
<thead>
<tr>
<th>Bitmap</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>0:7</td>
<td>0 normal</td>
</tr>
<tr>
<td></td>
<td>1 fast only &quot;1.5 times&quot;</td>
</tr>
<tr>
<td></td>
<td>n nX fast, 1/nX slow</td>
</tr>
<tr>
<td>30</td>
<td>Framedrop:</td>
</tr>
<tr>
<td></td>
<td>'0' during 1.5 times play, every other B frame is dropped</td>
</tr>
<tr>
<td></td>
<td>'1' during 1.5 times play, stream is unchanged (bitrate must not exceed 8mbps)</td>
</tr>
<tr>
<td>31</td>
<td>Speed:</td>
</tr>
<tr>
<td></td>
<td>'0' slow</td>
</tr>
<tr>
<td></td>
<td>'1' fast</td>
</tr>
</tbody>
</table>

**Note**: n is limited to 2. Anything higher does not result in faster playback. Instead the host should start dropping frames.

**Param[1]**

Direction: 0=forward, 1=reverse

**Note**: to make reverse playback work you have to write full GOPs in reverse order.

**Param[2]**

<table>
<thead>
<tr>
<th>Picture mask:</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1=I frames</td>
<td></td>
</tr>
<tr>
<td>3=I, P frames</td>
<td></td>
</tr>
<tr>
<td>7=I, P, B frames</td>
<td></td>
</tr>
</tbody>
</table>
**Param[3]**

B frames per GOP (for reverse play only)

**Note:** for reverse playback the Picture Mask should be set to I or I, P. Adding B frames to the mask will result in corrupt video. This field has to be set to the correct value in order to keep the timing correct.

---

**Param[4]**

Mute audio: 0=disable, 1=enable

**Param[5]**

Display 0=frame, 1=field

**Param[6]**

Specifies the number of muted audio frames to play before normal audio resumes. (Not implemented in the firmware, leave at 0)

---

**CX2341X_DEC_STEP_VIDEO**

Enum: 5/0x05

**Description**

Each call to this API steps the playback to the next unit defined below in the current playback direction.

**Param[0]**

0=frame, 1=top field, 2=bottom field

---

**CX2341X_DEC_SET_DMA_BLOCK_SIZE**

Enum: 8/0x08
Description

Set DMA transfer block size. Counterpart to API 0xC9

Param[0]

DMA transfer block size in bytes. A different size may be specified when issuing the DMA transfer command.

**CX2341X_DEC_GET_XFER_INFO**

Enum: 9/0x09

Description

This API call may be used to detect an end of stream condition.

Result[0]

Stream type

Result[1]

Address offset

Result[2]

Maximum bytes to transfer

Result[3]

Buffer fullness

**CX2341X_DEC_GET_DMA_STATUS**

Enum: 10/0x0A
Description

Status of the last DMA transfer

Result[0]

Bit 1 set means transfer complete Bit 2 set means DMA error Bit 3 set means linked list error

Result[1]

DMA type: 0=MPEG, 1=OSD, 2=YUV

**CX2341X_DEC_SCHED_DMA_FROM_HOST**

Enum: 11/0x0B

Description

Setup DMA from host operation. Counterpart to API 0xCC

**Param[0]**

Memory address of link list

**Param[1]**

Total # of bytes to transfer

**Param[2]**

DMA type (0=MPEG, 1=OSD, 2=YUV)

**CX2341X_DEC_PAUSE_PLAYBACK**

Enum: 13/0x0D

2.9. Media driver-specific documentation
Description

Freeze playback immediately. In this mode, when internal buffers are full, no more data will be accepted and data request IRQs will be masked.

Param[0]

Display: 0=last frame, 1=black

CX2341X_DEC_HALT_FW

Enum: 14/0x0E

Description

The firmware is halted and no further API calls are serviced until the firmware is uploaded again.

CX2341X_DEC_SET_STANDARD

Enum: 16/0x10

Description

Selects display standard

Param[0]

0=NTSC, 1=PAL

CX2341X_DEC_GET_VERSION

Enum: 17/0x11

Description

Returns decoder firmware version information
Result[0]

Version bitmask:
• Bits 0:15 build
• Bits 16:23 minor
• Bits 24:31 major

CX2341X_DEC_SET_STREAM_INPUT

Enum: 20/0x14

Description
Select decoder stream input port

Param[0]
0=memory (default), 1=streaming

CX2341X_DEC_GET_TIMING_INFO

Enum: 21/0x15

Description
Returns timing information from start of playback

Result[0]
Frame count by decode order

Result[1]
Video PTS bits 0:31 by display order
Result[2]

Video PTS bit 32 by display order

Result[3]

SCR bits 0:31 by display order

Result[4]

SCR bit 32 by display order

**CX2341X_DEC_SET_AUDIO_MODE**

Enum: 22/0x16

**Description**

Select audio mode

**Param[0]**

**Dual mono mode action**: 0=Stereo, 1=Left, 2=Right, 3=Mono, 4=Swap, -1=Unchanged

**Param[1]**

**Stereo mode action**: 0=Stereo, 1=Left, 2=Right, 3=Mono, 4=Swap, -1=Unchanged

**CX2341X_DEC_SET_EVENT_NOTIFICATION**

Enum: 23/0x17

**Description**

Setup firmware to notify the host about a particular event. Counterpart to API 0xD5
Param[0]

Event:
- 0=Audio mode change between mono, (joint) stereo and dual channel.
- 3=Decoder started
- 4=Unknown: goes off 10-15 times per second while decoding.
- 5=Some sync event: goes off once per frame.

Param[1]

Notification 0=disabled, 1=enabled

Param[2]

Interrupt bit

Param[3]

Mailbox slot, -1 if no mailbox required.

**CX2341X_DEC_SET_DISPLAY_BUFFERS**

Enum: 24/0x18

Description

Number of display buffers. To decode all frames in reverse playback you must use nine buffers.

Param[0]

0=six buffers, 1=nine buffers

**CX2341X_DEC_EXTRACT_VBI**

Enum: 25/0x19
Description

Extracts VBI data

Param[0]

0=extract from extension & user data, 1=extract from private packets

Result[0]

VBI table location

Result[1]

VBI table size

**CX2341X_DEC_SET_DECODER_SOURCE**

Enum: 26/0x1A

Description

Selects decoder source. Ensure that the parameters passed to this API match the encoder settings.

Param[0]

Mode: 0=MPEG from host, 1=YUV from encoder, 2=YUV from host

Param[1]

YUV picture width

Param[2]

YUV picture height
Param[3]

Bitmap: see Param[0] of API 0xBD

**CX2341X_DEC_SET_PREBUFFERING**

Enum: 30/0x1E

**Description**

Decoder prebuffering, when enabled up to 128KB are buffered for streams <8mbps or 640KB for streams >8mbps

**Param[0]**

0=off, 1=on

**PVR350 Video decoder registers 0x02002800 -> 0x02002B00**

Author: Ian Armstrong <ian@iarmst.demon.co.uk>

Version: v0.4

Date: 12 March 2007

This list has been worked out through trial and error. There will be mistakes and omissions. Some registers have no obvious effect so it’s hard to say what they do, while others interact with each other, or require a certain load sequence. Horizontal filter setup is one example, with six registers working in unison and requiring a certain load sequence to correctly configure. The indexed colour palette is much easier to set at just two registers, but again it requires a certain load sequence.

Some registers are fussy about what they are set to. Load in a bad value & the decoder will fail. A firmware reload will often recover, but sometimes a reset is required. For registers containing size information, setting them to 0 is generally a bad idea. For other control registers i.e. 2878, you’ll only find out what values are bad when it hangs.

<table>
<thead>

</thead>
<tbody>
<tr>
<td></td>
<td>Decoder horizontal Y alias register 2</td>
</tr>
</tbody>
</table>
These six registers control the horizontal aliasing filter for the Y plane. The first five registers must all be loaded before accessing the trigger (2818), as this register actually clocks the data through for the first five.

To correctly program set the filter, this whole procedure must be done 16 times. The actual register contents are copied from a lookup-table in the firmware which contains 4 different filter settings.

These six registers control the horizontal aliasing for the UV plane. Operation is the same as the Y filter, with 2830 being the trigger register.
bits 0:15
  Decoder Y source width in pixels

bits 16:31
  Decoder Y destination width in pixels

---------------

2838
bits 0:15
  Decoder UV source width in pixels

bits 16:31
  Decoder UV destination width in pixels

NOTE: For both registers, the resulting image must be fully visible on
screen. If the image exceeds the right edge both the source and destination
size must be adjusted to reflect the visible portion. For the source width,
you must take into account the scaling when calculating the new value.

---------------

283C
bits 0:31
  Decoder Y horizontal scaling
    Normally = Reg 2854 >> 2

---------------

2840
bits 0:31
  Decoder ?? unknown - horizontal scaling
    Usually 0x00000514

---------------

2844
bits 0:31
  Decoder UV horizontal scaling
    Normally = Reg 2854 >> 2

---------------

2848
bits 0:31
  Decoder ?? unknown - horizontal scaling
    Usually 0x00100514

---------------

284C
bits 0:31
  Decoder ?? unknown - Y plane
    Usually 0x00200020

---------------

2850
bits 0:31
  Decoder ?? unknown - UV plane
    Usually 0x00200020

---------------

2854
bits 0:31
  Decoder 'master' value for horizontal scaling

---------------

2858
bits 0:31
  Decoder ?? unknown
    Usually 0
Most of these registers either control horizontal scaling, or appear linked to it in some way. Register 2854 contains the 'master' value & the other registers can be calculated from that one. You must also remember to correctly set the divider in Reg 2874.

To enlarge:
\[
\text{Reg 2854} = (\text{source_width} \times 0x00200000) / \text{destination_width}
\]
\[
\text{Reg 2874} = \text{No divide}
\]

To reduce from full size down to half size:
\[
\text{Reg 2854} = (\text{source_width}/2 \times 0x00200000) / \text{destination width}
\]
\[
\text{Reg 2874} = \text{Divide by 2}
\]

To reduce from half size down to quarter size:
\[
\text{Reg 2854} = (\text{source_width}/4 \times 0x00200000) / \text{destination width}
\]
\[
\text{Reg 2874} = \text{Divide by 4}
\]

The result is always rounded up.
Decoder horizontal UV output offset

Offsets the actual video output. Controls output alignment of the Y & UV planes. The higher the value, the greater the shift to the left. Use reg 2890 to move the image right.

------------------------------------------------------------------------
2874
bits 0:1
   Decoder horizontal Y output size divider
     00 = No divide
     01 = Divide by 2
     10 = Divide by 3

bits 4:5
   Decoder horizontal UV output size divider
     00 = No divide
     01 = Divide by 2
     10 = Divide by 3

bit 8
   Decoder ?? unknown
     0 = Normal
     1 = Affects video output levels

bit 16
   Decoder ?? unknown
     0 = Normal
     1 = Disable horizontal filter

------------------------------------------------------------------------
2878
bit 0
   ?? unknown

bit 1
   osd on/off
     0 = osd off
     1 = osd on

bit 2
   Decoder + osd video timing
     0 = NTSC
     1 = PAL

bits 3:4
   ?? unknown

bit 5
   Decoder + osd
      Swaps upper & lower fields

------------------------------------------------------------------------
287C
bits 0:10
   Decoder & osd ?? unknown
      Moves entire screen horizontally. Starts at 0x005 with the screen
shifted heavily to the right. Incrementing in steps of 0x004 will gradually shift the screen to the left.

bits 11:31
?? unknown

Normally contents are 0x00101111 (NTSC) or 0x1010111d (PAL)

-------------------------------
2880 -------- ?? unknown
2884 -------- ?? unknown
-------------------------------
2888
bit 0

Decoder + osd ?? unknown
0 = Normal
1 = Misaligned fields (Correctable through 289C & 28A4)

bit 4
?? unknown

bit 8
?? unknown

Warning: Bad values will require a firmware reload to recover.
Known to be bad are 0x000,0x011,0x100,0x111

-------------------------------
288C
bits 0:15

osd ?? unknown
Appears to affect the osd position stability. The higher the value the more unstable it becomes. Decoder output remains stable.

bits 16:31

osd ?? unknown
Same as bits 0:15

-------------------------------
2890
bits 0:11

Decoder output horizontal offset.

Horizontal offset moves the video image right. A small left shift is possible, but it's better to use reg 2870 for that due to its greater range.

NOTE: Video corruption will occur if video window is shifted off the right edge. To avoid this read the notes for 2834 & 2838.

-------------------------------
2894
bits 0:23

Decoder output video surround colour.

Contains the colour (in yuv) used to fill the screen when the video is running in a window.
bits 0:23
  Decoder video window colour
  Contains the colour (in yuv) used to fill the video window when the
  video is turned off.

bit 24
  Decoder video output
  0 = Video on
  1 = Video off

bit 28
  Decoder plane order
  0 = Y,UV
  1 = UV,Y

bit 29
  Decoder second plane byte order
  0 = Normal (UV)
  1 = Swapped (VU)

In normal usage, the first plane is Y & the second plane is UV. Though the
order of the planes can be swapped, only the byte order of the second plane
can be swapped. This isn't much use for the Y plane, but can be useful for
the UV plane.

--------------------------------------------------------------------------------
289C
bits 0:15
  Decoder vertical field offset 1

bits 16:31
  Decoder vertical field offset 2

Controls field output vertical alignment. The higher the number, the lower
the image on screen. Known starting values are 0x011E0017 (NTSC) &
0x01500017 (PAL)

--------------------------------------------------------------------------------
28A0
bits 0:15
  Decoder & osd width in pixels

bits 16:31
  Decoder & osd height in pixels

All output from the decoder & osd are disabled beyond this area. Decoder
output will simply go black outside of this region. If the osd tries to
exceed this area it will become corrupt.

--------------------------------------------------------------------------------
28A4
bits 0:11
  osd left shift.

Has a range of 0x770->0x7FF. With the exception of 0, any value outside of
this range corrupts the osd.

--------------------------------------------------------------------------------
28A8
bits 0:15
osd vertical field offset 1

bits 16:31
  osd vertical field offset 2

Controls field output vertical alignment. The higher the number, the lower
the image on screen. Known starting values are 0x011E0017 (NTSC) &
0x01500017 (PAL)

28AC -------- ?? unknown
  
V
28BC -------- ?? unknown

28C0
bit 0
  Current output field
  0 = first field
  1 = second field

bits 16:31
  Current scanline
  The scanline counts from the top line of the first field
  through to the last line of the second field.

28C4 -------- ?? unknown
  
V
28F8 -------- ?? unknown

28FC
bit 0
  ?? unknown
  0 = Normal
  1 = Breaks decoder & osd output

2900
bits 0:31
  Decoder vertical Y alias register 1

2904
bits 0:31
  Decoder vertical Y alias register 2

2908
bits 0:31
  Decoder vertical Y alias trigger

These three registers control the vertical aliasing filter for the Y plane. Operation is similar to the horizontal Y filter (2804). The only real
difference is that there are only two registers to set before accessing
the trigger register (2908). As for the horizontal filter, the values are
taken from a lookup table in the firmware, and the procedure must be
repeated 16 times to fully program the filter.
<table>
<thead>

<td>Decoder 'master' value for vertical scaling</td>
<td>bits 0:31</td>
</tr>
</tbody>
</table>

These three registers control the vertical aliasing filter for the UV plane. Operation is the same as the Y filter, with 2914 being the trigger.

NOTE: For both registers, the resulting image must be fully visible on screen. If the image exceeds the bottom edge both the source and destination size must be adjusted to reflect the visible portion. For the source height, you must take into account the scaling when calculating the new value.
Most of these registers either control vertical scaling, or appear linked to it in some way. Register 2930 contains the 'master' value & all other registers can be calculated from that one. You must also remember to correctly set the divider in Reg 296C.

To enlarge:

Reg 2930 = (source_height * 0x00200000) / destination_height
Reg 296C = No divide

To reduce from full size down to half size:

Reg 2930 = (source_height/2 * 0x00200000) / destination_height
Reg 296C = Divide by 2

To reduce from half down to quarter:

Reg 2930 = (source_height/4 * 0x00200000) / destination_height
Reg 296C = Divide by 4
2954
bits 0:15
   Decoder Y line index into display buffer, second field

bits 16:31
   Decoder Y vertical line skip, second field

2958
bits 0:15

bits 0:2
  osd colour mode
  000 = 8 bit indexed
  001 = 16 bit (565)
  010 = 15 bit (555)
  011 = 12 bit (444)
  100 = 32 bit (8888)

bits 4:5
  osd display bpp
  01 = 8 bit
  10 = 16 bit
  11 = 32 bit

bit 8
  osd global alpha
  0 = Off
  1 = On

bit 9
  osd local alpha
  0 = Off
  1 = On

bit 10
  osd colour key
  0 = Off
  1 = On

bit 11
  osd ?? unknown
  Must be 1

bit 13
osd colour space
0 = ARGB
1 = AYVU

bits 16:31
osd ?? unknown
Must be 0x001B (some kind of buffer pointer ?)

When the bits-per-pixel is set to 8, the colour mode is ignored and assumed to be 8 bit indexed. For 16 & 32 bits-per-pixel the colour depth is honoured, and when using a colour depth that requires fewer bytes than allocated the extra bytes are used as padding. So for a 32 bpp with 8 bit index colour, there are 3 padding bytes per pixel. It’s also possible to select 16bpp with a 32 bit colour mode. This results in the pixel width being doubled, but the color key will not work as expected in this mode.

Colour key is as it suggests. You designate a colour which will become completely transparent. When using 565, 555 or 444 colour modes, the colour key is always 16 bits wide. The colour to key on is set in Reg 2A18.

Local alpha works differently depending on the colour mode. For 32bpp & 8 bit indexed, local alpha is a per-pixel 256 step transparency, with 0 being transparent and 255 being solid. For the 16bpp modes 555 & 444, the unused bit(s) act as a simple transparency switch, with 0 being solid & 1 being fully transparent. There is no local alpha support for 16bit 565.

Global alpha is a 256 step transparency that applies to the entire osd, with 0 being transparent & 255 being solid.

It's possible to combine colour key, local alpha & global alpha.

2A04
bits 0:15
osd x coord for left edge

bits 16:31
osd y coord for top edge

2A08
bits 0:15
osd x coord for right edge

bits 16:31
osd y coord for bottom edge

For both registers, (0,0) = top left corner of the display area. These registers do not control the osd size, only where it's positioned & how much is visible. The visible osd area cannot exceed the right edge of the display, otherwise the osd will become corrupt. See reg 2A10 for setting osd width.

2A0C
bits 0:31
osd buffer index

An index into the osd buffer. Slowly incrementing this moves the osd left, wrapping around onto the right edge.
2A10
bits 0:11
    osd buffer 32 bit word width

Contains the width of the osd measured in 32 bit words. This means that all
colour modes are restricted to a byte width which is divisible by 4.

2A14
bits 0:15
    osd height in pixels

bits 16:32
    osd line index into buffer
    osd will start displaying from this line.

2A18
bits 0:31
    osd colour key

Contains the colour value which will be transparent.

2A1C
bits 0:7
    osd global alpha

Contains the global alpha value (equiv ivtvfbctl --alpha XX)

2A20 -------- ?? unknown

The cx231xx DMA engine

This page describes the structures and procedures used by the cx2341x DMA engine.
Introduction

The cx2341x PCI interface is busmaster capable. This means it has a DMA engine to efficiently transfer large volumes of data between the card and main memory without requiring help from a CPU. Like most hardware, it must operate on contiguous physical memory. This is difficult to come by in large quantities on virtual memory machines.

Therefore, it also supports a technique called “scatter-gather”. The card can transfer multiple buffers in one operation. Instead of allocating one large contiguous buffer, the driver can allocate several smaller buffers.

In practice, I’ve seen the average transfer to be roughly 80K, but transfers above 128K were not uncommon, particularly at startup. The 128K figure is important, because that is the largest block that the kernel can normally allocate. Even still, 128K blocks are hard to come by, so the driver writer is urged to choose a smaller block size and learn the scatter-gather technique.

Mailbox #10 is reserved for DMA transfer information.

Note: the hardware expects little-endian data (‘intel format’).

Flow

This section describes, in general, the order of events when handling DMA transfers. Detailed information follows this section.

- The card raises the Encoder interrupt.
- The driver reads the transfer type, offset and size from Mailbox #10.
- The driver constructs the scatter-gather array from enough free dma buffers to cover the size.
- The driver schedules the DMA transfer via the ScheduleDMAtoHost API call.
- The card raises the DMA Complete interrupt.
- The driver checks the DMA status register for any errors.
- The driver post-processes the newly transferred buffers.

NOTE! It is possible that the Encoder and DMA Complete interrupts get raised simultaneously. (End of the last, start of the next, etc.)

Mailbox #10

The Flags, Command, Return Value and Timeout fields are ignored.

- Name: Mailbox #10
- Results[0]: Type: 0: MPEG.
- Results[1]: Offset: The position relative to the card’s memory space.
- Results[2]: Size: The exact number of bytes to transfer.

My speculation is that since the StartCapture API has a capture type of “RAW” available, that the type field will have other values that correspond to YUV and PCM data.
**Scatter-Gather Array**

The scatter-gather array is a contiguously allocated block of memory that tells the card the source and destination of each data-block to transfer. Card “addresses” are derived from the offset supplied by Mailbox #10. Host addresses are the physical memory location of the target DMA buffer.

Each S-G array element is a struct of three 32-bit words. The first word is the source address, the second is the destination address. Both take up the entire 32 bits. The lowest 18 bits of the third word is the transfer byte count. The high-bit of the third word is the “last” flag. The last-flag tells the card to raise the DMA DONE interrupt. From hard personal experience, if you forget to set this bit, the card will still “work” but the stream will most likely get corrupted.

The transfer count must be a multiple of 256. Therefore, the driver will need to track how much data in the target buffer is valid and deal with it accordingly.

**Array Element:**
- 32-bit Source Address
- 32-bit Destination Address
- 14-bit reserved (high bit is the last flag)
- 18-bit byte count

**DMA Transfer Status**

Register 0x0004 holds the DMA Transfer Status:
- bit 0: read completed
- bit 1: write completed
- bit 2: DMA read error
- bit 3: DMA write error
- bit 4: Scatter-Gather array error

### 2.9.1.4 The cx88 driver

Author: Gerd Hoffmann

**Documentation missing at the cx88 datasheet**

MO_OUTPUT_FORMAT (0x310164)

</tbody>
</table>

GPIO 16(I believe) is tied to the IR port (if present).

From the data sheet:
- Register 24’h20004 PCI Interrupt Status
- bit [18] IR_SMP_INT Set when 32 input samples have been collected over
  - gpio[16] pin into GP_SAMPLE register.

What’s missing from the data sheet:
- Setup 4KHz sampling rate (roughly 2x oversampled; good enough for our RC5 compat remote)
- set register 0x35C050 to 0xa80a80

620 Chapter 2. Media subsystem kernel internal API
• enable sampling
• set register 0x35C054 to 0x5
• enable the IRQ bit 18 in the interrupt mask register (and provide for a handler)

GP_SAMPLE register is at 0x35C058

Bits are then right shifted into the GP_SAMPLE register at the specified rate; you get an interrupt when a full DWORD is received. You need to recover the actual RC5 bits out of the (oversampled) IR sensor bits. (Hint: look for the 0/1 and 1/0 crossings of the RC5 bi-phase data)
An actual raw RC5 code will span 2-3 DWORDS, depending on the actual alignment.
I’m pretty sure when no IR signal is present the receiver is always in a marking state (1); but stray light, etc can cause intermittent noise values as well. Remember, this is a free running sample of the IR receiver state over time, so don’t assume any sample starts at any particular place.

Additional info

This data sheet (google search) seems to have a lovely description of the RC5 basics: [http://www.atmel.com/dyn/resources/prod_documents/doc2817.pdf](http://www.atmel.com/dyn/resources/prod_documents/doc2817.pdf)
This document has more data: [http://www.nenya.be/beor/electronics/rc5.htm](http://www.nenya.be/beor/electronics/rc5.htm)
This document has a how to decode a bi-phase data stream: [http://www.ee.washington.edu/circuit_archive/text/ir_decode.txt](http://www.ee.washington.edu/circuit_archive/text/ir_decode.txt)

### 2.9.1.7 The pvrusb2 driver

Author: Mike Isely <isely@pobox.com>
Background

This driver is intended for the “Hauppauge WinTV PVR USB 2.0”, which is a USB 2.0 hosted TV Tuner. This driver is a work in progress. Its history started with the reverse-engineering effort by Björn Danielsson <pvrusb2@dax.nu> whose web page can be found here: http://pvrusb2.dax.nu/

From there Aurelien Alleaume <slts@free.fr> began an effort to create a video4linux compatible driver. I began with Aurelien’s last known snapshot and evolved the driver to the state it is in here.

More information on this driver can be found at: https://www.isely.net/pvrusb2.html

This driver has a strong separation of layers. They are very roughly:

1. Low level wire-protocol implementation with the device.
2. I2C adaptor implementation and corresponding I2C client drivers implemented elsewhere in V4L.
3. High level hardware driver implementation which coordinates all activities that ensure correct operation of the device.
4. A “context” layer which manages instancing of driver, setup, tear-down, arbitration, and interaction with high level interfaces appropriately as devices are hotplugged in the system.
5. High level interfaces which glue the driver to various published Linux APIs (V4L, sysfs, maybe DVB in the future).

The most important shearing layer is between the top 2 layers. A lot of work went into the driver to ensure that any kind of conceivable API can be laid on top of the core driver. (Yes, the driver internally leverages V4L to do its work but that really has nothing to do with the API published by the driver to the outside world.) The architecture allows for different APIs to simultaneously access the driver. I have a strong sense of fairness about APIs and also feel that it is a good design principle to keep implementation and interface isolated from each other. Thus while right now the V4L high level interface is the most complete, the sysfs high level interface will work equally well for similar functions, and there’s no reason I see right now why it shouldn’t be possible to produce a DVB high level interface that can sit right alongside V4L.

Building

To build these modules essentially amounts to just running “Make”, but you need the kernel source tree nearby and you will likely also want to set a few controlling environment variables first in order to link things up with that source tree. Please see the Makefile here for comments that explain how to do that.
Source file list / functional overview

(Note: The term “module” used below generally refers to loosely defined functional units within the pvrusb2 driver and bears no relation to the Linux kernel’s concept of a loadable module.)

pvrusb2-audio.[ch] - This is glue logic that resides between this driver and the msp3400.ko I2C client driver (which is found elsewhere in V4L).

pvrusb2-context.[ch] - This module implements the context for an instance of the driver. Everything else eventually ties back to or is otherwise instance within the data structures implemented here. Hotplugging is ultimately coordinated here. All high level interfaces tie into the driver through this module. This module helps arbitrate each interface’s access to the actual driver core, and is designed to allow concurrent access through multiple instances of multiple interfaces (thus you can for example change the tuner’s frequency through sysfs while simultaneously streaming video through V4L out to an instance of mplayer).

pvrusb2-debug.h - This header defines a printk() wrapper and a mask of debugging bit definitions for the various kinds of debug messages that can be enabled within the driver.

pvrusb2-debugifc.[ch] - This module implements a crude command line oriented debug interface into the driver. Aside from being part of the process for implementing manual firmware extraction (see the pvrusb2 web site mentioned earlier), probably I’m the only one who has ever used this. It is mainly a debugging aid.

pvrusb2-eeprom.[ch] - This is glue logic that resides between this driver and the tveeprom.ko module, which is itself implemented elsewhere in V4L.

pvrusb2-encoder.[ch] - This module implements all protocol needed to interact with the Conexant mpeg2 encoder chip within the pvrusb2 device. It is a crude echo of corresponding logic in ivtv, however the design goals (strict isolation) and physical layer (proxy through USB instead of PCI) are enough different that this implementation had to be completely different.

pvrusb2-hdw-internal.h - This header defines the core data structure in the driver used to track ALL internal state related to control of the hardware. Nobody outside of the core hardware-handling modules should have any business using this header. All external access to the driver should be through one of the high level interfaces (e.g. V4L, sysfs, etc), and in fact even those high level interfaces are restricted to the API defined in pvrusb2-hdw.h and NOT this header.

pvrusb2-hdw.h - This header defines the full internal API for controlling the hardware. High level interfaces (e.g. V4L, sysfs) will work through here.

pvrusb2-hdw.c - This module implements all the various bits of logic that handle overall control of a specific pvrusb2 device. (Policy, instantiation, and arbitration of pvrusb2 devices fall within the jurisdiction of pvrusb-context not here).

pvrusb2-i2c-chips-*.c - These modules implement the glue logic to tie together and configure various I2C modules as they attach to the I2C bus. There are two versions of this file. The “v4l2” version is intended to be used in-tree alongside V4L, where we implement just the logic that makes sense for a pure V4L environment. The “all” version is intended for use outside of V4L, where we might encounter other possibly “challenging” modules from ivtv or older kernel snapshots (or even the support modules in the standalone snapshot).
pvrusb2-i2c-cmd-v4l1.[ch] - This module implements generic V4L1 compatible commands to the I2C modules. It is here where state changes inside the pvrusb2 driver are translated into V4L1 commands that are in turn send to the various I2C modules.

pvrusb2-i2c-cmd-v4l2.[ch] - This module implements generic V4L2 compatible commands to the I2C modules. It is here where state changes inside the pvrusb2 driver are translated into V4L2 commands that are in turn send to the various I2C modules.

pvrusb2-i2c-core.[ch] - This module provides an implementation of a kernel-friendly I2C adaptor driver, through which other external I2C client drivers (e.g. msp3400, tuner, lirc) may connect and operate corresponding chips within the pvrusb2 device. It is through here that other V4L modules can reach into this driver to operate specific pieces (and those modules are in turn driven by glue logic which is coordinated by pvrusb2-hdw, doled out by pvrusb2-context, and then ultimately made available to users through one of the high level interfaces).

pvrusb2-io.[ch] - This module implements a very low level ring of transfer buffers, required in order to stream data from the device. This module is very low level. It only operates the buffers and makes no attempt to define any policy or mechanism for how such buffers might be used.

pvrusb2-ioread.[ch] - This module layers on top of pvrusb2-io.[ch] to provide a streaming API usable by a read() system call style of I/O. Right now this is the only layer on top of pvrusb2-io.[ch], however the underlying architecture here was intended to allow for other styles of I/O to be implemented with additional modules, like mmap()’ed buffers or something even more exotic.

pvrusb2-main.c - This is the top level of the driver. Module level and USB core entry points are here. This is our “main”.

pvrusb2-sysfs.[ch] - This is the high level interface which ties the pvrusb2 driver into sysfs. Through this interface you can do everything with the driver except actually stream data.

pvrusb2-tuner.[ch] - This is glue logic that resides between this driver and the tuner.ko I2C client driver (which is found elsewhere in V4L).

pvrusb2-util.h - This header defines some common macros used throughout the driver. These macros are not really specific to the driver, but they had to go somewhere.

pvrusb2-v4l2.[ch] - This is the high level interface which ties the pvrusb2 driver into video4linux. It is through here that V4L applications can open and operate the driver in the usual V4L ways. Note that ALL V4L functionality is published only through here and nowhere else.

pvrusb2-video-*.ch] - This is glue logic that resides between this driver and the saa711x.ko I2C client driver (which is found elsewhere in V4L). Note that saa711x.ko used to be known as saa7115.ko in ivtv. There are two versions of this; one is selected depending on the particular saa711[5x].ko that is found.

pvrusb2.h - This header contains compile time tunable parameters (and at the moment the driver has very little that needs to be tuned).
2.9.1.8 PXA-Camera Host Driver

Author: Robert Jarzmik <robert.jarzmik@free.fr>

Constraints

a) Image size for YUV422P format All YUV422P images are enforced to have width x height % 16 = 0. This is due to DMA constraints, which transfers only planes of 8 byte multiples.

Global video workflow

a) QCI stopped Initially, the QCI interface is stopped. When a buffer is queued (pxa_videobuf_ops->buf_queue), the QCI starts.

b) QCI started More buffers can be queued while the QCI is started without halting the capture. The new buffers are “appended” at the tail of the DMA chain, and smoothly captured one frame after the other.

Once a buffer is filled in the QCI interface, it is marked as “DONE” and removed from the active buffers list. It can be then requeued or dequeued by userland application.

Once the last buffer is filled in, the QCI interface stops.

c) Capture global finite state machine schema

![Finite State Machine Diagram]
DMA usage

a) DMA flow

- first buffer queued for capture Once a first buffer is queued for capture, the QCI is started, but data transfer is not started. On “End Of Frame” interrupt, the irq handler starts the DMA chain.
- capture of one videobuffer The DMA chain starts transferring data into videobuffer RAM pages. When all pages are transferred, the DMA irq is raised on “ENDINTR” status.
- finishing one videobuffer The DMA irq handler marks the videobuffer as “done”, and removes it from the active running queue Meanwhile, the next videobuffer (if there is one), is transferred by DMA.
- finishing the last videobuffer On the DMA irq of the last videobuffer, the QCI is stopped.

b) DMA prepared buffer will have this structure

```
+------------+-----+---------------+-----------------+
| desc-sg[0] | ... | desc-sg[last] | finisher/linker |
+------------+-----+---------------+-----------------+
```

This structure is pointed by dma->sg_cpu. The descriptors are used as follows:
- desc-sg[i]: i-th descriptor, transferring the i-th sg element to the video buffer scatter gather
- finisher: has ddadr=DADDR_STOP, dcmd=ENDIRQEN
- linker: has ddadr= desc-sg[0] of next video buffer, dcmd=0

For the next schema, let’s assume d0=desc-sg[0].. dN=desc-sg[N], “f” stands for finisher and “l” for linker. A typical running chain is:

```
<table>
<thead>
<tr>
<th>Videobuffer 1</th>
<th>Videobuffer 2</th>
</tr>
</thead>
<tbody>
<tr>
<td>+-----------+---+------------+---+</td>
<td></td>
</tr>
<tr>
<td>d0</td>
<td>..</td>
</tr>
</tbody>
</table>
```
After the chaining is finished, the chain looks like:

+---------+----+---+ +----+----+----+---+ +----+----+----+---+
| d0 | .. | dN | l | | d0 | .. | dN | f |
+---------+----+-|-+ ^----+----+----+-|-+ ^----+----+----+---+
| | | |
+----+ +----+

### c) DMA hot chaining timeslice issue

As DMA chaining is done while DMA is running, the linking may be done while the DMA jumps from one Videobuffer to another. On the schema, that would be a problem if the following sequence is encountered:

- DMA chain is Videobuffer1 + Videobuffer2
- pxa_videobuf_queue() is called to queue Videobuffer3
- DMA controller finishes Videobuffer2, and DMA stops

```
=>
+---------+----+---+ +----+----+----+---+ +----+----+----+---+
| d0 | .. | dN | l | | d0 | .. | dN | f |
+---------+----+-|-+ ^----+----+----+-|-+ ^----+----+----+---+
| | | |
+----+ +----+

pxa_dma_add_tail_buf() is called, the Videobuffer2 “finisher” is replaced by a “linker” to Videobuffer3 (creation of new_link)

- pxa_videobuf_queue() finishes
- the DMA irq handler is called, which terminates Videobuffer2
- Videobuffer3 capture is not scheduled on DMA chain (as it stopped !!!)

```

```
+---------+----+---+ +----+----+----+---+ +----+----+----+---+
| d0 | .. | dN | l | | d0 | .. | dN | f |
+---------+----+-|-+ ^----+----+----+-|-+ ^----+----+----+---+
| | | |
+----+ +----+

pxa_camera_check_link_miss() is called This checks if the DMA is finished and a buffer is still on the pdev->capture list. If that’s the case, the capture will be restarted, and Videobuffer3 is scheduled on DMA chain.

- the DMA irq handler finishes
**Note:** If DMA stops just after `pxa_camera_check_link_miss()` reads `DDADR()` value, we have the guarantee that the DMA irq handler will be called back when the DMA will finish the buffer, and `pxa_camera_check_link_miss()` will be called again, to reschedule Video buffer 3.

### 2.9.1.9 The Radiotrack radio driver

**Author:** Stephen M. Benoit &lt;benoits@servicepro.com&gt;  
**Date:** Dec 14, 1996

**ACKNOWLEDGMENTS**

This document was made based on ‘C’ code for Linux from Gideon le Grange (legrang@active.co.za or legrang@cs.sun.ac.za) in 1994, and elaborations from Frans Brinkman (brinkman@esd.nl) in 1996. The results reported here are from experiments that the author performed on his own setup, so your mileage may vary... I make no guarantees, claims or warranties to the suitability or validity of this information. No other documentation on the AIMS Lab (http://www.aimslab.com/) RadioTrack card was made available to the author. This document is offered in the hopes that it might help users who want to use the RadioTrack card in an environment other than MS Windows.

**WHY THIS DOCUMENT?**

I have a RadioTrack card from back when I ran an MS-Windows platform. After converting to Linux, I found Gideon le Grange’s command-line software for running the card, and found that it was good! Frans Brinkman made a comfortable X-windows interface, and added a scanning feature. For hack value, I wanted to see if the tuner could be tuned beyond the usual FM radio broadcast band, so I could pick up the audio carriers from North American broadcast TV channels, situated just below and above the 87.0-109.0 MHz range. I did not get much success, but I learned about programming ioports under Linux and gained some insights about the hardware design used for the card.

So, without further delay, here are the details.

**PHYSICAL DESCRIPTION**

The RadioTrack card is an ISA 8-bit FM radio card. The radio frequency (RF) input is simply an antenna lead, and the output is a power audio signal available through a miniature phone plug. Its RF frequencies of operation are more or less limited from 87.0 to 109.0 MHz (the commercial FM broadcast band). Although the registers can be programmed to request frequencies beyond these limits, experiments did not give promising results. The variable frequency oscillator (VFO) that demodulates the intermediate frequency (IF) signal probably has a small range of useful frequencies, and wraps around or gets clipped beyond the limits mentioned above.
CONTROLLING THE CARD WITH IOPORT

The RadioTrack (base) ioport is configurable for 0x30c or 0x20c. Only one ioport seems to be involved. The ioport decoding circuitry must be pretty simple, as individual ioport bits are directly matched to specific functions (or blocks) of the radio card. This way, many functions can be changed in parallel with one write to the ioport. The only feedback available through the ioports appears to be the “Stereo Detect” bit.

The bits of the ioport are arranged as follows:

<table>
<thead>
<tr>
<th>MSb</th>
<th>VolA</th>
<th>VolB</th>
<th>Stereo</th>
<th>Radio</th>
<th>TuneA</th>
<th>TuneB</th>
<th>Tune</th>
</tr>
</thead>
<tbody>

PROGRAMMING EXAMPLES

Default:  BASE <-- 0xc8  (current volume, no stereo detect, radio enable, tuner adjust disable)

Card Off: BASE <-- 0x00  (audio mute, no stereo detect, radio disable, tuner adjust disable)

Card On:  BASE <-- 0x00  (see "Card Off", clears any unfinished business)
          BASE <-- 0xc8  (see "Default")

Volume Down: BASE <-- 0x48  (volume down, no stereo detect, radio enable, tuner adjust disable)
              wait 10 msec
              BASE <-- 0xc8  (see "Default")

Volume Up:  BASE <-- 0x88  (volume up, no stereo detect, radio enable, tuner adjust disable)
             wait 10 msec
             BASE <-- 0xc8  (see "Default")

Check Stereo: BASE <-- 0xd8  (current volume, stereo detect, radio enable, tuner adjust disable)
               wait 100 msec
               x <-- BASE  (read iport)
               BASE <-- 0xc8  (see "Default")

               x=0xff ==> "not stereo", x=0xfd ==> "stereo detected"

Set Frequency:  code = (freq*40) + 10486188
               foreach of the 24 bits in code, (from Least to Most Significant):
               to write a "zero" bit,
               BASE <-- 0x01  (audio mute, no stereo detect, radio disable, "zero" bit phase 1, tuner adjust)
               BASE <-- 0x03  (audio mute, no stereo detect, radio disable, "zero" bit phase 2, tuner adjust)
               to write a "one" bit,
               BASE <-- 0x05  (audio mute, no stereo detect, radio disable, "one" bit phase 1, tuner adjust)
               BASE <-- 0x07  (audio mute, no stereo detect, radio disable, "one" bit phase 2, tuner adjust)

2.9.1.10 The saa7134 driver

Author Gerd Hoffmann
Card Variations:

Cards can use either of these two crystals (xtal):

- 32.11 MHz -> .audio_clock=0x187de7
- 24.576MHz -> .audio_clock=0x200000 (xtal *.audio_clock = 51539600)

Some details about 30/34/35:

- saa7130 - low-price chip, doesn’t have mute, that is why all those cards should have .mute field defined in their tuner structure.
- saa7134 - usual chip
- saa7133/35 - saa7135 is probably a marketing decision, since all those chips identifies itself as 33 on pci.

LifeView GPIOs

2.9.1.11 Cropping and Scaling algorithm, used in the sh_mobile_ceu_camera driver

Author: Guennadi Liakhovetski <g.liakhovetski@gmx.de>

Terminology

sensor scales: horizontal and vertical scales, configured by the sensor driver host scales: -“-
host driver combined scales: sensor_scale * host_scale

Generic scaling / cropping scheme

```
-1-
 | -2- \
 |   | -3-
 |   | -4-
 |    | -5-
 |    |    .-7-
 |    |    .6-
 |    |    .6'
 |    |    .-7'
 |    |  .-4'-
 |    |    .-3'-
 | -2- "/
 | -1-
```
In the above chart minuses and slashes represent “real” data amounts, points and accents represent “useful” data, basically, CEU scaled and cropped output, mapped back onto the client’s source plane.

Such a configuration can be produced by user requests:

S_CROP(left / top = (5) - (1), width / height = (5') - (5)) S_FMT(width / height = (6') - (6))

Here:

1 to (1') - whole max width or height
1 to (2) - sensor cropped left or top
2 to (2') - sensor cropped width or height
3 to (3') - sensor scale
4 to (4') - CEU cropped left or top
4 to (4') - CEU cropped width or height
5 to (5') - reverse sensor scale applied to CEU cropped width or height
5 to (5') - reverse sensor scale applied to CEU cropped left or top
6 to (6) - CEU scale - user window

**S_FMT**

Do not touch input rectangle - it is already optimal.

1. Calculate current sensor scales:
   
   \[ \text{scale}_s = \frac{(2') - (2)}{(3') - (3)} \]

2. Calculate “effective” input crop (sensor subwindow) - CEU crop scaled back at current sensor scales onto input window - this is user S_CROP:
   
   \[ \text{width}_u = (5') - (5) = ((4') - (4)) * \text{scale}_s \]

3. Calculate new combined scales from “effective” input window to requested user window:
   
   \[ \text{scale}_\text{comb} = \frac{\text{width}_u}{(6') - (6)} \]

4. Calculate sensor output window by applying combined scales to real input window:
   
   \[ \text{width}_s\_\text{out} = \frac{(7') - (7)}{(2') - (2)} / \text{scale}_\text{comb} \]

5. Apply iterative sensor S_FMT for sensor output window.

   \[
   \text{subdev}->\text{video_ops}->\text{s_fmt}(\text{.width} = \text{width}_s\_\text{out})
   \]

6. Retrieve sensor output window (g_fmt)

7. Calculate new sensor scales:
   
   \[ \text{scale}_s\_\text{new} = \frac{(3')\_\text{new} - (3)\_\text{new}}{(2') - (2)} \]

8. Calculate new CEU crop - apply sensor scales to previously calculated “effective” crop:
   
   \[
   \text{width}_\text{ceu} = \frac{(4')\_\text{new} - (4)\_\text{new}}{\text{width}_u / \text{scale}_s\_\text{new} \text{left}_\text{ceu} = (4)\_\text{new} - (3)\_\text{new} = ((5) - (2)) / \text{scale}_s\_\text{new}}
   \]

9. Use CEU cropping to crop to the new window:
   
   \[
   \text{ceu}_\text{crop}(\text{.width} = \text{width}_\text{ceu}, \text{.left} = \text{left}_\text{ceu})
   \]

10. Use CEU scaling to scale to the requested user window:
    
    \[
    \text{scale}_\text{ceu} = \text{width}_\text{ceu} / \text{width}
    \]
The V4L2 crop API says:

“…specification does not define an origin or units. However by convention drivers should horizontally count unscaled samples relative to 0H.”

We choose to follow the advice and interpret cropping units as client input pixels.

Cropping is performed in the following 6 steps:

1. Request exactly user rectangle from the sensor.
2. If smaller - iterate until a larger one is obtained. Result: sensor cropped to 2 : 2’, target crop 5 : 5’, current output format 6’ - 6.
3. In the previous step the sensor has tried to preserve its output frame as good as possible, but it could have changed. Retrieve it again.
4. Sensor scaled to 3 : 3’. Sensor’s scale is (2’ - 2) / (3’ - 3). Calculate intermediate window: 4’ - 4 = (5’ - 5) * (3’ - 3) / (2’ - 2)
5. Calculate and apply host scale = (6’ - 6) / (4’ - 4)
6. Calculate and apply host crop: 6 - 7 = (5 - 2) * (6’ - 6) / (5’ - 5)

2.9.1.12 Tuner drivers

Simple tuner Programming

There are some flavors of Tuner programming APIs. These differ mainly by the bandswitch byte.

- L= LG_API (VHF_LO=0x01, VHF_HI=0x02, UHF=0x08, radio=0x04)
- P= PHILIPS_API (VHF_LO=0xA0, VHF_HI=0x90, UHF=0x30, radio=0x04)
- T= TEMIC_API (VHF_LO=0x02, VHF_HI=0x04, UHF=0x01)
- A= ALPS_API (VHF_LO=0x14, VHF_HI=0x12, UHF=0x11)
- M= PHILIPS_MK3 (VHF_LO=0x01, VHF_HI=0x02, UHF=0x04, radio=0x19)

Tuner Manufacturers

- Samsung Tuner identification: (e.g. TCPM9091PD27)
These Tuners are PHILIPS_API compatible.

Philips Tuner identification: (e.g. FM1216MF)

F[IRMQ]12[1345]6{MF|ME|MP}
  F[IRMQ]:
  FI12x6: Tuner Series
  FR12x6: Tuner + Radio IF
  FM12x6: Tuner + FM

  FMR12x6: special
  TD15xx: Digital Tuner ATSC
12[1345]6:
  1216: PAL BG
  1236: NTSC
  1246: PAL I
  1256: Pal DK
{MF|ME|MP}
  MF: BG LL w/ Secam (Multi France)
  ME: BG DK I LL (Multi Europe)
  MP: BG DK I (Multi PAL)
  MR: BG DK M (?)
  MG: BG DKI M (?)
MK2 series PHILIPS_API, most tuners are compatible to this one!
MK3 series introduced in 2002 w/ PHILIPS_MK3_API

Temic Tuner identification: (e.g. 4006FH5)

4[01][0136][269]F[HYNR]5
  40x2: Tuner (5V/33V), TEMIC_API.
  40x6: Tuner 5V
  41xx: Tuner compact
  40x9: Tuner+FM compact
[0136]
  xx0x: PAL BG
  xx1x: Pal DK, Secam LL
  xx3x: NTSC
  xx6x: PAL I
F[HYNR]5
  FH5: Pal BG
  FY5: others
  FN5: multistandard
  FR5: w/ FM radio
Linux Innotek Tuner:

- TPI8NSR11: NTSC J/M (TPI8NSR01 w/FM) (P,210/497)
- TPI8PSB11: PAL B/G (TPI8PSB01 w/FM) (P,170/450)
- TAPC-I701: PAL I (TAPC-I001 w/FM) (P,170/450)
- TPI8PSB12: PAL D/K+B/G (TPI8PSB02 w/FM) (P,170/450)
- TAPC-G701P: PAL B/G (TAPC-G001P w/FM) (L,170/450)
- TAPC-W701P: PAL I (TAPC-W001P w/FM) (L,170/450)
- TAPC-Q703P: PAL D/K (TAPC-Q001P w/FM) (L,170/450)
- TAPC-Q704P: PAL D/K+I (L,170/450)
- TAPC-G702P: PAL D/K+B/G (L,170/450)
- TADC-H002F: NTSC (L,175/410?; 2-B, C-W+11, W+12-69)
- TADC-M201D: PAL D/K+B/G+I (L,143/425) (sound control at I2C address 0xc8)
- TADC-T003F: NTSC Taiwan (L,175/410?; 2-B, C-W+11, W+12-69)

Suffix:

- P = Standard phono female socket
- D = IEC female socket
- F = F-connector

Other Tuners:

- TCL2002MB-1: PAL BG + DK =TUNER_LG_PAL_NEW_TAPC
- TCL2002MB-1F: PAL BG + DK w/FM =PHILIPS_PAL
- TCL2002MI-2: PAL I = ??

ALPS Tuners:

- Most are LG_API compatible
- TSCH6 has ALPS_API (TSCH5 ?)
- TSBE1 has extra API 05,02,08 Control_byte=0xCB Source:¹

¹ conexant100029b-PCI-Decoder-ApplicationNote.pdf
The Virtual Media Controller Driver (vimc)

**Source code documentation**

**vimc-streamer**

struct `vimc_stream`

struct that represents a stream in the pipeline

**Definition**

```c
struct vimc_stream {
    struct media_pipeline pipe;
    struct vimc_ent_device *ved_pipeline[VIMC_STREAMER_PIPELINE_MAX_SIZE];
    unsigned int pipe_size;
    struct task_struct *kthread;
};
```

**Members**

- **pipe** the media pipeline object associated with this stream
- **ved_pipeline** array containing all the entities participating in the stream. The order is from a video device (usually a capture device) where `stream_on` was called, to the entity generating the first base image to be processed in the pipeline.
- **pipe_size** size of **ved_pipeline**
- **kthread** thread that generates the frames of the stream.

**Description**

When the user call `stream_on` in a video device, `struct vimc_stream` is used to keep track of all entities and subdevices that generates and process frames for the stream.

```c
struct media_entity *vimc_get_source_entity(struct media_entity *ent)

get the entity connected with the first sink pad
```

**Parameters**

- **struct media_entity *ent** reference media_entity

**Description**

Helper function that returns the media entity containing the source pad linked with the first sink pad from the given media entity pad list.

**Return**

The source pad or NULL, if it wasn’t found.

```c
void vimc_streamer_pipeline_terminate(struct vimc_stream *stream)

Disable stream in all ved in stream
```

**Parameters**

- **struct vimc_stream *stream** the pointer to the stream structure with the pipeline to be disabled.
**Description**

Calls `s_stream` to disable the stream in each entity of the pipeline.

```c
int vimc_streamer_pipeline_init(struct vimc_stream *stream, struct vimc_ent_device *ved)
```

Initializes the stream structure.

**Parameters**

- `struct vimc_stream *stream`: the pointer to the stream structure to be initialized
- `struct vimc_ent_device *ved`: the pointer to the vimc entity initializing the stream

**Description**

Initializes the stream structure. Walks through the entity graph to construct the pipeline used later on the streamer thread. Calls `vimc_streamer_s_stream()` to enable stream in all entities of the pipeline.

**Return**

0 if success, error code otherwise.

```c
int vimc_streamer_thread(void *data)
```

Process frames through the pipeline.

**Parameters**

- `void *data`: vimc_stream struct of the current stream

**Description**

From the source to the sink, gets a frame from each subdevice and sends to the next one of the pipeline at a fixed framerate.

**Return**

Always zero (created as int instead of void to comply with kthread API).

```c
int vimc_streamer_s_stream(struct vimc_stream *stream, struct vimc_ent_device *ved, int enable)
```

Start/stop the streaming on the media pipeline.

**Parameters**

- `struct vimc_stream *stream`: the pointer to the stream structure of the current stream
- `struct vimc_ent_device *ved`: pointer to the vimc entity of the entity of the stream
- `int enable`: flag to determine if stream should start/stop

**Description**

When starting, check if there is no `stream->kthread` allocated. This should indicate that a stream is already running. Then, it initializes the pipeline, creates and runs a kthread to consume buffers through the pipeline. When stopping, analogously check if there is a stream running, stop the thread and terminates the pipeline.

**Return**

0 if success, error code otherwise.
2.9.1.14 The Zoran driver

unified zoran driver (zr360x7, zoran, buz, dc10(+), dc30(+), lml33)
website: http://mjpeg.sourceforge.net/driver-zoran/

Frequently Asked Questions

What cards are supported

Iomega Buz, Linux Media Labs LML33/LML33R10, Pinnacle/Miro DC10/DC10+/DC30/DC30+ and related boards (available under various names).

Iomega Buz

- Zoran zr36067 PCI controller
- Zoran zr36060 MJPEG codec
- Philips saa7111 TV decoder
- Philips saa7185 TV encoder

Drivers to use: videodev, i2c-core, i2c-algo-bit, videocodec, saa7111, saa7185, zr36060, zr36067

Inputs/outputs: Composite and S-video

Norms: PAL, SECAM (720x576 @ 25 fps), NTSC (720x480 @ 29.97 fps)

Card number: 7

AverMedia 6 Eyes AVS6EYES

- Zoran zr36067 PCI controller
- Zoran zr36060 MJPEG codec
- Samsung ks0127 TV decoder
- Conexant bt866 TV encoder

Drivers to use: videodev, i2c-core, i2c-algo-bit, videocodec, ks0127, bt866, zr36060, zr36067

Inputs/outputs: Six physical inputs. 1-6 are composite, 1-2, 3-4, 5-6 doubles as S-video, 1-3 triples as component. One composite output.

Norms: PAL, SECAM (720x576 @ 25 fps), NTSC (720x480 @ 29.97 fps)

Card number: 8

Note: Not autodetected, card=8 is necessary.
Linux Media Labs LML33

- Zoran zr36067 PCI controller
- Zoran zr36060 MJPEG codec
- Brooktree bt819 TV decoder
- Brooktree bt856 TV encoder

Drivers to use: videodev, i2c-core, i2c-algo-bit, videocodec, bt819, bt856, zr36060, zr36067

Inputs/outputs: Composite and S-video

Norms: PAL (720x576 @ 25 fps), NTSC (720x480 @ 29.97 fps)

Card number: 5

Linux Media Labs LML33R10

- Zoran zr36067 PCI controller
- Zoran zr36060 MJPEG codec
- Philips saa7114 TV decoder
- Analog Devices adv7170 TV encoder

Drivers to use: videodev, i2c-core, i2c-algo-bit, videocodec, saa7114, adv7170, zr36060, zr36067

Inputs/outputs: Composite and S-video

Norms: PAL (720x576 @ 25 fps), NTSC (720x480 @ 29.97 fps)

Card number: 6

Pinnacle/Miro DC10(new)

- Zoran zr36057 PCI controller
- Zoran zr36060 MJPEG codec
- Philips saa7110a TV decoder
- Analog Devices adv7176 TV encoder

Drivers to use: videodev, i2c-core, i2c-algo-bit, videocodec, saa7110, adv7175, zr36060, zr36067

Inputs/outputs: Composite, S-video and Internal

Norms: PAL, SECAM (768x576 @ 25 fps), NTSC (640x480 @ 29.97 fps)

Card number: 1
**Pinnacle/Miro DC10+**

- Zoran zr36067 PCI controller
- Zoran zr36060 MJPEG codec
- Philips saa7110a TV decoder
- Analog Devices adv7176 TV encoder

Drivers to use: videodev, i2c-core, i2c-algo-bit, videocodec, saa7110, adv7175, zr36060, zr36067

Inputs/outputs: Composite, S-video and Internal

Norms: PAL, SECAM (768x576 @ 25 fps), NTSC (640x480 @ 29.97 fps)

Card number: 2

**Pinnacle/Miro DC10(older)**

- Zoran zr36057 PCI controller
- Zoran zr36050 MJPEG codec
- Zoran zr36016 Video Front End or Fuji md0211 Video Front End (clone?)
- Micronas vpx3220a TV decoder
- mse3000 TV encoder or Analog Devices adv7176 TV encoder

Drivers to use: videodev, i2c-core, i2c-algo-bit, videocodec, vpx3220, mse3000/adv7175, zr36050, zr36016, zr36067

Inputs/outputs: Composite, S-video and Internal

Norms: PAL, SECAM (768x576 @ 25 fps), NTSC (640x480 @ 29.97 fps)

Card number: 0

**Pinnacle/Miro DC30**

- Zoran zr36057 PCI controller
- Zoran zr36050 MJPEG codec
- Zoran zr36016 Video Front End
- Micronas vpx3225d/vpx3220a/vpx3216b TV decoder
- Analog Devices adv7176 TV encoder

Drivers to use: videodev, i2c-core, i2c-algo-bit, videocodec, vpx3220/vpx3224, adv7175, zr36050, zr36016, zr36067

Inputs/outputs: Composite, S-video and Internal

Norms: PAL, SECAM (768x576 @ 25 fps), NTSC (640x480 @ 29.97 fps)

Card number: 3
**Pinnacle/Miro DC30+**

- Zoran zr36067 PCI controller
- Zoran zr36050 MJPEG codec
- Zoran zr36016 Video Front End
- Micronas vpx3225d/vpx3220a/vpx3216b TV decoder
- Analog Devices adv7176 TV encoder

Drivers to use: videodev, i2c-core, i2c-algo-bit, videocodec, vpx3220/vpx3224, adv7175, zr36050, zr36015, zr36067

Inputs/outputs: Composite, S-video and Internal

Norms: PAL, SECAM (768x576 @ 25 fps), NTSC (640x480 @ 29.97 fps)

Card number: 4

**Note:**

1) No module for the mse3000 is available yet

2) No module for the vpx3224 is available yet

**1.1 What the TV decoder can do and what not**

The best know TV standards are NTSC/PAL/SECAM, but for decoding a frame that information is not enough. There are several formats of the TV standards. And not every TV decoder is able to handle every format. Also the every combination is supported by the driver. There are currently 11 different tv broadcast formats all aver the world.

The CCIR defines parameters needed for broadcasting the signal. The CCIR has defined different standards: A,B,D,E,F,G,D,H,I,K,K1,L,M,N,... The CCIR says not much about the colorsystem used !!! And talking about a colorsystem says not to much about how it is broadcast.

The CCIR standards A,E,F are not used any more.

When you speak about NTSC, you usually mean the standard: CCIR - M using the NTSC colorsystem which is used in the USA, Japan, Mexico, Canada and a few others.

When you talk about PAL, you usually mean: CCIR - B/G using the PAL colorsystem which is used in many Countries.

When you talk about SECAM, you mean: CCIR - L using the SECAM Colorsystem which is used in France, and a few others.

There the other version of SECAM, CCIR - D/K is used in Bulgaria, China, Slovakai, Hungary, Korea (Rep.), Poland, Rumania and a others.

The CCIR - H uses the PAL colorsystem (sometimes SECAM) and is used in Egypt, Libya, Sri Lanka, Syrian Arab. Rep.

The CCIR - I uses the PAL colorsystem, and is used in Great Britain, Hong Kong, Ireland, Nigeria, South Africa.
The CCIR - N uses the PAL colorsystem and PAL frame size but the NTSC framerate, and is used in Argentina, Uruguay, an a few others.

We do not talk about how the audio is broadcast!

Other weird things around: NTSC 4.43 is a modified NTSC, which is mainly used in PAL VCR's that are able to play back NTSC. PAL 60 seems to be the same as NTSC 4.43. The Datasheets also talk about NTSC 44, It seems as if it would be the same as NTSC 4.43. NTSC Combs seems to be a decoder mode where the decoder uses a comb filter to split coma and luma instead of a Delay line.

But I did not defiantly find out what NTSC Comb is.

**Philips saa7111 TV decoder**

- was introduced in 1997, is used in the BUZ and
- can handle: PAL B/G/H/I, PAL N, PAL M, NTSC M, NTSC N, NTSC 4.43 and SECAM

**Philips saa7110a TV decoder**

- was introduced in 1995, is used in the Pinnacle/Miro DC10(new), DC10+ and
- can handle: PAL B/G, NTSC M and SECAM

**Philips saa7114 TV decoder**

- was introduced in 2000, is used in the LML33R10 and
- can handle: PAL B/G/D/H/I/N, PAL N, PAL M, NTSC M, NTSC 4.43 and SECAM

**Brooktree bt819 TV decoder**

- was introduced in 1996, and is used in the LML33 and
- can handle: PAL B/D/G/H/I, NTSC M

**Micronas vpx3220a TV decoder**

- was introduced in 1996, is used in the DC30 and DC30+ and
- can handle: PAL B/G/H/I, PAL N, PAL M, NTSC M, NTSC 44, PAL 60, SECAM,NTSC Comb
**Samsung ks0127 TV decoder**

- is used in the AVS6EYES card and
- can handle: NTSC-M/N/44, PAL-M/N/B/G/H/I/D/K/L and SECAM

**What the TV encoder can do an what not**

The TV encoder is doing the “same” as the decoder, but in the other direction. You feed them digital data and they generate a Composite or SVHS signal. For information about the colorsystems and TV norm take a look in the TV decoder section.

**Philips saa7185 TV Encoder**

- was introduced in 1996, is used in the BUZ
- can generate: PAL B/G, NTSC M

**Brooktree bt856 TV Encoder**

- was introduced in 1994, is used in the LML33
- can generate: PAL B/D/G/H/I/N, PAL M, NTSC M, PAL-N (Argentina)

**Analog Devices adv7170 TV Encoder**

- was introduced in 2000, is used in the LML300R10
- can generate: PAL B/D/G/H/I/N, PAL M, NTSC M, PAL 60

**Analog Devices adv7175 TV Encoder**

- was introduced in 1996, is used in the DC10, DC10+, DC10 old, DC30, DC30+
- can generate: PAL B/D/G/H/I/N, PAL M, NTSC M

**ITT mse3000 TV encoder**

- was introduced in 1991, is used in the DC10 old
- can generate: PAL, NTSC, SECAM
Conexant bt866 TV encoder

- is used in AVS6EYES, and
- can generate: NTSC/PAL, PAL-M, PAL-N

The adv717x, should be able to produce PAL N. But you find nothing PAL N specific in the registers. Seem that you have to reuse a other standard to generate PAL N, maybe it would work if you use the PAL M settings.

How do I get this damn thing to work

Load zr36067.o. If it can’t autodetect your card, use the card=X insmod option with X being the card number as given in the previous section. To have more than one card, use card=X1[,X2[,X3[,X4[..]]]]

To automate this, add the following to your /etc/modprobe.d/zoran.conf:

options zr36067 card=X1[,X2[,X3[,X4[..]]]] alias char-major-81-0 zr36067

One thing to keep in mind is that this doesn’t load zr36067.o itself yet. It just automates loading. If you start using xawtv, the device won’t load on some systems, since you’re trying to load modules as a user, which is not allowed (“permission denied”). A quick workaround is to add ‘Load “v4l”’ to XF86Config-4 when you use X by default, or to run ‘v4l-conf -c <device>’ in one of your startup scripts (normally rc.local) if you don’t use X. Both make sure that the modules are loaded on startup, under the root account.

What mainboard should I use (or why doesn’t my card work)

<insert lousy disclaimer here>. In short: good=SiS/Intel, bad=VIA.

Experience tells us that people with a Buz, on average, have more problems than users with a DC10+/LML33. Also, it tells us that people owning a VIA-based mainboard (ktXXX, MVP3) have more problems than users with a mainboard based on a different chipset. Here’s some notes from Andrew Stevens:

Here’s my experience of using LML33 and Buz on various motherboards:

- VIA MVP3
  - Forget it. Pointless. Doesn’t work.
- Intel 430FX (Pentium 200)
  - LML33 perfect, Buz tolerable (3 or 4 frames dropped per movie)
- Intel 440BX (early stepping)
  - LML33 tolerable. Buz starting to get annoying (6-10 frames/hour)
- Intel 440BX (late stepping)
  - Buz tolerable, LML3 almost perfect (occasional single frame drops)
- SiS735
  - LML33 perfect, Buz tolerable.
• VIA KT133(*)
  - LML33 starting to get annoying, Buz poor enough that I have up.
• Both 440BX boards were dual CPU versions.

Bernhard Praschinger later added:
• AMD 751
  - Buz perfect-tolerable
• AMD 760
  - Buz perfect-tolerable

In general, people on the user mailinglist won’t give you much of a chance if you have a VIA-based motherboard. They may be cheap, but sometimes, you’d rather want to spend some more money on better boards. In general, VIA mainboard’s IDE/PCI performance will also suck badly compared to others. You’ll noticed the DC10+/DC30+ aren’t mentioned anywhere in the overview. Basically, you can assume that if the Buz works, the LML33 will work too. If the LML33 works, the DC10+/DC30+ will work too. They’re most tolerant to different mainboard chipsets from all of the supported cards.

If you experience timeouts during capture, buy a better mainboard or lower the quality/buffersize during capture (see ‘Concerning buffer sizes, quality, output size etc.’). If it hangs, there’s little we can do as of now. Check your IRQs and make sure the card has its own interrupts.

**Programming interface**

This driver conforms to video4linux2. Support for V4L1 and for the custom zoran ioctls has been removed in kernel 2.6.38.

For programming example, please, look at lavrec.c and lavplay.c code in the MJPEG-tools (http://mjpeg.sf.net/).

Additional notes for software developers:

The driver returns maxwidth and maxheight parameters according to the current TV standard (norm). Therefore, the software which communicates with the driver and “asks” for these parameters should first set the correct norm. Well, it seems logically correct: TV standard is “more constant” for current country than geometry settings of a variety of TV capture cards which may work in ITU or square pixel format.

**Applications**

Applications known to work with this driver:

TV viewing:
• xawtv
• kwintv
• probably any TV application that supports video4linux or video4linux2.

MJPEG capture/playback:
Concerning buffer sizes, quality, output size etc.

The zr36060 can do 1:2 JPEG compression. This is really the theoretical maximum that the chipset can reach. The driver can, however, limit compression to a maximum (size) of 1:4. The reason for this is that some cards (e.g. Buz) can’t handle 1:2 compression without stopping capture after only a few minutes. With 1:4, it’ll mostly work. If you have a Buz, use ‘low_bitrate=1’ to go into 1:4 max. compression mode.

100% JPEG quality is thus 1:2 compression in practice. So for a full PAL frame (size 720x576). The JPEFG fields are stored in YUY2 format, so the size of the fields are 720x288x16/2 bits/field (2 fields/frame) = 207360 bytes/field x 2 = 414720 bytes/frame (add some more bytes for headers and DHT (huffman)/DQT (quantization) tables, and you’ll get to something like 512kB per frame for 1:2 compression. For 1:4 compression, you’d have frames of half this size.

Some additional explanation by Martin Samuelsson, which also explains the importance of buffer sizes: – > Hmm, I do not think it is really that way. With the current (downloaded > at 18:00 Monday) driver I get that output sizes for 10 sec: > -q 50 -b 128 : 24.283.332 Bytes > -q 50 -b 256 : 48.442.368 > -q 25 -b 128 : 24.655.992 > -q 25 -b 256 : 25.859.820

I woke up, and can’t go to sleep again. I’ll kill some time explaining why this doesn’t look strange to me.

Let’s do some math using a width of 704 pixels. I’m not sure whether the Buz actually use that number or not, but that’s not too important right now.

704x288 pixels, one field, is 202752 pixels. Divided by 64 pixels per block; 3168 blocks per field. Each pixel consist of two bytes; 128 bytes per block; 1024 bits per block. 100% in the new driver mean 1:2 compression; the maximum output becomes 512 bits per block. Actually 510, but 512 is simpler to use for calculations.

Let’s say that we specify d1q50. We thus want 256 bits per block; times 3168 becomes 811008 bits; 101376 bytes per field. We’re talking raw bits and bytes here, so we don’t need to do any fancy corrections for bits-per-pixel or such things. 101376 bytes per field.

d1 video contains two fields per frame. Those sum up to 202752 bytes per frame, and one of those frames goes into each buffer.
But wait a second! -b128 gives 128kB buffers! It’s not possible to cram 202752 bytes of JPEG data into 128kB!

This is what the driver notice and automatically compensate for in your examples. Let’s do some math using this information:

128kB is 131072 bytes. In this buffer, we want to store two fields, which leaves 65536 bytes for each field. Using 3168 blocks per field, we get 20.68686868... available bytes per block; 165 bits. We can’t allow the request for 256 bits per block when there’s only 165 bits available! The -q50 option is silently overridden, and the -b128 option takes precedence, leaving us with the equivalence of -q32.

This gives us a data rate of 165 bits per block, which, times 3168, sums up to 65340 bytes per field, out of the allowed 65536. The current driver has another level of rate limiting; it won’t accept -q values that fill more than 6/8 of the specified buffers. (I’m not sure why. “Playing it safe” seem to be a safe bet. Personally, I think I would have lowered requested-bits-per-block by one, or something like that.) We can’t use 165 bits per block, but have to lower it again, to 6/8 of the available buffer space: We end up with 124 bits per block, the equivalence of -q24.

With 128kB buffers, you can’t use greater than -q24 at -d1. (And PAL, and 704 pixels width...)

The third example is limited to -q24 through the same process. The second example, using very similar calculations, is limited to -q48. The only example that actually grab at the specified -q value is the last one, which is clearly visible, looking at the file size.

Conclusion: the quality of the resulting movie depends on buffer size, quality, whether or not you use ‘low_bitrate=1’ as insmod option for the zr36060.c module to do 1:4 instead of 1:2 compression, etc.

If you experience timeouts, lowering the quality/buffersize or using ‘low_bitrate=1 as insmod option for zr36060.o might actually help, as is proven by the Buz.

It hangs/crashes/fails/whatevers! Help!

Make sure that the card has its own interrupts (see /proc/interrupts), check the output of dmesg at high verbosity (load zr36067.o with debug=2, load all other modules with debug=1). Check that your mainboard is favorable (see question 2) and if not, test the card in another computer. Also see the notes given in question 3 and try lowering quality/buffersize/capturesize if recording fails after a period of time.

If all this doesn’t help, give a clear description of the problem including detailed hardware information (memory+brand, mainboard+chipset+brand, which MJPEG card, processor, other PCI cards that might be of interest), give the system PnP information (/proc/interrupts, /proc/dma, /proc/devices), and give the kernel version, driver version, glibc version, gcc version and any other information that might possibly be of interest. Also provide the dmesg output at high verbosity. See ‘Contacting’ on how to contact the developers.

2.9.1.15 MIPI CCS camera sensor driver

The MIPI CCS camera sensor driver is a generic driver for MIPI CCS compliant camera sensors. It exposes three sub-devices representing the pixel array, the binner and the scaler.

As the capabilities of individual devices vary, the driver exposes interfaces based on the capabilities that exist in hardware.

Pixel Array sub-device

The pixel array sub-device represents the camera sensor’s pixel matrix, as well as analogue crop functionality present in many compliant devices. The analogue crop is configured using the V4L2_SEL_TGT_CROP on the source pad (0) of the entity. The size of the pixel matrix can be obtained by getting the V4L2_SEL_TGT_NATIVE_SIZE target.

Binner

The binner sub-device represents the binning functionality on the sensor. For that purpose, selection target V4L2_SEL_TGT_COMPOSE is supported on the sink pad (0).

Additionally, if a device has no scaler or digital crop functionality, the source pad (1) expses another digital crop selection rectangle that can only crop at the end of the lines and frames.
Scaler

The scaler sub-device represents the digital crop and scaling functionality of the sensor. The V4L2 selection target `V4L2_SEL_TGT_CROP` is used to configure the digital crop on the sink pad (0) when digital crop is supported. Scaling is configured using selection target `V4L2_SEL_TGT_COMPOSE` on the sink pad (0) as well.

Additionally, if the scaler sub-device exists, its source pad (1) exposes another digital crop selection rectangle that can only crop at the end of the lines and frames.

Digital and analogue crop

Digital crop functionality is referred to as cropping that effectively works by dropping some data on the floor. Analogue crop, on the other hand, means that the cropped information is never retrieved. In case of camera sensors, the analogue data is never read from the pixel matrix that are outside the configured selection rectangle that designates crop. The difference has an effect in device timing and likely also in power consumption.

Register definition generator

The `ccs-regs.asc` file contains MIPI CCS register definitions that are used to produce C source code files for definitions that can be better used by programs written in C language. As there are many dependencies between the produced files, please do not modify them manually as it's error-prone and in vain, but instead change the script producing them.

Usage

Conventionally the script is called this way to update the CCS driver definitions:

```
$ Documentation/driver-api/media/drivers/ccs/mk-ccs-regs -k \
   -e drivers/media/i2c/ccs/ccs-regs.h \
   -L drivers/media/i2c/ccs/ccs-limits.h \
   -l drivers/media/i2c/ccs/ccs-limits.c \
   -c Documentation/driver-api/media/drivers/ccs/ccs-regs.asc
```

2.9.1.16 CCS PLL calculator

The CCS PLL calculator is used to compute the PLL configuration, given sensor’s capabilities as well as board configuration and user specified configuration. As the configuration space that encompasses all these configurations is vast, the PLL calculator isn’t entirely trivial. Yet it is relatively simple to use for a driver.

The PLL model implemented by the PLL calculator corresponds to MIPI CCS 1.1.

```
struct ccs_pll_branch_fr

    CCS PLL configuration (front)
```

Definition
struct ccs_pll_branch_fr {
    u16 pre_pll_clk_div;
    u16 pll_multiplier;
    u32 pll_ip_clk_freq_hz;
    u32 pll_op_clk_freq_hz;
};

Members

pre_pll_clk_div Pre-PLL clock divisor

pll_multiplier PLL multiplier

pll_ip_clk_freq_hz PLL input clock frequency

pll_op_clk_freq_hz PLL output clock frequency

Description

A single branch front-end of the CCS PLL tree.

struct ccs_pll_branch_bk

    CCS PLL configuration (back)

Definition

struct ccs_pll_branch_bk {
    u16 sys_clk_div;
    u16 pix_clk_div;
    u32 sys_clk_freq_hz;
    u32 pix_clk_freq_hz;
};

Members

sys_clk_div System clock divider

pix_clk_div Pixel clock divider

sys_clk_freq_hz System clock frequency

pix_clk_freq_hz Pixel clock frequency

Description

A single branch back-end of the CCS PLL tree.

struct ccs_pll

    Full CCS PLL configuration

Definition

struct ccs_pll {
    u8 bus_type;
    u8 op_lanes;
    u8 vt_lanes;
    struct {
        u8 lanes;
    } csi2;
    u8 binning_horizontal;
    u8 binning_vertical;
```c
u8 scale_m;
u8 scale_n;
u8 bits_per_pixel;
u8 op_bits_per_lane;
u16 flags;
u32 link_freq;
u32 ext_clk_freq_hz;
struct ccs_pll_branch_fr vt_fr;
struct ccs_pll_branch_bk vt_bk;
struct ccs_pll_branch_fr op_fr;
struct ccs_pll_branch_bk op_bk;
u32 pixel_rate_csi;
u32 pixel_rate_pixel_array;
```

**Members**

- **bus_type** Type of the data bus, CCS_PLL_BUS_TYPE_* (input)
- **op_lanes** Number of operational lanes (input)
- **vt_lanes** Number of video timing lanes (input)
- **csi2** CSI-2 related parameters
- **csi2.lanes** The number of the CSI-2 data lanes (input)
- **binning_horizontal** Horizontal binning factor (input)
- **binning_vertical** Vertical binning factor (input)
- **scale_m** Downscaling factor, M component, [16, max] (input)
- **scale_n** Downscaling factor, N component, typically 16 (input)
- **bits_per_pixel** Bits per pixel on the output data bus (input)
- **op_bits_per_lane** Number of bits per OP lane (input)
- **flags** CCS_PLL_FLAG_* (input)
- **link_freq** Chosen link frequency (input)
- **ext_clk_freq_hz** External clock frequency, i.e. the sensor’s input clock (input)
- **vt_fr** Video timing front-end configuration (output)
- **vt_bk** Video timing back-end configuration (output)
- **op_fr** Operational timing front-end configuration (output)
- **op_bk** Operational timing back-end configuration (output)
- **pixel_rate_csi** Pixel rate on the output data bus (output)
- **pixel_rate_pixel_array** Nominal pixel rate in the sensor’s pixel array (output)

**Description**

All information required to calculate CCS PLL configuration.

```c
struct ccs_pll_branch_limits_fr
    CCS PLL front-end limits
```
Definition

```c
struct ccs_pll_branch_limits_fr {
    u16 min_pre_pll_clk_div;
    u16 max_pre_pll_clk_div;
    u32 min_pll_ip_clk_freq_hz;
    u32 max_pll_ip_clk_freq_hz;
    u16 min_pll_multiplier;
    u16 max_pll_multiplier;
    u32 min_pll_op_clk_freq_hz;
    u32 max_pll_op_clk_freq_hz;
};
```

Members

- **min_pre_pll_clk_div** Minimum pre-PLL clock divider
- **max_pre_pll_clk_div** Maximum pre-PLL clock divider
- **min_pll_ip_clk_freq_hz** Minimum PLL input clock frequency
- **max_pll_ip_clk_freq_hz** Maximum PLL input clock frequency
- **min_pll_multiplier** Minimum PLL multiplier
- **max_pll_multiplier** Maximum PLL multiplier
- **min_pll_op_clk_freq_hz** Minimum PLL output clock frequency
- **max_pll_op_clk_freq_hz** Maximum PLL output clock frequency

struct `ccs_pll_branch_limits_bk`  
CCS PLL back-end limits

Definition

```c
struct ccs_pll_branch_limits_bk {
    u16 min_sys_clk_div;
    u16 max_sys_clk_div;
    u32 min_sys_clk_freq_hz;
    u32 max_sys_clk_freq_hz;
    u16 min_pix_clk_div;

max_pix_clk_freq_hz Maximum pixel clock frequency

struct ccs_pll_limits
   CCS PLL limits

Definition

```c
struct ccs_pll_limits {
    u32 min_ext_clk_freq_hz;
    u32 max_ext_clk_freq_hz;
    struct ccs_pll_branch_limits_fr vt_fr;
    struct ccs_pll_branch_limits_bk vt_bk;
    struct ccs_pll_branch_limits_fr op_fr;
    struct ccs_pll_branch_limits_bk op_bk;
    u32 min_line_length_pck_bin;
    u32 min_line_length_pck;
};
```

Members

min_ext_clk_freq_hz Minimum external clock frequency

max_ext_clk_freq_hz Maximum external clock frequency

vt_fr Video timing front-end limits

vt_bk Video timing back-end limits

op_fr Operational timing front-end limits

op_bk Operational timing back-end limits

min_line_length_pck_bin Minimum line length in pixels, with binning

min_line_length_pck Minimum line length in pixels without binning

int ccs_pll_calculate(struct device *dev, const struct ccs_pll_limits *limits, struct ccs_pll *pll);
   Calculate CCS PLL configuration based on input parameters

Parameters

struct device *dev Device pointer, used for printing messages

const struct ccs_pll_limits *limits Limits specific to the sensor

struct ccs_pll *pll Given PLL configuration

Description

Calculate the CCS PLL configuration based on the limits as well as given device specific, system specific or user configured input data.

2.9.2 Digital TV drivers

2.9.2.1 Idea behind the dvb-usb-framework

Note:

1) This documentation is outdated. Please check at the DVB wiki at https://linuxtv.org/wiki for more updated info.

2) deprecated: Newer DVB USB drivers should use the dvb-usb-v2 framework.

In March 2005 I got the new Twinhan USB2.0 DVB-T device. They provided specs and a firmware.

Quite keen I wanted to put the driver (with some quirks of course) into dibusb. After reading some specs and doing some USB snooping, it realized, that the dibusb-driver would be a complete mess afterwards. So I decided to do it in a different way: With the help of a dvb-usb-framework.

The framework provides generic functions (mostly kernel API calls), such as:

• Transport Stream URB handling in conjunction with dvb-demux-feed-control (bulk and isoc are supported)
• registering the device for the DVB-API
• registering an I2C-adapter if applicable
• remote-control/input-device handling
• firmware requesting and loading (currently just for the Cypress USB controllers)
• other functions/methods which can be shared by several drivers (such as functions for bulk-control-commands)
• TODO: a I2C-chunker. It creates device-specific chunks of register-accesses depending on length of a register and the number of values that can be multi-written and multi-read.

The source code of the particular DVB USB devices does just the communication with the device via the bus. The connection between the DVB-API-functionality is done via callbacks, assigned in a static device-description (struct dvb_usb_device) each device-driver has to have.

For an example have a look in drivers/media/usb/dvb-usb/vp7045*.

Objective is to migrate all the usb-devices (dibusb, cinergyT2, maybe the ttusb; flexcop-usb already benefits from the generic flexcop-device) to use the dvb-usb-lib.

TODO: dynamic enabling and disablimg of the pid-filter in regard to number of feeds requested.
Supported devices

See the LinuxTV DVB Wiki at https://linuxtv.org for a complete list of cards/drivers/firmwares: https://linuxtv.org/wiki/index.php/DVB_USB

0. History & News:

2005-06-30

• added support for WideView WT-220U (Thanks to Steve Chang)

2005-05-30

• added basic isochronous support to the dvb-usb-framework

• added support for Conexant Hybrid reference design and Nebula DigiTV USB

2005-04-17

• all dibusb devices ported to make use of the dvb-usb-framework

2005-04-02

• re-enabled and improved remote control code.

2005-03-31

• ported the Yakumo/Hama/Typhoon DVB-T USB2.0 device to dvb-usb.

2005-03-30

• first commit of the dvb-usb-module based on the dibusb-source. First device is a new driver for the TwinhanDTV Alpha / MagicBox II USB2.0-only DVB-T device.

• (change from dvb-dibusb to dvb-usb)

2005-03-28

• added support for the AVerMedia AverTV DVB-T USB2.0 device (Thanks to Glen Harris and Jiun-Kuei Jung, AVerMedia)

2005-03-14

• added support for the Typhoon/Yakumo/HAMA DVB-T mobile USB2.0

2005-02-11

• added support for the KWorl/ADSTech Instant DVB-T USB2.0. Thanks a lot to Joachim von Caron

2005-02-02 - added support for the Hauppauge Win-TV Nova-T USB2

2005-01-31 - distorted streaming is gone for USB1.1 devices

2005-01-13

• moved the mirrored pid_filter_table back to dvb-dibusb first almost working version for HanfTek UMT-010 found out, that Yakumo/HAMA/Typhoon are predecessors of the HanfTek UMT-010

2005-01-10

• refactoring completed, now everything is very delightful
• tuner quirks for some weird devices (Artec T1 AN2235 device has sometimes a Panasonic Tuner assembled). Tunerprobing implemented. Thanks a lot to Gunnar Wittich.

2004-12-29
• after several days of struggling around bug of no returning URBs fixed.

2004-12-26
• refactored the dibusb-driver, split into separate files
• i2c-probing enabled

2004-12-06
• possibility for demod i2c-address probing
• new usb IDs (Compro, Artec)

2004-11-23
• merged changes from DiB3000MC_ver2.1
• revised the debugging
• possibility to deliver the complete TS for USB2.0

2004-11-21
• first working version of the dib3000mc/p frontend driver.

2004-11-12
• added additional remote control keys. Thanks to Uwe Hanke.

2004-11-07
• added remote control support. Thanks to David Matthews.

2004-11-05
• added support for a new devices (Grandtec/Avermedia/Artec)
• merged my changes (for dib3000mb/dibusb) to the FE_REFACTORIZING, because it became HEAD
• moved transfer control (pid filter, fifo control) from usb driver to frontend, it seems better settled there (added xfer_ops-struct)
• created a common files for frontends (mc/p/mb)

2004-09-28
• added support for a new device (Unknown, vendor ID is Hyper-Paltek)

2004-09-20
• added support for a new device (Compro DVB-U2000), thanks to Amaury Demol for reporting
• changed usb TS transfer method (several urbs, stopping transfer before setting a new pid)

2004-09-13
• added support for a new device (Artec T1 USB TVBOX), thanks to Christian Motschke for reporting

2004-09-05
• released the dibusb device and dib3000mb-frontend driver (old news for vp7041.c)

2004-07-15
• found out, by accident, that the device has a TUA6010XS for PLL

2004-07-12
• figured out, that the driver should also work with the CTS Portable (Chinese Television System)

2004-07-08
• firmware-extraction-2.422-problem solved, driver is now working properly with firmware extracted from 2.422
• #if for 2.6.4 (dvb), compile issue
• changed firmware handling, see vp7041.txt sec 1.1

2004-07-02
• some tuner modifications, v0.1, cleanups, first public

2004-06-28
• now using the dvb_dmx_swfilter_packets, everything runs fine now

2004-06-27
• able to watch and switching channels (pre-alpha)
• no section filtering yet

2004-06-06
• first TS received, but kernel oops :/

2004-05-14
• firmware loader is working

2004-05-11
• start writing the driver

How to use?

Firmware

Most of the USB drivers need to download a firmware to the device before start working. Have a look at the Wiki page for the DVB-USB-drivers to find out, which firmware you need for your device:
https://linuxtv.org/wiki/index.php/DVB_USB
Compiling

Since the driver is in the linux kernel, activating the driver in your favorite config-environment should sufficient. I recommend to compile the driver as module. Hotplug does the rest.

If you use dvb-kernel enter the build-2.6 directory run ‘make’ and ‘insmod.sh load’ afterwards.

Loading the drivers

Hotplug is able to load the driver, when it is needed (because you plugged in the device).

If you want to enable debug output, you have to load the driver manually and from within the dvb-kernel cvs repository.

first have a look, which debug level are available:

```bash
# modinfo dvb-usb
# modinfo dvb-usb-vp7045
etc.
```

modprobe dvb-usb debug=<level>
modprobe dvb-usb-vp7045 debug=<level>
etc.

should do the trick.

When the driver is loaded successfully, the firmware file was in the right place and the device is connected, the “Power”-LED should be turned on.

At this point you should be able to start a dvb-capable application. I’m use (t)szap, mplayer and dvbscan to test the basics. VDR-xine provides the long-term test scenario.

Known problems and bugs

- Don’t remove the USB device while running an DVB application, your system will go crazy or die most likely.

Adding support for devices

TODO
USB1.1 Bandwidth limitation

A lot of the currently supported devices are USB1.1 and thus they have a maximum bandwidth of about 5-6 MBit/s when connected to a USB2.0 hub. This is not enough for receiving the complete transport stream of a DVB-T channel (which is about 16 MBit/s). Normally this is not a problem, if you only want to watch TV (this does not apply for HDTV), but watching a channel while recording another channel on the same frequency simply does not work very well. This applies to all USB1.1 DVB-T devices, not just the dvb-usb-devices.

The bug, where the TS is distorted by a heavy usage of the device is gone definitely. All dvb-usb-devices I was using (Twinhan, Kworld, DiBcom) are working like charm now with VDR. Sometimes I even was able to record a channel and watch another one.

Comments

Patches, comments and suggestions are very very welcome.

3. Acknowledgements

Amaury Demol (Amaury.Demol@parrot.com) and Francois Kanounnikoff from DiBcom for providing specs, code and help, on which the dvb-dibusb, dib3000mb and dib3000mc are based.

David Matthews for identifying a new device type (Artec T1 with AN2235) and for extending dibusb with remote control event handling. Thank you.

Alex Woods for frequently answering question about usb and dvb stuff, a big thank you.

Bernd Wagner for helping with huge bug reports and discussions.

Gunnar Wittich and Joachim von Caron for their trust for providing root-shells on their machines to implement support for new devices.

Allan Third and Michael Hutchinson for their help to write the Nebula digitv-driver.

Glen Harris for bringing up, that there is a new dibusb-device and Jiun-Kuei Jung from AVerMedia who kindly provided a special firmware to get the device up and running in Linux.

Jennifer Chen, Jeff and Jack from Twinhan for kindly supporting by writing the vp7045-driver.

Steve Chang from WideView for providing information for new devices and firmware files.

Michael Paxton for submitting remote control keymaps.

Some guys on the linux-dvb mailing list for encouraging me.

Peter Schildmann >peter.schildmann-nospam-at-web.de< for his user-level firmware loader, which saves a lot of time (when writing the vp7041 driver)

Ulf Hermenau for helping me out with traditional chinese.
André Smoktun and Christian Frömmel for supporting me with hardware and listening to my problems very patiently.

## 2.9.2.2 Frontend drivers

### Frontend attach headers

**struct a8293_platform_data**

Platform data for the a8293 driver

**Definition**

```c
struct a8293_platform_data {
    struct dvb_frontend *dvb_frontend;
};
```

**Members**

- **dvb_frontend** DVB frontend.

**struct af9013_platform_data**

Platform data for the af9013 driver

**Definition**

```c
struct af9013_platform_data {
    u32 clk;
    #define AF9013_TUNER_MXL5003D 3;
    #define AF9013_TUNER_MXL5005D 13;

int (*pid_filter_ctrl)(struct dvb_frontend *, int);
int (*pid_filter)(struct dvb_frontend *, u8, u16, int);

Members

clock Clock frequency.
tuner Used tuner model.
if_frequency IF frequency.
ts_mode TS mode.
ts_output_pin TS output pin.
spec_inv Input spectrum inverted.
api_version Firmware API version.
gpio GPIOs.

get_dvb_frontend Get DVB frontend callback.
get_i2c_adapter Get I2C adapter.
pid_filter_ctrl Control PID filter.
pid_filter Set PID to PID filter.

struct ascot2e_config

the configuration of Ascot2E tuner driver

Definition

struct ascot2e_config {
    u8 i2c_address;
    u8 xtal_freq_mhz;
    void *set_tuner_priv;
    int (*set_tuner_callback)(void *, int);
};

Members

i2c_address I2C address of the tuner
xtal_freq_mhz Oscillator frequency, MHz
set_tuner_priv Callback function private context
set_tuner_callback Callback function that notifies the parent driver which tuner is active

struct *ascot2e_attach(struct dvb_frontend *fe, const struct ascot2e_config *config, struct i2c_adapter *i2c)

Attach an ascot2e tuner

Parameters

struct dvb_frontend *fe frontend to be attached
const struct ascot2e_config *config pointer to struct ascot2e_config with tuner configuration.

struct i2c_adapter *i2c i2c adapter to use.

Return
FE pointer on success, NULL on failure.

struct cxd2820r_platform_data
Platform data for the cxd2820r driver

Definition

```c
struct cxd2820r_platform_data {
    u8 ts_mode;
    bool ts_clk_inv;
    bool if_agc_polarity;
    bool spec_inv;
    int **gpio_chip_base;
    struct dvb_frontend* (*get_dvb_frontend)(struct i2c_client *);
};
```

Members

ts_mode TS mode.

ts_clk_inv TS clock inverted.

if_agc_polarity IF AGC polarity.

spec_inv Input spectrum inverted.

gpio_chip_base GPIO.

get_dvb_frontend Get DVB frontend.

struct cxd2820r_config
configuration for cxd2020r demod

Definition

```c
struct cxd2820r_config {
    u8 i2c_address;
    u8 ts_mode;
    bool ts_clock_inv;
    bool if_agc_polarity;
    bool spec_inv;
};
```

Members

i2c_address Demodulator I2C address. Driver determines DVB-C slave I2C address automatically from master address. Default: none, must set. Values: 0x6c, 0x6d.

ts_mode TS output mode. Default: none, must set. Values: FIXME?

ts_clock_inv TS clock inverted. Default: 0. Values: 0, 1.

if_agc_polarity Default: 0. Values: 0, 1

spec_inv Spectrum inversion. Default: 0. Values: 0, 1.
struct `dvb_frontend` *cxd2820r_attach(const struct cxd2820r_config *config, struct i2c_adapter *i2c, int *gpio_chip_base)

Attach a cxd2820r demod

**Parameters**

const struct cxd2820r_config *config pointer to `struct cxd2820r_config` with demod configuration.

struct i2c_adapter *i2c i2c adapter to use.

int *gpio_chip_base if zero, disables GPIO setting. Otherwise, if CONFIG_GPIOLIB is set dynamically allocate gpio base; if is not set, use its value to setup the GPIO pins.

**Return**

FE pointer on success, NULL on failure.

struct `drxk_config`

Configure the initial parameters for DRX-K

**Definition**

```c
struct drxk_config {
    u8 adr;
    bool single_master;
    bool no_i2c_bridge;
    bool parallel_ts;
    bool dynamic_clk;
    bool enable_merr_cfg;
    bool antenna_dvbt;
    u16 antenna_gpio;
    u8 mpeg_out_clk_strength;
    int chunk_size;
    const char *microcode_name;
    int qam_demod_parameter_count;
};
```

**Members**

adr I2C address of the DRX-K

single_master Device is on the single master mode

no_i2c_bridge Don’t switch the I2C bridge to talk with tuner

parallel_ts True means that the device uses parallel TS, Serial otherwise.

dynamic_clk True means that the clock will be dynamically adjusted. Static clock otherwise.

enable_merr_cfg Enable SIO_PDR_PERR_CFG/SIO_PDR_MVAL_CFG.

antenna_dvbt GPIO bit for changing antenna to DVB-C. A value of 1 means that 1=DVBC, 0=DVBT. Zero means the opposite.

antenna_gpio GPIO bit used to control the antenna

mpeg_out_clk_strength DRXK Mpeg output clock drive strength.

chunk_size maximum size for I2C messages

microcode_name Name of the firmware file with the microcode

---

2.9. Media driver-specific documentation 665
qam_demod_parameter_count The number of parameters used for the command to set the demodulator parameters. All firmwares are using the 2-parameter command. An exception is the drxk_a3.mc firmware, which uses the 4-parameter command. A value of 0 (default) or lower indicates that the correct number of parameters will be automatically detected.

Description
On the *_gpio vars, bit 0 is UIO-1, bit 1 is UIO-2 and bit 2 is UIO-3.

```
struct dvb_frontend *drxk_attach(const struct drxk_config *config, struct i2c_adapter *i2c)
```

Attach a drxk demod

Parameters
const struct drxk_config *config pointer to struct drxk_config with demod configuration.

struct i2c_adapter *i2c i2c adapter to use.

Return
FE pointer on success, NULL on failure.

```
struct dvb_frontend *dwb_pll_attach(struct dvb_frontend *fe, int pll_addr, struct i2c_adapter *i2c, unsigned int pll_desc_id)
```

Attach a dvb-pll to the supplied frontend structure.

Parameters
struct dvb_frontend *fe Frontend to attach to.

int pll_addr i2c address of the PLL (if used).

struct i2c_adapter *i2c i2c adapter to use (set to NULL if not used).

unsigned int pll_desc_id dvb_pll_desc to use.

Return
Frontend pointer on success, NULL on failure

```
struct helene_config
```

the configuration of 'Helene' tuner driver

Definition
```
struct helene_config {
  u8 i2c_address;
  u8 xtal_freq_mhz;
  void *set_tuner_priv;
  int (*set_tuner_callback)(void *, int);
  enum helene_xtal xtal;
  struct dvb_frontend *fe;
};
```

Members
i2c_address I2C address of the tuner

xtal_freq_mhz Oscillator frequency, MHz

set_tuner_priv Callback function private context
set_tuner_callback Callback function that notifies the parent driver which tuner is active now

xtal Crystal frequency as described by enum helene_xtal

fe Frontend for which connects this tuner

struct dvb_frontend *helene_attach(struct dvb_frontend *fe, const struct helene_config *config, struct i2c_adapter *i2c)

Attach a helene tuner (terrestrial and cable standards)

Parameters

struct dvb_frontend *fe frontend to be attached

const struct helene_config *config pointer to struct helene_config with tuner configuration.

struct i2c_adapter *i2c i2c adapter to use.

Return

FE pointer on success, NULL on failure.

struct dvb_frontend *helene_attach_s(struct dvb_frontend *fe, const struct helene_config *config, struct i2c_adapter *i2c)

Attach a helene tuner (satellite standards)

Parameters

struct dvb_frontend *fe frontend to be attached

const struct helene_config *config pointer to struct helene_config with tuner configuration.

struct i2c_adapter *i2c i2c adapter to use.

Return

FE pointer on success, NULL on failure.

struct horus3a_config the configuration of Horus3A tuner driver

Definition

struct horus3a_config {
    u8 i2c_address;
    u8 xtal_freq_mhz;
    void *set_tuner_priv;
    int (*set_tuner_callback)(void *, int);
};

Members

i2c_address I2C address of the tuner

xtal_freq_mhz Oscillator frequency, MHz

set_tuner_priv Callback function private context

set_tuner_callback Callback function that notifies the parent driver which tuner is active now
struct * horus3a_attach(struct *fe, const struct horus3a_config *config, struct i2c_adapter *i2c)

Attach a horus3a tuner

Parameters

struct dvb_frontend *fe frontend to be attached
const struct horus3a_config *config pointer to struct helene_config with tuner configuration.

struct i2c_adapter *i2c i2c adapter to use.

Return

FE pointer on success, NULL on failure.

struct ix2505v_config
ix2505 attachment configuration

Definition

struct ix2505v_config {
    u8 tuner_address;
    u8 tuner_gain;
    u8 tuner_chargepump;
    int min_delay_ms;
    u8 tuner_write_only;
};

Members

tuner_address tuner address

tuner_gain Baseband AMP gain control 0/1=0dB(default) 2=-2dB 3=-4dB

tuner_chargepump Charge pump output +/- 0=120 1=260 2=555 3=1200(default)

min_delay_ms delay after tune

tuner_write_only disables reads

struct * ix2505v_attach(struct *fe, const struct ix2505v_config *config, struct i2c_adapter *i2c)

Attach a ix2505v tuner to the supplied frontend structure.

Parameters

struct dvb_frontend *fe Frontend to attach to.
const struct ix2505v_config *config pointer to struct ix2505v_config
struct i2c_adapter *i2c pointer to struct i2c_adapter.

Return

FE pointer on success, NULL on failure.

eenum m88ds3103_ts_mode
    TS connection mode

Constants

M88DS3103_TS_SERIAL TS output pin D0, normal
M88DS3103_TS_SERIAL_D7  TS output pin D7
M88DS3103_TS_PARALLEL  TS Parallel mode
M88DS3103_TS_CI  TS CI Mode

enum m88ds3103_clock_out

Constants
M88DS3103_CLOCK_OUT_DISABLED Clock output is disabled
M88DS3103_CLOCK_OUT_ENABLED Clock output is enabled with crystal clock.
M88DS3103_CLOCK_OUT_ENABLED_DIV2 Clock output is enabled with half crystal clock.

struct m88ds3103_platform_data
   Platform data for the m88ds3103 driver

Definition

struct m88ds3103_platform_data {
    u32 clk;
    u16 i2c_wr_max;
    enum m88ds3103_ts_mode ts_mode;
    u32 ts_clk;
    enum m88ds3103_clock_out clk_out;
    u8 ts_clk_pol;
    u8 spec_inv;
    u8 agc;
    u8 agc_inv;
    u8 envelope_mode;
    u8 lnb_hv_pol;
    u8 lnb_en_pol;
    struct dvb_frontend* (*get_dvb_frontend)(struct i2c_client *);
    struct i2c_adapter* (*get_i2c_adapter)(struct i2c_client *);
};

Members
clk  Clock frequency.
i2c_wr_max  Max bytes I2C adapter can write at once.
ts_mode  TS mode.
ts_clk  TS clock (KHz).
clk_out  Clock output.
ts_clk_pol  TS clk polarity. 1-active at falling edge; 0-active at rising edge.
spec_inv  Input spectrum inversion.
agc  AGC configuration.
agc_inv  AGC polarity.
envelope_mode  DiSEqC envelope mode.
lnb_hv_pol  LNB H/V pin polarity. 0: pin high set to VOLTAGE_18, pin low to set VOLTAGE_13.
           1: pin high set to VOLTAGE_13, pin low to set VOLTAGE_18.
**lnb_en_pol** LNB enable pin polarity. 0: pin high to disable, pin low to enable. 1: pin high to enable, pin low to disable.

**get_dvb_frontend** Get DVB frontend.

**get_i2c_adapter** Get I2C adapter.

**struct m88ds3103_config**

- **m88ds3102 configuration**

**Definition**

```c
struct m88ds3103_config {
    u8 i2c_addr;
    u32 clock;
    u16 i2c_wr_max;
    u8 ts_mode;
    u32 ts_clk;
    u8 ts_clk_pol:1;
    u8 spec_inv:1;
    u8 agc_inv:1;
    u8 clock_out;
    u8 envelope_mode:1;
    u8 agc;
    u8 lnb_hv_pol:1;
    u8 lnb_en_pol:1;
};
```

**Members**

- **i2c_addr** I2C address. Default: none, must set. Example: 0x68, ...

- **clock** Device’s clock. Default: none, must set. Example: 27000000

- **i2c_wr_max** Max bytes I2C provider is asked to write at once. Default: none, must set. Example: 33, 65, ...

- **ts_mode** TS output mode, as defined by `enum m88ds3103_ts_mode`. Default: M88DS3103_TS_SERIAL.

- **ts_clk** TS clk in KHz. Default: 0.

- **ts_clk_pol** TS clk polarity. Default: 0. 1-active at falling edge; 0-active at rising edge.

- **spec_inv** Spectrum inversion. Default: 0.

- **agc_inv** AGC polarity. Default: 0.

- **clock_out** Clock output, as defined by `enum m88ds3103_clock_out`. Default: M88DS3103_CLOCK_OUT_DISABLED.

- **envelope_mode** DiSEqC envelope mode. Default: 0.

- **agc** AGC configuration. Default: none, must set.

- **lnb_hv_pol** LNB H/V pin polarity. Default: 0. Values: 1: pin high set to VOLTAGE_13, pin low to set VOLTAGE_18; 0: pin high set to VOLTAGE_18, pin low to set VOLTAGE_13.

- **lnb_en_pol** LNB enable pin polarity. Default: 0. Values: 1: pin high to enable, pin low to disable; 0: pin high to disable, pin low to enable.
struct *m88ds3103_attach(const struct m88ds3103_config *config, struct i2c_adapter *i2c, struct i2c_adapter **tuner_i2c)

   Attach a m88ds3103 demod

Parameters

const struct m88ds3103_config *config pointer to struct m88ds3103_config with demod configuration.

struct i2c_adapter *i2c i2c adapter to use.

struct i2c_adapter **tuner_i2c on success, returns the I2C adapter associated with m88ds3103 tuner.

Return

FE pointer on success, NULL on failure.

Note

Do not add new m88ds3103_attach() users! Use I2C bindings instead.

struct mb86a20s_config

   Define the per-device attributes of the frontend

Definition

struct mb86a20s_config {
    u32 fclk;
    u8 demod_address;
    bool is_serial;
};

Members

fclk Clock frequency. If zero, assumes the default (32.57142 Mhz)

demod_address the demodulator’s i2c address

is_serial if true, TS is serial. Otherwise, TS is parallel

struct *mb86a20s_attach(const struct mb86a20s_config *config, struct i2c_adapter *i2c)

   Attach a mb86a20s demod

Parameters

const struct mb86a20s_config *config pointer to struct mb86a20s_config with demod configuration.

struct i2c_adapter *i2c i2c adapter to use.

Return

FE pointer on success, NULL on failure.

struct mn88472_config

   Platform data for the mn88472 driver

Definition
struct mn88472_config {
    unsigned int xtal;
#define MN88472_TS_MODE_SERIAL 0;
#define MN88472_TS_MODE_PARALLEL 1;
    int ts_mode;
#define MN88472_TS_CLK_FIXED 0;
#define MN88472_TS_CLK_VARIABLE 1;
    int ts_clock;
    u16 i2c_wr_max;
    struct dvb_frontend **fe;
    struct dvb_frontend* (*get_dvb_frontend)(struct i2c_client *);
};

Members

xtal Clock frequency.

ts_mode TS mode.

ts_clock TS clock config.

i2c_wr_max Max number of bytes driver writes to I2C at once.

fe pointer to a frontend pointer

get_dvb_frontend Get DVB frontend callback.

struct rtl2830_platform_data
    Platform data for the rtl2830 driver

Definition

struct rtl2830_platform_data {
    u32 clk;
    bool spec_inv;
    u8 vtop;
    u8 krf;
    u8 agc_targ_val;
    struct dvb_frontend* (*get_dvb_frontend)(struct i2c_client *);
    struct i2c_adapter* (*get_i2c_adapter)(struct i2c_client *);
    int (*pid_filter)(struct dvb_frontend *, u8, u16, int);
    int (*pid_filter_ctrl)(struct dvb_frontend *, int);
};

Members

clock Clock frequency (4000000, 16000000, 25000000, 28800000).

spec_inv Spectrum inversion.

vtop AGC take-over point.

krf AGC ratio.

agc_targ_val AGC.

get_dvb_frontend Get DVB frontend.

get_i2c_adapter Get I2C adapter.

pid_filter Set PID to PID filter.
**pid_filter_ctrl** Control PID filter.

**struct rtl2832_platform_data**
Platform data for the rtl2832 driver

**Definition**

```c
struct rtl2832_platform_data {
    u32 clk;
    #define RTL2832_TUNER_FC2580 0x21;
    #define RTL2832_TUNER_TUA9001 0x24;
    #define RTL2832_TUNER_FC0012 0x26;
    #define RTL2832_TUNER_E4000 0x27;
    #define RTL2832_TUNER_FC0013 0x29;
    #define RTL2832_TUNER_R820T 0x2a;
    #define RTL2832_TUNER_R828D 0x2b;
    #define RTL2832_TUNER_SI2157 0x2c;
    u8 tuner;
    struct dvb_frontend* (*get_dvb_frontend)(struct i2c_client *);
    struct i2c_adapter* (*get_i2c_adapter)(struct i2c_client *);
    int (*slave_ts_ctrl)(struct i2c_client *, bool);
    int (*pid_filter)(struct dvb_frontend *, u8, u16, int);
    int (*pid_filter_ctrl)(struct dvb_frontend *, int);
};
```

**Members**

- **clk** Clock frequency (4000000, 16000000, 25000000, 28800000).
- **tuner** Used tuner model.
- **get_dvb_frontend** Get DVB frontend.
- **get_i2c_adapter** Get I2C adapter.
- **slave_ts_ctrl** Control slave TS interface.
- **pid_filter** Set PID to PID filter.
- **pid_filter_ctrl** Control PID filter.

**struct rtl2832_sdr_platform_data**
Platform data for the rtl2832_sdr driver

**Definition**

```c
struct rtl2832_sdr_platform_data {
    u32 clk;
    #define RTL2832_SDR_TUNER_FC2580 0x21;
    #define RTL2832_SDR_TUNER_TUA9001 0x24;
    #define RTL2832_SDR_TUNER_FC0012 0x26;
    #define RTL2832_SDR_TUNER_E4000 0x27;
    #define RTL2832_SDR_TUNER_FC0013 0x29;
    #define RTL2832_SDR_TUNER_R820T 0x2a;
    #define RTL2832_SDR_TUNER_R828D 0x2b;
    #define RTL2832_SDR_TUNER_SI2157 0x2c;
    u8 tuner;
    struct regmap *regmap;
    struct dvb_frontend *dvb_frontend;
    struct v4l2_subdev *v4l2_subdev;
    struct dvb_usb_device *dvb_usb_device;
};
```

2.9. Media driver-specific documentation
Members

**clk** Clock frequency (4000000, 16000000, 25000000, 28800000).

**tuner** Used tuner model.

**regmap** pointer to struct regmap.

**dvb_frontend** rtl2832 DVB frontend.

**v4l2_subdev** Tuner v4l2 controls.

**dvb_usb_device** DVB USB interface for USB streaming.

struct **dvb_frontend** * **stb6000_attach**(struct **dvb_frontend** * **fe**, int **addr**, struct **i2c_adapter** * **i2c**)

Attach a stb6000 tuner to the supplied frontend structure.

Parameters

**struct dvb_frontend** * **fe** Frontend to attach to.

**int addr** i2c address of the tuner.

**struct i2c_adapter** * **i2c** i2c adapter to use.

Return

FE pointer on success, NULL on failure.

**struct tda10071_platform_data** Platform data for the tda10071 driver

Definition

```c
struct tda10071_platform_data {
    u32 clk;
    u16 i2c_wr_max;
#define TDA10071_TS_SERIAL 0;
#define TDA10071_TS_PARALLEL 1;
    u8 ts_mode;
    bool spec_inv;
    u8 pll_multiplier;
    u8 tuner_i2c_addr;
    struct dvb_frontend* (*get_dvb_frontend)(struct i2c_client *);
};
```

Members

**clk** Clock frequency.

**i2c_wr_max** Max bytes I2C adapter can write at once.

**ts_mode** TS mode.

**spec_inv** Input spectrum inversion.

**pll_multiplier** PLL multiplier.

**tuner_i2c_addr** CX24118A tuner I2C address (0x14, 0x54, ...).

**get_dvb_frontend** Get DVB frontend.
struct `tda826x_attach` (struct `dvb_frontend` *fe, int addr, struct i2c_adapter *i2c, int has_loopthrough)

Attach a tda826x tuner to the supplied frontend structure.

**Parameters**

- **struct dvb_frontend *fe** Frontend to attach to.
- **int addr** i2c address of the tuner.
- **struct i2c_adapter *i2c** i2c adapter to use.
- **int has_loopthrough** Set to 1 if the card has a loopthrough RF connector.

**Return**

FE pointer on success, NULL on failure.

**struct zd1301_demod_platform_data**

Platform data for the zd1301_demod driver

**Definition**

```c
struct zd1301_demod_platform_data {
    void *reg_priv;
    int (*reg_read)(void *, u16, u8 *);
    int (*reg_write)(void *, u16, u8);
};
```

**Members**

- **reg_priv** First argument of reg_read and reg_write callbacks.
- **reg_read** Register read callback.
- **reg_write** Register write callback.

**struct `zd1301_demod_get_dvb_frontend` (struct platform_device *pdev)**

Get pointer to DVB frontend

**Parameters**

- **struct platform_device *pdev** Pointer to platform device

**Return**

Pointer to DVB frontend which given platform device owns.

**struct i2c_adapter *zd1301_demod_get_i2c_adapter** (struct platform_device *pdev)

Get pointer to I2C adapter

**Parameters**

- **struct platform_device *pdev** Pointer to platform device

**Return**

Pointer to I2C adapter which given platform device owns.

**struct `zl10036_attach` (struct `dvb_frontend` *fe, const struct zl10036_config *config, struct i2c_adapter *i2c)**

Attach a zl10036 tuner to the supplied frontend structure.

**Parameters**
struct dvb_frontend *fe  Frontend to attach to.

const struct zl10036_config *config  zl10036_config structure.

struct i2c_adapter *i2c  pointer to struct i2c_adapter.

Return
FE pointer on success, NULL on failure.

2.9.2.3 vidtv: Virtual Digital TV driver

Author: Daniel W. S. Almeida <dwlsalmeida@gmail.com>, June 2020.

Background

Vidtv is a virtual DVB driver that aims to serve as a reference for driver writers by serving as a template. It also validates the existing media DVB APIs, thus helping userspace application writers.

Currently, it consists of:

• A fake tuner driver, which will report a bad signal quality if the chosen frequency is too far away from a table of valid frequencies for a particular delivery system.

• A fake demod driver, which will constantly poll the fake signal quality returned by the tuner, simulating a device that can lose/reacquire a lock on the signal depending on the CNR levels.

• A fake bridge driver, which is the module responsible for modprobing the fake tuner and demod modules and implementing the demux logic. This module takes parameters at initialization that will dictate how the simulation behaves.

• Code responsible for encoding a valid MPEG Transport Stream, which is then passed to the bridge driver. This fake stream contains some hardcoded content. For now, we have a single, audio-only channel containing a single MPEG Elementary Stream, which in turn contains a SMPTE 302m encoded sine-wave. Note that this particular encoder was chosen because it is the easiest way to encode PCM audio data in a MPEG Transport Stream.

Building vidtv

vidtv is a test driver and thus is not enabled by default when compiling the kernel.

In order to enable compilation of vidtv:
• Enable DVB_TEST_DRIVERS, then
• Enable DVB_VIDTV

When compiled as a module, expect the following .ko files:
• dvb_vidtv_tuner.ko
• dvb_vidtv_demod.ko
• dvb_vidtv_bridge.ko
Running vidtv

When compiled as a module, run:

```
modprobe vidtv
```

That’s it! The bridge driver will initialize the tuner and demod drivers as part of its own initialization.

By default, it will accept the following frequencies:

- 474 MHz for DVB-T/T2/C;
- 11,362 GHz for DVB-S/S2.

For satellite systems, the driver simulates an universal extended LNBf, with frequencies at Ku-Band, ranging from 10.7 GHz to 12.75 GHz.

You can optionally define some command-line arguments to vidtv.

**Command-line arguments to vidtv**

Below is a list of all arguments that can be supplied to vidtv:

- **drop_tslock_prob_on_low_snr**: Probability of losing the TS lock if the signal quality is bad. This probability be used by the fake demodulator driver to eventually return a status of 0 when the signal quality is not good.
- **recover_tslock_prob_on_good_snr**: Probability recovering the TS lock when the signal improves. This probability be used by the fake demodulator driver to eventually return a status of 0x1f when/if the signal quality improves.
- **mock_power_up_delay_msec**: Simulate a power up delay. Default: 0.
- **mock_tune_delay_msec**: Simulate a tune delay. Default 0.
- **vidtv_valid_dvb_t_freqs**: Valid DVB-T frequencies to simulate, in Hz.
- **vidtv_valid_dvb_c_freqs**: Valid DVB-C frequencies to simulate, in Hz.
- **vidtv_valid_dvb_s_freqs**: Valid DVB-S/S2 frequencies to simulate at Ku-Band, in kHz.
- **max_frequency_shift_hz**: Maximum shift in HZ allowed when tuning in a channel.
- **si_period_msec**: How often to send SI packets. Default: 40ms.
- **pcr_period_msec**: How often to send PCR packets. Default: 40ms.
- **mux_rate_kbytes_sec**: Attempt to maintain this bit rate by inserting TS null packets, if necessary. Default: 4096.
- **pcr_pid**: PCR PID for all channels. Default: 0x200.
- **mux_buf_sz_pktss**: Size for the mux buffer in multiples of 188 bytes.
vidtv internal structure

The kernel modules are split in the following way:

**vidtv_tuner.[ch]** Implements a fake tuner DVB driver.

**vidtv_demod.[ch]** Implements a fake demodulator DVB driver.

**vidtv_bridge.[ch]** Implements a bridge driver.

The MPEG related code is split in the following way:

**vidtv_ts.[ch]** Code to work with MPEG TS packets, such as TS headers, adaptation fields, PCR packets and NULL packets.

**vidtv_psi.[ch]** This is the PSI generator. PSI packets contain general information about a MPEG Transport Stream. A PSI generator is needed so userspace apps can retrieve information about the Transport Stream and eventually tune into a (dummy) channel.

Because the generator is implemented in a separate file, it can be reused elsewhere in the media subsystem.

Currently vidtv supports working with 5 PSI tables: PAT, PMT, SDT, NIT and EIT.

The specification for PAT and PMT can be found in *ISO 13818-1: Systems*, while the specification for the SDT, NIT, EIT can be found in *ETSI EN 300 468: Specification for Service Information (SI) in DVB systems*.

It isn’t strictly necessary, but using a real TS file helps when debugging PSI tables. Vidtv currently tries to replicate the PSI structure found in this file: `TS1Globo.ts`.

A good way to visualize the structure of streams is by using `DVBInspector`.

**vidtv_pes.[ch]** Implements the PES logic to convert encoder data into MPEG TS packets. These can then be fed into a TS multiplexer and eventually into userspace.

**vidtv_encoder.h** An interface for vidtv encoders. New encoders can be added to this driver by implementing the calls in this file.

**vidtv_s302m.[ch]** Implements a S302M encoder to make it possible to insert PCM audio data in the generated MPEG Transport Stream. The relevant specification is available online as *SMPTE 302M-2007: Television - Mapping of AES3 Data into MPEG-2 Transport Stream*.

The resulting MPEG Elementary Stream is conveyed in a private stream with a S302M registration descriptor attached.

This shall enable passing an audio signal into userspace so it can be decoded and played by media software. The corresponding decoder in ffmpeg is located in ‘libavcodec/s302m.c’ and is experimental.

**vidtv_channel.[ch]** Implements a ‘channel’ abstraction.

When vidtv boots, it will create some hardcoded channels:

1. Their services will be concatenated to populate the SDT.
2. Their programs will be concatenated to populate the PAT
3. Their events will be concatenated to populate the EIT
4. For each program in the PAT, a PMT section will be created
5. The PMT section for a channel will be assigned its streams.

6. Every stream will have its corresponding encoder polled in a loop to produce TS packets. These packets may be interleaved by the muxer and then delivered to the bridge.

**vidtv_mux.[ch]** Implements a MPEG TS mux, loosely based on the ffmpeg implementation in "libavcodec/mpegtsenc.c"

The muxer runs a loop which is responsible for:

1. Keeping track of the amount of time elapsed since the last iteration.
2. Polling encoders in order to fetch ‘elapsed_time’ worth of data.
3. Inserting PSI and/or PCR packets, if needed.
4. Padding the resulting stream with NULL packets if necessary in order to maintain the chosen bit rate.
5. Delivering the resulting TS packets to the bridge driver so it can pass them to the demux.

**Testing vidtv with v4l-utils**

Using the tools in v4l-utils is a great way to test and inspect the output of vidtv. It is hosted here: v4l-utils Documentation.

From its webpage:

The v4l-utils are a series of packages for handling media devices.

It is hosted at http://git.linuxtv.org/v4l-utils.git, and packaged on most distributions.

It provides a series of libraries and utilities to be used to control several aspect of the media boards.

Start by installing v4l-utils and then modprobing vidtv:

```
modprobe dvb_vidtv_bridge
```

If the driver is OK, it should load and its probing code will run. This will pull in the tuner and demod drivers.

**Using dvb-fe-tool**

The first step to check whether the demod loaded successfully is to run:

```
$ dvb-fe-tool
Device Dummy demod for DVB-T/T2/C/S/S2 (/dev/dvb/adapter0/frontend0) capabilities:
  CAN_FEC_1_2
  CAN_FEC_2_3
  CAN_FEC_3_4
  CAN_FEC_4_5
  CAN_FEC_5_6
  CAN_FEC_6_7
```
CAN_FEC_7_8
CAN_FEC_8_9
CAN_FEC_AUTO
CAN_Guard_interval_AUTO
CAN_Hierarchy_AUTO
CAN_Inversion_AUTO
CAN_QAM_16
CAN_QAM_32
CAN_QAM_64
CAN_QAM_128
CAN_QAM_256
CAN_QAM_AUTO
CAN_QPSK
CAN_Transmission_MODE_AUTO

DVB API Version 5.11, Current v5 delivery system: DVBC/ANNEX_A

Supported delivery systems:
- DVBT
- DVBT2
- [DVBC/ANNEX_A]
- DVBS
- DVBS2

Frequency range for the current standard:

**From:** 51.0 MHz
**To:** 2.15 GHz
**Step:** 62.5 kHz
**Tolerance:** 29.5 MHz

Symbol rate ranges for the current standard:

**From:** 1.00 MBauds
**To:** 45.0 MBauds

This should return what is currently set up at the demod struct, i.e.:

```c
static const struct dvb_frontend_ops vidtv_demod_ops = {
  .delsys = {
    SYS_DVBT,
    SYS_DVBT2,
    SYS_DVBC_ANNEX_A,
    SYS_DVBS,
    SYS_DVBS2,
  },
  .info = {
    .name = "Dummy demod for DVB-T/T2/C/S/S2",
    .frequency_min_hz = 51 * MHz,
    .frequency_max_hz = 2150 * MHz,
    .frequency_stepsize_hz = 62500,
    .frequency_tolerance_hz = 29500 * kHz,
    .symbol_rate_min = 1000000,
    .symbol_rate_max = 45000000,
    .caps = FE_CAN_FEC_1_2 |
      FE_CAN_FEC_2_3 |
      FE_CAN_FEC_3_4 |
      FE_CAN_FEC_4_5 |
      FE_CAN_FEC_5_6 |
      FE_CAN_FEC_6_7 |
      FE_CAN_FEC_7_8 |
  },
};
```
LinuxMediaDocumentation

FE_CAN_HIERARCHY_AUTO,
}

For more information on dvb-fe-tools check its online documentation here: dvb-fe-tool Documentation.

Using dvb-scan

In order to tune into a channel and read the PSI tables, we can use dvb-scan.

For this, one should provide a configuration file known as a ‘scan file’, here’s an example:

```
[Channel]
FREQUENCY = 474000000
MODULATION = QAM/AUTO
SYMBOL_RATE = 6940000
INNER_FEC = AUTO
DELIVERY_SYSTEM = DVBC/ANNEX_A
```

**Note:** The parameters depend on the video standard you’re testing.

**Note:** Vidtv is a fake driver and does not validate much of the information in the scan file. Just specifying ‘FREQUENCY’ and ‘DELIVERY_SYSTEM’ should be enough for DVB-T/DVB-T2. For DVB-S/DVB-C however, you should also provide ‘SYMBOL_RATE’.

You can browse scan tables online here: dvb-scan-tables.

Assuming this channel is named ‘channel.conf’, you can then run:

```
$ dvbv5-scan channel.conf
dvbv5-scan ~/vidtv.conf
ERROR command BANDWIDTH_HZ (5) not found during retrieve
Cannot calc frequency shift. Either bandwidth/symbol-rate is unavailable (yet).
Scanning frequency #1 330000000
 (0x00) Signal= -68.00dBm
Scanning frequency #2 474000000
 Lock (0x1f) Signal= -34.45dBm C/N= 33.74dB UCB= 0
Service Beethoven, provider LinuxTV.org: digital television
```
For more information on `dvb-scan`, check its documentation online here: [dvb-scan Documentation](#).

**Using `dvb-zap`**

`dvbv5-zap` is a command line tool that can be used to record MPEG-TS to disk. The typical use is to tune into a channel and put it into record mode. The example below - which is taken from the documentation - illustrates that¹:

```
$ dvbv5-zap -c dvb_channel.conf "beethoven" -o music.ts -P -t 10
using demux 'dvb0.demux0'
reading channels from file 'dvb_channel.conf'
tuning to 474000000 Hz
pass all PID's to TS
dvb_set_pesfilter 8192
dvb_dev_set_bufsize: buffer set to 6160384
Lock (0x1f) Quality= Good Signal= -34.66dBm C/N= 33.41dB UCB= 0 postBER= 0 preBER= 1.
→ 05x10^-3 PER= 0
Lock (0x1f) Quality= Good Signal= -34.57dBm C/N= 33.46dB UCB= 0 postBER= 0 preBER= 1.
→ 05x10^-3 PER= 0
Record to file 'music.ts' started
received 24587768 bytes (2401 Kbytes/sec)
Lock (0x1f) Quality= Good Signal= -34.42dBm C/N= 33.89dB UCB= 0 postBER= 0 preBER= 2.
→ 44x10^-3 PER= 0
```

The channel can be watched by playing the contents of the stream with some player that recognizes the MPEG-TS format, such as `mplayer` or `vlc`.

By playing the contents of the stream one can visually inspect the workings of `vidtv`, e.g., to play a recorded TS file with:

```
$ mplayer music.ts
```

or, alternatively, running this command on one terminal:

```
$ dvbv5-zap -c dvb_channel.conf "beethoven" -P -r &
```

And, on a second terminal, playing the contents from DVR interface with:

```
$ mplayer /dev/dvb/adapter0/dvr0
```

For more information on `dvb-zap` check its online documentation here: [dvb-zap Documentation](#).

See also: `zap`

¹ In this example, it records 10 seconds with all program ID’s stored at the music.ts file.
What can still be improved in vidtv

Add debugfs integration

Although frontend drivers provide DVBv5 statistics via the .read status call, a nice addition would be to make additional statistics available to userspace via debugfs, which is a simple-to-use, RAM-based filesystem specifically designed for debug purposes.

The logic for this would be implemented on a separate file so as not to pollute the frontend driver. These statistics are driver-specific and can be useful during tests.

The Siano driver is one example of a driver using debugfs to convey driver-specific statistics to userspace and it can be used as a reference.

This should be further enabled and disabled via a Kconfig option for convenience.

Add a way to test video

Currently, vidtv can only encode PCM audio. It would be great to implement a barebones version of MPEG-2 video encoding so we can also test video. The first place to look into is *ISO 13818-2: Information technology — Generic coding of moving pictures and associated audio information — Part 2: Video*, which covers the encoding of compressed video in MPEG Transport Streams.

This might optionally use the Video4Linux2 Test Pattern Generator, v4l2-tpg, which resides at:

```bash
drivers/media/common/v4l2-tpg/
```

Add white noise simulation

The vidtv tuner already has code to identify whether the chosen frequency is too far away from a table of valid frequencies. For now, this means that the demodulator can eventually lose the lock on the signal, since the tuner will report a bad signal quality.

A nice addition is to simulate some noise when the signal quality is bad by:

- Randomly dropping some TS packets. This will trigger a continuity error if the continuity counter is updated but the packet is not passed on to the demux.
- Updating the error statistics accordingly (e.g. BER, etc).
- Simulating some noise in the encoded data.

Functions and structs used within vidtv

```c
struct vidtv_dvb
    Vidtv bridge state

Definition
```

```c
struct vidtv_dvb {
    struct platform_device *pdev;
    struct dvb_frontend *fe[NUM_FE];
    struct dvb_adapter adapter;
```
struct dvb_demux demux;
struct dmxdev dmx_dev;
struct dmx_frontend dmx_fe[NUM_FE];
struct i2c_adapter i2c_adapter;
struct i2c_client *i2c_client_demod[NUM_FE];
struct i2c_client *i2c_client_tuner[NUM_FE];
u32 nfeeds;
struct mutex feed_lock;
bool streaming;
struct vidtv_mux *mux;
#ifdef CONFIG_MEDIA_CONTROLLER_DVB;
struct media_device mdev;
#endif;
};

Members
pdev The platform device. Obtained when the bridge is probed.
fe The frontends. Obtained when probing the demodulator modules.
adapter Represents a DTV adapter. See ‘dvb_register_adapter’.
demux The demux used by the \texttt{dvb_dmx_swfilter_packets()} call.
dmx_dev Represents a demux device.
dmx_fe The frontends associated with the demux.
i2c_adapter The i2c_adapter associated with the bridge driver.
i2c_client_demod The i2c_clients associated with the demodulator modules.
i2c_client_tuner The i2c_clients associated with the tuner modules.
nfeeds The number of feeds active.
feed_lock Protects access to the start/stop stream logic/data.
streaming Whether we are streaming now.
mux The abstraction responsible for delivering MPEG TS packets to the bridge.
mdev The media_device struct for media controller support.

struct vidtv_channel
    A ‘channel’ abstraction

Definition

struct vidtv_channel {
    char *name;
    u16 transport_stream_id;
    struct vidtv_psi_table_sdt_service *service;
    u16 program_num;
    struct vidtv_psi_table_pat_program *program;
    struct vidtv_psi_table_pmt_stream *streams;
    struct vidtv_encoder *encoders;
    struct vidtv_psi_table_eit_event *events;
    struct vidtv_channel *next;
};
Members

name name of the channel

transport_stream_id a number to identify the TS, chosen at will.

service A single service. Will be concatenated into the SDT.

program_num The link between PAT, PMT and SDT.

program A single program with one or more streams associated with it. Will be concatenated into the PAT.

streams A stream loop used to populate the PMT section for ‘program’

encoders A encoder loop. There must be one encoder for each stream.

events Optional event information. This will feed into the EIT.

next Optionally chain this channel.

Description

When vidtv boots, it will create some hardcoded channels. Their services will be concatenated to populate the SDT. Their programs will be concatenated to populate the PAT. For each program in the PAT, a PMT section will be created. The PMT section for a channel will be assigned its streams. Every stream will have its corresponding encoder polled to produce TS packets. These packets may be interleaved by the mux and then delivered to the bridge.

```c
int vidtv_channel_si_init(struct vidtv_mux *m)
    Init the PSI tables from the channels in the mux
```

Parameters

- **struct vidtv_mux *m** The mux containing the channels.

```c
int vidtv_channels_init(struct vidtv_mux *m)
    Init hardcoded, fake ‘channels’.
```

Parameters

- **struct vidtv_mux *m** The mux to store the channels into.

```c
struct vidtv_demod_cnr_to_qual_s
    Map CNR values to a given combination of modulation and fec_inner
```

Definition

```c
struct vidtv_demod_cnr_to_qual_s {
    u32 modulation;
    u32 fec;
    u32 cnr_ok;
    u32 cnr_good;
};
```

Members

- **modulation** see enum fe_modulation
- **fec** see enum fe_fec_rate
- **cnr_ok** S/N threshold to consider the signal as OK. Below that, there’s a chance of losing sync.
- **cnr_good** S/N threshold to consider the signal strong.
Description

This struct matches values for ‘good’ and ‘ok’ CNRs given the combination of modulation and fec_inner in use. We might simulate some noise if the signal quality is not too good.

The values were taken from libdvbv5.

struct **vidtv_demod_config**

   Configuration used to init the demod

**Definition**

```c
struct vidtv_demod_config {
    u8 drop_tslock_prob_on_low_snr;
    u8 recover_tslock_prob_on_good_snr;
};
```

**Members**

- `drop_tslock_prob_on_low_snr` probability of losing the lock due to low snr
- `recover_tslock_prob_on_good_snr` probability of recovering when the signal improves

**Description**

The configuration used to init the demodulator module, usually filled by a bridge driver. For vidtv, this is filled by `vidtv_bridge` before the demodulator module is probed.

struct **vidtv_demod_state**

   The demodulator state

**Definition**

```c
struct vidtv_demod_state {
    struct dvb_frontend frontend;
    struct vidtv_demod_config config;
    enum fe_status status;
    u16 tuner_cnr;
};
```

**Members**

- `frontend` The frontend structure allocated by the demod.
- `config` The config used to init the demod.
- `status` the demod status.
- `tuner_cnr` current S/N ratio for the signal carrier

struct **vidtv_encoder**

   A generic encoder type.

**Definition**

```c
struct vidtv_encoder {
    enum vidtv_encoder_id id;
    char *name;
    u8 *encoder_buf;
    u32 encoder_buf_sz;
    u32 encoder_buf_offset;
    u64 sample_count;
};
```
struct vidtv_access_unit *access_units;
void *src_buf;
u32 src_buf_sz;
u32 src_buf_offset;
bool is_video_encoder;
void *ctx;
__be16 stream_id;
__be16 es_pid;
void *(*encode)(struct vidtv_encoder *e);
u32 (*clear)(struct vidtv_encoder *e);
struct vidtv_encoder *sync;
u32 sampling_rate_hz;
void (*last_sample_cb)(u32 sample_no);
void (*destroy)(struct vidtv_encoder *e);
struct vidtv_encoder *next;
};

Members

id  So we can cast to a concrete implementation when needed.
name  Usually the same as the stream name.
encoder_buf  The encoder internal buffer for the access units.
encoder_buf_sz  The encoder buffer size, in bytes
encoder_buf_offset  Our byte position in the encoder buffer.
sample_count  How many samples we have encoded in total.
access_units  encoder payload units, used for clock references
src_buf  The source of raw data to be encoded, encoder might set a default if null.
src_buf_sz  size of src_buf.
src_buffer_offset  Our position in the source buffer.
is_video_encoder  Whether this a video encoder (as opposed to audio)
ctx  Encoder-specific state.
stream_id  Examples: Audio streams (0xc0-0xdf), Video streams (0xe0-0xef).
es_pid  The TS PID to use for the elementary stream in this encoder.
encode  Prepare enough AUs for the given amount of time.
clear  Clear the encoder output.
sync  Attempt to synchronize with this encoder.
sampling_rate_hz  The sampling rate (or fps, if video) used.
last_sample_cb  Called when the encoder runs out of data. This is so the source can read data
in a piecemeal fashion instead of having to provide it all at once.
destroy  Destroy this encoder, freeing allocated resources.
next  Next in the chain

struct vidtv_mux_timing  
Timing related information
**Definition**

```c
struct vidtv_mux_timing {
    u64 start_jiffies;
    u64 current_jiffies;
    u64 past_jiffies;
    u64 clk;
    u64 pcr_period_usecs;
    u64 si_period_usecs;
};
```

**Members**

- **start_jiffies** The value of ‘jiffies’ when we started the mux thread.
- **current_jiffies** The value of ‘jiffies’ for the current iteration.
- **past_jiffies** The value of ‘jiffies’ for the past iteration.
- **clk** A 27Mhz clock from which we will drive the PCR. Updated proportionally on every iteration.
- **pcr_period_usecs** How often we should send PCR packets.
- **si_period_usecs** How often we should send PSI packets.

**Description**

This is used to decide when PCR or PSI packets should be sent. This will also provide storage for the clock, which is used to compute the value for the PCR.

```c
struct vidtv_mux_si
    Store the PSI context.
```

**Definition**

```c
struct vidtv_mux_si {
    struct vidtv_psi_table_pat *pat;
    struct vidtv_psi_table_pmt **pmt_secs;
    struct vidtv_psi_table_sdt *sdt;
    struct vidtv_psi_table_nit *nit;
    struct vidtv_psi_table_eit *eit;
};
```

**Members**

- **pat** The PAT in use by the muxer.
- **pmt_secs** The PMT sections in use by the muxer. One for each program in the PAT.
- **sdt** The SDT in use by the muxer.
- **nit** The NIT in use by the muxer.
- **eit** the EIT in use by the muxer.

**Description**

This is used to store the PAT, PMT sections and SDT in use by the muxer.

The muxer acquire these by looking into the hardcoded channels in vidtv_channel and then periodically sends the TS packets for them.
struct **vidtv_mux_pid_ctx**

Store the context for a given TS PID.

### Definition

```c
struct vidtv_mux_pid_ctx {
    u16 pid;
    u8 cc;
    struct hlist_node h;
};
```

### Members

**pid** The TS PID.

**cc** The continuity counter for this PID. It is incremented on every TS pack and it will wrap around at 0xf0. If the decoder notices a sudden jump in this counter this will trigger a discontinuity state.

**h** This is embedded in a hash table, mapping pid -> vidtv_mux_pid_ctx

### struct **vidtv_mux**

A muxer abstraction loosely based in libavcodec/mpegtsenc.c

#### Definition

```c
struct vidtv_mux {
    struct dvb_frontend *fe;
    struct device *dev;
    struct vidtv_mux_timing timing;
    u32 mux_rate_kbytes_sec;
    unsigned long pid_ctx[1 << ((3) - 1)];
    void (*on_new_packets_available_cb)(void *priv, u8 *buf, u32 npackets);
    u8 *mux_buf;
    u32 mux_buf_sz;
    u32 mux_buf_offset;
    struct vidtv_channel *channels;
    struct vidtv_mux_si si;
    u64 num_streamed_pcr;
    u64 num_streamed_si;
    struct work_struct mpeg_thread;
    bool streaming;
    u16 pcr_pid;
    u16 transport_stream_id;
    u16 network_id;
    char *network_name;
    void *priv;
};
```

### Members

**fe** The frontend structure allocated by the muxer.

**dev** pointer to struct device.

**timing** Keeps track of timing related information.

**mux_rate_kbytes_sec** The bit rate for the TS, in kbytes.

**pid_ctx** A hash table to keep track of per-PID metadata.
**on_new_packets_available_cb** A callback to inform of new TS packets ready.

**mux_buf** A pointer to a buffer for this muxer. TS packets are stored there and then passed on to the bridge driver.

**mux_buf_sz** The size for ‘mux_buf’.

**mux_buf_offset** The current offset into ‘mux_buf’.

**channels** The channels associated with this muxer.

**si** Keeps track of the PSI context.

**num_streamed_pcr** Number of PCR packets streamed.

**num_streamed_si** The number of PSI packets streamed.

**mpeg_thread** Thread responsible for the muxer loop.

**streaming** whether ‘mpeg_thread’ is running.

**pcr_pid** The TS PID used for the PSI packets. All channels will share the same PCR.

**transport_stream_id** The transport stream ID

**network_id** The network ID

**network_name** The network name

**priv** Private data.

**struct vidtv_mux_init_args**

Arguments used to init the muxer.

**Definition**

```c
struct vidtv_mux_init_args {
    u32 mux_rate_kbytes_sec;
    void (*on_new_packets_available_cb)(void *priv, u8 *buf, u32 npackets);
    u32 mux_buf_sz;
    u64 pcr_period_usecs;
    u64 si_period_usecs;
    u16 pcr_pid;
    u16 transport_stream_id;
    struct vidtv_channel *channels;
    u16 network_id;
    char *network_name;
    void *priv;
};
```

**Members**

**mux_rate_kbytes_sec** The bit rate for the TS, in kbytes.

**on_new_packets_available_cb** A callback to inform of new TS packets ready.

**mux_buf_sz** The size for ‘mux_buf’.

**pcr_period_usecs** How often we should send PCR packets.

**si_period_usecs** How often we should send PSI packets.

**pcr_pid** The TS PID used for the PSI packets. All channels will share the same PCR.
transport_stream_id The transport stream ID

channels an optional list of channels to use

network_id The network ID

network_name The network name

priv Private data.

struct pes_header_write_args
Arguments to write a PES header.

Definition

```c
struct pes_header_write_args {
    void *dest_buf;
    u32 dest_offset;
    u32 dest_buf_sz;
    u32 encoder_id;
    bool send_pts;
    u64 pts;
    bool send_dts;
    u64 dts;
    u16 stream_id;
    u32 n_pes_h_s_bytes;
    u32 access_unit_len;
};
```

Members

dest_buf The buffer to write into.

dest_offset where to start writing in the dest_buffer.

dest_buf_sz The size of the dest_buffer

encoder_id Encoder id (see vidtv_encoder.h)

send_pts Should we send PTS?

pts PTS value to send.

send_dts Should we send DTS?

dts DTS value to send.

stream_id The stream id to use. Ex: Audio streams (0xc0-0xdf), Video streams (0xe0-0xef).

n_pes_h_s_bytes Padding bytes. Might be used by an encoder if needed, gets discarded by the decoder.

access_unit_len The size of one access unit (with any headers it might need)

struct pes_ts_header_write_args
Arguments to write a TS header.

Definition

```c
struct pes_ts_header_write_args {
    void *dest_buf;
    u32 dest_offset;
    u32 dest_buf_sz;
};
```
struct pes_write_args {
    void *dest_buf;
    void *from;
    u32 access_unit_len;
    u32 dest_offset;
    u32 dest_buf_sz;
    u16 pid;
    u32 encoder_id;
    u8 *continuity_counter;
    u16 stream_id;
    bool send_pts;
    u64 pts;
    bool send_dts;
    u64 dts;
    u32 n_pes_h_s_bytes;
    u64 pcr;
};

Members

dest_buf  The buffer to write into.
dest_offset where to start writing in the dest_buffer.
dest_buf_sz The size of the dest_buffer
pid The PID to use for the TS packets.
continuity_counter Incremented on every new TS packet.
wrote_pes_header Flag to indicate that the PES header was written
n_stuffing_bytes Padding bytes. Might be used by an encoder if needed, gets discarded by the decoder.
pcr counter driven by a 27Mhz clock.

struct pes_write_args
Arguments for the packetizer.

Definition

encoder_id  Encoder id (see vidtv_encoder.h)
continuity_counter  Incremented on every new TS packet.
stream_id  The stream id to use. Ex: Audio streams (0xc0-0xdf), Video streams (0xe0-0xef).
send_pts  Should we send PTS?
pts  PTS value to send.
send_dts  Should we send DTS?
dts  DTS value to send.
n_pes_h_s_bytes  Padding bytes. Might be used by an encoder if needed, gets discarded by the decoder.

pcr  counter driven by a 27Mhz clock.

u32 vidtv_pes_write_into(struct pes_write_args *args)
   Write a PES packet as MPEG-TS packets into a buffer.

Parameters

struct pes_write_args *args  The args to use when writing

Description

This function translate the ES data for one access unit from an encoder into MPEG TS packets. It does so by first encapsulating it with a PES header and then splitting it into TS packets. The data is then written into the buffer pointed to by ‘args.buf’

Return

The number of bytes written into the buffer. This is usually NOT equal to the size of the access unit, since we need space for PES headers, TS headers and padding bytes, if any.

struct psi_write_args  Arguments for the PSI packetizer.

Definition

struct psi_write_args {
   void *dest_buf;
   void *from;
   size_t len;
   u32 dest_offset;
   u16 pid;
   bool new_psi_section;
   u8 *continuity_counter;
   bool is_crc;
   u32 dest_buf_sz;
   u32 *crc;
};

Members

dest_buf  The buffer to write into.
from  PSI data to be copied.
len  How much to write.
**dest_offset** where to start writing in the dest_buffer.

**pid** TS packet ID.

**new_psi_section** Set when starting a table section.

**continuity_counter** Incremented on every new packet.

**is_crc** Set when writing the CRC at the end.

**dest_buf_sz** The size of the dest_buffer.

**crc** a pointer to store the crc for this chunk.

**struct desc_write_args**
Arguments in order to write a descriptor.

**Definition**

```
struct desc_write_args {
    void *dest_buf;
    u32 dest_offset;
    struct vidtv_psi_desc *desc;
    u16 pid;
    u8 *continuity_counter;
    u32 dest_buf_sz;
    u32 *crc;
};
```

**Members**

**dest_buf** The buffer to write into.

**dest_offset** where to start writing in the dest_buffer.

**desc** A pointer to the descriptor.

**pid** TS packet ID.

**continuity_counter** Incremented on every new packet.

**dest_buf_sz** The size of the dest_buffer.

**crc** a pointer to store the crc for this chunk.

**struct crc32_write_args**
Arguments in order to write the CRC at the end of the PSI tables.

**Definition**

```
struct crc32_write_args {
    void *dest_buf;
    u32 dest_offset;
    __be32 crc;
    u16 pid;
    u8 *continuity_counter;
    u32 dest_buf_sz;
};
```

**Members**

**dest_buf** The buffer to write into.
**dest_offset** where to start writing in the dest_buffer.

**crc** the CRC value to write

**pid** TS packet ID.

**continuity_counter** Incremented on every new packet.

**dest_buf_sz** The size of the dest_buffer

**struct header_write_args** Arguments in order to write the common table header

**Definition**

```c
struct header_write_args {
    void *dest_buf;
    u32 dest_offset;
    struct vidtv_psi_table_header *h;
    u16 pid;
    u8 *continuity_counter;
    u32 dest_buf_sz;
    u32 *crc;
};
```

**Members**

**dest_buf** The buffer to write into.

**dest_offset** where to start writing in the dest_buffer.

**h** a pointer to the header.

**pid** TS packet ID.

**continuity_counter** Incremented on every new packet.

**dest_buf_sz** The size of the dest_buffer

**crc** a pointer to store the crc for this chunk

```c
void vidtv_psi_sdt_service_assign(struct vidtv_psi_table_sdt *sdt, struct vidtv_psi_table_sdt_service *service)
```

Assigns the service loop to the SDT.

**Parameters**

**struct vidtv_psi_table_sdt **sdt** The SDT to assign to.

**struct vidtv_psi_table_sdt_service **service** The service loop (one or more services)

**Description**

This will free the previous service loop in the table. This will assign ownership of the service loop to the table, i.e. the table will free this service loop when a call to its destroy function is made.

```c
void vidtv_psi_desc_assign(struct vidtv_psi_desc **to, struct vidtv_psi_desc *desc)
```

Assigns a descriptor loop at some point

**Parameters**

**struct vidtv_psi_desc **to** Where to assign this descriptor loop to
struct vidtv_psi_desc *desc The descriptor loop that will be assigned.

Description
This will free the loop in ‘to’, if any.

void vidtv_pmt_desc_assign(struct vidtv_psi_table_pmt *pmt, struct vidtv_psi_desc **to, struct vidtv_psi_desc *desc)
Assigns a descriptor loop at some point in a PMT section.

Parameters
struct vidtv_psi_table_pmt *pmt The PMT section that will contain the descriptor loop
struct vidtv_psi_desc **to Where in the PMT to assign this descriptor loop to
struct vidtv_psi_desc *desc The descriptor loop that will be assigned.

Description
This will free the loop in ‘to’, if any. This will assign ownership of the loop to the table, i.e. the table will free this loop when a call to its destroy function is made.

void vidtv_sdt_desc_assign(struct vidtv_psi_table_sdt *sdt, struct vidtv_psi_desc **to, struct vidtv_psi_desc *desc)
Assigns a descriptor loop at some point in a SDT.

Parameters
struct vidtv_psi_table_sdt *sdt The SDT that will contain the descriptor loop
struct vidtv_psi_desc **to Where in the PMT to assign this descriptor loop to
struct vidtv_psi_desc *desc The descriptor loop that will be assigned.

Description
This will free the loop in ‘to’, if any. This will assign ownership of the loop to the table, i.e. the table will free this loop when a call to its destroy function is made.

void vidtv_psi_pat_program_assign(struct vidtv_psi_table_pat *pat, struct vidtv_psi_table_pat_program *p)
Assigns the program loop to the PAT.

Parameters
struct vidtv_psi_table_pat *pat The PAT to assign to.
struct vidtv_psi_table_pat_program *p The program loop (one or more programs)

Description
This will free the previous program loop in the table. This will assign ownership of the program loop to the table, i.e. the table will free this program loop when a call to its destroy function is made.

void vidtv_psi_pmt_stream_assign(struct vidtv_psi_table_pmt *pmt, struct vidtv_psi_table_pmt_stream *s)
Assigns the stream loop to the PAT.

Parameters
struct vidtv_psi_table_pmt *pmt The PMT to assign to.
struct vidtv_psi_table_pmt_stream *s The stream loop (one or more streams)
Description

This will free the previous stream loop in the table. This will assign ownership of the stream loop to the table, i.e. the table will free this stream loop when a call to its destroy function is made.

```c
struct vidtv_psi_table_pmt** vidtv_psi_pmt_create_sec_for_each_pat_entry(struct vidtv_psi_table_pat *pat, u16 pcr_pid)
```

Create a PMT section for each program found in the PAT

Parameters

- `struct vidtv_psi_table_pat *pat` The PAT to look for programs.
- `u16 pcr_pid` packet ID for the PCR to be used for the program described in this PMT section

```c
u16 vidtv_psi_pmt_get_pid(struct vidtv_psi_table_pmt *section, struct vidtv_psi_table_pat *pat)
```

Get the TS PID for a PMT section.

Parameters

- `struct vidtv_psi_table_pmt *section` The PMT section whose PID we want to retrieve.
- `struct vidtv_psi_table_pat *pat` The PAT table to look into.

Return

the TS PID for ‘section’

```c
void vidtv_psi_pat_table_update_sec_len(struct vidtv_psi_table_pat *pat)
```

Recompute and update the PAT section length.

Parameters

- `struct vidtv_psi_table_pat *pat` The PAT whose length is to be updated.

Description

This will traverse the table and accumulate the length of its components, which is then used to replace the ‘section_length’ field.

If `section_length > MAX_SECTION_LEN`, the operation fails.

```c
void vidtv_psi_pmt_table_update_sec_len(struct vidtv_psi_table_pmt *pmt)
```

Recompute and update the PMT section length.

Parameters

- `struct vidtv_psi_table_pmt *pmt` The PMT whose length is to be updated.

Description

This will traverse the table and accumulate the length of its components, which is then used to replace the ‘section_length’ field.

If `section_length > MAX_SECTION_LEN`, the operation fails.

```c
void vidtv_psi_sdt_table_update_sec_len(struct vidtv_psi_table_sdt *sdt)
```

Recompute and update the SDT section length.

Parameters

2.9. Media driver-specific documentation
**struct vidtv_psi_table_sdt *sdt**  The SDT whose length is to be updated.

**Description**

This will traverse the table and accumulate the length of its components, which is then used to replace the 'section_length' field.

If `section_length > MAX_SECTION_LEN`, the operation fails.

**struct vidtv_psi_pat_write_args**

Arguments for writing a PAT table

**Definition**

```c
struct vidtv_psi_pat_write_args {
    char *buf;
    u32 offset;
    struct vidtv_psi_table_pat *pat;
    u32 buf_sz;
    u8 *continuity_counter;
};
```

**Members**

- `buf` The destination buffer.
- `offset` The offset into the destination buffer.
- `pat` A pointer to the PAT.
- `buf_sz` The size of the destination buffer.
- `continuity_counter` A pointer to the CC. Incremented on every new packet.

```c
ü32 vidtv_psi_pat_write_into(struct vidtv_psi_pat_write_args *args)
    Write PAT as MPEG-TS packets into a buffer.
```

**Parameters**

- `struct vidtv_psi_pat_write_args *args` An instance of `struct vidtv_psi_pat_write_args`

**Description**

This function writes the MPEG TS packets for a PAT table into a buffer. Calling code will usually generate the PAT via a call to its init function and thus is responsible for freeing it.

**Return**

The number of bytes written into the buffer. This is NOT equal to the size of the PAT, since more space is needed for TS headers during TS encapsulation.

**struct vidtv_psi_sdt_write_args**

Arguments for writing a SDT table

**Definition**

```c
struct vidtv_psi_sdt_write_args {
    char *buf;
    u32 offset;
    struct vidtv_psi_table_sdt *sdt;
    u32 buf_sz;
};
```
u8 *continuity_counter;
};

Members

buf  The destination buffer.
offset  The offset into the destination buffer.
sdt  A pointer to the SDT.
buf_sz  The size of the destination buffer.
continuity_counter  A pointer to the CC. Incremented on every new packet.

u32 vidtv_psi_sdt_write_into(struct vidtv_psi_sdt_write_args *args)
  Write SDT as MPEG-TS packets into a buffer.

Parameters

struct vidtv_psi_sdt_write_args *args  an instance of  struct

Description

This function writes the MPEG TS packets for a SDT table into a buffer. Calling code will usually generate the SDT via a call to its init function and thus is responsible for freeing it.

Return

The number of bytes written into the buffer. This is NOT equal to the size of the SDT, since more space is needed for TS headers during TS encapsulation.

struct vidtv_psi_pmt_write_args  Arguments for writing a PMT section

Definition

struct vidtv_psi_pmt_write_args {
  char *buf;
  u32 offset;
  struct vidtv_psi_table_pmt *pmt;
  u16 pid;
  u32 buf_sz;
  u8 *continuity_counter;
  u16 pcr_pid;
};

Members

buf  The destination buffer.
offset  The offset into the destination buffer.
pmt  A pointer to the PMT.
 pid  Program ID
buf_sz  The size of the destination buffer.
continuity_counter  A pointer to the CC. Incremented on every new packet.
pcr_pid  The TS PID used for the PSI packets. All channels will share the same PCR.
u32 \texttt{vidtv\_psi\_pmt\_write\_into}(\textit{struct vidtv\_psi\_pmt\_write\_args *args})

Write PMT as MPEG-TS packets into a buffer.

**Parameters**

\textit{struct vidtv\_psi\_pmt\_write\_args *args} an instance of \textit{struct vidtv\_psi\_pmt\_write\_args}

**Description**

This function writes the MPEG TS packets for a PMT section into a buffer. Calling code will usually generate the PMT section via a call to its init function and thus is responsible for freeing it.

**Return**

The number of bytes written into the buffer. This is NOT equal to the size of the PMT section, since more space is needed for TS headers during TS encapsulation.

\texttt{struct vidtv\_psi\_table\_pmt *vidtv\_psi\_find\_pmt\_sec}(\textit{struct vidtv\_psi\_table\_pmt **pmt\_sections, u16 nsections, u16 program\_num})

Find the PMT section for ‘program\_num’

**Parameters**

\textit{struct vidtv\_psi\_table\_pmt **pmt\_sections} The sections to look into.

\textit{u16 nsections} The number of sections.

\textit{u16 program\_num} The ‘program\_num’ from PAT pointing to a PMT section.

**Return**

A pointer to the PMT, if found, or NULL.

\texttt{struct vidtv\_psi\_table\_transport}

A entry in the TS loop for the NIT and/or other tables. See ETSI 300 468 section 5.2.1

**Definition**

\begin{verbatim}
struct vidtv_psi_table_transport {
    __be16 transport_id;
    __be16 network_id;
    __be16 bitfield;
    struct vidtv_psi_desc *descriptor;
    struct vidtv_psi_table_transport *next;
};
\end{verbatim}

**Members**

\texttt{transport\_id} The TS ID being described

\texttt{network\_id} The network\_id that contains the TS ID

\texttt{bitfield} Contains the descriptor loop length

\texttt{descriptor} A descriptor loop

\texttt{next} Pointer to the next entry

\texttt{struct vidtv\_psi\_table\_nit}

A Network Information Table (NIT). See ETSI 300 468 section 5.2.1
Definition

```c
struct vidtv_psi_table_nit {
    struct vidtv_psi_table_header header;
    __be16 bitfield;
    struct vidtv_psi_desc *descriptor;
    __be16 bitfield2;
    struct vidtv_psi_table_transport *transport;
};
```

Members

- **header**: A PSI table header
- **bitfield**: Contains the network descriptor length
- **descriptor**: A descriptor loop describing the network
- **bitfield2**: Contains the transport stream loop length
- **transport**: The transport stream loop

struct *vidtv_psi_nit_write_args*

Arguments for writing a NIT section

Definition

```c
struct vidtv_psi_nit_write_args {
    char *buf;
    u32 offset;
    struct vidtv_psi_table_nit *nit;
    u32 buf_sz;
    u8 *continuity_counter;
};
```

Members

- **buf**: The destination buffer.
- **offset**: The offset into the destination buffer.
- **nit**: A pointer to the NIT
- **buf_sz**: The size of the destination buffer.
- **continuity_counter**: A pointer to the CC. Incremented on every new packet.

u32 **vidtv_psi_nit_write_into** (struct *vidtv_psi_nit_write_args* *args)

Write NIT as MPEG-TS packets into a buffer.

Parameters

- **struct vidtv_psi_nit_write_args *args** an instance of `struct vidtv_psi_nit_write_args`

Description

This function writes the MPEG TS packets for a NIT table into a buffer. Calling code will usually generate the NIT via a call to its init function and thus is responsible for freeing it.

Return
The number of bytes written into the buffer. This is NOT equal to the size of the NIT, since more space is needed for TS headers during TS encapsulation.

```c
struct vidtv_psi_eit_write_args
    Arguments for writing an EIT section

Definition

struct vidtv_psi_eit_write_args {
    char *buf;
    u32 offset;
    struct vidtv_psi_table_eit *eit;
    u32 buf_sz;
    u8 *continuity_counter;
};
```

**Members**

- **buf**  The destination buffer.
- **offset**  The offset into the destination buffer.
- **eit**  A pointer to the EIT
- **buf_sz**  The size of the destination buffer.
- **continuity_counter**  A pointer to the CC. Incremented on every new packet.

```c
u32 vidtv_psi_eit_write_into(struct vidtv_psi_eit_write_args *args)
    Write EIT as MPEG-TS packets into a buffer.
```

**Parameters**

```c
struct vidtv_psi_eit_write_args *args
    an instance of struct vidtv_psi_nit_write_args
```

**Description**

This function writes the MPEG TS packets for a EIT table into a buffer. Calling code will usually generate the EIT via a call to its init function and thus is responsible for freeing it.

**Return**

The number of bytes written into the buffer. This is NOT equal to the size of the EIT, since more space is needed for TS headers during TS encapsulation.

```c
void vidtv_psi_eit_table_update_sec_len(struct vidtv_psi_table_eit *eit)
    Recompute and update the EIT section length.
```

**Parameters**

```c
struct vidtv_psi_table_eit *eit
    The EIT whose length is to be updated.
```

**Description**

This will traverse the table and accumulate the length of its components, which is then used to replace the 'section_length' field.

If `section_length > EIT_MAX_SECTION_LEN`, the operation fails.

```c
void vidtv_psi_eit_event_assign(struct vidtv_psi_table_eit *eit, struct vidtv_psi_table_eit_event *e)
    Assigns the event loop to the EIT.
```
Parameters

struct vidtv_psi_table_eit *eit The EIT to assign to.
struct vidtv_psi_table_eit_event *e The event loop

Description

This will free the previous event loop in the table. This will assign ownership of the stream loop to the table, i.e. the table will free this stream loop when a call to its destroy function is made.

struct vidtv_s302m_ctx
    s302m encoder context.

Definition

```c
struct vidtv_s302m_ctx {
    struct vidtv_encoder *enc;
    u32 frame_index;
    u32 au_count;
    int last_duration;
    unsigned int note_offset;
    enum musical_notes last_tone;
};
```

Members

enc A pointer to the containing encoder structure.
frame_index The current frame in a block
au_count The total number of access units encoded up to now
last_duration Duration of the tone currently being played
note_offset Position at the music tone array
last_tone Tone currently being played

struct vidtv_s302m_encoder_init_args
    Args for the s302m encoder.

Definition

```c
struct vidtv_s302m_encoder_init_args {
    char *name;
    void *src_buf;
    u32 src_buf_sz;
    u16 es_pid;
    struct vidtv_encoder *sync;
    void (*last_sample_cb)(u32 sample_no);
    struct vidtv_encoder *head;
};
```

Members

name A name to identify this particular instance
src_buf The source buffer, encoder will default to a sine wave if this is NULL.
src_buf_sz The size of the source buffer.
es_pid The MPEG Elementary Stream PID to use.
**sync** Attempt to synchronize audio with this video encoder, if not NULL.

**last_sample_cb** A callback called when the encoder runs out of data.

**head** Add to this chain

**struct pcr_write_args**

Arguments for the pcr_write_into function.

**Definition**

```c
struct pcr_write_args {
    void *dest_buf;
    u32 dest_offset;
    u16 pid;
    u32 buf_sz;
    u8 *continuity_counter;
    u64 pcr;
};
```

**Members**

- **dest_buf** The buffer to write into.
- **dest_offset** The byte offset into the buffer.
- **pid** The TS PID for the PCR packets.
- **buf_sz** The size of the buffer in bytes.
- **continuity_counter** The TS continuity_counter.
- **pcr** A sample from the system clock.

**struct null_packet_write_args**

Arguments for the null_write_into function

**Definition**

```c
struct null_packet_write_args {
    void *dest_buf;
    u32 dest_offset;
    u32 buf_sz;
    u8 *continuity_counter;
};
```

**Members**

- **dest_buf** The buffer to write into.
- **dest_offset** The byte offset into the buffer.
- **buf_sz** The size of the buffer in bytes.
- **continuity_counter** The TS continuity_counter.

**u32 vidtv_ts_null_write_into(struct null_packet_write_args args)**

Write a TS null packet into a buffer.

**Parameters**

**struct null_packet_write_args args** the arguments to use when writing.
**Description**

This function will write a null packet into a buffer. This is usually used to pad TS streams.

**Return**

The number of bytes written into the buffer.

```c
u32 vidtv_ts_pcr_write_into(struct pcr_write_args args)
    Write a PCR packet into a buffer.
```

**Parameters**

`struct pcr_write_args args` the arguments to use when writing.

**Description**

This function will write a PCR packet into a buffer. This is used to synchronize the clocks between encoders and decoders.

**Return**

The number of bytes written into the buffer.

`struct vidtv_tuner_config`

Configuration used to init the tuner.

**Definition**

```c
struct vidtv_tuner_config {
    struct dvb_frontend *fe;
    u32 mock_power_up_delay_msec;
    u32 mock_tune_delay_msec;
    u32 vidtv_valid_dvb_t_freqs[NUM_VALID_TUNER_FREQS];
    u32 vidtv_valid_dvb_c_freqs[NUM_VALID_TUNER_FREQS];
    u32 vidtv_valid_dvb_s_freqs[NUM_VALID_TUNER_FREQS];
    u8 max_frequency_shift_hz;
};
```

**Members**

`fe` A pointer to the dvb_frontend structure allocated by vidtv_demod.

`mock_power_up_delay_msec` Simulate a power-up delay.

`mock_tune_delay_msec` Simulate a tune delay.

`vidtv_valid_dvb_t_freqs` The valid DVB-T frequencies to simulate.

`vidtv_valid_dvb_c_freqs` The valid DVB-C frequencies to simulate.

`vidtv_valid_dvb_s_freqs` The valid DVB-S frequencies to simulate.

`max_frequency_shift_hz` The maximum frequency shift in HZ allowed when tuning in a channel.

**Description**

The configuration used to init the tuner module, usually filled by a bridge driver. For vidtv, this is filled by vidtv_bridge before the tuner module is probed.

```c
u32 vidtv_memcpy(void *to, size_t to_offset, size_t to_size, const void *from, size_t len)
    wrapper routine to be used by MPEG-TS generator, in order to avoid going past the output buffer.
```
Parameters

void *to  Starting element to where a MPEG-TS packet will be copied.
size_t to_offset  Starting position of the to buffer to be filled.
size_t to_size  Size of the to buffer.
const void *from  Starting element of the buffer to be copied.
size_t len  Number of elements to be copy from from buffer into to**+ **to_offset buffer.

Note

Real digital TV demod drivers should not have memcpy wrappers. We use it here because emulating MPEG-TS generation at kernelspace requires some extra care.

Return

Returns the number of bytes written

u32 vidtv_memset(void *to, size_t to_offset, size_t to_size, const int c, size_t len)
wrapper routine to be used by MPEG-TS generator, in order to avoid going past the output buffer.

Parameters

void *to  Starting element to set
size_t to_offset  Starting position of the to buffer to be filled.
size_t to_size  Size of the to buffer.
const int c  The value to set the memory to.
size_t len  Number of elements to be copy from from buffer into to**+ **to_offset buffer.

Note

Real digital TV demod drivers should not have memset wrappers. We use it here because emulating MPEG-TS generation at kernelspace requires some extra care.

Return

Returns the number of bytes written

struct vidtv_tuner_hardware_state
Simulate the tuner hardware status

Definition

```c
struct vidtv_tuner_hardware_state {
    bool asleep;
    u32 lock_status;
    u32 if_frequency;
    u32 tuned_frequency;
    u32 bandwidth;
};
```

Members

asleep  whether the tuner is asleep, i.e whether _sleep() or _suspend() was called.
lock_status  Whether the tuner has managed to lock on the requested frequency.
**if_frequency** The tuner’s intermediate frequency. Hardcoded for the purposes of simulation.

**tuned_frequency** The actual tuned frequency.

**bandwidth** The actual bandwidth.

**Description**
This structure is meant to simulate the status of the tuner hardware, as if we had a physical tuner hardware.

```c
struct vidtv_tuner_dev
{
    struct dvb_frontend *fe;
    struct vidtv_tuner_hardware_state hw_state;
    struct vidtv_tuner_config config;
};
```

**Members**

- `fe` A pointer to the `dvb_frontend` structure allocated by `vidtv_demod`
- `hw_state` A struct to simulate the tuner’s hardware state as if we had a physical tuner hardware.
- `config` The configuration used to start the tuner module, usually filled by a bridge driver. For `vidtv`, this is filled by `vidtv_bridge` before the tuner module is probed.

### 2.9.2.4 Contributors

**Note:** This documentation is outdated. There are several other DVB contributors that aren’t listed below.

Thanks go to the following people for patches and contributions:

- Michael Hunold <m.hunold@gmx.de>
  - for the initial saa7146 driver and its recent overhaul
- Christian Theiss
  - for his work on the initial Linux DVB driver
- Marcus Metzler <mocm@metzlerbros.de> and Ralph Metzler <rjkm@metzlerbros.de>
  - for their continuing work on the DVB driver
- Michael Holzt <kju@debian.org>
  - for his contributions to the `dvb-net` driver
- Diego Picciani <d.picciani@novacomp.it>
- for CyberLogin for Linux which allows logging onto EON (in case you are wondering where CyberLogin is, EON changed its login procedure and CyberLogin is no longer used.)

• Martin Schaller <martin@smurf.franken.de>
  - for patching the cable card decoder driver

• Klaus Schmidinger <Klaus.Schmidinger@cadsoft.de>
  - for various fixes regarding tuning, OSD and CI stuff and his work on VDR

• Steve Brown <sbrown@cortland.com>
  - for his AFC kernel thread

• Christoph Martin <martin@uni-mainz.de>
  - for his LIRC infrared handler

• Andreas Oberritter <obi@linuxtv.org>, Dennis Noermann <dennis.noermann@noernet.de>, Felix Domke <tmbinc@elitedvb.net>, Florian Schirmer <jolt@tuxbox.org>, Ronny Strutz <3des@elitedvb.de>, Wolfram Joost <dbox2@frokaschwei.de> and all the other dbox2 people
  - for many bug fixes in the generic DVB Core, frontend drivers and their work on the dbox2 port of the DVB driver

• Oliver Endriss <o.endriss@gmx.de>
  - for many bug fixes

• Andrew de Quincey <adq_dvb@lidskialf.net>
  - for the tda1004x frontend driver, and various bug fixes

• Peter Schildmann <peter.schildmann@web.de>
  - for the driver for the Technisat SkyStar2 PCI DVB card

• Vadim Catana <skystar@moldova.cc>, Roberto Ragusa <r.ragusa@libero.it> and Augusto Cardoso <augusto@carhil.net>
  - for all the work for the FlexCopII chipset by B2C2, Inc.

• Davor Emard <emard@sothome.net>
  - for his work on the budget drivers, the demux code, the module unloading problems, ...

• Hans-Frieder Vogt <hfvogt@arcor.de>
  - for his work on calculating and checking the crc’s for the TechnoTrend/Hauppauge DEC driver firmware

• Michael Dreher <michael@5dot1.de> and Andreas ‘randy’ Weinberger
  - for the support of the Fujitsu-Siemens Activy budget DVB-S

• Kenneth Aafløy <ke-aa@frisurf.no>
  - for adding support for Typhoon DVB-S budget card

• Ernst Peinlich <e.peinlich@inode.at>
- for tuning/DiSEqC support for the DEC 3000-s

- Peter Beutner <p.beutner@gmx.net>
  - for the IR code for the ttusb-dec driver

- Wilson Michaels <wilsonmichaels@earthlink.net>
  - for the lgdt330x frontend driver, and various bugfixes

- Michael Krufky <mkrufky@linuxtv.org>
  - for maintaining v4l/dvb inter-tree dependencies

- Taylor Jacob <rtjacob@earthlink.net>
  - for the nxt2002 frontend driver

- Jean-Francois Thibert <jeanfrancois@sagetv.com>
  - for the nxt2004 frontend driver

- Kirk Lapray <kirk.lapray@gmail.com>
  - for the or51211 and or51132 frontend drivers, and for merging the nxt2002 and nxt2004 modules into a single nxt200x frontend driver.

(If you think you should be in this list, but you are not, drop a line to the DVB mailing list)

CHAPTER THREE

LINUX MEDIA INFRASTRUCTURE USERSPACE API

This section contains the driver development information and Kernel APIs used by media devices.

Please see:

Documentation/admin-guide/media/index.rst

• for usage information about media subsystem and supported drivers;

Documentation/driver-api/media/index.rst

• for driver development information and Kernel APIs used by media devices;

3.1 Introduction

This document covers the Linux Kernel to Userspace API's used by video and radio streaming devices, including video cameras, analog and digital TV receiver cards, AM/FM receiver cards, Software Defined Radio (SDR), streaming capture and output devices, codec devices and remote controllers.

A typical media device hardware is shown at Typical Media Device.

The media infrastructure API was designed to control such devices. It is divided into five parts.

1. The first part covers radio, video capture and output, cameras, analog TV devices and codecs.

2. The second part covers the API used for digital TV and Internet reception via one of the several digital tv standards. While it is called as DVB API, in fact it covers several different video standards including DVB-T/T2, DVB-S/S2, DVB-C, ATSC, ISDB-T, ISDB-S, DTMB, etc. The complete list of supported standards can be found at fe_delivery_system.

3. The third part covers the Remote Controller API.

4. The fourth part covers the Media Controller API.

5. The fifth part covers the CEC (Consumer Electronics Control) API.

It should also be noted that a media device may also have audio components, like mixers, PCM capture, PCM playback, etc, which are controlled via ALSA API. For additional information and for the latest development code, see: https://linuxtv.org. For discussing improvements, reporting troubles, sending new drivers, etc, please mail to: Linux Media Mailing List (LMML).
PS.: picture is not complete: other blocks may be present

Fig. 1: Typical Media Device
3.2 Part I - Video for Linux API

This part describes the Video for Linux API version 2 (V4L2 API) specification.

Revision 4.5

3.2.1 Common API Elements

Programming a V4L2 device consists of these steps:

• Opening the device
• Changing device properties, selecting a video and audio input, video standard, picture brightness a. o.
• Negotiating a data format
• Negotiating an input/output method
• The actual input/output loop
• Closing the device

In practice most steps are optional and can be executed out of order. It depends on the V4L2 device type, you can read about the details in Interfaces. In this chapter we will discuss the basic concepts applicable to all devices.

3.2.1.1 Opening and Closing Devices

Controlling a hardware peripheral via V4L2

Hardware that is supported using the V4L2 uAPI often consists of multiple devices or peripherals, each of which have their own driver.

The bridge driver exposes one or more V4L2 device nodes (see V4L2 Device Node Naming). There are other drivers providing support for other components of the hardware, which may also expose device nodes, called V4L2 sub-devices.

When such V4L2 sub-devices are exposed, they allow controlling those other hardware components - usually connected via a serial bus (like I²C, SMBus or SPI). Depending on the bridge driver, those sub-devices can be controlled indirectly via the bridge driver or explicitly via the Media Controller and via the V4L2 sub-devices.

The devices that require the use of the Media Controller are called MC-centric devices. The devices that are fully controlled via V4L2 device nodes are called video-node-centric.

Userspace can check if a V4L2 hardware peripheral is MC-centric by calling ioctl VIDIOC_QUERYCAP and checking the device_caps field.

If the device returns V4L2_CAP_I0_MC flag at device_caps, then it is MC-centric, otherwise, it is video-node-centric.

It is required for MC-centric drivers to identify the V4L2 sub-devices and to configure the pipelines via the media controller API before using the peripheral. Also, the sub-devices’ configuration shall be controlled via the sub-device API.
Note:

A video-node-centric may still provide media-controller and sub-device interfaces as well.

However, in that case the media-controller and the sub-device interfaces are read-only and just provide information about the device. The actual configuration is done via the video nodes.

V4L2 Device Node Naming

V4L2 drivers are implemented as kernel modules, loaded manually by the system administrator or automatically when a device is first discovered. The driver modules plug into the videodev kernel module. It provides helper functions and a common application interface specified in this document.

Each driver thus loaded registers one or more device nodes with major number 81. Minor numbers are allocated dynamically unless the kernel is compiled with the kernel option CONFIG_VIDEO_FIXED_MINOR_RANGES. In that case minor numbers are allocated in ranges depending on the device node type.

The device nodes supported by the Video4Linux subsystem are:

<table>
<thead>
<tr>
<th>Default device node name</th>
<th>Usage</th>
</tr>
</thead>
<tbody>
<tr>
<td>/dev/videoX</td>
<td>Video and metadata for capture/output devices</td>
</tr>
<tr>
<td>/dev/vbiX</td>
<td>Vertical blank data (i.e. closed captions, teletext)</td>
</tr>
<tr>
<td>/dev/radioX</td>
<td>Radio tuners and modulators</td>
</tr>
<tr>
<td>/dev/swradioX</td>
<td>Software Defined Radio tuners and modulators</td>
</tr>
<tr>
<td>/dev/v4l-touchX</td>
<td>Touch sensors</td>
</tr>
<tr>
<td>/dev/v4l-subdevX</td>
<td>Video sub-devices (used by sensors and other components of the hardware peripheral)¹</td>
</tr>
</tbody>
</table>

Where X is a non-negative integer.

Note:

1. The actual device node name is system-dependent, as udev rules may apply.
2. There is no guarantee that X will remain the same for the same device, as the number depends on the device driver’s probe order. If you need an unique name, udev default rules produce /dev/v4l/by-id/ and /dev/v4l/by-path/ directories containing links that can be used uniquely to identify a V4L2 device node:

```
$ tree /dev/v4l
/dev/v4l/
    └── by-id
        └── usb-0OmniVision._USB_Camera-B4.04.27.1-video-index0 -> ../../video0
    └── by-path
        └── pci-0000:00:14.0-usb-0:2:1.0-video-index0 -> ../../video0
```

¹ V4L2 sub-device nodes (e.g. /dev/v4l-subdevX) use a different set of system calls, as covered at Sub-device Interface.
Many drivers support “video_nr”, “radio_nr” or “vbi_nr” module options to select specific video/radio/vbi node numbers. This allows the user to request that the device node is named e.g. /dev/video5 instead of leaving it to chance. When the driver supports multiple devices of the same type more than one device node number can be assigned, separated by commas:

```
# modprobe mydriver video_nr=0,1 radio_nr=0,1
```

In /etc/modules.conf this may be written as:

```
options mydriver video_nr=0,1 radio_nr=0,1
```

When no device node number is given as module option the driver supplies a default.

Normally udev will create the device nodes in /dev automatically for you. If udev is not installed, then you need to enable the CONFIG_VIDEO_FIXED_MINOR_RANGES kernel option in order to be able to correctly relate a minor number to a device node number. i.e., you need to be certain that minor number 5 maps to device node name video5. With this kernel option different device types have different minor number ranges. These ranges are listed in Interfaces.

The creation of character special files (with mknod) is a privileged operation and devices cannot be opened by major and minor number. That means applications cannot reliably scan for loaded or installed drivers. The user must enter a device name, or the application can try the conventional device names.

### Related Devices

Devices can support several functions. For example video capturing, VBI capturing and radio support.

The V4L2 API creates different V4L2 device nodes for each of these functions.

The V4L2 API was designed with the idea that one device node could support all functions. However, in practice this never worked: this ‘feature’ was never used by applications and many drivers did not support it and if they did it was certainly never tested. In addition, switching a device node between different functions only works when using the streaming I/O API, not with the read()/write() API.

Today each V4L2 device node supports just one function.

Besides video input or output the hardware may also support audio sampling or playback. If so, these functions are implemented as ALSA PCM devices with optional ALSA audio mixer devices.

One problem with all these devices is that the V4L2 API makes no provisions to find these related V4L2 device nodes. Some really complex hardware use the Media Controller (see Part IV - Media Controller API) which can be used for this purpose. But several drivers do not use it, and while some code exists that uses sysfs to discover related V4L2 device nodes (see libmedia_dev in the v4l-utils git repository), there is no library yet that can provide a single API towards both Media Controller-based devices and devices that do not use the Media Controller. If you want to work on this please write to the linux-media mailing list: https://linuxtv.org/lists.php.
Multiple Opens

V4L2 devices can be opened more than once.\(^2\) When this is supported by the driver, users can for example start a “panel” application to change controls like brightness or audio volume, while another application captures video and audio. In other words, panel applications are comparable to an ALSA audio mixer application. Just opening a V4L2 device should not change the state of the device.\(^3\)

Once an application has allocated the memory buffers needed for streaming data (by calling the `ioctl VIDIOC_REQBUFS` or `ioctl VIDIOC_CREATE_BUFS` ioctl, or implicitly by calling the `read()` or `write()` functions) that application (filehandle) becomes the owner of the device. It is no longer allowed to make changes that would affect the buffer sizes (e.g. by calling the `VIDIOC_S_FMT` ioctl) and other applications are no longer allowed to allocate buffers or start or stop streaming. The EBUSY error code will be returned instead.

Merely opening a V4L2 device does not grant exclusive access.\(^4\) Initiating data exchange however assigns the right to read or write the requested type of data, and to change related properties, to this file descriptor. Applications can request additional access privileges using the priority mechanism described in Application Priority.

Shared Data Streams

V4L2 drivers should not support multiple applications reading or writing the same data stream on a device by copying buffers, time multiplexing or similar means. This is better handled by a proxy application in userspace.

Functions

To open and close V4L2 devices applications use the `open()` and `close()` function, respectively. Devices are programmed using the `ioctl()` function as explained in the following sections.

3.2.1.2 Querying Capabilities

Because V4L2 covers a wide variety of devices not all aspects of the API are equally applicable to all types of devices. Furthermore devices of the same type have different capabilities and this specification permits the omission of a few complicated and less important parts of the API.

The `ioctl VIDIOC_QUERYCAP` ioctl is available to check if the kernel device is compatible with this specification, and to query the functions and I/O methods supported by the device.

Starting with kernel version 3.1, `ioctl VIDIOC_QUERYCAP` will return the V4L2 API version used by the driver, with generally matches the Kernel version. There’s no need of using `ioctl VIDIOC_QUERYCAP` to check if a specific ioctl is supported, the V4L2 core now returns ENOTTY if a driver doesn’t provide support for an ioctl.

---

\(^2\) There are still some old and obscure drivers that have not been updated to allow for multiple opens. This implies that for such drivers `open()` can return an EBUSY error code when the device is already in use.

\(^3\) Unfortunately, opening a radio device often switches the state of the device to radio mode in many drivers. This behavior should be fixed eventually as it violates the V4L2 specification.

\(^4\) Drivers could recognize the O_EXCL open flag. Presently this is not required, so applications cannot know if it really works.
Other features can be queried by calling the respective ioctl, for example `ioctl VIDIOC_ENUMINPUT` to learn about the number, types and names of video connectors on the device. Although abstraction is a major objective of this API, the `ioctl VIDIOC_QUERYCAP` ioctl also allows driver specific applications to reliably identify the driver.

All V4L2 drivers must support `ioctl VIDIOC_QUERYCAP`. Applications should always call this ioctl after opening the device.

### 3.2.1.3 Application Priority

When multiple applications share a device it may be desirable to assign them different priorities. Contrary to the traditional “rm -rf/” school of thought, a video recording application could for example block other applications from changing video controls or switching the current TV channel. Another objective is to permit low priority applications working in background, which can be preempted by user controlled applications and automatically regain control of the device at a later time.

Since these features cannot be implemented entirely in user space V4L2 defines the `VIDIOC_G_PRIORITY` and `VIDIOC_S_PRIORITY` ioctls to request and query the access priority associated with a file descriptor. Opening a device assigns a medium priority, compatible with earlier versions of V4L2 and drivers not supporting these ioctls. Applications requiring a different priority will usually call `VIDIOC_S_PRIORITY` after verifying the device with the `ioctl VIDIOC_QUERYCAP` ioctl.

Ioctls changing driver properties, such as `VIDIOC_S_INPUT`, return an EBUSY error code after another application obtained higher priority.

### 3.2.1.4 Video Inputs and Outputs

Video inputs and outputs are physical connectors of a device. These can be for example: RF connectors (antenna/cable), CVBS a.k.a. Composite Video, S-Video and RGB connectors. Camera sensors are also considered to be a video input. Video and VBI capture devices have inputs. Video and VBI output devices have outputs, at least one each. Radio devices have no video inputs or outputs.

To learn about the number and attributes of the available inputs and outputs applications can enumerate them with the `ioctl VIDIOC_ENUMINPUT` and `ioctl VIDIOC_ENUMOUTPUT` ioctl, respectively. The struct v4l2_input returned by the `ioctl VIDIOC_ENUMINPUT` ioctl also contains signal status information applicable when the current video input is queried.

The `VIDIOC_G_INPUT` and `VIDIOC_G_OUTPUT` ioctls return the index of the current video input or output. To select a different input or output applications call the `VIDIOC_S_INPUT` and `VIDIOC_S_OUTPUT` ioctls. Drivers must implement all the input ioctls when the device has one or more inputs, all the output ioctls when the device has one or more outputs.
Example: Information about the current video input

```c
struct v4l2_input input;
int index;

if (-1 == ioctl(fd, VIDIOC_G_INPUT, &index)) {
    perror("VIDIOC_G_INPUT");
    exit(EXIT_FAILURE);
}

memset(&input, 0, sizeof(input));
input.index = index;

if (-1 == ioctl(fd, VIDIOC_ENUMINPUT, &input)) {
    perror("VIDIOC_ENUMINPUT");
    exit(EXIT_FAILURE);
}

printf("Current input: %s\n", input.name);
```

Example: Switching to the first video input

```c
int index;

index = 0;

if (-1 == ioctl(fd, VIDIOC_S_INPUT, &index)) {
    perror("VIDIOC_S_INPUT");
    exit(EXIT_FAILURE);
}
```

3.2.1.5 Audio Inputs and Outputs

Audio inputs and outputs are physical connectors of a device. Video capture devices have inputs, output devices have outputs, zero or more each. Radio devices have no audio inputs or outputs. They have exactly one tuner which in fact is an audio source, but this API associates tuners with video inputs or outputs only, and radio devices have none of these.\(^1\) A connector on a TV card to loop back the received audio signal to a sound card is not considered an audio output.

Audio and video inputs and outputs are associated. Selecting a video source also selects an audio source. This is most evident when the video and audio source is a tuner. Further audio connectors can combine with more than one video input or output. Assumed two composite video inputs and two audio inputs exist, there may be up to four valid combinations. The relation of video and audio connectors is defined in the audioset field of the respective struct `v4l2_input` or struct `v4l2_output`, where each bit represents the index number, starting at zero, of one audio input or output.

To learn about the number and attributes of the available inputs and outputs applications can enumerate them with the `ioctl VIDIOC_ENUMAUDINPUT` and `VIDIOC_ENUMAUDOUTPUT` ioctl, re-

\(^1\) Actually struct `v4l2_audio` ought to have a tuner field like struct `v4l2_input`, not only making the API more consistent but also permitting radio devices with multiple tuners.
spectively. The struct `v4l2_audio` returned by the `ioctl VIDIOC_ENUMAUDIO` ioctl also contains signal status information applicable when the current audio input is queried.

The `VIDIOC_G_AUDIO` and `VIDIOC_G_AUDOUT` ioctls report the current audio input and output, respectively.

**Note:** Note that, unlike `VIDIOC_G_INPUT` and `VIDIOC_G_OUTPUT` these ioctls return a structure as `ioctl VIDIOC_ENUMAUDIO` and `VIDIOC_ENUMAUDOUT` do, not just an index.

To select an audio input and change its properties applications call the `VIDIOC_S_AUDIO` ioctl. To select an audio output (which presently has no changeable properties) applications call the `VIDIOC_S_AUDOUT` ioctl.

Drivers must implement all audio input ioctls when the device has multiple selectable audio inputs, all audio output ioctls when the device has multiple selectable audio outputs. When the device has any audio inputs or outputs the driver must set the `V4L2_CAP_AUDIO` flag in the struct `v4l2_capability` returned by the `ioctl VIDIOC_QUERYCAP` ioctl.

**Example: Information about the current audio input**

```c
struct v4l2_audio audio;
memset(&audio, 0, sizeof(audio));
if (-1 == ioctl(fd, VIDIOC_G_AUDIO, &audio)) {
    perror("VIDIOC_G_AUDIO");
    exit(EXIT_FAILURE);
}
printf("Current input: %s\n", audio.name);
```

**Example: Switching to the first audio input**

```c
struct v4l2_audio audio;
memset(&audio, 0, sizeof(audio)); /* clear audio.mode, audio.reserved */
audio.index = 0;
if (-1 == ioctl(fd, VIDIOC_S_AUDIO, &audio)) {
    perror("VIDIOC_S_AUDIO");
    exit(EXIT_FAILURE);
}
```
3.2.1.6 Tuners and Modulators

Tuners

Video input devices can have one or more tuners demodulating a RF signal. Each tuner is associated with one or more video inputs, depending on the number of RF connectors on the tuner. The type field of the respective struct `v4l2_input` returned by the `ioctl VIDIOC_ENUMINPUT` ioctl is set to `V4L2_INPUT_TYPE_TUNER` and its tuner field contains the index number of the tuner.

Radio input devices have exactly one tuner with index zero, no video inputs.

To query and change tuner properties applications use the `VIDIOC_G_TUNER` and `VIDIOC_S_TUNER` ioctls, respectively. The struct `v4l2_tuner` returned by `VIDIOC_G_TUNER` also contains signal status information applicable when the tuner of the current video or radio input is queried.

Note: `VIDIOC_S_TUNER` does not switch the current tuner, when there is more than one. The tuner is solely determined by the current video input. Drivers must support both ioctls and set the `V4L2_CAP_TUNER` flag in the struct `v4l2_capability` returned by the `ioctl VIDIOC_QUERYCAP` ioctl when the device has one or more tuners.

Modulators

Video output devices can have one or more modulators, that modulate a video signal for radiation or connection to the antenna input of a TV set or video recorder. Each modulator is associated with one or more video outputs, depending on the number of RF connectors on the modulator. The type field of the respective struct `v4l2_output` returned by the `ioctl VIDIOC_ENUMOUTPUT` ioctl is set to `V4L2_OUTPUT_TYPE_MODULATOR` and its modulator field contains the index number of the modulator.

Radio output devices have exactly one modulator with index zero, no video outputs.

A video or radio device cannot support both a tuner and a modulator. Two separate device nodes will have to be used for such hardware, one that supports the tuner functionality and one that supports the modulator functionality. The reason is a limitation with the `VIDIOC_S_FREQUENCY` ioctl where you cannot specify whether the frequency is for a tuner or a modulator.

To query and change modulator properties applications use the `VIDIOC_G_MODULATOR` and `VIDIOC_S_MODULATOR` ioctls. Note that `VIDIOC_S_MODULATOR` does not switch the current modulator, when there is more than one at all. The modulator is solely determined by the current video output. Drivers must support both ioctls and set the `V4L2_CAP_MODULATOR` flag in the struct `v4l2_capability` returned by the `ioctl VIDIOC_QUERYCAP` ioctl when the device has one or more modulators.
Radio Frequency

To get and set the tuner or modulator radio frequency applications use the `VIDIOC_G_FREQUENCY` and `VIDIOC_S_FREQUENCY` ioctl which both take a pointer to a struct `v4l2_frequency`. These ioctls are used for TV and radio devices alike. Drivers must support both ioctls when the tuner or modulator ioctls are supported, or when the device is a radio device.

### 3.2.1.7 Video Standards

Video devices typically support one or more different video standards or variations of standards. Each video input and output may support another set of standards. This set is reported by the `std` field of struct `v4l2_input` and struct `v4l2_output` returned by the `ioctl VIDIOC_ENUMINPUT` and `ioctl VIDIOC_ENUMOUTPUT` ioctls, respectively.

V4L2 defines one bit for each analog video standard currently in use worldwide, and sets aside bits for driver defined standards, e.g. hybrid standards to watch NTSC video tapes on PAL TVs and vice versa. Applications can use the predefined bits to select a particular standard, although presenting the user a menu of supported standards is preferred. To enumerate and query the attributes of the supported standards applications use the `ioctl VIDIOC_ENUMSTD, VIDIOC_SUBDEV_ENUMSTD` ioctl.

Many of the defined standards are actually just variations of a few major standards. The hardware may in fact not distinguish between them, or do so internal and switch automatically. Therefore enumerated standards also contain sets of one or more standard bits.

Assume a hypothetic tuner capable of demodulating B/PAL, G/PAL and I/PAL signals. The first enumerated standard is a set of B and G/PAL, switched automatically depending on the selected radio frequency in UHF or VHF band. Enumeration gives a “PAL-B/G” or “PAL-I” choice. Similar a Composite input may collapse standards, enumerating “PAL-B/G/H/I”, “NTSC-M” and “SECAM-D/K”.

To query and select the standard used by the current video input or output applications call the `VIDIOC_G_STD` and `VIDIOC_S_STD` ioctl, respectively. The `received` standard can be sensed with the `ioctl VIDIOC_QUERYSTD, VIDIOC_SUBDEV_QUERYSTD` ioctl.

**Note:** The parameter of all these ioctls is a pointer to a `v4l2_std_id` type (a standard set), *not* an index into the standard enumeration. Drivers must implement all video standard ioctls when the device has one or more video inputs or outputs.

Special rules apply to devices such as USB cameras where the notion of video standards makes little sense. More generally for any capture or output device which is:

- incapable of capturing fields or frames at the nominal rate of the video standard, or
- that does not support the video standard formats at all.

Here the driver shall set the `std` field of struct `v4l2_input` and struct `v4l2_output` to zero and the `VIDIOC_G_STD, VIDIOC_S_STD, ioctl VIDIOC_QUERYSTD, VIDIOC_SUBDEV_QUERYSTD` and `ioctl VIDIOC_ENUMSTD, VIDIOC_SUBDEV_ENUMSTD` ioctls shall return the `ENOTTY` error code or the `EINVAL` error code.

---

1 Some users are already confused by technical terms PAL, NTSC and SECAM. There is no point asking them to distinguish between B, G, D, or K when the software or hardware can do that automatically.
Applications can make use of the Input capabilities and Output capabilities flags to determine whether the video standard ioctl can be used with the given input or output.

Example: Information about the current video standard

```c
v4l2_std_id std_id;
struct v4l2_standard standard;

if (-1 == ioctl(fd, VIDIOC_G_STD, &std_id)) {
    /* Note when VIDIOC_ENUMSTD always returns ENOTTY this
     * is no video device or it falls under the USB exception,
     * and VIDIOC_G_STD returning ENOTTY is no error. */
    perror("VIDIOC_G_STD");
    exit(EXIT_FAILURE);
}
memset(&standard, 0, sizeof(standard));
standard.index = 0;

while (0 == ioctl(fd, VIDIOC_ENUMSTD, &standard)) {
    if (standard.id & std_id) {
        printf("Current video standard: %s\n", standard.name);
        exit(EXIT_SUCCESS);
    }
    standard.index++;
}
/* EINVAL indicates the end of the enumeration, which cannot be
   empty unless this device falls under the USB exception. */
if (errno == EINVAL || standard.index == 0) {
    perror("VIDIOC_ENUMSTD");
    exit(EXIT_FAILURE);
}
```

Example: Listing the video standards supported by the current input

```c
struct v4l2_input input;
struct v4l2_standard standard;
memset(&input, 0, sizeof(input));

if (-1 == ioctl(fd, VIDIOC_G_INPUT, &input.index)) {
    perror("VIDIOC_G_INPUT");
    exit(EXIT_FAILURE);
}
if (-1 == ioctl(fd, VIDIOC_ENUMINPUT, &input)) {
    perror("VIDIOC_ENUM_INPUT");
    exit(EXIT_FAILURE);
}
```
printf("Current input %s supports:\n", input.name);

memset(&standard, 0, sizeof(standard));
standard.index = 0;

while (0 == ioctl(fd, VIDIOC_ENUMSTD, &standard)) {
    if (standard.id & input.std)
        printf("%s\n", standard.name);
    standard.index++;
}

/* EINVAL indicates the end of the enumeration, which cannot be empty unless this device falls under the USB exception. */

if (errno != EINVAL || standard.index == 0) {
    perror("VIDIOC_ENUMSTD");
    exit(EXIT_FAILURE);
}

Example: Selecting a new video standard

struct v4l2_input input;
v4l2_std_id std_id;

memset(&input, 0, sizeof(input));

if (-1 == ioctl(fd, VIDIOC_G_INPUT, &input.index)) {
    perror("VIDIOC_G_INPUT");
    exit(EXIT_FAILURE);
}

if (-1 == ioctl(fd, VIDIOC_ENUMINPUT, &input)) {
    perror("VIDIOC_ENUM_INPUT");
    exit(EXIT_FAILURE);
}

if (0 == (input.std & V4L2_STD_PAL_BG)) {
    fprintf(stderr, "Oops. B/G PAL is not supported.\n");
    exit(EXIT_FAILURE);
}

/* Note this is also supposed to work when only B or G/PAL is supported. */

std_id = V4L2_STD_PAL_BG;

if (-1 == ioctl(fd, VIDIOC_S_STD, &std_id)) {
    perror("VIDIOC_S_STD");
    exit(EXIT_FAILURE);
3.2.1.8 Digital Video (DV) Timings

The video standards discussed so far have been dealing with Analog TV and the corresponding video timings. Today there are many more different hardware interfaces such as High Definition TV interfaces (HDMI), VGA, DVI connectors etc., that carry video signals and there is a need to extend the API to select the video timings for these interfaces. Since it is not possible to extend the \texttt{v4l2\_std\_id} due to the limited bits available, a new set of ioctl parameters was added to set/get video timings at the input and output.

These ioctl parameters deal with the detailed digital video timings that define each video format. This includes parameters such as the active video width and height, signal polarities, front porches, back porches, sync widths etc. The \texttt{linux/v4l2-dv-timings.h} header can be used to get the timings of the formats in the \textit{CEA-861-E} and \textit{VESA DMT} standards.

To enumerate and query the attributes of the DV timings supported by a device applications use the \texttt{ioctl VIDIOC_ENUM_DV_TIMINGS}, \texttt{VIDIOC_SUBDEV_ENUM_DV_TIMINGS} and \texttt{ioctl VIDIOC_DV_TIMINGS_CAP, VIDIOC_SUBDEV_DV_TIMINGS_CAP} ioctl parameters. To set DV timings for the device applications use the \texttt{VIDIOC_S_DV_TIMINGS} ioctl and to get current DV timings they use the \texttt{VIDIOC_G_DV_TIMINGS} ioctl. To detect the DV timings as seen by the video receiver applications use the \texttt{ioctl VIDIOC_QUERY_DV_TIMINGS} ioctl.

Applications can make use of the \textit{Input capabilities} and \textit{Output capabilities} flags to determine whether the digital video ioctl parameters can be used with the given input or output.

3.2.1.9 User Controls

Devices typically have a number of user-settable controls such as brightness, saturation and so on, which would be presented to the user on a graphical user interface. But, different devices will have different controls available, and furthermore, the range of possible values, and the default value will vary from device to device. The control ioctl parameters provide the information and a mechanism to create a nice user interface for these controls that will work correctly with any device.

All controls are accessed using an ID value. V4L2 defines several IDs for specific purposes. Drivers can also implement their own custom controls using \texttt{V4L2\_CID\_PRIVATE\_BASE} and higher values. The pre-defined control IDs have the prefix \texttt{V4L2\_CID\_}, and are listed in \textit{Control IDs}. The ID is used when querying the attributes of a control, and when getting or setting the current value.

Generally applications should present controls to the user without assumptions about their purpose. Each control comes with a name string the user is supposed to understand. When the purpose is non-intuitive the driver writer should provide a user manual, a user interface plug-in or a driver specific panel application. Predefined IDs were introduced to change a few controls programmatically, for example to mute a device during a channel switch.

Drivers may enumerate different controls after switching the current video input or output, tuner or modulator, or audio input or output. Different in the sense of other bounds, another

\footnote{The use of \texttt{V4L2\_CID\_PRIVATE\_BASE} is problematic because different drivers may use the same \texttt{V4L2\_CID\_PRIVATE\_BASE} ID for different controls. This makes it hard to programmatically set such controls since the meaning of the control with that ID is driver dependent. In order to resolve this drivers use unique IDs and the \texttt{V4L2\_CID\_PRIVATE\_BASE} IDs are mapped to those unique IDs by the kernel. Consider these \texttt{V4L2\_CID\_PRIVATE\_BASE} IDs as aliases to the real IDs. Many applications today still use the \texttt{V4L2\_CID\_PRIVATE\_BASE} IDs instead of using ioctl parameters with the \texttt{V4L2\_CTRL\_FLAG\_NEXT\_CTRL} flag to enumerate all IDs, so support for \texttt{V4L2\_CID\_PRIVATE\_BASE} is still around.}
default and current value, step size or other menu items. A control with a certain custom ID can also change name and type.

If a control is not applicable to the current configuration of the device (for example, it doesn’t apply to the current video input) drivers set the V4L2_CTRL_FLAG_INACTIVE flag.

Control values are stored globally, they do not change when switching except to stay within the reported bounds. They also do not change e. g. when the device is opened or closed, when the tuner radio frequency is changed or generally never without application request.

V4L2 specifies an event mechanism to notify applications when controls change value (see ioctl VIDIOC_SUBSCRIBE_EVENT, VIDIOC_UNSUBSCRIBE_EVENT, event V4L2_EVENT_CTRL), panel applications might want to make use of that in order to always reflect the correct control value.

All controls use machine endianness.

**Control IDs**

**V4L2_CID_BASE**  First predefined ID, equal to V4L2_CID_BRIGHTNESS.

**V4L2_CID_USER_BASE**  Synonym of V4L2_CID_BASE.

**V4L2_CID_BRIGHTNESS (integer)**  Picture brightness, or more precisely, the black level.

**V4L2_CID_CONTRAST (integer)**  Picture contrast or luma gain.

**V4L2_CID_SATURATION (integer)**  Picture color saturation or chroma gain.

**V4L2_CID_HUE (integer)**  Hue or color balance.

**V4L2_CID_AUDIO_VOLUME (integer)**  Overall audio volume. Note some drivers also provide an OSS or ALSA mixer interface.

**V4L2_CID_AUDIO_BALANCE (integer)**  Audio stereo balance. Minimum corresponds to all the way left, maximum to right.

**V4L2_CID_AUDIO_BASS (integer)**  Audio bass adjustment.

**V4L2_CID_AUDIO_TREBLE (integer)**  Audio treble adjustment.

**V4L2_CID_AUDIO_MUTE (boolean)**  Mute audio, i. e. set the volume to zero, however without affecting V4L2_CID_AUDIO_VOLUME. Like ALSA drivers, V4L2 drivers must mute at load time to avoid excessive noise. Actually the entire device should be reset to a low power consumption state.

**V4L2_CID_AUDIO_LOUDNESS (boolean)**  Loudness mode (bass boost).

**V4L2_CID_BLACK_LEVEL (integer)**  Another name for brightness (not a synonym of V4L2_CID_BRIGHTNESS). This control is deprecated and should not be used in new drivers and applications.

**V4L2_CID_AUTO_WHITE_BALANCE (boolean)**  Automatic white balance (cameras).

**V4L2_CID_DO_WHITE_BALANCE (button)**  This is an action control. When set (the value is ignored), the device will do a white balance and then hold the current setting. Contrast this with the boolean V4L2_CID_AUTO_WHITE_BALANCE, which, when activated, keeps adjusting the white balance.

**V4L2_CID_RED_BALANCE (integer)**  Red chroma balance.
V4L2_CID_BLUE_BALANCE (integer) Blue chroma balance.

V4L2_CID_GAMMA (integer) Gamma adjust.

V4L2_CID_WHITE_BALANCE (integer) Whiteness for grey-scale devices. This is a synonym for V4L2_CID_GAMMA. This control is deprecated and should not be used in new drivers and applications.

V4L2_CID_EXPOSURE (integer) Exposure (cameras). [Unit?]

V4L2_CID_AUTOGAIN (boolean) Automatic gain/exposure control.

V4L2_CID_GAIN (integer) Gain control.

Primarily used to control gain on e.g. TV tuners but also on webcams. Most devices control only digital gain with this control but on some this could include analogue gain as well. Devices that recognise the difference between digital and analogue gain use controls V4L2_CID_DIGITAL_GAIN and V4L2_CID_ANALOGUE_GAIN.

V4L2_CID_HFLIP (boolean) Mirror the picture horizontally.

V4L2_CID_VFLIP (boolean) Mirror the picture vertically.

V4L2_CID_POWER_LINE_FREQUENCY (enum) Enables a power line frequency filter to avoid flicker. Possible values for enum v4l2_power_line_frequency are:

<table>
<thead>
<tr>
<th>V4L2_CID_POWER_LINE_FREQUENCY_DISABLED</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td>V4L2_CID_POWER_LINE_FREQUENCY_50HZ</td>
<td>1</td>
</tr>
<tr>
<td>V4L2_CID_POWER_LINE_FREQUENCY_60HZ</td>
<td>2</td>
</tr>
<tr>
<td>V4L2_CID_POWER_LINE_FREQUENCY_AUTO</td>
<td>3</td>
</tr>
</tbody>
</table>

V4L2_CID_HUE_AUTO (boolean) Enables automatic hue control by the device. The effect of setting V4L2_CID_HUE while automatic hue control is enabled is undefined, drivers should ignore such request.

V4L2_CID_WHITE_BALANCE_TEMPERATURE (integer) This control specifies the white balance settings as a color temperature in Kelvin. A driver should have a minimum of 2800 (incandescent) to 6500 (daylight). For more information about color temperature see Wikipedia.

V4L2_CID_SHARPNESS (integer) Adjusts the sharpness filters in a camera. The minimum value disables the filters, higher values give a sharper picture.

V4L2_CID_BACKLIGHT_COMPENSATION (integer) Adjusts the backlight compensation in a camera. The minimum value disables backlight compensation.

V4L2_CID_CHROMA_AGC (boolean) Chroma automatic gain control.

V4L2_CID_CHROMA_GAIN (integer) Adjusts the Chroma gain control (for use when chroma AGC is disabled).

V4L2_CID_COLOR_KILLER (boolean) Enable the color killer (i.e. force a black & white image in case of a weak video signal).

V4L2_CID_COLORFX (enum) Selects a color effect. The following values are defined:
<table>
<thead>
<tr>
<th>V4L2_COLORFX_NONE</th>
<th>Color effect is disabled.</th>
</tr>
</thead>
<tbody>
<tr>
<td>V4L2_COLORFX_ANTIQUE</td>
<td>An aging (old photo) effect.</td>
</tr>
<tr>
<td>V4L2_COLORFX_ART_FREEZE</td>
<td>Frost color effect.</td>
</tr>
<tr>
<td>V4L2_COLORFX_AQUA</td>
<td>Water color, cool tone.</td>
</tr>
<tr>
<td>V4L2_COLORFX_BW</td>
<td>Black and white.</td>
</tr>
<tr>
<td>V4L2_COLORFX_EMBoss</td>
<td>Emboss, the highlights and shadows replace light/dark boundaries and low contrast areas are set to a gray background.</td>
</tr>
<tr>
<td>V4L2_COLORFX_GRASS_GREEN</td>
<td>Grass green.</td>
</tr>
<tr>
<td>V4L2_COLORFX_NEGATIVE</td>
<td>Negative.</td>
</tr>
<tr>
<td>V4L2_COLORFX_SEPIA</td>
<td>Sepia tone.</td>
</tr>
<tr>
<td>V4L2_COLORFX_SKETCH</td>
<td>Sketch.</td>
</tr>
<tr>
<td>V4L2_COLORFX_SKIN_WHITEN</td>
<td>Skin whiten.</td>
</tr>
<tr>
<td>V4L2_COLORFX_SKY_BLUE</td>
<td>Sky blue.</td>
</tr>
<tr>
<td>V4L2_COLORFX_SOLARIZATION</td>
<td>Solarization, the image is partially reversed in tone, only color values above or below a certain threshold are inverted.</td>
</tr>
<tr>
<td>V4L2_COLORFX_SILHOUETTE</td>
<td>Silhouette (outline).</td>
</tr>
<tr>
<td>V4L2_COLORFX_VIVID</td>
<td>Vivid colors.</td>
</tr>
<tr>
<td>V4L2_COLORFX_SET_CBCR</td>
<td>The Cb and Cr chroma components are replaced by fixed coefficients determined by V4L2_CID_COLORFX_CBCR control.</td>
</tr>
</tbody>
</table>

**V4L2_CID_COLORFX_CBCR (integer)** Determines the Cb and Cr coefficients for V4L2_COLORFX_SET_CBCR color effect. Bits [7:0] of the supplied 32 bit value are interpreted as Cr component, bits [15:8] as Cb component and bits [31:16] must be zero.

**V4L2_CID_AUTOBRIGHTNESS (boolean)** Enable Automatic Brightness.

**V4L2_CID_ROTATE (integer)** Rotates the image by specified angle. Common angles are 90, 270 and 180. Rotating the image to 90 and 270 will reverse the height and width of the display window. It is necessary to set the new height and width of the picture using the VIDIOC_S_FMT ioctl according to the rotation angle selected.

**V4L2_CID_BG_COLOR (integer)** Sets the background color on the current output device. Background color needs to be specified in the RGB24 format. The supplied 32 bit value is interpreted as bits 0-7 Red color information, bits 8-15 Green color information, bits 16-23 Blue color information and bits 24-31 must be zero.

**V4L2_CID_ILLUMINATORS_1 V4L2_CID_ILLUMINATORS_2 (boolean)** Switch on or off the illuminator 1 or 2 of the device (usually a microscope).

**V4L2_CID_MIN_BUFFERS_FOR_CAPTURE (integer)** This is a read-only control that can be read by the application and used as a hint to determine the number of CAPTURE buffers to pass to REQBUFS. The value is the minimum number of CAPTURE buffers that is necessary for hardware to work.

**V4L2_CID_MIN_BUFFERS_FOR_OUTPUT (integer)** This is a read-only control that can be read by the application and used as a hint to determine the number of OUTPUT buffers to pass to REQBUFS. The value is the minimum number of OUTPUT buffers that is necessary for hardware to work.

**V4L2_CID_ALPHA_COMPONENT (integer)** Sets the alpha color component. When a capture device (or capture queue of a mem-to-mem device) produces a frame format that includes an alpha component (e.g. packed RGB image formats) and the alpha value is not defined by
the device or the mem-to-mem input data this control lets you select the alpha component value of all pixels. When an output device (or output queue of a mem-to-mem device) consumes a frame format that doesn’t include an alpha component and the device supports alpha channel processing this control lets you set the alpha component value of all pixels for further processing in the device.

**V4L2_CID_LASTP1** End of the predefined control IDs (currently V4L2_CID_ALPHA_COMPONENT + 1).

**V4L2_CID_PRIVATE_BASE** ID of the first custom (driver specific) control. Applications depending on particular custom controls should check the driver name and version, see Querying Capabilities.

Applications can enumerate the available controls with the *ioctl* VIDIOC_QUERYCTRL, VIDIOC_QUERY_EXT_CTRL and VIDIOC_QUERYMENU ioctl, get and set a control value with the VIDIOC_G_CTRL and VIDIOC_S_CTRL ioctl. Drivers must implement VIDIOC_QUERYCTRL, VIDIOC_G_CTRL and VIDIOC_S_CTRL when the device has one or more controls, VIDIOC_QUERYMENU when it has one or more menu type controls.

**Example: Enumerating all controls**

```c
struct v4l2_queryctrl queryctrl;
struct v4l2_querymenu querymenu;

static void enumerate_menu(__u32 id)
{
    printf(" Menu items:\n");

    memset(&querymenu, 0, sizeof(querymenu));
    querymenu.id = id;

    for (querymenu.index = queryctrl.minimum;
        querymenu.index <= queryctrl.maximum;
        querymenu.index++) {
        if (0 == ioctl(fd, VIDIOC_QUERYMENU, &querymenu)) {
            printf(" %s\n", querymenu.name);
        }
    }

    memset(&queryctrl, 0, sizeof(queryctrl));

    queryctrl.id = V4L2_CTRL_FLAG_NEXT_CTRL;
    while (0 == ioctl(fd, VIDIOC_QUERYCTRL, &queryctrl)) {
        if (!(queryctrl.flags & V4L2_CTRL_FLAG_DISABLED)) {
            printf(" Control %s\n", queryctrl.name);

            if (queryctrl.type == V4L2_CTRL_TYPE_MENU)
                enumerate_menu(queryctrl.id);
        }

        queryctrl.id |= V4L2_CTRL_FLAG_NEXT_CTRL;
    }
    if (errno != EINVAL) {
        perror("VIDIOC_QUERYCTRL");
    }
```

728 Chapter 3. Linux Media Infrastructure userspace API
Example: Enumerating all controls including compound controls

```c
struct v4l2_query_ext_ctrl query_ext_ctrl;
memset(&query_ext_ctrl, 0, sizeof(query_ext_ctrl));

query_ext_ctrl.id = V4L2_CTRL_FLAG_NEXT_CTRL | V4L2_CTRL_FLAG_NEXT_COMPOUND;
while (0 == ioctl(fd, VIDIOC_QUERY_EXT_CTRL, &query_ext_ctrl)) {
    if (!(query_ext_ctrl.flags & V4L2_CTRL_FLAG_DISABLED)) {
        printf("Control %s\n", query_ext_ctrl.name);
        if (query_ext_ctrl.type == V4L2_CTRL_TYPE_MENU)
            enumerate_menu(query_ext_ctrl.id);
    }
    query_ext_ctrl.id |= V4L2_CTRL_FLAG_NEXT_CTRL | V4L2_CTRL_FLAG_NEXT_COMPOUND;
}
if (errno != EINVAL) {
    perror("VIDIOC_QUERY_EXT_CTRL");
    exit(EXIT_FAILURE);
}
```

Example: Enumerating all user controls (old style)

```c
memset(&queryctrl, 0, sizeof(queryctrl));

for (queryctrl.id = V4L2_CID_BASE;
    queryctrl.id < V4L2_CID_LASTP1;
    queryctrl.id++) {
    if (0 == ioctl(fd, VIDIOC_QUERYCTRL, &queryctrl)) {
        if (queryctrl.flags & V4L2_CTRL_FLAG_DISABLED)
            continue;
        printf("Control %s\n", queryctrl.name);
        if (queryctrl.type == V4L2_CTRL_TYPE_MENU)
            enumerate_menu(queryctrl.id);
    } else {
        if (errno == EINVAL)
            continue;
        perror("VIDIOC_QUERYCTRL");
        exit(EXIT_FAILURE);
    }
}
for (queryctrl.id = V4L2_CID_PRIVATE_BASE;;
    queryctrl.id++) {
    if (0 == ioctl(fd, VIDIOC_QUERYCTRL, &queryctrl)) {
        if (queryctrl.flags & V4L2_CTRL_FLAG_DISABLED)
```
Example: Changing controls

```c
struct v4l2_queryctrl queryctrl;
struct v4l2_control control;

memset(&queryctrl, 0, sizeof(queryctrl));
queryctrl.id = V4L2_CID_BRIGHTNESS;

if (-1 == ioctl(fd, VIDIOC_QUERYCTRL, &queryctrl)) {
    if (errno != EINVAL) {
        perror("VIDIOC_QUERYCTRL");
        exit(EXIT_FAILURE);
    } else {
        printf("V4L2_CID_BRIGHTNESS is not supported\n");
    }
} else if (queryctrl.flags & V4L2_CTRL_FLAG_DISABLED) {
    printf("V4L2_CID_BRIGHTNESS is not supported\n");
} else {
    memset(&control, 0, sizeof(control));
    control.id = V4L2_CID_BRIGHTNESS;
    control.value = queryctrl.default_value;

    if (-1 == ioctl(fd, VIDIOC_S_CTRL, &control)) {
        perror("VIDIOC_S_CTRL");
        exit(EXIT_FAILURE);
    }
}

memset(&control, 0, sizeof(control));
control.id = V4L2_CID_CONTRAST;

if (0 == ioctl(fd, VIDIOC_G_CTRL, &control)) {
    control.value += 1;

    /* The driver may clamp the value or return ERANGE, ignored here */
}
```
/* Ignore if V4L2_CID_CONTRAST is unsupported */
} else if (errno != EINVAL) {
    perror("VIDIOC_G_CTRL");
    exit(EXIT_FAILURE);
}

control.id = V4L2_CID_AUDIO_MUTE;
control.value = 1; /* silence */
/* Errors ignored */
ioctl(fd, VIDIOC_S_CTRL, &control);

3.2.1.10 Extended Controls API

Introduction

The control mechanism as originally designed was meant to be used for user settings (brightness, saturation, etc). However, it turned out to be a very useful model for implementing more complicated driver APIs where each driver implements only a subset of a larger API.

The MPEG encoding API was the driving force behind designing and implementing this extended control mechanism: the MPEG standard is quite large and the currently supported hardware MPEG encoders each only implement a subset of this standard. Furthermore, many parameters relating to how the video is encoded into an MPEG stream are specific to the MPEG encoding chip since the MPEG standard only defines the format of the resulting MPEG stream, not how the video is actually encoded into that format.

Unfortunately, the original control API lacked some features needed for these new uses and so it was extended into the (not terribly originally named) extended control API.

Even though the MPEG encoding API was the first effort to use the Extended Control API, nowadays there are also other classes of Extended Controls, such as Camera Controls and FM Transmitter Controls. The Extended Controls API as well as all Extended Controls classes are described in the following text.

The Extended Control API

Three new ioctls are available: VIDIOC_G_EXT_CTRLS, VIDIOC_S_EXT_CTRLS and VIDIOC_TRY_EXT_CTRLS. These ioctls act on arrays of controls (as opposed to the VIDIOC_G_CTRL and VIDIOC_S_CTRL ioctls that act on a single control). This is needed since it is often required to atomically change several controls at once.

Each of the new ioctls expects a pointer to a struct v4l2_ext_controls. This structure contains a pointer to the control array, a count of the number of controls in that array and a control class. Control classes are used to group similar controls into a single class. For example, control class V4L2_CTRL_CLASS_USER contains all user controls (i.e. all controls that can also be set using the old VIDIOC_S_CTRL ioctl). Control class V4L2_CTRL_CLASS_CODEC contains controls relating to codecs.

All controls in the control array must belong to the specified control class. An error is returned if this is not the case.
It is also possible to use an empty control array (`count == 0`) to check whether the specified control class is supported.

The control array is a struct `v4l2_ext_control` array. The struct `v4l2_ext_control` is very similar to struct `v4l2_control`, except for the fact that it also allows for 64-bit values and pointers to be passed.

Since the struct `v4l2_ext_control` supports pointers it is now also possible to have controls with compound types such as N-dimensional arrays and/or structures. You need to specify the `V4L2_CTRL_FLAG_NEXT_COMPOUND` when enumerating controls to actually be able to see such compound controls. In other words, these controls with compound types should only be used programmatically.

Since such compound controls need to expose more information about themselves than is possible with `VIDIOC_QUERYCTRL` the `VIDIOC_QUERY_EXT_CTRL` ioctl was added. In particular, this ioctl gives the dimensions of the N-dimensional array if this control consists of more than one element.

**Note:**

1. It is important to realize that due to the flexibility of controls it is necessary to check whether the control you want to set actually is supported in the driver and what the valid range of values is. So use `ioctl VIDIOC_QUERYCTRL, VIDIOC_QUERY_EXT_CTRL and VIDIOC_QUERYMENU` to check this.

2. It is possible that some of the menu indices in a control of type `V4L2_CTRL_TYPE_MENU` may not be supported (`VIDIOC_QUERYMENU` will return an error). A good example is the list of supported MPEG audio bitrates. Some drivers only support one or two bitrates, others support a wider range.

All controls use machine endianness.

**Enumerating Extended Controls**

The recommended way to enumerate over the extended controls is by using `ioctl VIDIOC_QUERYCTRL, VIDIOC_QUERY_EXT_CTRL and VIDIOC_QUERYMENU` in combination with the `V4L2_CTRL_FLAG_NEXT_CTRL` flag:

```c
struct v4l2_queryctrl qctrl;
qctrl.id = V4L2_CTRL_FLAG_NEXT_CTRL;
while (0 == ioctl (fd, VIDIOC_QUERYCTRL, &qctrl)) {
    /* ... */
    qctrl.id |= V4L2_CTRL_FLAG_NEXT_CTRL;
}
```

The initial control ID is set to 0 ORed with the `V4L2_CTRL_FLAG_NEXT_CTRL` flag. The `VIDIOC_QUERYCTRL` ioctl will return the first control with a higher ID than the specified one. When no such controls are found an error is returned.

If you want to get all controls within a specific control class, then you can set the initial `qctrl.id` value to the control class and add an extra check to break out of the loop when a control of another control class is found:
The 32-bit `qctrl.id` value is subdivided into three bit ranges: the top 4 bits are reserved for flags (e.g. `V4L2_CTRL_FLAG_NEXT_CTRL`) and are not actually part of the ID. The remaining 28 bits form the control ID, of which the most significant 12 bits define the control class and the least significant 16 bits identify the control within the control class. It is guaranteed that these last 16 bits are always non-zero for controls. The range of 0x1000 and up are reserved for driver-specific controls. The macro `V4L2_CTRL_ID2CLASS(id)` returns the control class ID based on a control ID.

If the driver does not support extended controls, then `VIDIOC_QUERYCTRL` will fail when used in combination with `V4L2_CTRL_FLAG_NEXT_CTRL`. In that case the old method of enumerating control should be used (see Example: Enumerating all controls). But if it is supported, then it is guaranteed to enumerate over all controls, including driver-private controls.

### Creating Control Panels

It is possible to create control panels for a graphical user interface where the user can select the various controls. Basically you will have to iterate over all controls using the method described above. Each control class starts with a control of type `V4L2_CTRL_TYPE_CTRL_CLASS`. `VIDIOC_QUERYCTRL` will return the name of this control class which can be used as the title of a tab page within a control panel.

The flags field of struct `v4l2_queryctrl` also contains hints on the behavior of the control. See the `ioctl` `VIDIOC_QUERYCTRL`, `VIDIOC_QUERY_EXT_CTRL` and `VIDIOC_QUERYMENU` documentation for more details.

### 3.2.1.11 Camera Control Reference

The Camera class includes controls for mechanical (or equivalent digital) features of a device such as controllable lenses or sensors.

#### Camera Control IDs

`V4L2_CID_CAMERA_CLASS` (class) The Camera class descriptor. Calling `ioctl` `VIDIOC_QUERYCTRL`, `VIDIOC_QUERY_EXT_CTRL` and `VIDIOC_QUERYMENU` for this control will return a description of this control class.

`V4L2_CID_EXPOSURE_AUTO` (enum) Enables automatic adjustments of the exposure time and/or iris aperture. The effect of manual changes of the exposure time or iris aperture while these features are enabled is undefined, drivers should ignore such requests. Possible values are:
V4L2_EXPOSURE_AUTO
Automatic exposure time, automatic iris aperture.

V4L2_EXPOSURE_MANUAL
Manual exposure time, manual iris.

V4L2_EXPOSURE_SHUTTER_PRIORITY
Manual exposure time, auto iris.

V4L2_EXPOSURE_APERTURE_PRIORITY
Auto exposure time, manual iris.

**V4L2_CID_EXPOSURE_ABSOLUTE (integer)** Determines the exposure time of the camera sensor. The exposure time is limited by the frame interval. Drivers should interpret the values as 100 µs units, where the value 1 stands for 1/10000th of a second, 10000 for 1 second and 100000 for 10 seconds.

**V4L2_CID_EXPOSURE_AUTO_PRIORITY (boolean)** When V4L2_CID_EXPOSURE_AUTO is set to AUTO or APERTURE_PRIORITY, this control determines if the device may dynamically vary the frame rate. By default this feature is disabled (0) and the frame rate must remain constant.

**V4L2_CID_AUTO_EXPOSURE_BIAS (integer menu)** Determines the automatic exposure compensation, it is effective only when V4L2_CID_EXPOSURE_AUTO control is set to AUTO, SHUTTER_PRIORITY or APERTURE_PRIORITY. It is expressed in terms of EV, drivers should interpret the values as 0.001 EV units, where the value 1000 stands for +1 EV.

Increasing the exposure compensation value is equivalent to decreasing the exposure value (EV) and will increase the amount of light at the image sensor. The camera performs the exposure compensation by adjusting absolute exposure time and/or aperture.

**V4L2_CID_EXPOSURE_METERING (enum)**

enum v4l2_exposure_metering - Determines how the camera measures the amount of light available for the frame exposure. Possible values are:

| V4L2_EXPOSURE_METERING_AVERAGE | Use the light information coming from the entire frame and average giving no weighting to any particular portion of the metered area. |
| V4L2_EXPOSURE_METERING_CENTER_WEIGHTED | Average the light information coming from the entire frame giving priority to the center of the metered area. |
| V4L2_EXPOSURE_METERING_SPOT | Measure only very small area at the center of the frame. |
| V4L2_EXPOSURE_METERING_MATRIX | A multi-zone metering. The light intensity is measured in several points of the frame and the results are combined. The algorithm of the zones selection and their significance in calculating the final value is device dependent. |

**V4L2_CID_PAN_RELATIVE (integer)** This control turns the camera horizontally by the specified amount. The unit is undefined. A positive value moves the camera to the right (clockwise when viewed from above), a negative value to the left. A value of zero does not cause motion. This is a write-only control.

**V4L2_CID_TILT_RELATIVE (integer)** This control turns the camera vertically by the specified amount. The unit is undefined. A positive value moves the camera up, a negative value down. A value of zero does not cause motion. This is a write-only control.
**V4L2_CID_PAN_RESET** *(button)* When this control is set, the camera moves horizontally to the default position.

**V4L2_CID_TILT_RESET** *(button)* When this control is set, the camera moves vertically to the default position.

**V4L2_CID_PAN_ABSOLUTE** *(integer)* This control turns the camera horizontally to the specified position. Positive values move the camera to the right (clockwise when viewed from above), negative values to the left. Drivers should interpret the values as arc seconds, with valid values between \(-180 \times 3600\) and \(+180 \times 3600\) inclusive.

**V4L2_CID_TILT_ABSOLUTE** *(integer)* This control turns the camera vertically to the specified position. Positive values move the camera up, negative values down. Drivers should interpret the values as arc seconds, with valid values between \(-180 \times 3600\) and \(+180 \times 3600\) inclusive.

**V4L2_CID_FOCUS_ABSOLUTE** *(integer)* This control sets the focal point of the camera to the specified position. The unit is undefined. Positive values set the focus closer to the camera, negative values towards infinity.

**V4L2_CID_FOCUS_RELATIVE** *(integer)* This control moves the focal point of the camera by the specified amount. The unit is undefined. Positive values move the focus closer to the camera, negative values towards infinity. This is a write-only control.

**V4L2_CID_FOCUS_AUTO** *(boolean)* Enables continuous automatic focus adjustments. The effect of manual focus adjustments while this feature is enabled is undefined, drivers should ignore such requests.

**V4L2_CID_AUTO_FOCUS_START** *(button)* Starts single auto focus process. The effect of setting this control when **V4L2_CID_FOCUS_AUTO** is set to **TRUE** (1) is undefined, drivers should ignore such requests.

**V4L2_CID_AUTO_FOCUS_STOP** *(button)* Aborts automatic focusing started with **V4L2_CID_AUTO_FOCUS_START** control. It is effective only when the continuous automatic focus is disabled, that is when **V4L2_CID_FOCUS_AUTO** control is set to **FALSE** (0).

**V4L2_CID_AUTO_FOCUS_STATUS** *(bitmask)* The automatic focus status. This is a read-only control.

<table>
<thead>
<tr>
<th>V4L2_AUTO_FOCUS_STATUS_IDLE</th>
<th>Automatic focus is not active.</th>
</tr>
</thead>
<tbody>
<tr>
<td>V4L2_AUTO_FOCUS_STATUS_BUSY</td>
<td>Automatic focusing is in progress.</td>
</tr>
<tr>
<td>V4L2_AUTO_FOCUS_STATUS_REACHED</td>
<td>Focus has been reached.</td>
</tr>
<tr>
<td>V4L2_AUTO_FOCUS_STATUS_FAILED</td>
<td>Automatic focus has failed, the driver will not transition from this state until another action is performed by an application.</td>
</tr>
</tbody>
</table>

**V4L2_CID_AUTO_FOCUS_RANGE** *(enum)*

`enum v4l2_auto_focus_range` - Determines auto focus distance range for which lens may be adjusted.
The camera automatically selects the focus range.

Normal distance range, limited for best automatic focus performance.

Macro (close-up) auto focus. The camera will use its minimum possible distance for auto focus.

The lens is set to focus on an object at infinite distance.

Specify the objective lens focal length as an absolute value. The zoom unit is driver-specific and its value should be a positive integer.

Specify the objective lens focal length relatively to the current value. Positive values move the zoom lens group towards the telephoto direction, negative values towards the wide-angle direction. The zoom unit is driver-specific. This is a write-only control.

Move the objective lens group at the specified speed until it reaches physical device limits or until an explicit request to stop the movement. A positive value moves the zoom lens group towards the telephoto direction. A value of zero stops the zoom lens group movement. A negative value moves the zoom lens group towards the wide-angle direction. The zoom speed unit is driver-specific.

This control sets the camera’s aperture to the specified value. The unit is undefined. Larger values open the iris wider, smaller values close it.

This control modifies the camera’s aperture by the specified amount. The unit is undefined. Positive values open the iris one step further, negative values close it one step further. This is a write-only control.

Prevent video from being acquired by the camera. When this control is set to TRUE (1), no image can be captured by the camera. Common means to enforce privacy are mechanical obturation of the sensor and firmware image processing, but the device is not restricted to these methods. Devices that implement the privacy control must support read access and may support write access.

Switch the band-stop filter of a camera sensor on or off, or specify its strength. Such band-stop filters can be used, for example, to filter out the fluorescent light component.

Sets white balance to automatic, manual or a preset. The presets determine color temperature of the light as a hint to the camera for white balance adjustments resulting in most accurate color representation. The following white balance presets are listed in order of increasing color temperature.
**V4L2_WHITE_BALANCE_MANUAL**

Manual white balance.

**V4L2_WHITE_BALANCE_AUTO**

Automatic white balance adjustments.

**V4L2_WHITE_BALANCE_INCANDESCENT**

White balance setting for incandescent (tungsten) lighting. It generally cools down the colors and corresponds approximately to 2500…3500 K color temperature range.

**V4L2_WHITE_BALANCE_FLUORESCENT**

White balance preset for fluorescent lighting. It corresponds approximately to 4000…5000 K color temperature.

**V4L2_WHITE_BALANCE_FLUORESCENT_H**

With this setting the camera will compensate for fluorescent H lighting.

**V4L2_WHITE_BALANCE_HORIZON**

White balance setting for horizon daylight. It corresponds approximately to 5000 K color temperature.

**V4L2_WHITE_BALANCE_DAYLIGHT**

White balance preset for daylight (with clear sky). It corresponds approximately to 5000…6500 K color temperature.

**V4L2_WHITE_BALANCE_FLASH**

With this setting the camera will compensate for the flash light. It slightly warms up the colors and corresponds roughly to 5000…5500 K color temperature.

**V4L2_WHITE_BALANCE_CLOUDY**

White balance preset for moderately overcast sky. This option corresponds approximately to 6500…8000 K color temperature range.

**V4L2_WHITE_BALANCE_SHADE**

White balance preset for shade or heavily overcast sky. It corresponds approximately to 9000…10000 K color temperature.

**V4L2_CID_WIDE_DYNAMIC_RANGE (boolean)**

Enables or disables the camera’s wide dynamic range feature. This feature allows to obtain clear images in situations where intensity of the illumination varies significantly throughout the scene, i.e. there are simultaneously very dark and very bright areas. It is most commonly realized in cameras by combining two subsequent frames with different exposure times.¹

**V4L2_CID_IMAGE_STABILIZATION (boolean)**

Enables or disables image stabilization.

**V4L2_CID_ISO_SENSITIVITY (integer menu)**

Determines ISO equivalent of an image sensor indicating the sensor’s sensitivity to light. The numbers are expressed in arithmetic scale, as per ISO 12232:2006 standard, where doubling the sensor sensitivity is represented by doubling the numerical ISO value. Applications should interpret the values as standard ISO values multiplied by 1000, e.g. control value 800 stands for ISO 0.8. Drivers will usually support only a subset of standard ISO values. The effect of setting this control while the V4L2_CID_ISO_SENSITIVITY_AUTO control is set to a value other than V4L2_CID_ISO_SENSITIVITY_MANUAL is undefined, drivers should ignore such requests.

**V4L2_CID_ISO_SENSITIVITY_AUTO (enum)**

enum v4l2_iso_sensitivity_type - Enables or disables automatic ISO sensitivity adjustments.

|----------------------------------|-------------------------|

¹ This control may be changed to a menu control in the future, if more options are required.
**V4L2_CID_SCENE_MODE** (enum)

```text
enum v4l2_scene_mode
```

- **V4L2_SCENE_MODE_NONE** - The scene mode feature is disabled.
- **V4L2_SCENE_MODE_BACKLIGHT** - Backlight. Compensates for dark shadows when light is coming from behind a subject, also by automatically turning on the flash.
- **V4L2_SCENE_MODE_BEACH_SNOW** - Beach and snow. This mode compensates for all-white or bright scenes, which tend to look gray and low contrast, when camera’s automatic exposure is based on an average scene brightness. To compensate, this mode automatically slightly overexposes the frames. The white balance may also be adjusted to compensate for the fact that reflected snow looks bluish rather than white.
- **V4L2_SCENE_MODE_CANDLELIGHT** - Candle light. The camera generally raises the ISO sensitivity and lowers the shutter speed. This mode compensates for relatively close subject in the scene. The flash is disabled in order to preserve the ambiance of the light.
- **V4L2_SCENE_MODE_DAWN_DUSK** - Dawn and dusk. Preserves the colors seen in low natural light before dusk and after dawn. The camera may turn off the flash, and automatically focus at infinity. It will usually boost saturation and lower the shutter speed.
- **V4L2_SCENE_MODE_FALL_COLORS** - Fall colors. Increases saturation and adjusts white balance for color enhancement. Pictures of autumn leaves get saturated reds and yellows.
- **V4L2_SCENE_MODE_FIREWORKS** - Fireworks. Long exposure times are used to capture the expanding burst of light from a firework. The camera may invoke image stabilization.
- **V4L2_SCENE_MODE_LANDSCAPE** - Landscape. The camera may choose a small aperture to provide deep depth of field and long exposure duration to help capture detail in dim light conditions. The focus is fixed at infinity. Suitable for distant and wide scenery.
- **V4L2_SCENE_MODE_NIGHT** - Night, also known as Night Landscape. Designed for low light conditions, it preserves detail in the dark areas without blowing out bright objects. The camera generally sets itself to a medium-to-high ISO sensitivity, with a relatively long exposure time, and turns flash off. As such, there will be increased image noise and the possibility of blurred image.
- **V4L2_SCENE_MODE_PARTY_INDOOR** - Party and indoor. Designed to capture indoor scenes that are lit by indoor background lighting as well as the flash. The camera usually increases ISO sensitivity, and adjusts exposure for the low light conditions.
- **V4L2_SCENE_MODE_PORTrait** - Portrait. The camera adjusts the aperture so that the depth of field is reduced, which helps to isolate the subject against a smooth background. Most cameras recognize the presence of faces in the scene and focus on them. The color hue is adjusted to enhance skin tones. The intensity of the flash is often reduced.

When the scene mode feature is not used, this control should be set to **V4L2_SCENE_MODE_NONE** to make sure the other possibly related controls are accessible. The following scene programs are defined:
Table 1 – continued from previous page

<table>
<thead>
<tr>
<th>Code Point</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>V4L2_SCENE_MODE_SPORTS</td>
<td>Sports. Significantly increases ISO and uses a fast shutter speed to freeze motion of rapidly-moving subjects. Increased image noise may be seen in this mode.</td>
</tr>
<tr>
<td>V4L2_SCENE_MODE_SUNSET</td>
<td>Sunset. Preserves deep hues seen in sunsets and sunrises. It bumps up the saturation.</td>
</tr>
<tr>
<td>V4L2_SCENE_MODE_TEXT</td>
<td>Text. It applies extra contrast and sharpness, it is typically a black-and-white mode optimized for readability. Automatic focus may be switched to close-up mode and this setting may also involve some lens-distortion correction.</td>
</tr>
</tbody>
</table>

**V4L2_CID_3A_LOCK (bitmask)** This control locks or unlocks the automatic focus, exposure and white balance. The automatic adjustments can be paused independently by setting the corresponding lock bit to 1. The camera then retains the settings until the lock bit is cleared. The following lock bits are defined:

When a given algorithm is not enabled, drivers should ignore requests to lock it and should return no error. An example might be an application setting bit V4L2_LOCK_WHITE_BALANCE when the V4L2_CID_AUTO_WHITE_BALANCE control is set to FALSE. The value of this control may be changed by exposure, white balance or focus controls.

<tr>
<td>V4L2_LOCK_FOCUS</td>
<td>Automatic focus lock.</td>
</tr>
</tbody>
</table>

**V4L2_CID_PAN_SPEED (integer)** This control turns the camera horizontally at the specified speed. The unit is undefined. A positive value moves the camera to the right (clockwise when viewed from above), a negative value to the left. A value of zero stops the motion if one is in progress and has no effect otherwise.

**V4L2_CID_TILT_SPEED (integer)** This control turns the camera vertically at the specified speed. The unit is undefined. A positive value moves the camera up, a negative value down. A value of zero stops the motion if one is in progress and has no effect otherwise.

**V4L2_CID_CAMERA_ORIENTATION (menu)** This read-only control describes the camera orientation by reporting its mounting position on the device where the camera is installed. The control value is constant and not modifiable by software. This control is particularly meaningful for devices which have a well defined orientation, such as phones, laptops and portable devices since the control is expressed as a position relative to the device’s intended usage orientation. For example, a camera installed on the user-facing side of a phone, a tablet or a laptop device is said to be have V4L2_CAMERA_ORIENTATION_FRONT orientation, while a camera installed on the opposite side of the front one is said to be have V4L2_CAMERA_ORIENTATION_BACK orientation. Camera sensors not directly attached to the device, or attached in a way that allows them to move freely, such as webcams and digital cameras, are said to have the V4L2_CAMERA_ORIENTATION_EXTERNAL orientation.

<table>
<thead>
<tr>
<th>Code Point</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>V4L2_CAMERA_ORIENTATION_FRONT</td>
<td>The camera is oriented towards the user facing side of the device.</td>
</tr>
<tr>
<td>V4L2_CAMERA_ORIENTATION_BACK</td>
<td>The camera is oriented towards the back facing side of the device.</td>
</tr>
<tr>
<td>V4L2_CAMERA_ORIENTATION_EXTERNAL</td>
<td>The camera is not directly attached to the device and is freely movable.</td>
</tr>
</tbody>
</table>

**V4L2_CID_CAMERA_SENSOR_ROTATION (integer)** This read-only control describes the rotation
correction in degrees in the counter-clockwise direction to be applied to the captured images once captured to memory to compensate for the camera sensor mounting rotation.

For a precise definition of the sensor mounting rotation refer to the extensive description of the ‘rotation’ properties in the device tree bindings file ‘video-interfaces.txt’.

A few examples are below reported, using a shark swimming from left to right in front of the user as the example scene to capture.

<table>
<thead>
<tr>
<th>θ</th>
<th>X-axis</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td></td>
</tr>
</tbody>
</table>

Example one - Webcam

Assuming you can bring your laptop with you while swimming with sharks, the camera module of the laptop is installed on the user facing part of a laptop screen casing, and is typically used for video calls. The captured images are meant to be displayed in landscape mode (width > height) on the laptop screen.

The camera is typically mounted upside-down to compensate the lens optical inversion effect. In this case the value of the V4L2_CID_CAMERA_SENSOR_ROTATION control is 0, no rotation is required to display images correctly to the user.

If the camera sensor is not mounted upside-down it is required to compensate the lens optical inversion effect and the value of the V4L2_CID_CAMERA_SENSOR_ROTATION control is 180 degrees, as images will result rotated when captured to memory.

A software rotation correction of 180 degrees has to be applied to correctly display the image on the user screen.
Example two - Phone camera

It is more handy to go and swim with sharks with only your mobile phone with you and take pictures with the camera that is installed on the back side of the device, facing away from the user. The captured images are meant to be displayed in portrait mode (height > width) to match the device screen orientation and the device usage orientation used when taking the picture.

The camera sensor is typically mounted with its pixel array longer side aligned to the device longer side, upside-down mounted to compensate for the lens optical inversion effect.

The images once captured to memory will be rotated and the value of the V4L2_CID_CAMERA_SENSOR_ROTATION will report a 90 degree rotation.

A correction of 90 degrees in counter-clockwise direction has to be applied to correctly display the image in portrait mode on the device screen.
3.2.1.12 Flash Control Reference

The V4L2 flash controls are intended to provide generic access to flash controller devices. Flash controller devices are typically used in digital cameras.

The interface can support both LED and xenon flash devices. As of writing this, there is no xenon flash driver using this interface.

Supported use cases

**Unsynchronised LED flash (software strobe)**

Unsynchronised LED flash is controlled directly by the host as the sensor. The flash must be enabled by the host before the exposure of the image starts and disabled once it ends. The host is fully responsible for the timing of the flash.

Example of such device: Nokia N900.

**Synchronised LED flash (hardware strobe)**

The synchronised LED flash is pre-programmed by the host (power and timeout) but controlled by the sensor through a strobe signal from the sensor to the flash.

The sensor controls the flash duration and timing. This information typically must be made available to the sensor.

**LED flash as torch**

LED flash may be used as torch in conjunction with another use case involving camera or individually.

Flash Control IDs

**V4L2_CID_FLASH_CLASS (class)** The FLASH class descriptor.

**V4L2_CID_FLASH_LED_MODE (menu)** Defines the mode of the flash LED, the high-power white LED attached to the flash controller. Setting this control may not be possible in presence of some faults. See V4L2_CID_FLASH_FAULT.

<table>
<thead>
<tr>
<th>V4L2_FLASH_LED_MODE_NONE</th>
<th>Off.</th>
</tr>
</thead>
<tbody>
<tr>
<td>V4L2_FLASH_LED_MODE_FLASH</td>
<td>Flash mode.</td>
</tr>
<tr>
<td>V4L2_FLASH_LED_MODE_TORCH</td>
<td>Torch mode. See V4L2_CID_FLASH_TORCH_INTENSITY.</td>
</tr>
</tbody>
</table>

**V4L2_CID_FLASH_STROBE_SOURCE (menu)** Defines the source of the flash LED strobe.
The flash strobe is triggered by using the V4L2_CID_FLASH_STROBE control.

The flash strobe is triggered by an external source. Typically this is a sensor, which makes it possible to synchronise the flash strobe start to exposure start.

**V4L2_CID_FLASH_STROBE** (button) Strobe flash. Valid when V4L2_CID_FLASH_LED_MODE is set to V4L2_FLASH_LED_MODE_FLASH and V4L2_CID_FLASH_STROBE_SOURCE is set to V4L2_FLASH_STROBE_SOURCE_SOFTWARE. Setting this control may not be possible in presence of some faults. See V4L2_CID_FLASH_FAULT.

**V4L2_CID_FLASH_STROBE_STOP** (button) Stop flash strobe immediately.

**V4L2_CID_FLASH_STROBE_STATUS** (boolean) Strobe status: whether the flash is strobing at the moment or not. This is a read-only control.

**V4L2_CID_FLASH_TIMEOUT** (integer) Hardware timeout for flash. The flash strobe is stopped after this period of time has passed from the start of the strobe.

**V4L2_CID_FLASH_INTENSITY** (integer) Intensity of the flash strobe when the flash LED is in flash mode (V4L2_FLASH_LED_MODE_FLASH). The unit should be milliamps (mA) if possible.

**V4L2_CID_FLASH_TORCH_INTENSITY** (integer) Intensity of the flash LED in torch mode (V4L2_FLASH_LED_MODE_TORCH). The unit should be milliamps (mA) if possible. Setting this control may not be possible in presence of some faults. See V4L2_CID_FLASH_FAULT.

**V4L2_CID_FLASH_INDICATOR_INTENSITY** (integer) Intensity of the indicator LED. The indicator LED may be fully independent of the flash LED. The unit should be microamps (µA) if possible.

**V4L2_CID_FLASH_FAULT** (bitmask) Faults related to the flash. The faults tell about specific problems in the flash chip itself or the LEDs attached to it. Faults may prevent further use of some of the flash controls. In particular, V4L2_CID_FLASH_LED_MODE is set to V4L2_FLASH_LED_MODE_NONE if the fault affects the flash LED. Exactly which faults have such an effect is chip dependent. Reading the faults resets the control and returns the chip to a usable state if possible.
<table>
<thead>
<tr>
<th>V4L2_FLASH_FAULT_OVER_VOLTAGE</th>
<th>Flash controller voltage to the flash LED has exceeded the limit specific to the flash controller.</th>
</tr>
</thead>
<tbody>
<tr>
<td>V4L2_FLASH_FAULT_TIMEOUT</td>
<td>The flash strobe was still on when the timeout set by the user — V4L2_CID_FLASH_TIMEOUT control — has expired. Not all flash controllers may set this in all such conditions.</td>
</tr>
<tr>
<td>V4L2_FLASH_FAULT_OVER_TEMPERATURE</td>
<td>The flash controller has overheated.</td>
</tr>
<tr>
<td>V4L2_FLASH_FAULT_SHORT_CIRCUIT</td>
<td>The short circuit protection of the flash controller has been triggered.</td>
</tr>
<tr>
<td>V4L2_FLASH_FAULT_OVER_CURRENT</td>
<td>Current in the LED power supply has exceeded the limit specific to the flash controller.</td>
</tr>
<tr>
<td>V4L2_FLASH_FAULT_INDICATOR</td>
<td>The flash controller has detected a short or open circuit condition on the indicator LED.</td>
</tr>
<tr>
<td>V4L2_FLASH_FAULT_UNDER_VOLTAGE</td>
<td>Flash controller voltage to the flash LED has been below the minimum limit specific to the flash controller.</td>
</tr>
<tr>
<td>V4L2_FLASH_FAULT_INPUT_VOLTAGE</td>
<td>The input voltage of the flash controller is below the limit under which strobing the flash at full current will not be possible. The condition persists until this flag is no longer set.</td>
</tr>
<tr>
<td>V4L2_FLASH_FAULT_LED_OVER_TEMPERATURE</td>
<td>The temperature of the LED has exceeded its allowed upper limit.</td>
</tr>
</tbody>
</table>

**V4L2_CID_FLASH_CHARGE (boolean)** Enable or disable charging of the xenon flash capacitor.

**V4L2_CID_FLASH_READY (boolean)** Is the flash ready to strobe? Xenon flashes require their capacitors charged before strobing. LED flashes often require a cooldown period after strobe during which another strobe will not be possible. This is a read-only control.

### 3.2.1.13 Image Source Control Reference

The Image Source control class is intended for low-level control of image source devices such as image sensors. The devices feature an analogue to digital converter and a bus transmitter to transmit the image data out of the device.

#### Image Source Control IDs

**V4L2_CID_IMAGE_SOURCE_CLASS (class)** The IMAGE_SOURCE class descriptor.

**V4L2_CID_VBLANK (integer)** Vertical blanking. The idle period after every frame during which no image data is produced. The unit of vertical blanking is a line. Every line has length of the image width plus horizontal blanking at the pixel rate defined by V4L2_CID_PIXEL_RATE control in the same sub-device.

**V4L2_CID_HBLANK (integer)** Horizontal blanking. The idle period after every line of image data during which no image data is produced. The unit of horizontal blanking is pixels.

**V4L2_CID_ANALOGUE_GAIN (integer)** Analogue gain is gain affecting all colour components in the pixel matrix. The gain operation is performed in the analogue domain before A/D conversion.
V4L2_CID_TEST_PATTERN_RED (integer) Test pattern red colour component.

V4L2_CID_TEST_PATTERN_GREENR (integer) Test pattern green (next to red) colour component.

V4L2_CID_TEST_PATTERN_BLUE (integer) Test pattern blue colour component.

V4L2_CID_TEST_PATTERN_GREENB (integer) Test pattern green (next to blue) colour component.

V4L2_CID_UNIT_CELL_SIZE (struct) This control returns the unit cell size in nanometers. The struct `v4l2_area` provides the width and the height in separate fields to take into consideration asymmetric pixels. This control does not take into consideration any possible hardware binning. The unit cell consists of the whole area of the pixel, sensitive and non-sensitive. This control is required for automatic calibration of sensors/cameras.

```
struct v4l2_area {
    __u32 width;  // Width of the area.
    __u32 height; // Height of the area.
};
```

### 3.2.1.14 Image Process Control Reference

The Image Process control class is intended for low-level control of image processing functions. Unlike V4L2_CID_IMAGE_SOURCE_CLASS, the controls in this class affect processing the image, and do not control capturing of it.

#### Image Process Control IDs

**V4L2_CID_IMAGE_PROC_CLASS (class)** The IMAGE_PROC class descriptor.

**V4L2_CID_LINK_FREQ (integer menu)** The frequency of the data bus (e.g. parallel or CSI-2).

**V4L2_CID_PIXEL_RATE (64-bit integer)** Pixel sampling rate in the device’s pixel array. This control is read-only and its unit is pixels / second.

Some devices use horizontal and vertical blanking to configure the frame rate. The frame rate can be calculated from the pixel rate, analogue crop rectangle as well as horizontal and vertical blanking. The pixel rate control may be present in a different sub-device than the blanking controls and the analogue crop rectangle configuration.

The configuration of the frame rate is performed by selecting the desired horizontal and vertical blanking. The unit of this control is Hz.

**V4L2_CID_TEST_PATTERN (menu)** Some capture/display/sensor devices have the capability to generate test pattern images. These hardware specific test patterns can be used to test if a device is working properly.

**V4L2_CID_DEINTERLACING_MODE (menu)** The video deinterlacing mode (such as Bob, Weave, ...). The menu items are driver specific and are documented in Video4Linux (V4L) driver-specific documentation.

**V4L2_CID_DIGITAL_GAIN (integer)** Digital gain is the value by which all colour components are multiplied by. Typically the digital gain applied is the control value divided by e.g.
0x100, meaning that to get no digital gain the control value needs to be 0x100. The no-gain configuration is also typically the default.

### 3.2.1.15 Codec Control Reference

Below all controls within the Codec control class are described. First the generic controls, then controls specific for certain hardware.

**Note:** These controls are applicable to all codecs and not just MPEG. The defines are prefixed with V4L2_CID_MPEG/V4L2_MPEG as the controls were originally made for MPEG codecs and later extended to cover all encoding formats.

### Generic Codec Controls

#### Codec Control IDs

**V4L2_CID_CODEC_CLASS** *(class)* The Codec class descriptor. Calling ioctl `VIDIOC_QUERYCTRL`, `VIDIOC_QUERY_EXT_CTRL` and `VIDIOC_QUERYMENU` for this control will return a description of this control class. This description can be used as the caption of a Tab page in a GUI, for example.

**V4L2_CID_MPEG_STREAM_TYPE** *(enum)*

*enum v4l2_mpeg_stream_type* - The MPEG-1, -2 or -4 output stream type. One cannot assume anything here. Each hardware MPEG encoder tends to support different subsets of the available MPEG stream types. This control is specific to multiplexed MPEG streams. The currently defined stream types are:

| V4L2_MPEG_STREAM_TYPE_MPEG2_PS   | MPEG-2 program stream |
| V4L2_MPEG_STREAM_TYPE_MPEG2_TS   | MPEG-2 transport stream |
| V4L2_MPEG_STREAM_TYPE_MPEG1_SS   | MPEG-1 system stream |
| V4L2_MPEG_STREAM_TYPE_MPEG2_DVD  | MPEG-2 DVD-compatible stream |
| V4L2_MPEG_STREAM_TYPE_MPEG1_VCD  | MPEG-1 VCD-compatible stream |
| V4L2_MPEG_STREAM_TYPE_MPEG2_SVCD | MPEG-2 SVCD-compatible stream |

**V4L2_CID_MPEG_STREAM_PID_PMT** *(integer)* Program Map Table Packet ID for the MPEG transport stream (default 16)

**V4L2_CID_MPEG_STREAM_PID_AUDIO** *(integer)* Audio Packet ID for the MPEG transport stream (default 256)

**V4L2_CID_MPEG_STREAM_PID_VIDEO** *(integer)* Video Packet ID for the MPEG transport stream (default 260)

**V4L2_CID_MPEG_STREAM_PID_PCR** *(integer)* Packet ID for the MPEG transport stream carrying PCR fields (default 259)

**V4L2_CID_MPEG_STREAM_PES_ID_AUDIO** *(integer)* Audio ID for MPEG PES

**V4L2_CID_MPEG_STREAM_PES_ID_VIDEO** *(integer)* Video ID for MPEG PES

**V4L2_CID_MPEG_STREAM_VBI_FMT** *(enum)*
enum v4l2_mpeg_stream_vbi_fmt - Some cards can embed VBI data (e.g. Closed Caption, Teletext) into the MPEG stream. This control selects whether VBI data should be embedded, and if so, what embedding method should be used. The list of possible VBI formats depends on the driver. The currently defined VBI format types are:

<table>
<thead>
<tr>
<th>V4L2_MPEG_STREAM_VBI_FMT_NONE</th>
<th>No VBI in the MPEG stream</th>
</tr>
</thead>
<tbody>
<tr>
<td>V4L2_MPEG_STREAM_VBI_FMT_IVTV</td>
<td>VBI in private packets, IVTV format (documented in the kernel sources in the file Documentation/userspace-api/media/drivers/cx2341x-uapi.rst)</td>
</tr>
</tbody>
</table>

V4L2_CID_MPEG_AUDIO_SAMPLING_FREQ (enum)

enum v4l2_mpeg_audio_sampling_freq - MPEG Audio sampling frequency. Possible values are:

| V4L2_MPEG_AUDIO_SAMPLING_FREQ_44100 | 44.1 kHz |
| V4L2_MPEG_AUDIO_SAMPLING_FREQ_48000 | 48 kHz |
| V4L2_MPEG_AUDIO_SAMPLING_FREQ_32000 | 32 kHz |

V4L2_CID_MPEG_AUDIO_ENCODING (enum)

enum v4l2_mpeg_audio_encoding - MPEG Audio encoding. This control is specific to multiplexed MPEG streams. Possible values are:

| V4L2_MPEG_AUDIO_ENCODING_LAYER_1 | MPEG-1/2 Layer I encoding |
| V4L2_MPEG_AUDIO_ENCODING_LAYER_2 | MPEG-1/2 Layer II encoding |
| V4L2_MPEG_AUDIO_ENCODING_LAYER_3 | MPEG-1/2 Layer III encoding |
| V4L2_MPEG_AUDIO_ENCODING_AAC | MPEG-2/4 AAC (Advanced Audio Coding) |
| V4L2_MPEG_AUDIO_ENCODING_AC3 | AC-3 aka ATSC A/52 encoding |

V4L2_CID_MPEG_AUDIO_L1_BITRATE (enum)

enum v4l2_mpeg_audio_l1_bitrate - MPEG-1/2 Layer I bitrate. Possible values are:

| V4L2_MPEG_AUDIO_L1_BITRATE_32K | 32 kbit/s |
| V4L2_MPEG_AUDIO_L1_BITRATE_64K | 64 kbit/s |
| V4L2_MPEG_AUDIO_L1_BITRATE_96K | 96 kbit/s |
| V4L2_MPEG_AUDIO_L1_BITRATE_128K | 128 kbit/s |
| V4L2_MPEG_AUDIO_L1_BITRATE_160K | 160 kbit/s |
| V4L2_MPEG_AUDIO_L1_BITRATE_192K | 192 kbit/s |
| V4L2_MPEG_AUDIO_L1_BITRATE_224K | 224 kbit/s |
| V4L2_MPEG_AUDIO_L1_BITRATE_256K | 256 kbit/s |
| V4L2_MPEG_AUDIO_L1_BITRATE_288K | 288 kbit/s |
| V4L2_MPEG_AUDIO_L1_BITRATE_300K | 300 kbit/s |
| V4L2_MPEG_AUDIO_L1_BITRATE_320K | 320 kbit/s |
| V4L2_MPEG_AUDIO_L1_BITRATE_352K | 352 kbit/s |
| V4L2_MPEG_AUDIO_L1_BITRATE_384K | 384 kbit/s |
| V4L2_MPEG_AUDIO_L1_BITRATE_416K | 416 kbit/s |
| V4L2_MPEG_AUDIO_L1_BITRATE_448K | 448 kbit/s |

V4L2_CID_MPEG_AUDIO_L2_BITRATE (enum)
**enum v4l2_mpeg_audio_l2_bitrate** - MPEG-1/2 Layer II bitrate. Possible values are:

<table>
<thead>
<tr>
<th>Enum Value</th>
<th>Bitrate</th>
</tr>
</thead>
<tbody>
<tr>
<td>V4L2_MPEG_AUDIO_L2_BITRATE_32K</td>
<td>32 kbit/s</td>
</tr>
<tr>
<td>V4L2_MPEG_AUDIO_L2_BITRATE_48K</td>
<td>48 kbit/s</td>
</tr>
<tr>
<td>V4L2_MPEG_AUDIO_L2_BITRATE_56K</td>
<td>56 kbit/s</td>
</tr>
<tr>
<td>V4L2_MPEG_AUDIO_L2_BITRATE_64K</td>
<td>64 kbit/s</td>
</tr>
<tr>
<td>V4L2_MPEG_AUDIO_L2_BITRATE_80K</td>
<td>80 kbit/s</td>
</tr>
<tr>
<td>V4L2_MPEG_AUDIO_L2_BITRATE_96K</td>
<td>96 kbit/s</td>
</tr>
<tr>
<td>V4L2_MPEG_AUDIO_L2_BITRATE_112K</td>
<td>112 kbit/s</td>
</tr>
<tr>
<td>V4L2_MPEG_AUDIO_L2_BITRATE_128K</td>
<td>128 kbit/s</td>
</tr>
<tr>
<td>V4L2_MPEG_AUDIO_L2_BITRATE_160K</td>
<td>160 kbit/s</td>
</tr>
<tr>
<td>V4L2_MPEG_AUDIO_L2_BITRATE_192K</td>
<td>192 kbit/s</td>
</tr>
<tr>
<td>V4L2_MPEG_AUDIO_L2_BITRATE_224K</td>
<td>224 kbit/s</td>
</tr>
<tr>
<td>V4L2_MPEG_AUDIO_L2_BITRATE_256K</td>

<td>320 kbit/s</td>
</tr>
<tr>
<td>V4L2_MPEG_AUDIO_L2_BITRATE_384K</td>
<td>384 kbit/s</td>
</tr>
</tbody>
</table>

**V4L2_CID_MPEG_AUDIO_L3_BITRATE** (enum)

**enum v4l2_mpeg_audio_l3_bitrate** - MPEG-1/2 Layer III bitrate. Possible values are:

<table>
<thead>
<tr>
<th>Enum Value</th>
<th>Bitrate</th>
</tr>
</thead>
<tbody>
<tr>
<td>V4L2_MPEG_AUDIO_L3_BITRATE_32K</td>
<td>32 kbit/s</td>
</tr>
<tr>
<td>V4L2_MPEG_AUDIO_L3_BITRATE_40K</td>
<td>40 kbit/s</td>
</tr>
<tr>
<td>V4L2_MPEG_AUDIO_L3_BITRATE_48K</td>
<td>48 kbit/s</td>
</tr>
<tr>
<td>V4L2_MPEG_AUDIO_L3_BITRATE_56K</td>
<td>56 kbit/s</td>
</tr>
<tr>
<td>V4L2_MPEG_AUDIO_L3_BITRATE_64K</td>
<td>64 kbit/s</td>
</tr>
<tr>
<td>V4L2_MPEG_AUDIO_L3_BITRATE_80K</td>
<td>80 kbit/s</td>
</tr>
<tr>
<td>V4L2_MPEG_AUDIO_L3_BITRATE_96K</td>
<td>96 kbit/s</td>
</tr>
<tr>
<td>V4L2_MPEG_AUDIO_L3_BITRATE_112K</td>
<td>112 kbit/s</td>
</tr>
<tr>
<td>V4L2_MPEG_AUDIO_L3_BITRATE_128K</td>
<td>128 kbit/s</td>
</tr>
<tr>
<td>V4L2_MPEG_AUDIO_L3_BITRATE_160K</td>
<td>160 kbit/s</td>
</tr>
<tr>
<td>V4L2_MPEG_AUDIO_L3_BITRATE_192K</td>
<td>192 kbit/s</td>
</tr>
<tr>
<td>V4L2_MPEG_AUDIO_L3_BITRATE_224K</td>
<td>224 kbit/s</td>
</tr>
<tr>
<td>V4L2_MPEG_AUDIO_L3_BITRATE_256K</td>
<td>256 kbit/s</td>
</tr>
<tr>
<td>V4L2_MPEG_AUDIO_L3_BITRATE_320K</td>
<td>320 kbit/s</td>
</tr>
<tr>
<td>V4L2_MPEG_AUDIO_L3_BITRATE_384K</td>
<td>384 kbit/s</td>
</tr>
</tbody>
</table>

**V4L2_CID_MPEG_AUDIO_AAC_BITRATE** (integer) AAC bitrate in bits per second.

**V4L2_CID_MPEG_AUDIO_AC3_BITRATE** (enum)

**enum v4l2_mpeg_audio_ac3_bitrate** - AC-3 bitrate. Possible values are:

<table>
<thead>
<tr>
<th>Enum Value</th>
<th>Bitrate</th>
</tr>
</thead>
<tbody>
<tr>
<td>V4L2_MPEG_AUDIO_AC3_BITRATE_320K</td>
<td>320 kbit/s</td>
</tr>
</tbody>
</table>
V4L2_CID_MPEG_AUDIO_MODE (enum)

e num v4l2_mpeg_audio_mode - MPEG Audio mode. Possible values are:

| V4L2_MPEG_AUDIO_MODE_STEREO                | Stereo             |
| V4L2_MPEG_AUDIO_MODE_JOINT_STEREO         | Joint Stereo       |
| V4L2_MPEG_AUDIO_MODE_DUAL                 | Bilingual          |
| V4L2_MPEG_AUDIO_MODE_MONO                 | Mono               |

V4L2_CID_MPEG_AUDIO_MODE_EXTENSION (enum)

e num v4l2_mpeg_audio_mode_extension - Joint Stereo audio mode extension. In Layer I and II they indicate which subbands are in intensity stereo. All other subbands are coded in stereo. Layer III is not (yet) supported. Possible values are:

| V4L2_MPEG_AUDIO_MODE_EXTENSION_BOUND_4     | Subbands 4-31 in intensity stereo |
| V4L2_MPEG_AUDIO_MODE_EXTENSION_BOUND_8     | Subbands 8-31 in intensity stereo |
| V4L2_MPEG_AUDIO_MODE_EXTENSION_BOUND_12    | Subbands 12-31 in intensity stereo|
| V4L2_MPEG_AUDIO_MODE_EXTENSION_BOUND_16    | Subbands 16-31 in intensity stereo|

V4L2_CID_MPEG_AUDIO_EMPHASIS (enum)

e num v4l2_mpeg_audio_emphasis - Audio Emphasis. Possible values are:

| V4L2_MPEG_AUDIO_EMPHASIS_NONE              | None                        |
| V4L2_MPEG_AUDIO_EMPHASIS_50_DIV_15_usS    | 50/15 microsecond emphasis  |
| V4L2_MPEG_AUDIO_EMPHASIS_CITT_J17         | CITT_J17                  |

V4L2_CID_MPEG_AUDIO_CRC (enum)
enum v4l2_mpeg_audio_crc - CRC method. Possible values are:

<table>
<thead>
<tr>
<th>V4L2_MPEG_AUDIO_CRC_NONE</th>
<th>None</th>
</tr>
</thead>
<tbody>
<tr>
<td>V4L2_MPEG_AUDIO_CRC_CRC16</td>
<td>16 bit parity check</td>
</tr>
</tbody>
</table>

V4L2_CID_MPEG_AUDIO_MUTE (boolean) Mutes the audio when capturing. This is not done by muting audio hardware, which can still produce a slight hiss, but in the encoder itself, guaranteeing a fixed and reproducible audio bitstream. 0 = unmuted, 1 = muted.

V4L2_CID_MPEG_AUDIO_DEC_PLAYBACK (enum)

enum v4l2_mpeg_audio_dec_playback - Determines how monolingual audio should be played back. Possible values are:

<table>
<thead>
<tr>
<th>V4L2_MPEG_AUDIO_DEC_PLAYBACK_AUTO</th>
<th>Automatically determines the best playback mode.</th>
</tr>
</thead>
<tbody>
<tr>
<td>V4L2_MPEG_AUDIO_DEC_PLAYBACK_STEREO</td>
<td>Stereo playback.</td>
</tr>
<tr>
<td>V4L2_MPEG_AUDIO_DEC_PLAYBACK_LEFT</td>
<td>Left channel playback.</td>
</tr>
<tr>
<td>V4L2_MPEG_AUDIO_DEC_PLAYBACK_RIGHT</td>
<td>Right channel playback.</td>
</tr>
<tr>
<td>V4L2_MPEG_AUDIO_DEC_PLAYBACK_MONO</td>
<td>Mono playback.</td>
</tr>
<tr>
<td>V4L2_MPEG_AUDIO_DEC_PLAYBACK_SWAPPED_STEREO</td>
<td>Stereo playback with swapped left and right channels.</td>
</tr>
</tbody>
</table>

V4L2_CID_MPEG_AUDIO_DEC_MULTILINGUAL_PLAYBACK (enum)

enum v4l2_mpeg_audio_dec_playback - Determines how multilingual audio should be played back.

V4L2_CID_MPEG_VIDEO_ENCODING (enum)

enum v4l2_mpeg_video_encoding - MPEG Video encoding method. This control is specific to multiplexed MPEG streams. Possible values are:

<table>
<thead>
<tr>
<th>V4L2_MPEG_VIDEO_ENCODING_MPEG_1</th>
<th>MPEG-1 Video encoding</th>
</tr>
</thead>
<tbody>
<tr>
<td>V4L2_MPEG_VIDEO_ENCODING_MPEG_2</td>
<td>MPEG-2 Video encoding</td>
</tr>
<tr>
<td>V4L2_MPEG_VIDEO_ENCODING_MPEG_4_AVC</td>
<td>MPEG-4 AVC (H.264) Video encoding</td>
</tr>
</tbody>
</table>

V4L2_CID_MPEG_VIDEO_ASPECT (enum)

enum v4l2_mpeg_video_aspect - Video aspect. Possible values are:

<table>
<thead>
<tr>
<th>V4L2_MPEG_VIDEO_ASPECT_1x1</th>
</tr>
</thead>
<tbody>
<tr>
<td>V4L2_MPEG_VIDEO_ASPECT_4x3</td>
</tr>
<tr>
<td>V4L2_MPEG_VIDEO_ASPECT_16x9</td>
</tr>
<tr>
<td>V4L2_MPEG_VIDEO_ASPECT_221x100</td>
</tr>
</tbody>
</table>

V4L2_CID_MPEG_VIDEO_B_FRAMES (integer) Number of B-Frames (default 2)

V4L2_CID_MPEG_VIDEO_GOP_SIZE (integer) GOP size (default 12)

V4L2_CID_MPEG_VIDEO_GOP_CLOSURE (boolean) GOP closure (default 1)

V4L2_CID_MPEG_VIDEO_PULLDOWN (boolean) Enable 3:2 pulldown (default 0)

V4L2_CID_MPEG_VIDEO_BITRATE_MODE (enum)
enum v4l2_mpeg_video_bitrate_mode - Video bitrate mode. Possible values are:

| V4L2_MPEG_VIDEO_BITRATE_MODE_VBR  | Variable bitrate          |
| V4L2_MPEG_VIDEO_BITRATE_MODE_CBR | Constant bitrate          |
| V4L2_MPEG_VIDEO_BITRATE_MODE_CQ  | Constant quality          |

V4L2_CID_MPEG_VIDEO_BITRATE (integer) Average video bitrate in bits per second.

V4L2_CID_MPEG_VIDEO_BITRATE_PEAK (integer) Peak video bitrate in bits per second. Must be larger or equal to the average video bitrate. It is ignored if the video bitrate mode is set to constant bitrate.

V4L2_CID_MPEG_VIDEO_CONSTANT_QUALITY (integer) Constant quality level control. This control is applicable when V4L2_CID_MPEG_VIDEO_BITRATE_MODE value is V4L2_MPEG_VIDEO_BITRATE_MODE_CQ. Valid range is 1 to 100 where 1 indicates lowest quality and 100 indicates highest quality. Encoder will decide the appropriate quantization parameter and bitrate to produce requested frame quality.

V4L2_CID_MPEG_VIDEO_FRAME_SKIP_MODE (enum)

enum v4l2_mpeg_video_frame_skip_mode - Indicates in what conditions the encoder should skip frames. If encoding a frame would cause the encoded stream to be larger then a chosen data limit then the frame will be skipped. Possible values are:

| V4L2_MPEG_VIDEO_FRAME_SKIP_MODE_DISABLED | Frame skip mode is disabled. |
| V4L2_MPEG_VIDEO_FRAME_SKIP_MODE_LEVEL_LIMIT | Frame skip mode enabled and buffer limit is set by the chosen level and is defined by the standard. |
| V4L2_MPEG_VIDEO_FRAME_SKIP_MODE_BUF_LIMIT | Frame skip mode enabled and buffer limit is set by the VBV (MPEG1/2/4) or CPB (H264) buffer size control. |

V4L2_CID_MPEG_VIDEO_TEMPORAL_DECIMATION (integer) For every captured frame, skip this many subsequent frames (default 0).

V4L2_CID_MPEG_VIDEO_MUTE (boolean) “Mutes” the video to a fixed color when capturing. This is useful for testing, to produce a fixed video bitstream. 0 = unmuted, 1 = muted.

V4L2_CID_MPEG_VIDEO_MUTE_YUV (integer) Sets the “mute” color of the video. The supplied 32-bit integer is interpreted as follows (bit 0 = least significant bit):

| Bit 0:7 | V chrominance information |
| Bit 8:15 | U chrominance information |
| Bit 16:23 | Y luminance information |
| Bit 24:31 | Must be zero. |

V4L2_CID_MPEG_VIDEO_DEC_PTS (integer64) This read-only control returns the 33-bit video Presentation Time Stamp as defined in ITU T-REC-H.222.0 and ISO/IEC 13818-1 of the currently displayed frame. This is the same PTS as is used in ioctl VIDIOC_DECODER_CMD, VIDIOC_TRY_DECODER_CMD.

V4L2_CID_MPEG_VIDEO_DEC_FRAME (integer64) This read-only control returns the frame counter of the frame that is currently displayed (decoded). This value is reset to 0 whenever the decoder is started.
V4L2_CID_MPEG_VIDEO_DEC_CONCEAL_COLOR (integer64) This control sets the conceal color in YUV color space. It describes the client preference of the error conceal color in case of an error where the reference frame is missing. The decoder should fill the reference buffer with the preferred color and use it for future decoding. The control is using 16 bits per channel. Applicable to decoders.

<table>
<thead>
<tr>
<th></th>
<th>8bit format</th>
<th>10bit format</th>
<th>12bit format</th>
</tr>
</thead>
<tbody>
<tr>
<td>Y luminance</td>
<td>Bit 0:7</td>
<td>Bit 0:9</td>
<td>Bit 0:11</td>
</tr>
<tr>
<td>Cb chrominance</td>
<td>Bit 16:23</td>
<td>Bit 16:25</td>
<td>Bit 16:27</td>
</tr>
<tr>
<td>Cr chrominance</td>
<td>Bit 32:39</td>
<td>Bit 32:41</td>
<td>Bit 32:43</td>
</tr>
<tr>
<td>Must be zero</td>
<td>Bit 48:63</td>
<td>Bit 48:63</td>
<td>Bit 48:63</td>
</tr>
</tbody>
</table>

V4L2_CID_MPEG_VIDEO_DECODER.Slice_INTERFACE (boolean) If enabled the decoder expects to receive a single slice per buffer, otherwise the decoder expects a single frame in per buffer. Applicable to the decoder, all codecs.

V4L2_CID_MPEG_VIDEO_DEC_DISPLAY_DELAY_ENABLE (boolean) If the display delay is enabled then the decoder is forced to return a CAPTURE buffer (decoded frame) after processing a certain number of OUTPUT buffers. The delay can be set through V4L2_CID_MPEG_VIDEO_DEC_DISPLAY_DELAY. This feature can be used for example for generating thumbnails of videos. Applicable to the decoder.

V4L2_CID_MPEG_VIDEO_DEC_DISPLAY_DELAY (integer) Display delay value for decoder. The decoder is forced to return a decoded frame after the set ‘display delay’ number of frames. If this number is low it may result in frames returned out of display order, in addition the hardware may still be using the returned buffer as a reference picture for subsequent frames.

V4L2_CID_MPEG_VIDEO_AU_DELIMITER (boolean) If enabled then, AUD (Access Unit Delimiter) NALUs will be generated. That could be useful to find the start of a frame without having to fully parse each NALU. Applicable to the H264 and HEVC encoders.

V4L2_CID_MPEG_VIDEO_H264_VUI_SAR_ENABLE (boolean) Enable writing sample aspect ratio in the Video Usability Information. Applicable to the H264 encoder.

V4L2_CID_MPEG_VIDEO_H264_VUI_SAR_IDC (enum)

enum v4l2_mpeg_video_h264_vui_sar_idc - VUI sample aspect ratio indicator for H.264 encoding. The value is defined in the table E-1 in the standard. Applicable to the H264 encoder.
### V4L2_CID_MPEG_VIDEO_H264_VUI_SAR_IDC

### V4L2_CID_MPEG_VIDEO_MAX_REF_PIC (integer)

The maximum number of reference pictures used for encoding. Applicable to the encoder.

### V4L2_CID_MPEG_VIDEO_MULTI_SLICE_MODE (enum)

enum v4l2_mpeg_video_multi_slice_mode - Determines how the encoder should handle division of frame into slices. Applicable to the encoder. Possible values are:

<table>
<thead>
<tr>
<th>Mode</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Single slice per frame</td>
<td>Single slice per frame</td>
</tr>
<tr>
<td>Multiple slices with set maximum number of macroblocks per slice</td>
<td>Multiple slices with set maximum number of macroblocks per slice</td>
</tr>
<tr>
<td>Multiple slice with set maximum size in bytes per slice</td>
<td>Multiple slice with set maximum size in bytes per slice</td>
</tr>
</tbody>
</table>

### V4L2_CID_MPEG_VIDEO_MULTI_SLICE_MAX_MB (integer)

The maximum number of macroblocks in a slice. Used when V4L2_CID_MPEG_VIDEO_MULTI_SLICE_MODE is set to V4L2_CID_MPEG_VIDEO_MULTI_SLICE_MAX_MB. Applicable to the encoder.

### V4L2_CID_MPEG_VIDEO_MULTI_SLICE_MAX_BYTES (integer)

The maximum size of a slice in bytes. Used when V4L2_CID_MPEG_VIDEO_MULTI_SLICE_MODE is set to V4L2_CID_MPEG_VIDEO_MULTI_SLICE_MAX_BYTES. Applicable to the encoder.

### V4L2_CID_MPEG_VIDEO_H264_LOOP_FILTER_MODE (enum)

enum v4l2_mpeg_video_h264_loop_filter_mode - Loop filter mode for H264 encoder. Possible values are:

<table>
<thead>
<tr>
<th>Mode</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Loop filter is enabled</td>
<td>Loop filter is enabled</td>
</tr>
<tr>
<td>Loop filter is disabled</td>
<td>Loop filter is disabled</td>
</tr>
<tr>
<td>Loop filter is disabled at the slice boundary</td>
<td>Loop filter is disabled at the slice boundary</td>
</tr>
</tbody>
</table>

### V4L2_CID_MPEG_VIDEO_H264_LOOP_FILTER_ALPHA (integer)

Loop filter alpha coefficient, defined in the H264 standard. This value corresponds to the slice_alpha_c0_offset_div2 slice header field, and should be in the range of -6 to +6, inclusive. The actual alpha offset FilterOffsetA is twice this value. Applicable to the H264 encoder.
V4L2_CID_MPEG_VIDEO_H264_LOOP_FILTER_BETA (integer) Loop filter beta coefficient, defined in the H264 standard. This corresponds to the slice_beta_offset_div2 slice header field, and should be in the range of -6 to +6, inclusive. The actual beta offset FilterOffsetB is twice this value. Applicable to the H264 encoder.

V4L2_CID_MPEG_VIDEO_H264_ENTROPY_MODE (enum)

enum v4l2_mpeg_video_h264_entropy_mode - Entropy coding mode for H264 - CABAC/CAVL.C. Applicable to the H264 encoder. Possible values are:

| V4L2_MPEG_VIDEO_H264_ENTROPY_MODE_CAVLC | Use CAVLC entropy coding. |
| V4L2_MPEG_VIDEO_H264_ENTROPY_MODE_CABAC | Use CABAC entropy coding. |

V4L2_CID_MPEG_VIDEO_H264_8X8_TRANSFORM (boolean) Enable 8X8 transform for H264. Applicable to the H264 encoder.

V4L2_CID_MPEG_VIDEO_H264_CONSTRAINED_INTRA_PREDICTION (boolean) Enable constrained intra prediction for H264. Applicable to the H264 encoder.

V4L2_CID_MPEG_VIDEO_H264_CHROMA_QP_INDEX_OFFSET (integer) Specify the offset that should be added to the luma quantization parameter to determine the chroma quantization parameter. Applicable to the H264 encoder.

V4L2_CID_MPEG_VIDEO_CYCLIC_INTRA_REFRESH_MB (integer) Cyclic intra macroblock refresh. This is the number of continuous macroblocks refreshed every frame. Each frame a successive set of macroblocks is refreshed until the cycle completes and starts from the top of the frame. Setting this control to zero means that macroblocks will not be refreshed. Note that this control will not take effect when V4L2_CID_MPEG_VIDEO_INTRA_REFRESH_PERIOD control is set to non zero value. Applicable to H264, H263 and MPEG4 encoder.

V4L2_CID_MPEG_VIDEO_INTRA_REFRESH_PERIOD (integer) Intra macroblock refresh period. This sets the period to refresh the whole frame. In other words, this defines the number of frames for which the whole frame will be intra-refreshed. An example: setting period to 1 means that the whole frame will be refreshed, setting period to 2 means that the half of macroblocks will be intra-refreshed on frameX and the other half of macroblocks will be refreshed in frameX + 1 and so on. Setting the period to zero means no period is specified. Note that if the client sets this control to non zero value the V4L2_CID_MPEG_VIDEO_CYCLIC_INTRA_REFRESH_MB control shall be ignored. Applicable to H264 and HEVC encoders.

V4L2_CID_MPEG_VIDEO_FRAME_RC_ENABLE (boolean) Frame level rate control enable. If this control is disabled then the quantization parameter for each frame type is constant and set with appropriate controls (e.g. V4L2_CID_MPEG_VIDEO_H263_I_FRAME_QP). If frame rate control is enabled then quantization parameter is adjusted to meet the chosen bitrate. Minimum and maximum value for the quantization parameter can be set with appropriate controls (e.g. V4L2_CID_MPEG_VIDEO_H263_MIN_QP). Applicable to encoders.

V4L2_CID_MPEG_VIDEO_MB_RC_ENABLE (boolean) Macroblock level rate control enable. Applicable to the MPEG4 and H264 encoders.

V4L2_CID_MPEG_VIDEO_MPEG4_QPEL (boolean) Quarter pixel motion estimation for MPEG4. Applicable to the MPEG4 encoder.

V4L2_CID_MPEG_VIDEO_H263_I_FRAME_QP (integer) Quantization parameter for an I frame for H263. Valid range: from 1 to 31.

V4L2_CID_MPEG_VIDEO_H263_P_FRAME_QP (integer) Quantization parameter for an P frame for H263. Valid range: from 1 to 31.

V4L2_CID_MPEG_VIDEO_H263_B_FRAME_QP (integer) Quantization parameter for an B frame for H263. Valid range: from 1 to 31.

V4L2_CID_MPEG_VIDEO_H264_I_FRAME_QP (integer) Quantization parameter for an I frame for H264. Valid range: from 0 to 51.

V4L2_CID_MPEG_VIDEO_H264_MIN_QP (integer) Minimum quantization parameter for H264. Valid range: from 0 to 51.

V4L2_CID_MPEG_VIDEO_H264_MAX_QP (integer) Maximum quantization parameter for H264. Valid range: from 0 to 51.

V4L2_CID_MPEG_VIDEO_H264_P_FRAME_QP (integer) Quantization parameter for an P frame for H264. Valid range: from 0 to 51.

V4L2_CID_MPEG_VIDEO_H264_B_FRAME_QP (integer) Quantization parameter for an B frame for H264. Valid range: from 0 to 51.

V4L2_CID_MPEG_VIDEO_H264_I_FRAME_MIN_QP (integer) Minimum quantization parameter for the H264 I frame to limit I frame quality to a range. Valid range: from 0 to 51. If V4L2_CID_MPEG_VIDEO_H264_MIN_QP is also set, the quantization parameter should be chosen to meet both requirements.

V4L2_CID_MPEG_VIDEO_H264_I_FRAME_MAX_QP (integer) Maximum quantization parameter for the H264 I frame to limit I frame quality to a range. Valid range: from 0 to 51. If V4L2_CID_MPEG_VIDEO_H264_MAX_QP is also set, the quantization parameter should be chosen to meet both requirements.

V4L2_CID_MPEG_VIDEO_H264_P_FRAME_MIN_QP (integer) Minimum quantization parameter for the H264 P frame to limit P frame quality to a range. Valid range: from 0 to 51. If V4L2_CID_MPEG_VIDEO_H264_MIN_QP is also set, the quantization parameter should be chosen to meet both requirements.

V4L2_CID_MPEG_VIDEO_H264_P_FRAME_MAX_QP (integer) Maximum quantization parameter for the H264 P frame to limit P frame quality to a range. Valid range: from 0 to 51. If V4L2_CID_MPEG_VIDEO_H264_MAX_QP is also set, the quantization parameter should be chosen to meet both requirements.

V4L2_CID_MPEG_VIDEO_H264_B_FRAME_MIN_QP (integer) Minimum quantization parameter for the H264 B frame to limit B frame quality to a range. Valid range: from 0 to 51. If V4L2_CID_MPEG_VIDEO_H264_MIN_QP is also set, the quantization parameter should be chosen to meet both requirements.

V4L2_CID_MPEG_VIDEO_H264_B_FRAME_MAX_QP (integer) Maximum quantization parameter for the H264 B frame to limit B frame quality to a range. Valid range: from 0 to 51. If V4L2_CID_MPEG_VIDEO_H264_MAX_QP is also set, the quantization parameter should be chosen to meet both requirements.

V4L2_CID_MPEG_VIDEO_MPEG4_I_FRAME_QP (integer) Quantization parameter for an I frame for MPEG4. Valid range: from 1 to 31.

V4L2_CID_MPEG_VIDEO_MPEG4_P_FRAME_QP (integer) Quantization parameter for an P frame for MPEG4. Valid range: from 1 to 31.

V4L2_CID_MPEG_VIDEO_MPEG4_B_FRAME_QP (integer) Quantization parameter for an B frame for MPEG4. Valid range: from 1 to 31.

V4L2_CID_MPEG_VIDEO_MPEG4_P_FRAME_QP (integer) Quantization parameter for an P frame for MPEG4. Valid range: from 1 to 31.

V4L2_CID_MPEG_VIDEO_MVC_H_SEARCH_RANGE (integer) Horizontal search range defines maximum horizontal search area in pixels to search and match for the present Macroblock (MB) in the reference picture. This V4L2 control macro is used to set horizontal search range for motion estimation module in video encoder.

V4L2_CID_MPEG_VIDEO_MVC_V_SEARCH_RANGE (integer) Vertical search range defines maximum vertical search area in pixels to search and match for the present Macroblock (MB) in the reference picture. This V4L2 control macro is used to set vertical search range for motion estimation module in video encoder.

V4L2_CID_MPEG_VIDEO_FORCE_KEY_FRAME (button) Force a key frame for the next queued buffer. Applicable to encoders. This is a general, codec-agnostic keyframe control.

V4L2_CID_MPEG_VIDEO_H264_CPB_SIZE (integer) The Coded Picture Buffer size in kilobytes, it is used as a limitation of frame skip. The CPB is defined in the standard as a mean to verify that the produced stream will be successfully decoded. Applicable to the H264 encoder.

V4L2_CID_MPEG_VIDEO_H264_I_PERIOD (integer) Period between I-frames in the open GOP for H264. In case of an open GOP this is the period between two I-frames. The period between IDR (Instantaneous Decoding Refresh) frames is taken from the GOP_SIZE control. An IDR frame, which stands for Instantaneous Decoding Refresh is an I-frame after which no prior frames are referenced. This means that a stream can be restarted from an IDR frame without the need to store or decode any previous frames. Applicable to the H264 encoder.

V4L2_CID_MPEG_VIDEO_HEADER_MODE (enum)

enum v4l2_mpeg_video_header_mode - Determines whether the header is returned as the first buffer or is it returned together with the first frame. Applicable to encoders. Possible values are:

<table>
<thead>
<tr>
<th>V4L2_MPEG_VIDEO_HEADER_MODE_SEPARATE</th>
<th>The stream header is returned separately in the first buffer.</th>
</tr>
</thead>
<tbody>
<tr>
<td>V4L2_MPEG_VIDEO_HEADER_MODE_JOINED_WITH_1ST_FRAME</td>
<td>The stream header is returned together with the first encoded frame.</td>
</tr>
</tbody>
</table>

Chapter 3. Linux Media Infrastructure userspace API
**V4L2_CID_MPEG_VIDEO_REPEAT_SEQ_HEADER (boolean)** Repeat the video sequence headers. Repeating these headers makes random access to the video stream easier. Applicable to the MPEG1, 2 and 4 encoder.

**V4L2_CID_MPEG_VIDEO_DECODER_MPEG4_DEBLOCK_FILTER (boolean)** Enabled the deblocking post processing filter for MPEG4 decoder. Applicable to the MPEG4 decoder.

**V4L2_CID_MPEG_VIDEO_MPEG4_VOP_TIME_RES (integer)** `vop_time_increment_resolution` value for MPEG4. Applicable to the MPEG4 encoder.

**V4L2_CID_MPEG_VIDEO_MPEG4_VOP_TIME_INC (integer)** `vop_time_increment` value for MPEG4. Applicable to the MPEG4 encoder.

**V4L2_CID_MPEG_VIDEO_H264_SEI_FRAME_PACKING (boolean)** Enable generation of frame packing supplemental enhancement information in the encoded bitstream. The frame packing SEI message contains the arrangement of L and R planes for 3D viewing. Applicable to the H264 encoder.

**V4L2_CID_MPEG_VIDEO_H264_SEI_FP_CURRENT_FRAME_0 (boolean)** Sets current frame as frame0 in frame packing SEI. Applicable to the H264 encoder.

**enum v4l2_mpeg_video_h264_sei_fp_arrangement_type** - Frame packing arrangement type for H264 SEI. Applicable to the H264 encoder. Possible values are:

<table>
<thead>
<tr>
<th>Constant</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>V4L2_MPEG_VIDEO_H264_SEI_FP_ARRANGEMENT_TYPE_CHEKERBOARD</td>
<td>Pixels are alternatively from L and R.</td>
</tr>
<tr>
<td>V4L2_MPEG_VIDEO_H264_SEI_FP_ARRANGEMENT_TYPE_COLUMN</td>
<td>L and R are interlaced by column.</td>
</tr>
<tr>
<td>V4L2_MPEG_VIDEO_H264_SEI_FP_ARRANGEMENT_TYPE_ROW</td>
<td>L and R are interlaced by row.</td>
</tr>
<tr>
<td>V4L2_MPEG_VIDEO_H264_SEI_FP_ARRANGEMENT_TYPE_SIDE_BY_SIDE</td>
<td>L is on the left, R on the right.</td>
</tr>
<tr>
<td>V4L2_MPEG_VIDEO_H264_SEI_FP_ARRANGEMENT_TYPE_TOP_BOTTOM</td>
<td>L is on top, R on bottom.</td>
</tr>
<tr>
<td>V4L2_MPEG_VIDEO_H264_SEI_FP_ARRANGEMENT_TYPE_TEMPORAL</td>
<td>One view per frame.</td>
</tr>
</tbody>
</table>

**V4L2_CID_MPEG_VIDEO_H264_FMO (boolean)** Enables flexible macroblock ordering in the encoded bitstream. It is a technique used for restructuring the ordering of macroblocks in pictures. Applicable to the H264 encoder.

**V4L2_CID_MPEG_VIDEO_H264_FMO_MAP_TYPE (enum)**

**enum v4l2_mpeg_video_h264_fmo_map_type** - When using FMO, the map type divides the image in different scan patterns of macroblocks. Applicable to the H264 encoder. Possible values are:
| V4L2_MPEG_VIDEO_H264_FMO_MAP_TYPE_INTERLEAVED_SLICES | Slices are interleaved one after other with macroblocks in run length order. |
| V4L2_MPEG_VIDEO_H264_FMO_MAP_TYPE_SCATTERED_SLICES | Scatters the macroblocks based on a mathematical function known to both encoder and decoder. |
| V4L2_MPEG_VIDEO_H264_FMO_MAP_TYPE_FOREGROUND_WITH_LEFT_OVER | Macroblocks arranged in rectangular areas or regions of interest. |
| V4L2_MPEG_VIDEO_H264_FMO_MAP_TYPE_BOX_OUT | Slice groups grow in a cyclic way from centre to outwards. |
| V4L2_MPEG_VIDEO_H264_FMO_MAP_TYPE_RASTER_SCAN | Slice groups grow in raster scan pattern from left to right. |
| V4L2_MPEG_VIDEO_H264_FMO_MAP_TYPE_WIPE_SCAN | Slice groups grow in wipe scan pattern from top to bottom. |
| V4L2_MPEG_VIDEO_H264_FMO_MAP_TYPE_EXPLICIT | User defined map type. |

**V4L2_CID_MPEG_VIDEO_H264_FMO_SLICE_GROUP** (integer)  Number of slice groups in FMO. Applicable to the H264 encoder.

**V4L2_CID_MPEG_VIDEO_H264_FMO_CHANGE_DIRECTION** (enum)

enum v4l2_mpeg_video_h264_fmo_change_dir - Specifies a direction of the slice group change for raster and wipe maps. Applicable to the H264 encoder. Possible values are:

- V4L2_MPEG_VIDEO_H264_FMO_CHANGE_DIR_RIGHT: Raster scan or wipe right.
- V4L2_MPEG_VIDEO_H264_FMO_CHANGE_DIR_LEFT: Reverse raster scan or wipe left.

**V4L2_CID_MPEG_VIDEO_H264_FMO_CHANGE_RATE** (integer)  Specifies the size of the first slice group for raster and wipe map. Applicable to the H264 encoder.

**V4L2_CID_MPEG_VIDEO_H264_FMO_RUN_LENGTH** (integer)  Specifies the number of consecutive macroblocks for the interleaved map. Applicable to the H264 encoder.

**V4L2_CID_MPEG_VIDEO_H264_ASO** (boolean)  Enables arbitrary slice ordering in encoded bitstream. Applicable to the H264 encoder.

**V4L2_CID_MPEG_VIDEO_H264_ASO_SLICE_ORDER** (integer)  Specifies the slice order in ASO. Applicable to the H264 encoder. The supplied 32-bit integer is interpreted as follows (bit 0 = least significant bit):

| Bit 0:15 | Slice ID |
| Bit 16:32 | Slice position or order |

**V4L2_CID_MPEG_VIDEO_H264_HIERARCHICAL_CODING_TYPE** (enum)

enum v4l2_mpeg_video_h264_hierarchical_coding_type - Specifies the hierarchical coding type. Applicable to the H264 encoder. Possible values are:
V4L2_CID_MPEG_VIDEO_H264_HIERARCHICAL_CODING_B (integer) Specifies the number of hierarchical coding layers. Applicable to the H264 encoder.

V4L2_CID_MPEG_VIDEO_H264_HIERARCHICAL_CODING_P (integer) Specifies a user defined QP for each layer. Applicable to the H264 encoder. The supplied 32-bit integer is interpreted as follows (bit 0 = least significant bit):

<table>
<thead>
<tr>
<th>Bit 0:15</th>
<th>QP value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Bit 16:32</td>
<td>Layer number</td>
</tr>
</tbody>
</table>

V4L2_CID_MPEG_VIDEO_H264_HIER_CODING_L0_BR (integer) Indicates bit rate (bps) for hierarchical coding layer 0 for H264 encoder.

V4L2_CID_MPEG_VIDEO_H264_HIER_CODING_L1_BR (integer) Indicates bit rate (bps) for hierarchical coding layer 1 for H264 encoder.

V4L2_CID_MPEG_VIDEO_H264_HIER_CODING_L2_BR (integer) Indicates bit rate (bps) for hierarchical coding layer 2 for H264 encoder.

V4L2_CID_MPEG_VIDEO_H264_HIER_CODING_L3_BR (integer) Indicates bit rate (bps) for hierarchical coding layer 3 for H264 encoder.

V4L2_CID_MPEG_VIDEO_H264_HIER_CODING_L4_BR (integer) Indicates bit rate (bps) for hierarchical coding layer 4 for H264 encoder.

V4L2_CID_MPEG_VIDEO_H264_HIER_CODING_L5_BR (integer) Indicates bit rate (bps) for hierarchical coding layer 5 for H264 encoder.

V4L2_CID_MPEG_VIDEO_H264_HIER_CODING_L6_BR (integer) Indicates bit rate (bps) for hierarchical coding layer 6 for H264 encoder.

V4L2_CID_FWHT_I_FRAME_QP (integer) Quantization parameter for an I frame for FWHT. Valid range: from 1 to 31.

V4L2_CID_FWHT_P_FRAME_QP (integer) Quantization parameter for a P frame for FWHT. Valid range: from 1 to 31.
MFC 5.1 MPEG Controls

The following MPEG class controls deal with MPEG decoding and encoding settings that are specific to the Multi Format Codec 5.1 device present in the S5P family of SoCs by Samsung.

MFC 5.1 Control IDs

V4L2_CID_MPEG_MFC51_VIDEO_DECODER_H264_DISPLAY_DELAY_ENABLE (boolean) If the display delay is enabled then the decoder is forced to return a CAPTURE buffer (decoded frame) after processing a certain number of OUTPUT buffers. The delay can be set through V4L2_CID_MPEG_MFC51_VIDEO_DECODER_H264_DISPLAY_DELAY. This feature can be used for example for generating thumbnails of videos. Applicable to the H264 decoder.

Note: This control is deprecated. Use the standard V4L2_CID_MPEG_VIDEO_DEC_DISPLAY_DELAY_ENABLE control instead.

V4L2_CID_MPEG_MFC51_VIDEO_DECODER_H264_DISPLAY_DELAY (integer) Display delay value for H264 decoder. The decoder is forced to return a decoded frame after the set ‘display delay’ number of frames. If this number is low it may result in frames returned out of display order, in addition the hardware may still be using the returned buffer as a reference picture for subsequent frames.

Note: This control is deprecated. Use the standard V4L2_CID_MPEG_VIDEO_DEC_DISPLAY_DELAY control instead.

V4L2_CID_MPEG_MFC51_VIDEO_H264_NUM.Ref.PIC_FOR.P (integer) The number of reference pictures used for encoding a P picture. Applicable to the H264 encoder.

V4L2_CID_MPEG_MFC51_VIDEO_PADDING (boolean) Padding enable in the encoder - use a color instead of repeating border pixels. Applicable to encoders.

V4L2_CID_MPEG_MFC51_VIDEO_PADDING_YUV (integer) Padding color in the encoder. Applicable to encoders. The supplied 32-bit integer is interpreted as follows (bit 0 = least significant bit):

<table>
<thead>
<tr>
<th>Bit 0:7</th>
<th>V chrominance information</th>
</tr>
</thead>
<tbody>
<tr>
<td>Bit 8:15</td>
<td>U chrominance information</td>
</tr>
<tr>
<td>Bit 16:23</td>
<td>Y luminance information</td>
</tr>
<tr>
<td>Bit 24:31</td>
<td>Must be zero.</td>
</tr>
</tbody>
</table>

V4L2_CID_MPEG_MFC51_VIDEO_RC_REACTION_COEFF (integer) Reaction coefficient for MFC rate control. Applicable to encoders.

Note:

1. Valid only when the frame level RC is enabled.
2. For tight CBR, this field must be small (ex. 2 ~ 10). For VBR, this field must be large (ex. 100 ~ 1000).
3. It is not recommended to use the greater number than FRAME_RATE * (10^9 / BIT_RATE).

**V4L2_CID_MPEG_MFC51_VIDEO_H264_ADAPTIVE_RC_DARK** *(boolean)* Adaptive rate control for dark region. Valid only when H.264 and macroblock level RC is enabled (V4L2_CID_MPEG_VIDEO_MB_RC_ENABLE). Applicable to the H264 encoder.

**V4L2_CID_MPEG_MFC51_VIDEO_H264_ADAPTIVE_RC_SMOOTH** *(boolean)* Adaptive rate control for smooth region. Valid only when H.264 and macroblock level RC is enabled (V4L2_CID_MPEG_VIDEO_MB_RC_ENABLE). Applicable to the H264 encoder.

**V4L2_CID_MPEG_MFC51_VIDEO_H264_ADAPTIVE_RC_STATIC** *(boolean)* Adaptive rate control for static region. Valid only when H.264 and macroblock level RC is enabled (V4L2_CID_MPEG_VIDEO_MB_RC_ENABLE). Applicable to the H264 encoder.

**V4L2_CID_MPEG_MFC51_VIDEO_H264_ADAPTIVE_RC_ACTIVITY** *(boolean)* Adaptive rate control for activity region. Valid only when H.264 and macroblock level RC is enabled (V4L2_CID_MPEG_VIDEO_MB_RC_ENABLE). Applicable to the H264 encoder.

**V4L2_CID_MPEG_MFC51_VIDEO_FRAME_SKIP_MODE** *(enum)*

---

**enum v4l2_mpeg_mfc51_video_frame_skip_mode** - Indicates in what conditions the encoder should skip frames. If encoding a frame would cause the encoded stream to be larger then a chosen data limit then the frame will be skipped. Possible values are:

- **V4L2_MPEG_MFC51_VIDEO_FRAME_SKIP_MODE_DISABLED** - Frame skip mode is disabled.
- **V4L2_MPEG_MFC51_VIDEO_FRAME_SKIP_MODE_LEVEL_LIMIT** - Frame skip mode enabled and buffer limit is set by the chosen level and is defined by the standard.
- **V4L2_MPEG_MFC51_VIDEO_FRAME_SKIP_MODE_BUF_LIMIT** - Frame skip mode enabled and buffer limit is set by the VBV (MPEG1/2/4) or CPB (H264) buffer size control.

**V4L2_CID_MPEG_MFC51_VIDEO_RC_FIXED_TARGET_BIT** *(integer)* Enable rate-control with fixed target bit. If this setting is enabled, then the rate control logic of the encoder will calculate the average bit rate for a GOP and keep it below or equal the set bitrate target. Otherwise the rate control logic calculates the overall average bitrate for the stream and keeps it below or equal to the set bitrate. In the first case the average bitrate for the whole stream will be smaller then the set bitrate. This is caused because the average is calculated for smaller number of frames, on the other hand enabling this setting will ensure that the stream will meet tight bandwidth constraints. Applicable to encoders.

**V4L2_CID_MPEG_MFC51_VIDEO_FORCE_FRAME_TYPE** *(enum)*

---

**enum v4l2_mpeg_mfc51_video_force_frame_type** - Force a frame type for the next queued buffer. Applicable to encoders. Possible values are:

- **V4L2_MPEG_MFC51_FORCE_FRAME_TYPE_DISABLED** - Forcing a specific frame type disabled.
- **V4L2_MPEG_MFC51_FORCE_FRAME_TYPE_I_FRAME** - Force an I-frame.
- **V4L2_MPEG_MFC51_FORCE_FRAME_TYPE_NOT_CODED** - Force a non-coded frame.

---

3.2. Part I - Video for Linux API 763
**CX2341x MPEG Controls**

The following MPEG class controls deal with MPEG encoding settings that are specific to the Conexant CX23415 and CX23416 MPEG encoding chips.

### CX2341x Control IDs

**V4L2_CID_MPEG_CX2341X_VIDEO_SPATIAL_FILTER_MODE** (enum)

```c
enum v4l2_mpeg_cx2341x_videoSpatialFilterMode -
```

Sets the Spatial Filter mode (default MANUAL). Possible values are:

- **V4L2_MPEG_CX2341X_VIDEO_SPATIAL_FILTER_MODE_MANUAL** - Choose the filter manually
- **V4L2_MPEG_CX2341X_VIDEO_SPATIAL_FILTER_MODE_AUTO** - Choose the filter automatically

**V4L2_CID_MPEG_CX2341X_VIDEO_SPATIAL_FILTER** (integer (0-15))

The setting for the Spatial Filter. 0 = off, 15 = maximum. (Default is 0.)

**V4L2_CID_MPEG_CX2341X_VIDEO_LUMA_SPATIAL_FILTER_TYPE** (enum)

```c
enum v4l2_mpeg_cx2341x_videoLumaSpatialFilterType -
```

Select the algorithm to use for the Luma Spatial Filter (default 1D_HOR). Possible values are:

- **V4L2_MPEG_CX2341X_VIDEO_LUMA_SPATIAL_FILTER_TYPE_OFF** - No filter
- **V4L2_MPEG_CX2341X_VIDEO_LUMA_SPATIAL_FILTER_TYPE_1D_HOR** - One-dimensional horizontal
- **V4L2_MPEG_CX2341X_VIDEO_LUMA_SPATIAL_FILTER_TYPE_1D_VERT** - One-dimensional vertical
- **V4L2_MPEG_CX2341X_VIDEO_LUMA_SPATIAL_FILTER_TYPE_2D_HV_SEPARABLE** - Two-dimensional separable
- **V4L2_MPEG_CX2341X_VIDEO_LUMA_SPATIAL_FILTER_TYPE_2D_SYM_NON_SEPARABLE** - Two-dimensional symmetrical non-separable

**V4L2_CID_MPEG_CX2341X_VIDEO_CHROMA_SPATIAL_FILTER_TYPE** (enum)

```c
enum v4l2_mpeg_cx2341x_videoChromaSpatialFilterType -
```

Select the algorithm for the Chroma Spatial Filter (default 1D_HOR). Possible values are:

- **V4L2_MPEG_CX2341X_VIDEO_CHROMA_SPATIAL_FILTER_TYPE_OFF** - No filter
- **V4L2_MPEG_CX2341X_VIDEO_CHROMA_SPATIAL_FILTER_TYPE_1D_HOR** - One-dimensional horizontal

**V4L2_CID_MPEG_CX2341X_VIDEO_TEMPORAL_FILTER_MODE** (enum)

```c
enum v4l2_mpeg_cx2341x_videoTemporalFilterMode -
```

Sets the Temporal Filter mode (default MANUAL). Possible values are:

- **V4L2_MPEG_CX2341X_VIDEO_TEMPORAL_FILTER_MODE_MANUAL** - Choose the filter manually
- **V4L2_MPEG_CX2341X_VIDEO_TEMPORAL_FILTER_MODE_AUTO** - Choose the filter automatically

**V4L2_CID_MPEG_CX2341X_VIDEO_TEMPORAL_FILTER** (integer (0-31))

The setting for the Temporal Filter. 0 = off, 31 = maximum. (Default is 8 for full-scale capturing and 0 for scaled capturing.)

**V4L2_CID_MPEG_CX2341X_VIDEO_MEDIAN_FILTER_TYPE** (enum)

```c
enum v4l2_mpeg_cx2341x_videoMedianFilterType -
```

Median Filter Type (default OFF). Possible values are:
V4L2_MPEG_CX2341X_VIDEO_MEDIAN_FILTER_TYPE_OFF  No filter
V4L2_MPEG_CX2341X_VIDEO_MEDIAN_FILTER_TYPE_HOR  Horizontal filter
V4L2_MPEG_CX2341X_VIDEO_MEDIAN_FILTER_TYPE_VERT  Vertical filter
V4L2_MPEG_CX2341X_VIDEO_MEDIAN_FILTER_TYPE_HOR_VERT  Horizontal and vertical filter
V4L2_MPEG_CX2341X_VIDEO_MEDIAN_FILTER_TYPE_DIAG  Diagonal filter

V4L2_CID_MPEG_CX2341X_VIDEO_LUMA_MEDIAN_FILTER_BOTTOM (integer (0-255))
Threshold above which the luminance median filter is enabled (default 0)

V4L2_CID_MPEG_CX2341X_VIDEO_LUMA_MEDIAN_FILTER_TOP (integer (0-255))
Threshold below which the luminance median filter is enabled (default 255)

V4L2_CID_MPEG_CX2341X_VIDEO_CHROMA_MEDIAN_FILTER_BOTTOM (integer (0-255))
Threshold above which the chroma median filter is enabled (default 0)

V4L2_CID_MPEG_CX2341X_VIDEO_CHROMA_MEDIAN_FILTER_TOP (integer (0-255))
Threshold below which the chroma median filter is enabled (default 255)

V4L2_CID_MPEG_CX2341X_STREAM_INSERT_NAV_PACKETS (boolean) The CX2341X MPEG encoder can insert one empty MPEG-2 PES packet into the stream between every four video frames. The packet size is 2048 bytes, including the packet_start_code_prefix and stream_id fields. The stream_id is 0xBF (private stream 2). The payload consists of 0x00 bytes, to be filled in by the application. 0 = do not insert, 1 = insert packets.

**VPX Control Reference**

The VPX controls include controls for encoding parameters of VPx video codec.

**VPX Control IDs**

V4L2_CID_MPEG_VIDEO_VPX_NUM_PARTITIONS (enum)

enum v4l2_vp8_num_partitions - The number of token partitions to use in VP8 encoder. Possible values are:

<table>
<thead>
<tr>
<th>V4L2_CID_MPEG_VIDEO_VPX_1_PARTITION</th>
<th>1 coefficient partition</th>
</tr>
</thead>
<tbody>
<tr>
<td>V4L2_CID_MPEG_VIDEO_VPX_2_PARTITIONS</td>
<td>2 coefficient partitions</td>
</tr>
<tr>
<td>V4L2_CID_MPEG_VIDEO_VPX_4_PARTITIONS</td>
<td>4 coefficient partitions</td>
</tr>
<tr>
<td>V4L2_CID_MPEG_VIDEO_VPX_8_PARTITIONS</td>
<td>8 coefficient partitions</td>
</tr>
</tbody>
</table>

V4L2_CID_MPEG_VIDEO_VPX_IMD_DISABLE_4X4 (boolean) Setting this prevents intra 4x4 mode in the intra mode decision.

V4L2_CID_MPEG_VIDEO_VPX_NUM_REF_FRAMES (enum)

enum v4l2_vp8_num_ref_frames - The number of reference pictures for encoding P frames. Possible values are:
<table>
<thead>
<tr>
<th>Control Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>V4L2_CID_MPEG_VIDEO_VPX_1_REF_FRAME</td>
<td>Last encoded frame will be searched</td>
</tr>
<tr>
<td>V4L2_CID_MPEG_VIDEO_VPX_2_REF_FRAME</td>
<td>Two frames will be searched among the last encoded frame, the golden frame and the alternate reference (altref) frame. The encoder implementation will decide which two are chosen.</td>
</tr>
<tr>
<td>V4L2_CID_MPEG_VIDEO_VPX_3_REF_FRAME</td>
<td>The last encoded frame, the golden frame and the altref frame will be searched.</td>
</tr>
</tbody>
</table>

**V4L2_CID_MPEG_VIDEO_VPX_FILTER_LEVEL (integer)** Indicates the loop filter level. The adjustment of the loop filter level is done via a delta value against a baseline loop filter value.

**V4L2_CID_MPEG_VIDEO_VPX_FILTER_SHARPNESS (integer)** This parameter affects the loop filter. Anything above zero weakens the deblocking effect on the loop filter.

**V4L2_CID_MPEG_VIDEO_VPX_GOLDEN_FRAME_REF_PERIOD (integer)** Sets the refresh period for the golden frame. The period is defined in number of frames. For a value of 'n', every nth frame starting from the first key frame will be taken as a golden frame. For eg. for an encoding sequence of 0, 1, 2, 3, 4, 5, 6, 7 where the golden frame refresh period is set as 4, the frames 0, 4, 8 etc will be taken as the golden frames as frame 0 is always a key frame.

**V4L2_CID_MPEG_VIDEO_VPX_GOLDEN_FRAME_SEL (enum)**

- enum v4l2_vp8_golden_frame_sel - Selects the golden frame for encoding. Possible values are:
  - V4L2_CID_MPEG_VIDEO_VPX_GOLDEN_FRAME_USE_PREV | Use the (n-2)th frame as a golden frame, current frame index being 'n'.
  - V4L2_CID_MPEG_VIDEO_VPX_GOLDEN_FRAME_USE_REF_PERIOD | Use the previous specific frame indicated by V4L2_CID_MPEG_VIDEO_VPX_GOLDEN_FRAME_REF_PERIOD as a golden frame.

**V4L2_CID_MPEG_VIDEO_VPX_MIN_QP (integer)** Minimum quantization parameter for VP8.

**V4L2_CID_MPEG_VIDEO_VPX_MAX_QP (integer)** Maximum quantization parameter for VP8.

**V4L2_CID_MPEG_VIDEO_VPX_I_FRAME_QP (integer)** Quantization parameter for an I frame for VP8.

**V4L2_CID_MPEG_VIDEO_VPX_P_FRAME_QP (integer)** Quantization parameter for a P frame for VP8.

**V4L2_CID_MPEG_VIDEO_VP8_PROFILE (enum)**

- enum v4l2_mpeg_video_vp8_profile - This control allows selecting the profile for VP8 encoder. This is also used to enumerate supported profiles by VP8 encoder or decoder. Possible values are:
  - V4L2_MPEG_VIDEO_VP8_PROFILE_0 | Profile 0
  - V4L2_MPEG_VIDEO_VP8_PROFILE_1 | Profile 1
  - V4L2_MPEG_VIDEO_VP8_PROFILE_2 | Profile 2
  - V4L2_MPEG_VIDEO_VP8_PROFILE_3 | Profile 3

**V4L2_CID_MPEG_VIDEO_VP9_PROFILE (enum)**
**enum v4l2_mpeg_video_vp9_profile** - This control allows selecting the profile for VP9 encoder. This is also used to enumerate supported profiles by VP9 encoder or decoder. Possible values are:

<table>
<thead>
<tr>
<th>Value</th>
<th>Profile</th>
</tr>
</thead>
<tbody>
<tr>
<td>V4L2_MPEG_VIDEO_VP9_PROFILE_0</td>
<td>Profile 0</td>
</tr>
<tr>
<td>V4L2_MPEG_VIDEO_VP9_PROFILE_1</td>
<td>Profile 1</td>
</tr>
<tr>
<td>V4L2_MPEG_VIDEO_VP9_PROFILE_2</td>
<td>Profile 2</td>
</tr>
<tr>
<td>V4L2_MPEG_VIDEO_VP9_PROFILE_3</td>
<td>Profile 3</td>
</tr>
</tbody>
</table>

**V4L2_CID_MPEG_VIDEO_VP9_LEVEL (enum)**

**enum v4l2_mpeg_video_vp9_level** - This control allows selecting the level for VP9 encoder. This is also used to enumerate supported levels by VP9 encoder or decoder. More information can be found at [webmproject](#). Possible values are:

<table>
<thead>
<tr>
<th>Value</th>
<th>Level</th>
</tr>
</thead>
<tbody>
<tr>
<td>V4L2_MPEG_VIDEO_VP9_LEVEL_1_0</td>
<td>Level 1</td>
</tr>
<tr>
<td>V4L2_MPEG_VIDEO_VP9_LEVEL_1_1</td>
<td>Level 1.1</td>
</tr>
<tr>
<td>V4L2_MPEG_VIDEO_VP9_LEVEL_2_0</td>
<td>Level 2</td>
</tr>
<tr>
<td>V4L2_MPEG_VIDEO_VP9_LEVEL_2_1</td>
<td>Level 2.1</td>
</tr>
<tr>
<td>V4L2_MPEG_VIDEO_VP9_LEVEL_3_0</td>
<td>Level 3</td>
</tr>
<tr>
<td>V4L2_MPEG_VIDEO_VP9_LEVEL_3_1</td>
<td>Level 3.1</td>
</tr>
<tr>
<td>V4L2_MPEG_VIDEO_VP9_LEVEL_4_0</td>
<td>Level 4</td>
</tr>
<tr>
<td>V4L2_MPEG_VIDEO_VP9_LEVEL_4_1</td>
<td>Level 4.1</td>
</tr>
<tr>
<td>V4L2_MPEG_VIDEO_VP9_LEVEL_5_0</td>
<td>Level 5</td>
</tr>
<tr>
<td>V4L2_MPEG_VIDEO_VP9_LEVEL_5_1</td>
<td>Level 5.1</td>
</tr>
<tr>
<td>V4L2_MPEG_VIDEO_VP9_LEVEL_5_2</td>
<td>Level 5.2</td>
</tr>
<tr>
<td>V4L2_MPEG_VIDEO_VP9_LEVEL_6_0</td>
<td>Level 6</td>
</tr>
<tr>
<td>V4L2_MPEG_VIDEO_VP9_LEVEL_6_1</td>
<td>Level 6.1</td>
</tr>
<tr>
<td>V4L2_MPEG_VIDEO_VP9_LEVEL_6_2</td>
<td>Level 6.2</td>
</tr>
</tbody>
</table>

**High Efficiency Video Coding (HEVC/H.265) Control Reference**

The HEVC/H.265 controls include controls for encoding parameters of HEVC/H.265 video codec.

**HEVC/H.265 Control IDs**

**V4L2_CID_MPEG_VIDEO_HEVC_MIN_QP (integer)** Minimum quantization parameter for HEVC. Valid range: from 0 to 51 for 8 bit and from 0 to 63 for 10 bit.

**V4L2_CID_MPEG_VIDEO_HEVC_MAX_QP (integer)** Maximum quantization parameter for HEVC. Valid range: from 0 to 51 for 8 bit and from 0 to 63 for 10 bit.

**V4L2_CID_MPEG_VIDEO_HEVC_I_FRAME_QP (integer)** Quantization parameter for an I frame for HEVC. Valid range: [V4L2_CID_MPEG_VIDEO_HEVC_MIN_QP, V4L2_CID_MPEG_VIDEO_HEVC_MAX_QP].

**V4L2_CID_MPEG_VIDEO_HEVC_P_FRAME_QP (integer)** Quantization parameter for a P frame for HEVC. Valid range: [V4L2_CID_MPEG_VIDEO_HEVC_MIN_QP, V4L2_CID_MPEG_VIDEO_HEVC_MAX_QP].
### V4L2_CID_MPEG_VIDEO_HEVC_B_FRAME_QP (integer)
Quantization parameter for a B frame for HEVC. Valid range: [V4L2_CID_MPEG_VIDEO_HEVC_MIN_QP, V4L2_CID_MPEG_VIDEO_HEVC_MAX_QP].

### V4L2_CID_MPEG_VIDEO_HEVC_I_FRAME_MIN_QP (integer)
Minimum quantization parameter for the HEVC I frame to limit I frame quality to a range. Valid range: from 0 to 51 for 8 bit and from 0 to 63 for 10 bit. If V4L2_CID_MPEG_VIDEO_HEVC_MIN_QP is also set, the quantization parameter should be chosen to meet both requirements.

### V4L2_CID_MPEG_VIDEO_HEVC_I_FRAME_MAX_QP (integer)
Maximum quantization parameter for the HEVC I frame to limit I frame quality to a range. Valid range: from 0 to 51 for 8 bit and from 0 to 63 for 10 bit. If V4L2_CID_MPEG_VIDEO_HEVC_MAX_QP is also set, the quantization parameter should be chosen to meet both requirements.

### V4L2_CID_MPEG_VIDEO_HEVC_P_FRAME_MIN_QP (integer)
Minimum quantization parameter for the HEVC P frame to limit P frame quality to a range. Valid range: from 0 to 51 for 8 bit and from 0 to 63 for 10 bit. If V4L2_CID_MPEG_VIDEO_HEVC_MIN_QP is also set, the quantization parameter should be chosen to meet both requirements.

### V4L2_CID_MPEG_VIDEO_HEVC_P_FRAME_MAX_QP (integer)
Maximum quantization parameter for the HEVC P frame to limit P frame quality to a range. Valid range: from 0 to 51 for 8 bit and from 0 to 63 for 10 bit. If V4L2_CID_MPEG_VIDEO_HEVC_MAX_QP is also set, the quantization parameter should be chosen to meet both requirements.

### V4L2_CID_MPEG_VIDEO_HEVC_B_FRAME_MIN_QP (integer)
Minimum quantization parameter for the HEVC B frame to limit B frame quality to a range. Valid range: from 0 to 51 for 8 bit and from 0 to 63 for 10 bit. If V4L2_CID_MPEG_VIDEO_HEVC_MIN_QP is also set, the quantization parameter should be chosen to meet both requirements.

### V4L2_CID_MPEG_VIDEO_HEVC_B_FRAME_MAX_QP (integer)
Maximum quantization parameter for the HEVC B frame to limit B frame quality to a range. Valid range: from 0 to 51 for 8 bit and from 0 to 63 for 10 bit. If V4L2_CID_MPEG_VIDEO_HEVC_MAX_QP is also set, the quantization parameter should be chosen to meet both requirements.

### V4L2_CID_MPEG_VIDEO_HEVC_HIER_QP (boolean)
HIERARCHICAL_QP allows the host to specify the quantization parameter values for each temporal layer through HIERARCHICAL_QP_LAYER. This is valid only if HIERARCHICAL CODING_LAYER is greater than 1. Setting the control value to 1 enables setting of the QP values for the layers.

### V4L2_CID_MPEG_VIDEO_HEVC_HIER_CODING_TYPE (enum)

<table>
<thead>
<tr>
<th>enum v4l2_mpeg_video_hevc_hier_coding_type</th>
<th>Selects the hierarchical coding type for encoding. Possible values are:</th>
</tr>
</thead>
<tbody>
<tr>
<td>V4L2_MPEG_VIDEO_HEVC_HIERARCHICAL_CODING_B</td>
<td>Use the B frame for hierarchical coding.</td>
</tr>
<tr>
<td>V4L2_MPEG_VIDEO_HEVC_HIERARCHICAL_CODING_P</td>
<td>Use the P frame for hierarchical coding.</td>
</tr>
</tbody>
</table>

### V4L2_CID_MPEG_VIDEO_HEVC_HIER_CODING_LAYER (integer)
Selects the hierarchical coding layer. In normal encoding (non-hierarchical coding), it should be zero. Possible values are [0, 6]. 0 indicates HIERARCHICAL CODING_LAYER 0, 1 indicates HIERARCHICAL CODING_LAYER 1 and so on.

### V4L2_CID_MPEG_VIDEO_HEVC_HIER_CODING_L0_QP (integer)
Indicates quantization parameter for hierarchical coding layer 0. Valid range: [V4L2_CID_MPEG_VIDEO_HEVC_MIN_QP, V4L2_CID_MPEG_VIDEO_HEVC_MAX_QP].
V4L2_CID_MPEG_VIDEO_HEVC_HIER_CODING_L1_QP (integer) Indicates quantization parameter for hierarchical coding layer 1. Valid range: [V4L2_CID_MPEG_VIDEO_HEVC_MIN_QP, V4L2_CID_MPEG_VIDEO_HEVC_MAX_QP].

V4L2_CID_MPEG_VIDEO_HEVC_HIER_CODING_L2_QP (integer) Indicates quantization parameter for hierarchical coding layer 2. Valid range: [V4L2_CID_MPEG_VIDEO_HEVC_MIN_QP, V4L2_CID_MPEG_VIDEO_HEVC_MAX_QP].

V4L2_CID_MPEG_VIDEO_HEVC_HIER_CODING_L3_QP (integer) Indicates quantization parameter for hierarchical coding layer 3. Valid range: [V4L2_CID_MPEG_VIDEO_HEVC_MIN_QP, V4L2_CID_MPEG_VIDEO_HEVC_MAX_QP].

V4L2_CID_MPEG_VIDEO_HEVC_HIER_CODING_L4_QP (integer) Indicates quantization parameter for hierarchical coding layer 4. Valid range: [V4L2_CID_MPEG_VIDEO_HEVC_MIN_QP, V4L2_CID_MPEG_VIDEO_HEVC_MAX_QP].

V4L2_CID_MPEG_VIDEO_HEVC_HIER_CODING_L5_QP (integer) Indicates quantization parameter for hierarchical coding layer 5. Valid range: [V4L2_CID_MPEG_VIDEO_HEVC_MIN_QP, V4L2_CID_MPEG_VIDEO_HEVC_MAX_QP].

V4L2_CID_MPEG_VIDEO_HEVC_PROFILE (enum)

enum v4l2_mpeg_video_hevc_profile - Select the desired profile for HEVC encoder.

| V4L2_MPEG_VIDEO_HEVC_PROFILE_MAIN                  | Main profile.          |
| V4L2_MPEG_VIDEO_HEVC_PROFILE_MAIN_STILL_PICTURE   | Main still picture profile. |
| V4L2_MPEG_VIDEO_HEVC_PROFILE_MAIN_10              | Main 10 profile.       |

V4L2_CID_MPEG_VIDEO_HEVC_LEVEL (enum)

enum v4l2_mpeg_video_hevc_level - Selects the desired level for HEVC encoder.

| V4L2_MPEG_VIDEO_HEVC_LEVEL_1                   | Level 1.0       |
| V4L2_MPEG_VIDEO_HEVC_LEVEL_2                   | Level 2.0       |

| V4L2_MPEG_VIDEO_HEVC_LEVEL_6_2                 | Level 6.2       |

V4L2_CID_MPEG_VIDEO_HEVC_FRAME_RATE_RESOLUTION (integer) Indicates the number of evenly spaced subintervals, called ticks, within one second. This is a 16 bit unsigned integer and has a maximum value up to 0xffff and a minimum value of 1.

V4L2_CID_MPEG_VIDEO_HEVC_TIER (enum)
**enum v4l2_mpeg_video_hevc_tier** - TIER_FLAG specifies tiers information of the HEVC encoded picture. Tier were made to deal with applications that differ in terms of maximum bit rate. Setting the flag to 0 selects HEVC tier as Main tier and setting this flag to 1 indicates High tier. High tier is for applications requiring high bit rates.

| V4L2_MPEG_VIDEO_HEVC_TIER_MAIN | Main tier: |
| V4L2_MPEG_VIDEO_HEVC_TIER_HIGH | High tier: |

**V4L2_CID_MPEG_VIDEO_HEVC_MAX_PARTITION_DEPTH (integer)** Selects HEVC maximum coding unit depth.

**V4L2_CID_MPEG_VIDEO_HEVC_LOOP_FILTER_MODE (enum)**

**enum v4l2_mpeg_video_hevc_loop_filter_mode** - Loop filter mode for HEVC encoder. Possible values are:

| V4L2_MPEG_VIDEO_HEVC_LOOP_FILTER_MODE_DISABLED | Loop filter is disabled. |
| V4L2_MPEG_VIDEO_HEVC_LOOP_FILTER_MODE_ENABLED | Loop filter is enabled. |
| V4L2_MPEG_VIDEO_HEVC_LOOP_FILTER_MODE_DISABLED_AT_SLICE_BOUNDARY | Loop filter is disabled at the slice boundary. |

**V4L2_CID_MPEG_VIDEO_HEVC_LF_BETA_OFFSET_DIV2 (integer)** Selects HEVC loop filter beta offset. The valid range is [-6, +6].

**V4L2_CID_MPEG_VIDEO_HEVC_LF_TC_OFFSET_DIV2 (integer)** Selects HEVC loop filter tc offset. The valid range is [-6, +6].

**V4L2_CID_MPEG_VIDEO_HEVC_REFRESH_TYPE (enum)**

**enum v4l2_mpeg_video_hevc_hier_refresh_type** - Selects refresh type for HEVC encoder. Host has to specify the period into V4L2_CID_MPEG_VIDEO_HEVC_REFRESH_PERIOD.

| V4L2_MPEG_VIDEO_HEVC_REFRESH_NONE | Use the B frame for hierarchical coding. |
| V4L2_MPEG_VIDEO_HEVC_REFRESH_CRA | Use CRA (Clean Random Access Unit) picture encoding. |
| V4L2_MPEG_VIDEO_HEVC_REFRESH_IDR | Use IDR (Instantaneous Decoding Refresh) picture encoding. |

**V4L2_CID_MPEG_VIDEO_HEVC_REFRESH_PERIOD (integer)** Selects the refresh period for HEVC encoder. This specifies the number of I pictures between two CRA/IDR pictures. This is valid only if REFRESH_TYPE is not 0.

**V4L2_CID_MPEG_VIDEO_HEVC_LOSSLESS_CU (boolean)** Indicates HEVC lossless encoding. Setting it to 0 disables lossless encoding. Setting it to 1 enables lossless encoding.

**V4L2_CID_MPEG_VIDEO_HEVC_CONST_INTRA_PRED (boolean)** Indicates constant intra prediction for HEVC encoder. Specifies the constrained intra prediction in which intra largest coding unit (LCU) prediction is performed by using residual data and decoded samples of neighboring intra LCU only. Setting the value to 1 enables constant intra prediction and setting the value to 0 disables constant intra prediction.

**V4L2_CID_MPEG_VIDEO_HEVC_WAVEFRONT (boolean)** Indicates wavefront parallel processing for HEVC encoder. Setting it to 0 disables the feature and setting it to 1 enables the wavefront parallel processing.

**V4L2_CID_MPEG_VIDEO_HEVC_GENERAL_PB (boolean)** Setting the value to 1 enables combination of P and B frame for HEVC encoder.

**V4L2_CID_MPEG_VIDEO_HEVC_TEMPORAL_ID (boolean)** Indicates temporal identifier for HEVC encoder which is enabled by setting the value to 1.
**V4L2_CID_MPEG_VIDEO_HEVC_STRONG_SMOOTHING** (boolean) Indicates bi-linear interpolation is conditionally used in the intra prediction filtering process in the CVS when set to 1. Indicates bi-linear interpolation is not used in the CVS when set to 0.

**V4L2_CID_MPEG_VIDEO_HEVC_MAX_NUM_MERGE_MV_MINUS1** (integer) Indicates maximum number of merge candidate motion vectors. Values are from 0 to 4.

**V4L2_CID_MPEG_VIDEO_HEVC_TMV_PREDICTION** (boolean) Indicates temporal motion vector prediction for HEVC encoder. Setting it to 1 enables the prediction. Setting it to 0 disables the prediction.

**V4L2_CID_MPEG_VIDEO_HEVC_WITHOUT_STARTCODE** (boolean) Specifies if HEVC generates a stream with a size of the length field instead of start code pattern. The size of the length field is configurable through the V4L2_CID_MPEG_VIDEO_HEVC_SIZE_OF_LENGTH_FIELD control. Setting the value to 0 disables encoding without startcode pattern. Setting the value to 1 will enable encoding without startcode pattern.

**V4L2_CID_MPEG_VIDEO_HEVC_SIZE_OF_LENGTH_FIELD** (enum)

<table>
<thead>
<tr>

</tr>
<tr>
<td>4</td>
<td>Generate size of length field instead of start code pattern and length is 4.</td>
</tr>
</tbody>
</table>

**V4L2_CID_MPEG_VIDEO_HEVC_HIER_CODING_L0_BR** (integer) Indicates bit rate for hierarchical coding layer 0 for HEVC encoder.

**V4L2_CID_MPEG_VIDEO_HEVC_HIER_CODING_L1_BR** (integer) Indicates bit rate for hierarchical coding layer 1 for HEVC encoder.

**V4L2_CID_MPEG_VIDEO_HEVC_HIER_CODING_L2_BR** (integer) Indicates bit rate for hierarchical coding layer 2 for HEVC encoder.

**V4L2_CID_MPEG_VIDEO_HEVC_HIER_CODING_L3_BR** (integer) Indicates bit rate for hierarchical coding layer 3 for HEVC encoder.

**V4L2_CID_MPEG_VIDEO_HEVC_HIER_CODING_L4_BR** (integer) Indicates bit rate for hierarchical coding layer 4 for HEVC encoder.

**V4L2_CID_MPEG_VIDEO_HEVC_HIER_CODING_L5_BR** (integer) Indicates bit rate for hierarchical coding layer 5 for HEVC encoder.

**V4L2_CID_MPEG_VIDEO_HEVC_HIER_CODING_L6_BR** (integer) Indicates bit rate for hierarchical coding layer 6 for HEVC encoder.

**V4L2_CID_MPEG_VIDEO_REF_NUMBER_FOR_PFRAMES** (integer) Selects number of P reference pictures required for HEVC encoder. P-Frame can use 1 or 2 frames for reference.

**V4L2_CID_MPEG_VIDEO_PREPEND_SPSPPS_TO_IDR** (integer) Indicates whether to generate SPS and PPS at every IDR. Setting it to 0 disables generating SPS and PPS at every IDR. Setting it to 1 enables generating SPS and PPS at every IDR.

**V4L2_CID_MPEG_VIDEO_HEVC_SPS** (struct) Specifies the Sequence Parameter Set fields (as extracted from the bitstream) for the associated HEVC slice data. These bitstream pa-
rameters are defined according to \textit{ITU H.265/HEVC}. They are described in section 7.4.3.2 “Sequence parameter set RBSP semantics” of the specification.

- Timestamp of the V4L2 capture buffer to use as reference, used with B-coded and P-coded frames. The timestamp refers to the timestamp field in struct v4l2_buffer. Use the v4l2_timeval_to_ns() function to convert the struct timeval in struct v4l2_buffer to a __u64.

- The reference set for the reference frame (V4L2_HEVC_DPB_ENTRY_RPS_ST_CURR_BEFORE, V4L2_HEVC_DPB_ENTRY_RPS_ST_CURR_AFTER or V4L2_HEVC_DPB_ENTRY_RPS_LT_CURR)

- Whether the reference is a field picture or a frame.

- The picture order count of the reference. Only the first element of the array is used for frame pictures, while the first element identifies the top field and the second the bottom field in field-coded pictures.

- Applications and drivers must set this to zero.

- Applications and drivers must set this to zero.

V4L2_CID_MPEG_VIDEO_HEVC_DECODE_MODE (enum) Specifies the decoding mode to use. Currently exposes slice-based and frame-based decoding but new modes might be added later on. This control is used as a modifier for V4L2_PIX_FMT_HEVC_SLICE pixel format. Applications that support V4L2_PIX_FMT_HEVC_SLICE are required to set this control in order to specify the decoding mode that is expected for the buffer. Drivers may expose a single or multiple decoding modes, depending on what they can support.

**Note:** This menu control is not yet part of the public kernel API and it is expected to change.

v4l2_mpeg_video_hevc_decode_mode

<table>

<td>Decoding is done at the frame granularity. The OUTPUT buffer must contain all slices needed to decode the frame. The OUTPUT buffer must also contain both fields.</td>
</tr>
</tbody>
</table>

V4L2_CID_MPEG_VIDEO_HEVC_START_CODE (enum) Specifies the HEVC slice start code expected for each slice. This control is used as a modifier for V4L2_PIX_FMT_HEVC_SLICE.
Applications that support V4L2_PIX_FMT_HEVC_SLICE are required to set this control in order to specify the start code that is expected for the buffer. Drivers may expose a single or multiple start codes, depending on what they can support.

**Note:** This menu control is not yet part of the public kernel API and it is expected to change.

### v4l2_mpeg_video_hevc_start_code

<table>
<thead>
<tr>
<th>V4L2_MPEG_VIDEO_HEVC_START_CODE_NONE</th>
<th>0</th>
<th>Selecting this value specifies that HEVC slices are passed to the driver without any start code. The bitstream data should be according to ITU H.265/HEVC 7.3.1.1 General NAL unit syntax, hence contains emulation prevention bytes when required.</th>
</tr>
</thead>
<tbody>
<tr>
<td>V4L2_MPEG_VIDEO_HEVC_START_CODE_ANNEX_B</td>
<td>1</td>
<td>Selecting this value specifies that HEVC slices are expected to be prefixed by Annex B start codes. According to ITU H.265/HEVC valid start codes can be 3-bytes 0x000001 or 4-bytes 0x00000001.</td>
</tr>
</tbody>
</table>

**V4L2_CID_MPEG_VIDEO_BASELAYER_PRIORITY_ID** (integer) Specifies a priority identifier for the NAL unit, which will be applied to the base layer. By default this value is set to 0 for the base layer, and the next layer will have the priority ID assigned as 1, 2, 3 and so on. The video encoder can’t decide the priority id to be applied to a layer, so this has to come from client. This is applicable to H264 and valid Range is from 0 to 63. Source Rec. ITU-T H.264 (06/2019); G.7.4.1.1, G.8.8.1.

**V4L2_CID_MPEG_VIDEO_LTR_COUNT** (integer) Specifies the maximum number of Long Term Reference (LTR) frames at any given time that the encoder can keep. This is applicable to the H264 and HEVC encoders.

**V4L2_CID_MPEG_VIDEO_FRAME_LTR_INDEX** (integer) After setting this control the frame that will be queued next will be marked as a Long Term Reference (LTR) frame and given this LTR index which ranges from 0 to LTR_COUNT-1. This is applicable to the H264 and HEVC encoders. Source Rec. ITU-T H.264 (06/2019); Table 7.9

**V4L2_CID_MPEG_VIDEO_USE_LTR_FRAMES** (bitmask) Specifies the Long Term Reference (LTR) frame(s) to be used for encoding the next frame queued after setting this control. This provides a bitmask which consists of bits [0, LTR_COUNT-1]. This is applicable to the H264 and HEVC encoders.

**V4L2_CID_MPEG_VIDEO_HEVC_DECODE_PARAMS** (struct) Specifies various decode parameters, especially the references picture order count (POC) for all the lists (short, long, before, current, after) and the number of entries for each of them. These parameters are defined according to ITU H.265/HEVC. They are described in section 8.3 “Slice decoding process” of the specification.

3.2.1.16 Stateless Codec Control Reference

The Stateless Codec control class is intended to support stateless decoder and encoders (i.e. hardware accelerators).

These drivers are typically supported by the Memory-to-memory Stateless Video Decoder Interface, and deal with parsed pixel formats such as V4L2_PIX_FMT_H264_SLICE.

Stateless Codec Control ID

V4L2_CID_CODEC_STATELESS_CLASS (class) The Stateless Codec class descriptor.

V4L2_CID_STATELESS_H264_SPS (struct) Specifies the sequence parameter set (as extracted from the bitstream) for the associated H264 slice data. This includes the necessary parameters for configuring a stateless hardware decoding pipeline for H264. The bitstream parameters are defined according to ITU-T Rec. H.264 Specification (04/2017 Edition), section 7.4.2.1.1 “Sequence Parameter Set Data Semantics”. For further documentation, refer to the above specification, unless there is an explicit comment stating otherwise.

Table 22: struct v4l2_h264_dpb_entry

| __u64   | reference_ts                        | Timestamp of the V4L2 capture buffer to use as reference, used with B-coded and P-coded frames. The timestamp refers to the timestamp field in struct v4l2 buffer. Use the v4l2 timeval to ns() function to convert the struct timeval in struct v4l2_buffer to a __u64. |
| __u32   | pic_num                               | Specifies how the DPB entry is referenced. See Reference Fields |
| __u16   | frame_num                             | |
| __u8    | fields                                | Specifies how the DPB entry is referenced. See Reference Fields |
| __u8    | reserved[5]                           | Applications and drivers must set this to zero. |
| __s32   | top_field_order_cnt                   | |
| __s32   | bottom_field_order_cnt                | |
| __u32   | flags                                 | See DPB Entry Flags |

DPB Entries Flags

V4L2_H264_DPB_ENTRY_FLAG_VALID | 0x00000001 | The DPB entry is valid (non-empty) and should be considered.
V4L2_H264_DPB_ENTRY_FLAG_ACTIVE | 0x00000002 | The DPB entry is used for reference.
V4L2_H264_DPB_ENTRY_FLAG_LONG_TERM | 0x00000004 | The DPB entry is used for long-term reference.
V4L2_H264_DPB_ENTRY_FLAG_FIELD | 0x00000008 | The DPB entry is a single field or a complementary field pair.

V4L2_CID_STATELESS_H264_DECODE_MODE (enum) Specifies the decoding mode to use. Currently exposes slice-based and frame-based decoding but new modes might be added later on. This control is used as a modifier for V4L2_PIX_FMT_H264_SLICE pixel format. Applications that support V4L2_PIX_FMT_H264_SLICE are required to set this control in order to specify the decoding mode that is expected for the buffer. Drivers may expose a single or multiple decoding modes, depending on what they can support.

v4l2_stateless_h264_decode_mode

V4L2_STATELESS_H264_DECODE_MODE_SLICE_BASED | 0 | Decoding is done at the slice granularity. The OUTPUT buffer must contain a single slice. When this mode is selected, the V4L2_CID_STATELESS_H264_SLICE_PARAMS control shall be set. When multiple slices compose a frame, use of V4L2_BUF_CAP_SUPPORTS_M2M_HOLD_CAPTURE_BUF flag is required.
V4L2_STATELESS_H264_DECODE_MODE_FRAME_BASED | 1 | Decoding is done at the frame granularity. The OUTPUT buffer must contain all slices needed to decode the frame. The OUTPUT buffer must also contain both fields. This mode will be supported by devices that parse the slice(s) header(s) in hardware. When this mode is selected, the V4L2_CID_STATELESS_H264_SLICE_PARAMS control shall not be set.

V4L2_CID_STATELESS_H264_START_CODE (enum) Specifies the H264 slice start code expected for each slice. This control is used as a modifier for V4L2_PIX_FMT_H264_SLICE pixel format. Applications that support V4L2_PIX_FMT_H264_SLICE are required to set this control in order to specify the start code that is expected for the buffer. Drivers may expose a single or multiple start codes, depending on what they can support.

Chapter 3. Linux Media Infrastructure userspace API

### v4l2_stateless_h264_start_code

<table>
<thead>
<tr>
<th>V4L2_STATELESS_H264_START_CODE_NONE</th>
<th>0</th>
<th>Selecting this value specifies that H264 slices are passed to the driver without any start code. The bitstream data should be according to ITU-T Rec. H.264 Specification (04/2017 Edition) 7.3.1 NAL unit syntax, hence contains emulation prevention bytes when required.</th>
</tr>
</thead>
<tbody>
<tr>
<td>V4L2_STATELESS_H264_START_CODE_ANNEX_B</td>
<td>1</td>
<td>Selecting this value specifies that H264 slices are expected to be prefixed by Annex B start codes. According to ITU-T Rec. H.264 Specification (04/2017 Edition) valid start codes can be 3-bytes 0x000001 or 4-bytes 0x00000001.</td>
</tr>
</tbody>
</table>

### V4L2_CID_STATELESS_FWHT_PARAMS (struct)

Specifies the FWHT (Fast Walsh Hadamard Transform) parameters (as extracted from the bitstream) for the associated FWHT data. This includes the necessary parameters for configuring a stateless hardware decoding pipeline for FWHT. This codec is specific to the vicodec test driver.

#### v4l2_ctrl_fwht_params

Table 23: struct v4l2_ctrl fwht_params

| __u64 | backward_ref_ts | Timestamp of the V4L2 capture buffer to use as backward reference, used with P-coded frames. The timestamp refers to the timestamp field in struct v4l2_buffer. Use the v4l2_timeval_to_ns() function to convert the struct timeval in struct v4l2_buffer to a __u64. |
| __u32 | version | The version of the codec. Set to V4L2_FWHT_VERSION. |
| __u32 | width | The width of the frame. |
| __u32 | height | The height of the frame. |
| __u32 | flags | The flags of the frame, see FWHT Flags. |
| __u32 | colorspace | The colorspace of the frame, from enum v4l2_colorspace. |
| __u32 | xfer_func | The transfer function, from enum v4l2_xfer_func. |
| __u32 | ycbcr_enc | The Y’CbCr encoding, from enum v4l2_ycbcr_encoding. |
| __u32 | quantization | The quantization range, from enum v4l2_quantization. |

3.2. Part I - Video for Linux API 783
FWHT Flags

| V4L2_FWHT_FL_IS_INTERLACED     | 0x00000001 | Set if this is an interlaced format. |
| V4L2_FWHT_FL_IS_BOTTOM_FIRST  | 0x00000002 | Set if this is a bottom-first (NTSC) interlaced format. |
| V4L2_FWHT_FL_ALTERNATE        | 0x00000004 | Set if each 'frame' contains just one field. |
| V4L2_FWHT_FL_IS_BOTTOM_FIELD  | 0x00000008 | If V4L2_FWHT_FL_IS_ALTERNATE was set, then this is set if this 'frame' is the bottom field, else it is the top field. |
| V4L2_FWHT_FL_LUMA_IS_UNCOMPRESSED | 0x00000010 | Set if the Y' (luma) plane is uncompressed. |
| V4L2_FWHT_FL_CB_IS_UNCOMPRESSED | 0x00000020 | Set if the Cb plane is uncompressed. |
| V4L2_FWHT_FL_CR_IS_UNCOMPRESSED | 0x00000040 | Set if the Cr plane is uncompressed. |
| V4L2_FWHT_FL_CHROMA_FULL_HEIGHT | 0x00000080 | Set if the chroma plane has the same height as the luma plane, else the chroma plane is half the height of the luma plane. |
| V4L2_FWHT_FL_CHROMA_FULL_WIDTH | 0x00000100 | Set if the chroma plane has the same width as the luma plane, else the chroma plane is half the width of the luma plane. |
| V4L2_FWHT_FL_ALPHA_IS_UNCOMPRESSED | 0x00000200 | Set if the alpha plane is uncompressed. |
| V4L2_FWHT_FL_I_FRAME           | 0x00000400 | Set if this is an I-frame. |
| V4L2_FWHT_FL_COMPONENTS_NUM_MSK | 0x00070000 | The number of color components minus one. |
| V4L2_FWHT_FL_PIXENC_MSK        | 0x00180000 | The mask for the pixel encoding. |
| V4L2_FWHT_FL_PIXENC_YUV        | 0x00080000 | Set if the pixel encoding is YUV. |
| V4L2_FWHT_FL_PIXENC_RGB        | 0x00100000 | Set if the pixel encoding is RGB. |
| V4L2_FWHT_FL_PIXENC_HSV        | 0x00180000 | Set if the pixel encoding is HSV. |

V4L2_CID_STATELESS_VP8_FRAME (struct)Specifies the frame parameters for the associated VP8 parsed frame data. This includes the necessary parameters for configuring a stateless hardware decoding pipeline for VP8. The bitstream parameters are defined according to VP8.

MPEG-2 Sequence Flags
**V4L2_MPEG2_SEQ_FLAG_PROGRESSIVE** | 0x01 | Indication that all the frames for the sequence are progressive.

**V4L2_CID_STATELESS_MPEG2_PICTURE (struct)** Specifies the picture parameters (as extracted from the bitstream) for the associated MPEG-2 slice data. This includes fields matching the syntax elements from the picture header and picture coding extension parts of the bitstream as specified by ISO 13818-2.

**v4l2_ctrl_mpeg2_picture**

| _u64 | backward_ref_ts | Timestamp of the V4L2 capture buffer to use as backward reference, used with B-coded and P-coded frames. The timestamp refers to the timestamp field in struct v4l2_buffer. Use the v4l2_timeval_to_ns() function to convert the struct timeval in struct v4l2_buffer to a _u64. |
| _u64 | forward_ref_ts | Timestamp for the V4L2 capture buffer to use as forward reference, used with B-coded frames. The timestamp refers to the timestamp field in struct v4l2_buffer. Use the v4l2_timeval_to_ns() function to convert the struct timeval in struct v4l2_buffer to a _u64. |
| _u32 | flags | See MPEG-2 Picture Flags. |
| _u8  | f_code[2][2] | Motion vector codes. |
| _u8  | picture_coding_type | Picture coding type for the frame covered by the current slice (V4L2_MPEG2_PIC_CODING_TYPE_I, V4L2_MPEG2_PIC_CODING_TYPE_P, or V4L2_MPEG2_PIC_CODING_TYPE_B). |
| _u8  | picture_structure | Picture structure (1: interlaced top field, 2: interlaced bottom field, 3: progressive frame). |
| _u8  | intra_dc_precision | Precision of Discrete Cosine transform (0: 8 bits precision, 1: 9 bits precision, 2: 10 bits precision, 3: 11 bits precision). |
| _u8  | reserved[5] | Applications and drivers must set this to zero. |

**MPEG-2 Picture Flags**

| V4L2_MPEG2_PIC_FLAG_TOP_FIELD_FIRST | 0x00000001 | If set and it’s an interlaced stream, top field is output first. |
| V4L2_MPEG2_PIC_FLAG_FRAME_PRED_DCT | 0x00000002 | If set only frame-DCT and frame prediction are used. |
| V4L2_MPEG2_PIC_FLAG_CONCEALMENT_MV | 0x00000004 | If set motion vectors are coded for intra macroblocks. |
| V4L2_MPEG2_PIC_FLAG_Q_SCALE_TYPE | 0x00000008 | This flag affects the inverse quantization process. |
| V4L2_MPEG2_PIC_FLAG_INTRA_VLC | 0x00000010 | This flag affects the decoding of transform coefficient data. |
| V4L2_MPEG2_PIC_FLAG_ALT_SCAN | 0x00000020 | This flag affects the decoding of transform coefficients. |
| V4L2_MPEG2_PIC_FLAG_REPEAT_FIRST | 0x00000040 | This flag affects the decoding process of progressive frames. |
| V4L2_MPEG2_PIC_FLAG_PROGRESSIVE | 0x00000080 | Indicates whether the current frame is progressive. |

**V4L2_CID_STATELESS_MPEG2_QUANTISATION (struct)** Specifies quantisation matrices, in zigzag scanning order, for the associated MPEG-2 slice data. This control is initialized by the kernel to the matrices default values. If a bitstream transmits a user-defined quantisation matrices load, applications are expected to use this control. Applications are also expected to set the control loading the default values, if the quantisation matrices need to be reset, for instance on a sequence header. This process is specified by section 6.3.7. “Quant matrix extension” of the specification.

**v4l2_ctrl_mpeg2_quantisation**
### Table 35: struct v4l2_ctrl_mpeg2_quantisation

| __u8   | intra_quantiser_matrix[64] | The quantisation matrix coefficients for intra-coded frames, in zigzag scanning order. It is relevant for both luma and chroma components, although it can be superseded by the chroma-specific matrix for non-4:2:0 YUV formats. |
| __u8   | non_intra_quantiser_matrix[64] | The quantisation matrix coefficients for non-intra-coded frames, in zigzag scanning order. It is relevant for both luma and chroma components, although it can be superseded by the chroma-specific matrix for non-4:2:0 YUV formats. |
| __u8   | chroma_intra_quantiser_matrix[64] | The quantisation matrix coefficients for the chrominance component of intra-coded frames, in zigzag scanning order. Only relevant for non-4:2:0 YUV formats. |
| __u8   | chroma_non_intra_quantiser_matrix[64] | The quantisation matrix coefficients for the chrominance component of non-intra-coded frames, in zigzag scanning order. Only relevant for non-4:2:0 YUV formats. |

#### 3.2.1.17 JPEG Control Reference

The JPEG class includes controls for common features of JPEG encoders and decoders. Currently it includes features for codecs implementing progressive baseline DCT compression process with Huffman entropy coding.

**JPEG Control IDs**

**V4L2_CID_JPEG_CLASS (class)** The JPEG class descriptor. Calling *ioctl*s VIDIOC_QUERYCTRL, VIDIOC_QUERY_EXT_CTRL and VIDIOC_QUERYMENU for this control will return a description of this control class.

**V4L2_CID_JPEG_CHROMA_SUBSAMPLING (menu)** The chroma subsampling factors describe how each component of an input image is sampled, in respect to maximum sample rate in each spatial dimension. See *ITU-T.81*, clause A.1.1. for more details. The V4L2_CID_JPEG_CHROMA_SUBSAMPLING control determines how Cb and Cr components are downsampled after converting an input image from RGB to Y’CbCr color space.

<table>
<thead>
<tr>
<th>V4L2_JPEG_CHROMA_SUBSAMPLING_444</th>
<th>No chroma subsampling, each pixel has Y, Cr andCb values.</th>
</tr>
</thead>
<tbody>
<tr>
<td>V4L2_JPEG_CHROMA_SUBSAMPLING_422</td>
<td>Horizontally subsample Cr, Cb components by a factor of 2.</td>
</tr>
<tr>
<td>V4L2_JPEG_CHROMA_SUBSAMPLING_420</td>
<td>Subsample Cr, Cb components horizontally and vertically by 2.</td>
</tr>
<tr>
<td>V4L2_JPEG_CHROMA_SUBSAMPLING_411</td>
<td>Horizontally subsample Cr, Cb components by a factor of 4.</td>
</tr>
<tr>
<td>V4L2_JPEG_CHROMA_SUBSAMPLING_410</td>
<td>Subsample Cr, Cb components horizontally by 4 and vertically by 2.</td>
</tr>
<tr>
<td>V4L2_JPEG_CHROMA_SUBSAMPLING_GRAY</td>
<td>Use only luminance component.</td>
</tr>
</tbody>
</table>
**V4L2_CID_JPEG_RESTART_INTERVAL (integer)** The restart interval determines an interval of inserting RSTm markers (m = 0..7). The purpose of these markers is to additionally reinitialize the encoder process, in order to process blocks of an image independently. For the lossy compression processes the restart interval unit is MCU (Minimum Coded Unit) and its value is contained in DRI (Define Restart Interval) marker. If V4L2_CID_JPEG_RESTART_INTERVAL control is set to 0, DRI and RSTm markers will not be inserted.

**V4L2_CID_JPEG_COMPRESSION_QUALITY (integer)** Determines trade-off between image quality and size. It provides simpler method for applications to control image quality, without a need for direct reconfiguration of luminance and chrominance quantization tables. In cases where a driver uses quantization tables configured directly by an application, using interfaces defined elsewhere, V4L2_CID_JPEG_COMPRESSION_QUALITY control should be set by driver to 0.

The value range of this control is driver-specific. Only positive, non-zero values are meaningful. The recommended range is 1 - 100, where larger values correspond to better image quality.

**V4L2_CID_JPEG_ACTIVE_MARKER (bitmask)** Specify which JPEG markers are included in compressed stream. This control is valid only for encoders.

<table>
<thead>
<tr>
<th>V4L2_JPEG_ACTIVE_MARKER_APP0</th>
<th>Application data segment APP0.</th>
</tr>
</thead>
<tbody>
<tr>
<td>V4L2_JPEG_ACTIVE_MARKER_APP1</td>
<td>Application data segment APP1.</td>
</tr>
<tr>
<td>V4L2_JPEG_ACTIVE_MARKER_COM</td>
<td>Comment segment.</td>
</tr>
<tr>
<td>V4L2_JPEG_ACTIVE_MARKER_DQT</td>
<td>Quantization tables segment.</td>
</tr>
<tr>
<td>V4L2_JPEG_ACTIVE_MARKER_DHT</td>
<td>Huffman tables segment.</td>
</tr>
</tbody>
</table>

For more details about JPEG specification, refer to [ITU-T.81], [JFIF], [W3C JPEG JFIF].

### 3.2.1.18 Digital Video Control Reference

The Digital Video control class is intended to control receivers and transmitters for VGA, DVI (Digital Visual Interface), HDMI (HDMI) and DisplayPort (DP). These controls are generally expected to be private to the receiver or transmitter subdevice that implements them, so they are only exposed on the `/dev/v4l-subdev*` device node.

**Note**: Note that these devices can have multiple input or output pads which are hooked up to e.g. HDMI connectors. Even though the subdevice will receive or transmit video from/to only one of those pads, the other pads can still be active when it comes to EDID (Extended Display Identification Data, EDID) and HDCP (High-bandwidth Digital Content Protection System, HDCP) processing, allowing the device to do the fairly slow EDID/HDCP handling in advance. This allows for quick switching between connectors.

These pads appear in several of the controls in this section as bitmasks, one bit for each pad. Bit 0 corresponds to pad 0, bit 1 to pad 1, etc. The maximum value of the control is the set of valid pads.
Digital Video Control IDs

**V4L2_CID_DV_CLASS (class)** The Digital Video class descriptor.

**V4L2_CID_DV_TX_HOTPLUG (bitmask)** Many connectors have a hotplug pin which is high if EDID information is available from the source. This control shows the state of the hotplug pin as seen by the transmitter. Each bit corresponds to an output pad on the transmitter. If an output pad does not have an associated hotplug pin, then the bit for that pad will be 0. This read-only control is applicable to DVI-D, HDMI and DisplayPort connectors.

**V4L2_CID_DV_TX_RXSENSE (bitmask)** Rx Sense is the detection of pull-ups on the TMDS clock lines. This normally means that the sink has left/entered standby (i.e. the transmitter can sense that the receiver is ready to receive video). Each bit corresponds to an output pad on the transmitter. If an output pad does not have an associated Rx Sense, then the bit for that pad will be 0. This read-only control is applicable to DVI-D and HDMI devices.

**V4L2_CID_DV_TX_EDID_PRESENT (bitmask)** When the transmitter sees the hotplug signal from the receiver it will attempt to read the EDID. If set, then the transmitter has read at least the first block (= 128 bytes). Each bit corresponds to an output pad on the transmitter. If an output pad does not support EDIDs, then the bit for that pad will be 0. This read-only control is applicable to VGA, DVI-A/D, HDMI and DisplayPort connectors.

**V4L2_CID_DV_TX_MODE (enum)**

```c
enum v4l2_dv_tx_mode - HDMI transmitters can transmit in DVI-D mode (just video) or in HDMI mode (video + audio + auxiliary data). This control selects which mode to use:
V4L2_DV_TX_MODE_DVI_D or V4L2_DV_TX_MODE_HDMI. This control is applicable to HDMI connectors.
```

**V4L2_CID_DV_TX_RGB_RANGE (enum)**

```c
enum v4l2_dv_rgb_range - Select the quantization range for RGB output. V4L2_DV_RANGE_AUTO follows the RGB quantization range specified in the standard for the video interface (i.e. CEA-861-E for HDMI). V4L2_DV_RANGE_LIMITED and V4L2_DV_RANGE_FULL override the standard to be compatible with sinks that have not implemented the standard correctly (unfortunately quite common for HDMI and DVI-D). Full range allows all possible values to be used whereas limited range sets the range to \((16 << (N-8)) - (235 << (N-8))\) where \(N\) is the number of bits per component. This control is applicable to VGA, DVI-A/D, HDMI and DisplayPort connectors.
```

**V4L2_CID_DV_TX_IT_CONTENT_TYPE (enum)**

```c
enum v4l2_dv_it_content_type - Configures the IT Content Type of the transmitted video. This information is sent over HDMI and DisplayPort connectors as part of the AVI InfoFrame. The term ‘IT Content’ is used for content that originates from a computer as opposed to content from a TV broadcast or an analog source. The enum v4l2_dv_it_content_type defines the possible content types:
```
**V4L2_DV_IT_CONTENT_TYPE_GRAPHICS** | Graphics content. Pixel data should be passed unfiltered and without analog reconstruction.
---|---
**V4L2_DV_IT_CONTENT_TYPE_PHOTO** | Photo content. The content is derived from digital still pictures. The content should be passed through with minimal scaling and picture enhancements.
**V4L2_DV_IT_CONTENT_TYPE_CINEMA** | Cinema content.
**V4L2_DV_IT_CONTENT_TYPE_GAME** | Game content. Audio and video latency should be minimized.
**V4L2_DV_IT_CONTENT_TYPE_NO_ITC** | No IT Content information is available and the ITC bit in the AVI InfoFrame is set to 0.

**V4L2_CID_DV_RX_POWER_PRESENT** (bitmask) Detects whether the receiver receives power from the source (e.g. HDMI carries 5V on one of the pins). This is often used to power an eeprom which contains EDID information, such that the source can read the EDID even if the sink is in standby/power off. Each bit corresponds to an input pad on the receiver. If an input pad cannot detect whether power is present, then the bit for that pad will be 0. This read-only control is applicable to DVI-D, HDMI and DisplayPort connectors.

**V4L2_CID_DV_RX_RGB_RANGE** (enum)

enum v4l2_dv_rgb_range - Select the quantization range for RGB input. V4L2_DV_RANGE_AUTO follows the RGB quantization range specified in the standard for the video interface (ie. CEA-861-E for HDMI). V4L2_DV_RANGE_LIMITED and V4L2_DV_RANGE_FULL override the standard to be compatible with sources that have not implemented the standard correctly (unfortunately quite common for HDMI and DVI-D). Full range allows all possible values to be used whereas limited range sets the range to \((16 << (N-8)) - (235 << (N-8))\) where \(N\) is the number of bits per component. This control is applicable to VGA, DVI-A/D, HDMI and DisplayPort connectors.

**V4L2_CID_DV_RX_IT_CONTENT_TYPE** (enum)

enum v4l2_dv_it_content_type - Reads the IT Content Type of the received video. This information is sent over HDMI and DisplayPort connectors as part of the AVI InfoFrame. The term ‘IT Content’ is used for content that originates from a computer as opposed to content from a TV broadcast or an analog source. See V4L2_CID_DV_TX_IT_CONTENT_TYPE for the available content types.

### 3.2.1.19 RF Tuner Control Reference

The RF Tuner (RF_TUNER) class includes controls for common features of devices having RF tuner.

In this context, RF tuner is radio receiver circuit between antenna and demodulator. It receives radio frequency (RF) from the antenna and converts that received signal to lower intermediate frequency (IF) or baseband frequency (BB). Tuners that could do baseband output are often called Zero-IF tuners. Older tuners were typically simple PLL tuners inside a metal box, while newer ones are highly integrated chips without a metal box “silicon tuners”. These controls are mostly applicable for new feature rich silicon tuners, just because older tuners does not have much adjustable features.

For more information about RF tuners see Tuner (radio) and RF front end from Wikipedia.
RF_TUNER Control IDs

V4L2_CID_RF_TUNER_CLASS (class) The RF_TUNER class descriptor. Calling `ioctl` `VIDIOC_QUERYCTRL`, `VIDIOC_QUERY_EXT_CTRL` and `VIDIOC_QUERYMENU` for this control will return a description of this control class.

V4L2_CID_RF_TUNER_BANDWIDTH_AUTO (boolean) Enables/disables tuner radio channel bandwidth configuration. In automatic mode bandwidth configuration is performed by the driver.

V4L2_CID_RF_TUNER_BANDWIDTH (integer) Filter(s) on tuner signal path are used to filter signal according to receiving party needs. Driver configures filters to fulfill desired bandwidth requirement. Used when V4L2_CID_RF_TUNER_BANDWIDTH_AUTO is not set. Unit is in Hz. The range and step are driver-specific.

V4L2_CID_RF_TUNER_LNA_GAIN_AUTO (boolean) Enables/disables LNA automatic gain control (AGC)

V4L2_CID_RF_TUNER_MIXER_GAIN_AUTO (boolean) Enables/disables mixer automatic gain control (AGC)

V4L2_CID_RF_TUNER_IF_GAIN_AUTO (boolean) Enables/disables IF automatic gain control (AGC)

V4L2_CID_RF_TUNER_RF_GAIN (integer) The RF amplifier is the very first amplifier on the receiver signal path, just right after the antenna input. The difference between the LNA gain and the RF gain in this document is that the LNA gain is integrated in the tuner chip while the RF gain is a separate chip. There may be both RF and LNA gain controls in the same device. The range and step are driver-specific.

V4L2_CID_RF_TUNER_LNA_GAIN (integer) LNA (low noise amplifier) gain is first gain stage on the RF tuner signal path. It is located very close to tuner antenna input. Used when V4L2_CID_RF_TUNER_LNA_GAIN_AUTO is not set. See V4L2_CID_RF_TUNER_RF_GAIN to understand how RF gain and LNA gain differs from the each others. The range and step are driver-specific.

V4L2_CID_RF_TUNER_MIXER_GAIN (integer) Mixer gain is second gain stage on the RF tuner signal path. It is located inside mixer block, where RF signal is down-converted by the mixer. Used when V4L2_CID_RF_TUNER_MIXER_GAIN_AUTO is not set. The range and step are driver-specific.

V4L2_CID_RF_TUNER_IF_GAIN (integer) IF gain is last gain stage on the RF tuner signal path. It is located on output of RF tuner. It controls signal level of intermediate frequency output or baseband output. Used when V4L2_CID_RF_TUNER_IF_GAIN_AUTO is not set. The range and step are driver-specific.

V4L2_CID_RF_TUNER_PLL_LOCK (boolean) Is synthesizer PLL locked? RF tuner is receiving given frequency when that control is set. This is a read-only control.
3.2.1.20 FM Transmitter Control Reference

The FM Transmitter (FM_TX) class includes controls for common features of FM transmissions capable devices. Currently this class includes parameters for audio compression, pilot tone generation, audio deviation limiter, RDS transmission and tuning power features.

FM_TX Control IDs

V4L2_CID_FM_TX_CLASS (class) The FM TX class descriptor. Calling `ioctl VIDIOC_QUERYCTRL, VIDIOC_QUERY_EXT_CTRL and VIDIOC_QUERYMENU` for this control will return a description of this control class.

V4L2_CID_RDS_TX_DEVIATION (integer) Configures RDS signal frequency deviation level in Hz. The range and step are driver-specific.

V4L2_CID_RDS_TX_PI (integer) Sets the RDS Programme Identification field for transmission.

V4L2_CID_RDS_TX_PTY (integer) Sets the RDS Programme Type field for transmission. This encodes up to 31 pre-defined programme types.

V4L2_CID_RDS_TX_PS_NAME (string) Sets the Programme Service name (PS_NAME) for transmission. It is intended for static display on a receiver. It is the primary aid to listeners in programme service identification and selection. In Annex E of IEC 62106, the RDS specification, there is a full description of the correct character encoding for Programme Service name strings. Also from RDS specification, PS is usually a single eight character text. However, it is also possible to find receivers which can scroll strings sized as 8 x N characters. So, this control must be configured with steps of 8 characters. The result is it must always contain a string with size multiple of 8.

V4L2_CID_RDS_TX_RADIO_TEXT (string) Sets the Radio Text info for transmission. It is a textual description of what is being broadcasted. RDS Radio Text can be applied when broadcaster wishes to transmit longer PS names, programme-related information or any other text. In these cases, RadioText should be used in addition to V4L2_CID_RDS_TX_PS_NAME. The encoding for Radio Text strings is also fully described in Annex E of IEC 62106. The length of Radio Text strings depends on which RDS Block is being used to transmit it, either 32 (2A block) or 64 (2B block). However, it is also possible to find receivers which can scroll strings sized as 32 x N or 64 x N characters. So, this control must be configured with steps of 32 or 64 characters. The result is it must always contain a string with size multiple of 32 or 64.

V4L2_CID_RDS_TX_MONO_STEREO (boolean) Sets the Mono/Stereo bit of the Decoder Identification code. If set, then the audio was recorded as stereo.

V4L2_CID_RDS_TX_ARTIFICIAL_HEAD (boolean) Sets the Artificial Head bit of the Decoder Identification code. If set, then the audio was recorded using an artificial head.

V4L2_CID_RDS_TX_COMPRESSED (boolean) Sets the Compressed bit of the Decoder Identification code. If set, then the audio is compressed.

V4L2_CID_RDS_TX_DYNAMIC_PTY (boolean) Sets the Dynamic PTY bit of the Decoder Identification code. If set, then the PTY code is dynamically switched.

V4L2_CID_RDS_TX_TRAFFIC_ANNOUNCEMENT (boolean) If set, then a traffic announcement is in progress.
V4L2_CID_RDS_TX_TRAFFIC_PROGRAM (boolean) If set, then the tuned programme carries traffic announcements.

V4L2_CID_RDS_TX_MUSIC_SPEECH (boolean) If set, then this channel broadcasts music. If cleared, then it broadcasts speech. If the transmitter doesn’t make this distinction, then it should be set.

V4L2_CID_RDS_TX_ALT_FREQS_ENABLE (boolean) If set, then transmit alternate frequencies.

V4L2_CID_RDS_TX_ALT_FREQS (__u32 array) The alternate frequencies in kHz units. The RDS standard allows for up to 25 frequencies to be defined. Drivers may support fewer frequencies so check the array size.

V4L2_CID_AUDIO_LIMITER_ENABLED (boolean) Enables or disables the audio deviation limiter feature. The limiter is useful when trying to maximize the audio volume, minimize receiver-generated distortion and prevent overmodulation.

V4L2_CID_AUDIO_LIMITER_RELEASE_TIME (integer) Sets the audio deviation limiter feature release time. Unit is in usec. Step and range are driver-specific.

V4L2_CID_AUDIO_LIMITER_DEVIATION (integer) Configures audio frequency deviation level in Hz. The range and step are driver-specific.

V4L2_CID_AUDIO_COMPRESSION_ENABLED (boolean) Enables or disables the audio compression feature. This feature amplifies signals below the threshold by a fixed gain and compresses audio signals above the threshold by the ratio of Threshold/(Gain + Threshold).

V4L2_CID_AUDIO_COMPRESSION_GAIN (integer) Sets the gain for audio compression feature. It is a dB value. The range and step are driver-specific.

V4L2_CID_AUDIO_COMPRESSION_THRESHOLD (integer) Sets the threshold level for audio compression feature. It is a dB value. The range and step are driver-specific.

V4L2_CID_AUDIO_COMPRESSION_ATTACK_TIME (integer) Sets the attack time for audio compression feature. It is a usec value. The range and step are driver-specific.

V4L2_CID_AUDIO_COMPRESSION_RELEASE_TIME (integer) Sets the release time for audio compression feature. It is a usec value. The range and step are driver-specific.

V4L2_CID_PILOT_TONE_ENABLED (boolean) Enables or disables the pilot tone generation feature.

V4L2_CID_PILOT_TONE_DEVIATION (integer) Configures pilot tone frequency deviation level. Unit is in Hz. The range and step are driver-specific.

V4L2_CID_PILOT_TONE_FREQUENCY (integer) Configures pilot tone frequency value. Unit is in Hz. The range and step are driver-specific.

V4L2_CID_TUNE_PREEMPHASIS (enum)

enum v4l2_preemphasis - Configures the pre-emphasis value for broadcasting. A pre-emphasis filter is applied to the broadcast to accentuate the high audio frequencies. Depending on the region, a time constant of either 50 or 75 usec is used. The enum v4l2_preemphasis defines possible values for pre-emphasis. Here they are:

<table>
<thead>
<tr>
<th>V4L2_PREEMPHASIS_DISABLED</th>
<th>No pre-emphasis is applied.</th>
</tr>
</thead>
<tbody>
<tr>
<td>V4L2_PREEMPHASIS_50_uS</td>
<td>A pre-emphasis of 50 uS is used.</td>
</tr>
<tr>
<td>V4L2_PREEMPHASIS_75_uS</td>
<td>A pre-emphasis of 75 uS is used.</td>
</tr>
</tbody>
</table>

3.2. Part I - Video for Linux API
V4L2_CID_TUNE_POWER_LEVEL (integer) Sets the output power level for signal transmission. Unit is in dBuV. Range and step are driver-specific.

V4L2_CID_TUNE_ANTENNA_CAPACITY (integer) This selects the value of antenna tuning capacitor manually or automatically if set to zero. Unit, range and step are driver-specific.

For more details about RDS specification, refer to IEC 62106 document, from CENELEC.

3.2.1.21 FM Receiver Control Reference

The FM Receiver (FM_RX) class includes controls for common features of FM Reception capable devices.

FM_RX Control IDs

V4L2_CID_FM_RX_CLASS (class) The FM_RX class descriptor. Calling ioctls VIDIOC_QUERYCTRL, VIDIOC_QUERY_EXT_CTRL and VIDIOC_QUERYMENU for this control will return a description of this control class.

V4L2_CID_RDS_RECEPTION (boolean) Enables/disables RDS reception by the radio tuner

V4L2_CID_RDS_RX_PTY (integer) Gets RDS Programme Type field. This encodes up to 31 pre-defined programme types.

V4L2_CID_RDS_RX_PS_NAME (string) Gets the Programme Service name (PS_NAME). It is intended for static display on a receiver. It is the primary aid to listeners in programme service identification and selection. In Annex E of IEC 62106, the RDS specification, there is a full description of the correct character encoding for Programme Service name strings. Also from RDS specification, PS is usually a single eight character text. However, it is also possible to find receivers which can scroll strings sized as 8 x N characters. So, this control must be configured with steps of 8 characters. The result is it must always contain a string with size multiple of 8.

V4L2_CID_RDS_RX_RADIO_TEXT (string) Gets the Radio Text info. It is a textual description of what is being broadcasted. RDS Radio Text can be applied when broadcaster wishes to transmit longer PS names, programme-related information or any other text. In these cases, RadioText can be used in addition to V4L2_CID_RDS_RX_PS_NAME. The encoding for Radio Text strings is also fully described in Annex E of IEC 62106. The length of Radio Text strings depends on which RDS Block is being used to transmit it, either 32 (2A block) or 64 (2B block). However, it is also possible to find receivers which can scroll strings sized as 32 x N or 64 x N characters. So, this control must be configured with steps of 32 or 64 characters. The result is it must always contain a string with size multiple of 32 or 64.

V4L2_CID_RDS_RX_TRAFFIC_ANNOUNCEMENT (boolean) If set, then a traffic announcement is in progress.

V4L2_CID_RDS_RX_TRAFFIC_PROGRAM (boolean) If set, then the tuned programme carries traffic announcements.

V4L2_CID_RDS_RX_MUSIC_SPEECH (boolean) If set, then this channel broadcasts music. If cleared, then it broadcasts speech. If the transmitter doesn’t make this distinction, then it will be set.

V4L2_CID_TUNE_DEEMPHASIS (enum)
enum v4l2_deemphasis - Configures the de-emphasis value for reception. A de-emphasis filter is applied to the broadcast to accentuate the high audio frequencies. Depending on the region, a time constant of either 50 or 75 useconds is used. The enum v4l2_deemphasis defines possible values for de-emphasis. Here they are:

| V4L2_DEEMPHASIS_DISABLED       | No de-emphasis is applied. |
| V4L2_DEEMPHASIS_50_uS          | A de-emphasis of 50 μs is used. |
| V4L2_DEEMPHASIS_75_uS          | A de-emphasis of 75 μs is used. |

3.2.1.22 Detect Control Reference

The Detect class includes controls for common features of various motion or object detection capable devices.

Detect Control IDs

V4L2_CID_DETECT_CLASS (class) The Detect class descriptor. Calling iocls VIDIOC_QUERYCTRL, VIDIOC_QUERY_EXT_CTRL and VIDIOC_QUERYMENU for this control will return a description of this control class.

V4L2_CID_DETECT_MD_MODE (menu) Sets the motion detection mode.

| V4L2_DETECT_MD_MODE_DISABLED       | Disable motion detection. |
| V4L2_DETECT_MD_MODE_GLOBAL         | Use a single motion detection threshold. |
| V4L2_DETECT_MD_MODE_THRESHOLD_GRID | The image is divided into a grid, each cell with its own motion detection threshold. These thresholds are set through the V4L2_CID_DETECT_MD_THRESHOLD_GRID matrix control. |
| V4L2_DETECT_MD_MODE_REGION_GRID    | The image is divided into a grid, each cell with its own region value that specifies which per-region motion detection thresholds should be used. Each region has its own thresholds. How these per-region thresholds are set is driver-specific. The region values for the grid are set through the V4L2_CID_DETECT_MD_REGION_GRID matrix control. |

V4L2_CID_DETECT_MD_GLOBAL_THRESHOLD (integer) Sets the global motion detection threshold to be used with the V4L2_DETECT_MD_MODE_GLOBAL motion detection mode.

V4L2_CID_DETECT_MD_THRESHOLD_GRID (__u16 matrix) Sets the motion detection thresholds for each cell in the grid. To be used with the V4L2_DETECT_MD_MODE_THRESHOLD_GRID motion detection mode. Matrix element (0, 0) represents the cell at the top-left of the grid.

V4L2_CID_DETECT_MD_REGION_GRID (__u8 matrix) Sets the motion detection region value for each cell in the grid. To be used with the V4L2_DETECT_MD_MODE_REGION_GRID motion detection mode. Matrix element (0, 0) represents the cell at the top-left of the grid.
3.2.1.23 Colorimetry Control Reference

The Colorimetry class includes controls for High Dynamic Range imaging for representing colors in digital images and video. The controls should be used for video and image encoding and decoding as well as in HDMI receivers and transmitters.

**Colorimetry Control IDs**

**V4L2_CID_COLORIMETRY_CLASS (class)** The Colorimetry class descriptor. Calling `ioctls VIDIOC_QUERYCTRL, VIDIOC_QUERY_EXT_CTRL and VIDIOC_QUERYMENU` for this control will return a description of this control class.

**V4L2_CID_COLORIMETRY_HDR10_CLL_INFO (struct)** The Content Light Level defines upper bounds for the nominal target brightness light level of the pictures.

### v4l2_ctrl_hdr10_cll_info

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>u16 max_content_light_level</td>
<td>The upper bound for the maximum light level among all individual samples.</td>
</tr>
<tr>
<td>u16 max_pic_average_light_level</td>
<td>The upper bound for the maximum average light level among individual pictures.</td>
</tr>
</tbody>
</table>

**V4L2_CID_COLORIMETRY_HDR10_MASTERING_DISPLAY (struct)** The mastering display defines the color volume (the color primaries, white point and luminance range) of a display considered to be the mastering display for the current video content.

### v4l2_ctrl_hdr10_mastering_display

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>

3.2.1.24 Guidelines for Video4Linux pixel format 4CCs

Guidelines for Video4Linux 4CC codes defined using `v4l2_fourcc()` are specified in this document. First of the characters defines the nature of the pixel format, compression and colour space. The interpretation of the other three characters depends on the first one.

Existing 4CCs may not obey these guidelines.
Raw bayer

The following first characters are used by raw bayer formats:

- B: raw bayer, uncompressed
- b: raw bayer, DPCM compressed
- a: A-law compressed
- u: u-law compressed

2nd character: pixel order

- B: BGGR
- G: GBRG
- g: GRBG
- R: RGGB

3rd character: uncompressed bits-per-pixel 0–9, A–

4th character: compressed bits-per-pixel 0–9, A–

3.2.1.25 Data Formats

Data Format Negotiation

Different devices exchange different kinds of data with applications, for example video images, raw or sliced VBI data, RDS datagrams. Even within one kind many different formats are possible, in particular there is an abundance of image formats. Although drivers must provide a default and the selection persists across closing and reopening a device, applications should always negotiate a data format before engaging in data exchange. Negotiation means the application asks for a particular format and the driver selects and reports the best the hardware can do to satisfy the request. Of course applications can also just query the current selection.

A single mechanism exists to negotiate all data formats using the aggregate struct `v4l2_format` and the `VIDIOC_G_FMT` and `VIDIOC_S_FMT` ioctls. Additionally the `VIDIOC_TRY_FMT` ioctl can be used to examine what the hardware could do, without actually selecting a new data format. The data formats supported by the V4L2 API are covered in the respective device section in Interfaces. For a closer look at image formats see Image Formats.

The `VIDIOC_S_FMT` ioctl is a major turning-point in the initialization sequence. Prior to this point multiple panel applications can access the same device concurrently to select the current input, change controls or modify other properties. The first `VIDIOC_S_FMT` assigns a logical stream (video data, VBI data etc.) exclusively to one file descriptor.

Exclusive means no other application, more precisely no other file descriptor, can grab this stream or change device properties inconsistent with the negotiated parameters. A video standard change for example, when the new standard uses a different number of scan lines, can invalidate the selected image format. Therefore only the file descriptor owning the stream can make invalidating changes. Accordingly multiple file descriptors which grabbed different logical streams prevent each other from interfering with their settings. When for example video overlay is about to start or already in progress, simultaneous video capturing may be restricted to the same cropping and image size.
When applications omit the `VIDIOC_S_FMT` ioctl its locking side effects are implied by the next step, the selection of an I/O method with the `ioctl VIDIOC_REQBUFS` ioctl or implicit with the first `read()` or `write()` call.

Generally only one logical stream can be assigned to a file descriptor, the exception being drivers permitting simultaneous video capturing and overlay using the same file descriptor for compatibility with V4L and earlier versions of V4L2. Switching the logical stream or returning into “panel mode” is possible by closing and reopening the device. Drivers may support a switch using `VIDIOC_S_FMT`.

All drivers exchanging data with applications must support the `VIDIOC_G_FMT` and `VIDIOC_S_FMT` ioctl. Implementation of the `VIDIOC_TRY_FMT` is highly recommended but optional.

**Image Format Enumeration**

Apart of the generic format negotiation functions a special ioctl to enumerate all image formats supported by video capture, overlay or output devices is available.\(^1\)

The `ioctl VIDIOC_ENUM_FMT` ioctl must be supported by all drivers exchanging image data with applications.

---

**Important:** Drivers are not supposed to convert image formats in kernel space. They must enumerate only formats directly supported by the hardware. If necessary driver writers should publish an example conversion routine or library for integration into applications.

---

### 3.2.1.26 Single- and multi-planar APIs

Some devices require data for each input or output video frame to be placed in discontiguous memory buffers. In such cases, one video frame has to be addressed using more than one memory address, i.e. one pointer per “plane”. A plane is a sub-buffer of the current frame. For examples of such formats see [Image Formats](#).

Initially, V4L2 API did not support multi-planar buffers and a set of extensions has been introduced to handle them. Those extensions constitute what is being referred to as the “multi-planar API”.

Some of the V4L2 API calls and structures are interpreted differently, depending on whether single- or multi-planar API is being used. An application can choose whether to use one or the other by passing a corresponding buffer type to its ioctl calls. Multi-planar versions of buffer types are suffixed with an `_MPLANE` string. For a list of available multi-planar buffer types see `enum v4l2_buf_type`.

---

\(^1\) Enumerating formats an application has no a-priori knowledge of (otherwise it could explicitly ask for them and need not enumerate) seems useless, but there are applications serving as proxy between drivers and the actual video applications for which this is useful.
Multi-planar formats

Multi-planar API introduces new multi-planar formats. Those formats use a separate set of FourCC codes. It is important to distinguish between the multi-planar API and a multi-planar format. Multi-planar API calls can handle all single-planar formats as well (as long as they are passed in multi-planar API structures), while the single-planar API cannot handle multi-planar formats.

Calls that distinguish between single and multi-planar APIs

**VIDIOC_QUERYCAP** Two additional multi-planar capabilities are added. They can be set together with non-multi-planar ones for devices that handle both single- and multi-planar formats.

**VIDIOC_G_FMT, VIDIOC_S_FMT, VIDIOC_TRY_FMT** New structures for describing multi-planar formats are added: struct `v4l2_pix_format_mplane` and struct `v4l2_plane_pix_format`. Drivers may define new multi-planar formats, which have distinct FourCC codes from the existing single-planar ones.

**VIDIOC_QBUF, VIDIOC_DQBUF, VIDIOC_QUERYBUF** A new struct `v4l2_plane` structure for describing planes is added. Arrays of this structure are passed in the new `m.planes` field of struct `v4l2_buffer`.

**VIDIOC_REQBUFS** Will allocate multi-planar buffers as requested.

3.2.1.27 Cropping, composing and scaling – the SELECTION API

Introduction

Some video capture devices can sample a subsection of a picture and shrink or enlarge it to an image of arbitrary size. Next, the devices can insert the image into larger one. Some video output devices can crop part of an input image, scale it up or down and insert it at an arbitrary scan line and horizontal offset into a video signal. We call these abilities cropping, scaling and composing.

On a video *capture* device the source is a video signal, and the cropping target determine the area actually sampled. The sink is an image stored in a memory buffer. The composing area specifies which part of the buffer is actually written to by the hardware.

On a video *output* device the source is an image in a memory buffer, and the cropping target is a part of an image to be shown on a display. The sink is the display or the graphics screen. The application may select the part of display where the image should be displayed. The size and position of such a window is controlled by the compose target.

Rectangles for all cropping and composing targets are defined even if the device does supports neither cropping nor composing. Their size and position will be fixed in such a case. If the device does not support scaling then the cropping and composing rectangles have the same size.
**Selection targets**

![Cropping and composing targets](image)

Fig. 2: Cropping and composing targets  
Targets used by a cropping, composing and scaling process

See *Selection targets* for more information.

**Configuration**

Applications can use the *selection API* to select an area in a video signal or a buffer, and to query for default settings and hardware limits.

Video hardware can have various cropping, composing and scaling limitations. It may only scale up or down, support only discrete scaling factors, or have different scaling abilities in the horizontal and vertical directions. Also it may not support scaling at all. At the same time the cropping/composing rectangles may have to be aligned, and both the source and the sink may have arbitrary upper and lower size limits. Therefore, as usual, drivers are expected to adjust the requested parameters and return the actual values selected. An application can control the rounding behaviour using *constraint flags*.

**Configuration of video capture**

See figure *Cropping and composing targets* for examples of the selection targets available for a video capture device. It is recommended to configure the cropping targets before to the composing targets.

The range of coordinates of the top left corner, width and height of areas that can be sampled is given by the V4L2_SEL_TGT_CROP_BOUNDS target. It is recommended for the driver developers to put the top/left corner at position \((0, 0)\). The rectangle’s coordinates are expressed in pixels.

The top left corner, width and height of the source rectangle, that is the area actually sampled, is given by the V4L2_SEL_TGT_CROP target. It uses the same coordinate system as V4L2_SEL_TGT_CROP_BOUNDS. The active cropping area must lie completely inside the capture...
boundaries. The driver may further adjust the requested size and/or position according to hardware limitations.

Each capture device has a default source rectangle, given by the V4L2_SEL_TGT_CROP_DEFAULT target. This rectangle shall cover what the driver writer considers the complete picture. Drivers shall set the active crop rectangle to the default when the driver is first loaded, but not later.

The composing targets refer to a memory buffer. The limits of composing coordinates are obtained using V4L2_SEL_TGT_COMPOSE_BOUNDS. All coordinates are expressed in pixels. The rectangle’s top/left corner must be located at position \((0,0)\). The width and height are equal to the image size set by VIDIOC_S_FMT.

The part of a buffer into which the image is inserted by the hardware is controlled by the V4L2_SEL_TGT_COMPOSE target. The rectangle’s coordinates are also expressed in the same coordinate system as the bounds rectangle. The composing rectangle must lie completely inside bounds rectangle. The driver must adjust the composing rectangle to fit to the bounding limits. Moreover, the driver can perform other adjustments according to hardware limitations. The application can control rounding behaviour using constraint flags.

For capture devices the default composing rectangle is queried using V4L2_SEL_TGT_COMPOSE_DEFAULT. It is usually equal to the bounding rectangle.

The part of a buffer that is modified by the hardware is given by V4L2_SEL_TGT_COMPOSE_PADDED. It contains all pixels defined using V4L2_SEL_TGT_COMPOSE plus all padding data modified by hardware during insertion process. All pixels outside this rectangle must not be changed by the hardware. The content of pixels that lie inside the padded area but outside active area is undefined. The application can use the padded and active rectangles to detect where the rubbish pixels are located and remove them if needed.

**Configuration of video output**

For output devices targets and ioctls are used similarly to the video capture case. The composing rectangle refers to the insertion of an image into a video signal. The cropping rectangles refer to a memory buffer. It is recommended to configure the composing targets before to the cropping targets.

The cropping targets refer to the memory buffer that contains an image to be inserted into a video signal or graphical screen. The limits of cropping coordinates are obtained using V4L2_SEL_TGT_CROP_BOUNDS. All coordinates are expressed in pixels. The top/left corner is always point \((0,0)\). The width and height is equal to the image size specified using VIDIOC_S_FMT ioctl.

The top left corner, width and height of the source rectangle, that is the area from which image date are processed by the hardware, is given by the V4L2_SEL_TGT_CROP. Its coordinates are expressed in the same coordinate system as the bounds rectangle. The active cropping area must lie completely inside the crop boundaries and the driver may further adjust the requested size and/or position according to hardware limitations.

For output devices the default cropping rectangle is queried using V4L2_SEL_TGT_CROP_DEFAULT. It is usually equal to the bounding rectangle.

The part of a video signal or graphics display where the image is inserted by the hardware is controlled by V4L2_SEL_TGT_COMPOSE target. The rectangle’s coordinates are expressed in pixels. The composing rectangle must lie completely inside the bounds rectangle. The driver
must adjust the area to fit to the bounding limits. Moreover, the driver can perform other
adjustments according to hardware limitations.

The device has a default composing rectangle, given by the V4L2_SEL_TGT_COMPOSE_DEFAULT
target. This rectangle shall cover what the driver writer considers the complete picture. It is
recommended for the driver developers to put the top/left corner at position (0,0). Drivers
shall set the active composing rectangle to the default one when the driver is first loaded.

The devices may introduce additional content to video signal other than an image from memory
buffers. It includes borders around an image. However, such a padded area is driver-dependent
feature not covered by this document. Driver developers are encouraged to keep padded rect-
gle equal to active one. The padded target is accessed by the V4L2_SEL_TGT_COMPOSE_PADDED
identifier. It must contain all pixels from the V4L2_SEL_TGT_COMPOSE target.

**Scaling control**

An application can detect if scaling is performed by comparing the width and the height of
rectangles obtained using V4L2_SEL_TGT_CROP and V4L2_SEL_TGT_COMPOSE targets. If these
are not equal then the scaling is applied. The application can compute the scaling ratios using
these values.

**Comparison with old cropping API**

The selection API was introduced to cope with deficiencies of the older CROP API, that was de-
gsigned to control simple capture devices. Later the cropping API was adopted by video output
drivers. The ioctls are used to select a part of the display were the video signal is inserted. It
should be considered as an API abuse because the described operation is actually the compos-
ing. The selection API makes a clear distinction between composing and cropping operations
by setting the appropriate targets.

The CROP API lacks any support for composing to and cropping from an image inside a mem-
ory buffer. The application could configure a capture device to fill only a part of an image by
abusing V4L2 API. Cropping a smaller image from a larger one is achieved by setting the field
bytesperline at struct v4l2_pix_format. Introducing an image offsets could be done by mod-
ifying field m_userp ptr at struct v4l2_buffer before calling VIDIOC_QBUF. Those operations
should be avoided because they are not portable (endianness), and do not work for macroblock
and Bayer formats and mmap buffers.

The selection API deals with configuration of buffer cropping/composing in a clear, intuitive and
portable way. Next, with the selection API the concepts of the padded target and constraints
flags are introduced. Finally, struct v4l2_crop and struct v4l2_cropcap have no reserved
fields. Therefore there is no way to extend their functionality. The new struct v4l2_selection
provides a lot of place for future extensions.

Driver developers are encouraged to implement only selection API. The former cropping API
would be simulated using the new one.
Examples

(A video capture device is assumed; change V4L2_BUF_TYPE_VIDEO_CAPTURE for other devices; change target to V4L2_SEL_TGT_COMPOSE_* family to configure composing area)

Example: Resetting the cropping parameters

```c
struct v4l2_selection sel = {
    .type = V4L2_BUF_TYPE_VIDEO_CAPTURE,
    .target = V4L2_SEL_TGT_CROP_DEFAULT,
};
ret = ioctl(fd, VIDIOC_G_SELECTION, &sel);
if (ret)
    exit(-1);
sel.target = V4L2_SEL_TGT_CROP;
ret = ioctl(fd, VIDIOC_S_SELECTION, &sel);
if (ret)
    exit(-1);
```

Setting a composing area on output of size of at most half of limit placed at a center of a display.

Example: Simple downscaling

```c
struct v4l2_selection sel = {
    .type = V4L2_BUF_TYPE_VIDEO_OUTPUT,
    .target = V4L2_SEL_TGT_COMPOSE_BOUNDS,
};
struct v4l2_rect r;
ret = ioctl(fd, VIDIOC_G_SELECTION, &sel);
if (ret)
    exit(-1);
/* setting smaller compose rectangle */
r.width = sel.r.width / 2;
r.height = sel.r.height / 2;
r.left = sel.r.width / 4;
r.top = sel.r.height / 4;
sel.r = r;
sel.target = V4L2_SEL_TGT_COMPOSE;
sel.flags = V4L2_SEL_FLAG_LE;
ret = ioctl(fd, VIDIOC_S_SELECTION, &sel);
if (ret)
    exit(-1);
```

A video output device is assumed; change V4L2_BUF_TYPE_VIDEO_OUTPUT for other devices
Example: Querying for scaling factors

```c
struct v4l2_selection compose = {
    .type = V4L2_BUF_TYPE_VIDEO_OUTPUT,
    .target = V4L2_SEL_TGT_COMPOSE,
};

struct v4l2_selection crop = {
    .type = V4L2_BUF_TYPE_VIDEO_OUTPUT,
    .target = V4L2_SEL_TGT_CROP,
};

double hscale, vscale;

ret = ioctl(fd, VIDIOC_G_SELECTION, &compose);
if (ret)
    exit(-1);
ret = ioctl(fd, VIDIOC_G_SELECTION, &crop);
if (ret)
    exit(-1);

/* computing scaling factors */
hscale = (double)compose.r.width / crop.r.width;
vscale = (double)compose.r.height / crop.r.height;
```

3.2.1.28 Image Cropping, Insertion and Scaling – the CROP API

**Note:** The CROP API is mostly superseded by the newer **SELECTION API**. The new API should be preferred in most cases, with the exception of pixel aspect ratio detection, which is implemented by **VIDIOC_CROPCAP** and has no equivalent in the SELECTION API. See **Comparison with old cropping API** for a comparison of the two APIs.

Some video capture devices can sample a subsection of the picture and shrink or enlarge it to an image of arbitrary size. We call these abilities cropping and scaling. Some video output devices can scale an image up or down and insert it at an arbitrary scan line and horizontal offset into a video signal.

Applications can use the following API to select an area in the video signal, query the default area and the hardware limits.

**Note:** Despite their name, the **VIDIOC_CROPCAP**, **VIDIOC_G_CROP** and **VIDIOC_S_CROP** ioctls apply to input as well as output devices.

Scaling requires a source and a target. On a video capture or overlay device the source is the video signal, and the cropping ioctls determine the area actually sampled. The target are images read by the application or overlaid onto the graphics screen. Their size (and position for an overlay) is negotiated with the **VIDIOC_G_FMT** and **VIDIOC_S_FMT** ioctls.

On a video output device the source are the images passed in by the application, and their size is again negotiated with the **VIDIOC_G_FMT** and **VIDIOC_S_FMT** ioctls, or may be encoded in a compressed video stream. The target is the video signal, and the cropping ioctls determine the area where the images are inserted.
Source and target rectangles are defined even if the device does not support scaling or the \texttt{VIDIOC\_G\_CROP} and \texttt{VIDIOC\_S\_CROP} ioctls. Their size (and position where applicable) will be fixed in this case.

\textbf{Note:} All capture and output devices that support the CROP or SELECTION API will also support the \texttt{VIDIOC\_CROPCAP} ioctl.

### Cropping Structures

![Image](image.png)

**Fig. 3: Image Cropping, Insertion and Scaling**

The cropping, insertion and scaling process

For capture devices the coordinates of the top left corner, width and height of the area which can be sampled is given by the bounds substructure of the struct \texttt{v4l2\_cropcap} returned by the \texttt{VIDIOC\_CROPCAP} ioctl. To support a wide range of hardware this specification does not define an origin or units. However by convention drivers should horizontally count unscaled samples relative to \(0H\) (the leading edge of the horizontal sync pulse, see \textit{Figure 4.1. Line synchronization}). Vertically ITU-R line numbers of the first field (see ITU R-525 line numbering for 525 lines and for 625 lines), multiplied by two if the driver can capture both fields.

The top left corner, width and height of the source rectangle, that is the area actually sampled, is given by struct \texttt{v4l2\_crop} using the same coordinate system as struct \texttt{v4l2\_cropcap}. Applications can use the \texttt{VIDIOC\_G\_CROP} and \texttt{VIDIOC\_S\_CROP} ioctls to get and set this rectangle. It must lie completely within the capture boundaries and the driver may further adjust the requested size and/or position according to hardware limitations.

Each capture device has a default source rectangle, given by the \texttt{defrect} substructure of struct \texttt{v4l2\_cropcap}. The center of this rectangle shall align with the center of the active picture area of the video signal, and cover what the driver writer considers the complete picture. Drivers shall reset the source rectangle to the default when the driver is first loaded, but not later.
For output devices these structures and ioctl’s are used accordingly, defining the target rectangle where the images will be inserted into the video signal.

Scaling Adjustments

Video hardware can have various cropping, insertion and scaling limitations. It may only scale up or down, support only discrete scaling factors, or have different scaling abilities in horizontal and vertical direction. Also it may not support scaling at all. At the same time the struct v4l2_crop rectangle may have to be aligned, and both the source and target rectangles may have arbitrary upper and lower size limits. In particular the maximum width and height in struct v4l2_crop may be smaller than the struct v4l2_cropcap bounds area. Therefore, as usual, drivers are expected to adjust the requested parameters and return the actual values selected.

Applications can change the source or the target rectangle first, as they may prefer a particular image size or a certain area in the video signal. If the driver has to adjust both to satisfy hardware limitations, the last requested rectangle shall take priority, and the driver should preferably adjust the opposite one. The VIDIOC_TRY_FMT ioctl however shall not change the driver state and therefore only adjust the requested rectangle.

Suppose scaling on a video capture device is restricted to a factor 1:1 or 2:1 in either direction and the target image size must be a multiple of 16 × 16 pixels. The source cropping rectangle is set to defaults, which are also the upper limit in this example, of 640 × 400 pixels at offset 0, 0. An application requests an image size of 300 × 225 pixels, assuming video will be scaled down from the “full picture” accordingly. The driver sets the image size to the closest possible values 304 × 224, then chooses the cropping rectangle closest to the requested size, that is 608 × 224 (224 × 2:1 would exceed the limit 400). The offset 0, 0 is still valid, thus unmodified. Given the default cropping rectangle reported by VIDIOC_CROPCAP the application can easily propose another offset to center the cropping rectangle.

Now the application may insist on covering an area using a picture aspect ratio closer to the original request, so it asks for a cropping rectangle of 608 × 456 pixels. The present scaling factors limit cropping to 640 × 384, so the driver returns the cropping size 608 × 384 and adjusts the image size to closest possible 304 × 192.

Examples

Source and target rectangles shall remain unchanged across closing and reopening a device, such that piping data into or out of a device will work without special preparations. More advanced applications should ensure the parameters are suitable before starting I/O.

Note: On the next two examples, a video capture device is assumed; change V4L2_BUF_TYPE_VIDEO_CAPTURE for other types of device.
Example: Resetting the cropping parameters

```c
struct v4l2_cropcap cropcap;
struct v4l2_crop crop;

memset (&cropcap, 0, sizeof (cropcap));
cropcap.type = V4L2_BUF_TYPE_VIDEO_CAPTURE;
if (-1 == ioctl (fd, VIDIOC_CROPCAP, &cropcap)) {
    perror ("VIDIOC_CROPCAP");
    exit (EXIT_FAILURE);
}

memset (&crop, 0, sizeof (crop));
crop.type = V4L2_BUF_TYPE_VIDEO_CAPTURE;
crop.c = cropcap.defrect;
/* Ignore if cropping is not supported (EINVAL). */
if (-1 == ioctl (fd, VIDIOC_S_CROP, &crop)
    && errno != EINVAL) {
    perror ("VIDIOC_S_CROP");
    exit (EXIT_FAILURE);
}
```

Example: Simple downscaling

```c
struct v4l2_cropcap cropcap;
struct v4l2_format format;
reset_cropping_parameters ();

/* Scale down to 1/4 size of full picture. */
memset (&format, 0, sizeof (format)); /* defaults */
format.type = V4L2_BUF_TYPE_VIDEO_CAPTURE;
format.fmt.pix.width = cropcap.defrect.width >> 1;
format.fmt.pix.height = cropcap.defrect.height >> 1;
format.fmt.pix.pixelformat = V4L2_PIX_FMT_YUYV;
if (-1 == ioctl (fd, VIDIOC_S_FMT, &format)) {
    perror ("VIDIOC_S_FORMAT");
    exit (EXIT_FAILURE);
}
/* We could check the actual image size now, the actual scaling factor
or if the driver can scale at all. */
```
Example: Selecting an output area

Note: This example assumes an output device.

```c
struct v4l2_cropcap cropcap;
struct v4l2_crop crop;

memset (&cropcap, 0, sizeof (cropcap));
cropcap.type = V4L2_BUF_TYPE_VIDEO_OUTPUT;
if (-1 == ioctl (fd, VIDIOC_CROPCAP, &cropcap)) {
    perror("VIDIOC_CROPCAP");
    exit (EXIT_FAILURE);
}

memset (&crop, 0, sizeof (crop));
crop.type = V4L2_BUF_TYPE_VIDEO_OUTPUT;
crop.c = cropcap.defrect;
/* Scale the width and height to 50 % of their original size
   and center the output. */
crop.c.width /= 2;
crop.c.height /= 2;
crop.c.left += crop.c.width / 2;
crop.c.top += crop.c.height / 2;
/* Ignore if cropping is not supported (EINVAL). */
if (-1 == ioctl (fd, VIDIOC_S_CROP, &crop)
    && errno != EINVAL) {
    perror("VIDIOC_S_CROP");
    exit (EXIT_FAILURE);
}
```

Example: Current scaling factor and pixel aspect

Note: This example assumes a video capture device.

```c
struct v4l2_cropcap cropcap;
struct v4l2_crop crop;
struct v4l2_format format;
double hscale, vscale;
double aspect;
int dwidth, dheight;

memset (&cropcap, 0, sizeof (cropcap));
cropcap.type = V4L2_BUF_TYPE_VIDEO_CAPTURE;
if (-1 == ioctl (fd, VIDIOC_CROPCAP, &cropcap)) {
```
```c
perror("VIDIOC_CROPCAP");
exit(EXIT_FAILURE);
}

memset(&crop, 0, sizeof(crop));
crop.type = V4L2_BUF_TYPE_VIDEO_CAPTURE;

if (-1 == ioctl(fd, VIDIOC_G_CROP, &crop)) {
    if (errno != EINVAL) {
        perror("VIDIOC_G_CROP");
        exit(EXIT_FAILURE);
    }
    /* Cropping not supported. */
    crop.c = cropcap.defrect;
}

memset(&format, 0, sizeof(format));
format.fmt.type = V4L2_BUF_TYPE_VIDEO_CAPTURE;
if (-1 == ioctl(fd, VIDIOC_G_FMT, &format)) {
    perror("VIDIOC_G_FMT");
    exit(EXIT_FAILURE);
}

/* The scaling applied by the driver. */

hscale = format.fmt.pix.width / (double) crop.c.width;
vscale = format.fmt.pix.height / (double) crop.c.height;

aspect = cropcap.pixaspect.numerator / (double) cropcap.pixaspect.denominator;
aspect = aspect * hscale / vscale;

/* Devices following ITU-R BT.601 do not capture square pixels. For playback on a computer monitor we should scale the images to this size. */

dwidth = format.fmt.pix.width / aspect;
dheight = format.fmt.pix.height;
```

### 3.2.1.29 Streaming Parameters

Streaming parameters are intended to optimize the video capture process as well as I/O. Presently applications can request a high quality capture mode with the `VIDIOC_S_PARM` ioctl.

The current video standard determines a nominal number of frames per second. If less than this number of frames is to be captured or output, applications can request frame skipping or duplicating on the driver side. This is especially useful when using the `read()` or `write()`, which are not augmented by timestamps or sequence counters, and to avoid unnecessary data copying.

Finally these ioctls can be used to determine the number of buffers used internally by a driver in read/write mode. For implications see the section discussing the `read()` function.

To get and set the streaming parameters applications call the `VIDIOC_G_PARM` and `VIDOC_S_PARM` ioctls.
IOC_S_PARM ioctl, respectively. They take a pointer to a struct v4l2_streamparm, which contains a union holding separate parameters for input and output devices.

These ioctls are optional, drivers need not implement them. If so, they return the EINVAL error code.

### 3.2.2 Image Formats

The V4L2 API was primarily designed for devices exchanging image data with applications. The struct v4l2_pix_format and struct v4l2_pix_format_mplane structures define the format and layout of an image in memory. The former is used with the single-planar API, while the latter is used with the multi-planar version (see Single- and multi-planar APIs). Image formats are negotiated with the VIDIOC_S_FMT ioctl. (The explanations here focus on video capturing and output, for overlay frame buffer formats see also VIDIOC_G_FBUF.)

#### 3.2.2.1 Single-planar format structure

v4l2_pix_format

Table 38: struct v4l2_pix_format

<table>
<thead>
<tr>
<th>__u32</th>
<th>width</th>
<th>Image width in pixels.</th>
</tr>
</thead>
<tbody>
<tr>
<td>__u32</td>
<td>height</td>
<td>Image height in pixels. If field is one of V4L2_FIELD_TOP, V4L2_FIELD_BOTTOM or V4L2_FIELD_ALTERNATE then height refers to the number of lines in the field, otherwise it refers to the number of lines in the frame (which is twice the field height for interlaced formats).</td>
</tr>
</tbody>
</table>

Applications set these fields to request an image size, drivers return the closest possible values. In case of planar formats the width and height applies to the largest plane. To avoid ambiguities drivers must return values rounded up to a multiple of the scale factor of any smaller planes. For example when the image format is YUV 4:2:0, width and height must be multiples of two.

For compressed formats that contain the resolution information encoded inside the stream, when fed to a stateful mem2mem decoder, the fields may be zero to rely on the decoder to detect the right values. For more details see Memory-to-Memory Stateful Video Decoder Interface and format descriptions.

For compressed formats on the CAPTURE side of a stateful mem2mem encoder, the fields must be zero, since the coded size is expected to be calculated internally by the encoder itself, based on the OUTPUT side. For more details see Memory-to-Memory Stateful Video Encoder Interface and format descriptions.

| __u32 | pixelformat | The pixel format or type of compression, set by the application. This is a little endian four character code. V4L2 defines standard RGB formats in RGB Formats, YUV formats in YUV Formats, and reserved codes in Reserved Image Formats |

Continued on next page
<table>
<thead>
<tr>
<th>__u32</th>
<th>field</th>
<th>Field order, from enum <code>v4l2_field</code>. Video images are typically interlaced. Applications can request to capture or output only the top or bottom field, or both fields interlaced or sequentially stored in one buffer or alternating in separate buffers. Drivers return the actual field order selected. For more details on fields see Field Order.</th>
</tr>
</thead>
<tbody>
<tr>
<td>__u32</td>
<td>bytesperline</td>
<td>Distance in bytes between the leftmost pixels in two adjacent lines. Both applications and drivers can set this field to request padding bytes at the end of each line. Drivers however may ignore the value requested by the application, returning width times bytes per pixel or a larger value required by the hardware. That implies applications can just set this field to zero to get a reasonable default. Video hardware may access padding bytes, therefore they must reside in inaccessible memory. Consider cases where padding bytes after the last line of an image cross a system page boundary. Input devices may write padding bytes, the value is undefined. Output devices ignore the contents of padding bytes. When the image format is planar the bytesperline value applies to the first plane and is divided by the same factor as the width field for the other planes. For example the Cb and Cr planes of a YUV 4:2:0 image have half as many padding bytes following each line as the Y plane. To avoid ambiguities drivers must return a bytesperline value rounded up to a multiple of the scale factor. For compressed formats the bytesperline value makes no sense. Applications and drivers must set this to 0 in that case.</td>
</tr>
<tr>
<td>__u32</td>
<td>sizeimage</td>
<td>Size in bytes of the buffer to hold a complete image, set by the driver. Usually this is bytesperline times height. When the image consists of variable length compressed data this is the number of bytes required by the codec to support the worst-case compression scenario. The driver will set the value for uncompressed images. Clients are allowed to set the sizeimage field for variable length compressed data flagged with <code>V4L2_FMT_FLAG_COMPRESSED</code> at <code>ioctl VID_IOC_ENUM_FMT</code>, but the driver may ignore it and set the value itself, or it may modify the provided value based on alignment requirements or minimum/maximum size requirements. If the client wants to leave this to the driver, then it should set sizeimage to 0.</td>
</tr>
</tbody>
</table>
### Table 38 – continued from previous page

| __u32 | colorspace | Image colorspace, from enum v4l2_colorspace. This information supplements the pixel format and must be set by the driver for capture streams and by the application for output streams, see Colorspaces. If the application sets the flag V4L2_PIX_FMT_FLAG_SET_CSC then the application can set this field for a capture stream to request a specific colorspace for the captured image data. If the driver cannot handle requested conversion, it will return another supported colorspace. The driver indicates that colorspace conversion is supported by setting the flag V4L2_FMT_FLAG_CSC_COLORSPACE in the corresponding struct v4l2_fmtdesc during enumeration. See Image Format Description Flags. |
| __u32 | priv | This field indicates whether the remaining fields of the struct v4l2_pix_format, also called the extended fields, are valid. When set to V4L2_PIX_FMT_PRIV_MAGIC, it indicates that the extended fields have been correctly initialized. When set to any other value it indicates that the extended fields contain undefined values. Applications that wish to use the pixel format extended fields must first ensure that the feature is supported by querying the device for the V4L2_CAP_EXT_PIX_FORMAT capability. If the capability isn’t set the pixel format extended fields are not supported and using the extended fields will lead to undefined results. To use the extended fields, applications must set the priv field to V4L2_PIX_FMT_PRIV_MAGIC, initialize all the extended fields and zero the unused bytes of the struct v4l2_format raw_data field. When the priv field isn’t set to V4L2_PIX_FMT_PRIV_MAGIC drivers must act as if all the extended fields were set to zero. On return drivers must set the priv field to V4L2_PIX_FMT_PRIV_MAGIC and all the extended fields to applicable values. |
| __u32 | flags | Flags set by the application or driver; see Format Flags. |

union { (anonymous) | Continued on next page |}
Table 38 – continued from previous page

| __u32  | ycbcr_enc | Y’CbCr encoding, from enum v4l2_ycbcr_encoding. This information supplements the colorspace and must be set by the driver for capture streams and by the application for output streams, see Colorspaces. If the application sets the flag V4L2_PIX_FMT_FLAG_SET_CSC then the application can set this field for a capture stream to request a specific Y’CbCr encoding for the captured image data. If the driver cannot handle requested conversion, it will return another supported encoding. This field is ignored for HSV pixelformats. The driver indicates that ycbcr_enc conversion is supported by setting the flag V4L2_FMT_FLAG_CSC_YCBCR_ENC in the corresponding struct v4l2_fmtdesc during enumeration. See Image Format Description Flags. |
| ____ | ____ | ____ |
| _u32  | hsv_enc | HSV encoding, from enum v4l2_hsv_encoding. This information supplements the colorspace and must be set by the driver for capture streams and by the application for output streams, see Colorspaces. If the application sets the flag V4L2_PIX_FMT_FLAG_SET_CSC then the application can set this field for a capture stream to request a specific HSV encoding for the captured image data. If the driver cannot handle requested conversion, it will return another supported encoding. This field is ignored for non-HSV pixelformats. The driver indicates that hsv_enc conversion is supported by setting the flag V4L2_FMT_FLAG_CSC_HSV_ENC in the corresponding struct v4l2_fmtdesc during enumeration. See Image Format Description Flags. |
| ____ | ____ | ____ |
| _u32  | quantization | Quantization range, from enum v4l2_quantization. This information supplements the colorspace and must be set by the driver for capture streams and by the application for output streams, see Colorspaces. If the application sets the flag V4L2_PIX_FMT_FLAG_SET_CSC then the application can set this field for a capture stream to request a specific quantization range for the captured image data. If the driver cannot handle requested conversion, it will return another supported quantization. The driver indicates that quantization conversion is supported by setting the flag V4L2_FMT_FLAG_CSC_QUANTIZATION in the corresponding struct v4l2_fmtdesc during enumeration. See Image Format Description Flags. |
| ____ | ____ | ____ |
### Table 38 - continued from previous page

<table>
<thead>
<tr>
<th>u32</th>
<th>xfer_func</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Transfer function, from enum <code>v4l2_xfer_func</code>. This information supplements the colorspace and must be set by the driver for capture streams and by the application for output streams, see Colors. If the application sets the flag <code>V4L2_PIX_FMT_FLAG_SET_CSC</code> then the application can set this field for a capture stream to request a specific transfer function for the captured image data. If the driver cannot handle requested conversion, it will return another supported transfer function. The driver indicates that xfer_func conversion is supported by setting the flag <code>V4L2_FMT_FLAG_CSC_XFER_FUNC</code> in the corresponding struct <code>v4l2_fmtdesc</code> during enumeration. See Image Format Description Flags.</td>
</tr>
</tbody>
</table>

### Table 39: Format Flags

| V4L2_PIX_FMT_FLAG_PREMUL_ALPHA | 0x00000001 | The color values are premultiplied by the alpha channel value. For example, if a light blue pixel with 50% transparency was described by RGBA values (128, 192, 255, 128), the same pixel described with premultiplied colors would be described by RGBA values (64, 96, 128, 128) |
| V4L2_PIX_FMT_FLAG_SET_CSC     | 0x00000002 | Set by the application. It is only used for capture and is ignored for output streams. If set, then request the device to do colorspace conversion from the received colorspace to the requested colorspace values. If the colorimetry field (colorspace, xfer_func, ycbcr_enc, hsv_enc or quantization) is set to *DEFAULT*, then that colorimetry setting will remain unchanged from what was received. So in order to change the quantization, only the quantization field shall be set to non default value (V4L2_QUANTIZATION_FULL_RANGE or V4L2_QUANTIZATION_LIM_RANGE) and all other colorimetry fields shall be set to *DEFAULT*. To check which conversions are supported by the hardware for the current pixel format, see Image Format Description Flags. |
3.2.2.2 Multi-planar format structures

The struct `v4l2_plane_pix_format` structures define size and layout for each of the planes in a multi-planar format. The struct `v4l2_pix_format_mplane` structure contains information common to all planes (such as image width and height) and an array of struct `v4l2_plane_pix_format` structures, describing all planes of that format.

### v4l2_plane_pix_format

<table>
<thead>
<tr>

#### 3.2.2.3 Standard Image Formats

In order to exchange images between drivers and applications, it is necessary to have standard image data formats which both sides will interpret the same way. V4L2 includes several such formats, and this section is intended to be an unambiguous specification of the standard image data formats in V4L2.

V4L2 drivers are not limited to these formats, however. Driver-specific formats are possible. In that case the application may depend on a codec to convert images to one of the standard formats when needed. But the data can still be stored and retrieved in the proprietary format. For example, a device may support a proprietary compressed format. Applications can still capture and save the data in the compressed format, saving much disk space, and later use a codec to convert the images to the X Windows screen format when the video is to be displayed.

Even so, ultimately, some standard formats are needed, so the V4L2 specification would not be complete without well-defined standard formats.
The V4L2 standard formats are mainly uncompressed formats. The pixels are always arranged in memory from left to right, and from top to bottom. The first byte of data in the image buffer is always for the leftmost pixel of the topmost row. Following that is the pixel immediately to its right, and so on until the end of the top row of pixels. Following the rightmost pixel of the row there may be zero or more bytes of padding to guarantee that each row of pixel data has a certain alignment. Following the pad bytes, if any, is data for the leftmost pixel of the second row from the top, and so on. The last row has just as many pad bytes after it as the other rows.

In V4L2 each format has an identifier which looks like PIX_FMT_XXX, defined in the `videodev2.h` header file. These identifiers represent four character (FourCC) codes which are also listed below, however they are not the same as those used in the Windows world.

For some formats, data is stored in separate, discontiguous memory buffers. Those formats are identified by a separate set of FourCC codes and are referred to as “multi-planar formats”. For example, a YUV422 frame is normally stored in one memory buffer, but it can also be placed in two or three separate buffers, with Y component in one buffer and CbCr components in another in the 2-planar version or with each component in its own buffer in the 3-planar case. Those sub-buffers are referred to as “planes”.

### 3.2.2.4 Indexed Format

In this format each pixel is represented by an 8 bit index into a 256 entry ARGB palette. It is intended for Video Output Overlays only. There are no ioctl to access the palette, this must be done with ioctl of the Linux framebuffer API.

### 3.2.2.5 RGB Formats

These formats encode each pixel as a triplet of RGB values. They are packed formats, meaning that the RGB values for one pixel are stored consecutively in memory and each pixel consumes an integer number of bytes. When the number of bits required to store a pixel is not aligned to a byte boundary, the data is padded with additional bits to fill the remaining byte.

The formats differ by the number of bits per RGB component (typically but not always the same for all components), the order of components in memory, and the presence of an alpha component or additional padding bits.

The usage and value of the alpha bits in formats that support them (named ARGB or a permutation thereof, collectively referred to as alpha formats) depend on the device type and hardware operation. Capture devices (including capture queues of mem-to-mem devices) fill the alpha component in memory. When the device captures an alpha channel the alpha component will have a meaningful value. Otherwise, when the device doesn’t capture an alpha channel but can set the alpha bit to a user-configurable value, the V4L2_CID_ALPHA_COMPONENT control is used to specify that alpha value, and the alpha component of all pixels will be set to the value specified by that control. Otherwise a corresponding format without an alpha component (XRGB or XBGR) must be used instead of an alpha format.
Output devices (including output queues of mem-to-mem devices and video output overlay devices) read the alpha component from memory. When the device processes the alpha channel the alpha component must be filled with meaningful values by applications. Otherwise a corresponding format without an alpha component (XRGB or XBGR) must be used instead of an alpha format.

Formats that contain padding bits are named XRGB (or a permutation thereof). The padding bits contain undefined values and must be ignored by applications, devices and drivers, for both Video Capture Interface and Video Output Interface devices.

Note:
- In all the tables that follow, bit 7 is the most significant bit in a byte.
- ‘r’, ‘g’ and ‘b’ denote bits of the red, green and blue components respectively. ‘a’ denotes bits of the alpha component (if supported by the format), and ‘x’ denotes padding bits.

Less Than 8 Bits Per Component

These formats store an RGB triplet in one, two or four bytes. They are named based on the order of the RGB components as seen in a 8-, 16- or 32-bit word, which is then stored in memory in little endian byte order (unless otherwise noted by the presence of bit 31 in the 4CC value), and on the number of bits for each component. For instance, the RGB565 format stores a pixel in a 16-bit word [15:0] laid out at as [R4 R3 R2 R1 R0 G5 G4 G3 G2 G1 G0 B4 B3 B2 B1 B0], and stored in memory in two bytes, [R4 R3 R2 R1 R0 G5 G4 G3] followed by [G2 G1 G0 B4 B3 B2 B1 B0].

Table 43: RGB Formats With Less Than 8 Bits Per Component
8 Bits Per Component

These formats store an RGB triplet in three or four bytes. They are named based on the order of the RGB components as stored in memory, and on the total number of bits per pixel. For instance, RGB24 format stores a pixel with \([R_7 \ R_6 \ R_5 \ R_4 \ R_3 \ R_2 \ R_1 \ R_0]\) in the first byte, \([G_7 \ G_6 \ G_5 \ G_4 \ G_3 \ G_2 \ G_1 \ G_0]\) in the second byte and \([B_7 \ B_6 \ B_5 \ B_4 \ B_3 \ B_2 \ B_1 \ B_0]\) in the third byte. This differs from the DRM format nomenclature that instead use the order of components as seen in a 24- or 32-bit little endian word.

Deprecated RGB Formats

Formats defined in Deprecated Packed RGB Image Formats are deprecated and must not be used by new drivers. They are documented here for reference. The meaning of their alpha bits (a) is ill-defined and they are interpreted as in either the corresponding ARGB or XRGB format, depending on the driver.

A test utility to determine which RGB formats a driver actually supports is available from the LinuxTV v4l-dvb repository. See https://linuxtv.org/repo/ for access instructions.
3.2.2.6 Raw Bayer Formats

Description

The raw Bayer formats are used by image sensors before much if any processing is performed on the image. The formats contain green, red and blue components, with alternating lines of red and green, and blue and green pixels in different orders. See also the Wikipedia article on Bayer filter.

\[ \text{V4L2_PIX_FMT_SRGGB8 ('RGGB'), V4L2_PIX_FMT_SGRBG8 ('GRBG'),} \]
\[ \text{V4L2_PIX_FMT_SGBRG8 ('GBRG'), V4L2_PIX_FMT_SBGGR8 ('BA81'),} \]

8-bit Bayer formats

Description

These four pixel formats are raw sRGB / Bayer formats with 8 bits per sample. Each sample is stored in a byte. Each n-pixel row contains n/2 green samples and n/2 blue or red samples, with alternating red and blue rows. They are conventionally described as GRGR... BGBG..., RGRG... GBGB..., etc. Below is an example of a small V4L2_PIX_FMT_SBGGR8 image:

**Byte Order.** Each cell is one byte.

| start + 0: | B₀₀ | G₀₁ | B₀₂ | G₀₃ |
| start + 4: | G₁₀ | R₁₁ | G₁₂ | R₁₃ |
| start + 8: | B₂₀ | G₂₁ | B₂₂ | G₂₃ |
| start + 12: | G₃₀ | R₃₁ | G₃₂ | R₃₃ |

\[ \text{V4L2_PIX_FMT_SRGGB10 ('RG10'), V4L2_PIX_FMT_SGRBG10 ('BA10'),} \]
\[ \text{V4L2_PIX_FMT_SGBRG10 ('GB10'), V4L2_PIX_FMT_SBGGR10 ('BG10'),} \]

V4L2_PIX_FMT_SGRBG10 V4L2_PIX_FMT_SGBRG10 V4L2_PIX_FMT_SBGGR10 10-bit Bayer formats expanded to 16 bits

Description

These four pixel formats are raw sRGB / Bayer formats with 10 bits per sample. Each sample is stored in a 16-bit word, with 6 unused high bits filled with zeros. Each n-pixel row contains n/2 green samples and n/2 blue or red samples, with alternating red and blue rows. Bytes are stored in memory in little endian order. They are conventionally described as GRGR... BGBG..., RGRG... GBGB..., etc. Below is an example of one of these formats:

**Byte Order.** Each cell is one byte, the 6 most significant bits in the high bytes are 0.

| start + 0: | B₀₀low | B₀₀high | G₀₁low | G₀₁high | B₀₂low | B₀₂high | G₀₃low | G₀₃high |
| start + 8: | G₁₀low | G₁₀high | R₁₁low | R₁₁high | G₁₂low | G₁₂high | R₁₃low | R₁₃high |
| start + 16: | B₂₀low | B₂₀high | G₂₁low | G₂₁high | B₂₂low | B₂₂high | G₂₃low | G₂₃high |
| start + 24: | G₃₀low | G₃₀high | R₃₁low | R₃₁high | G₃₂low | G₃₂high | R₃₃low | R₃₃high |

V4L2_PIX_FMT_SRGBG10P V4L2_PIX_FMT_SGRBG10P V4L2_PIX_FMT_SBGGR10P 10-bit packed Bayer formats

Description

These four pixel formats are packed raw sRGB / Bayer formats with 10 bits per sample. Every four consecutive samples are packed into 5 bytes. Each of the first 4 bytes contain the 8 high order bits of the pixels, and the 5th byte contains the 2 least significant bits of each pixel, in the same order.

Each n-pixel row contains n/2 green samples and n/2 blue or red samples, with alternating green-red and green-blue rows. They are conventionally described as GRGR... BGBG..., RGRG... GBGB..., etc. Below is an example of a small V4L2_PIX_FMT_SBGGR10P image:

**Byte Order.** Each cell is one byte.

V4L2_PIX_FMT_SGRBG10DPCM8 V4L2_PIX_FMT_SGBRG10DPCM8 10-bit Bayer formats compressed to 8 bits

Description

These four pixel formats are raw sRGB / Bayer formats with 10 bits per colour compressed to 8 bits each, using DPCM compression. DPCM, differential pulse-code modulation, is lossy. Each colour component consumes 8 bits of memory. In other respects this format is similar to V4L2_PIX_FMT_SRGGGB10 (‘RG10’), V4L2_PIX_FMT_SGRBG10 (‘BA10’), V4L2_PIX_FMT_SGBRG10 (‘GB10’), V4L2_PIX_FMT_SBGGR10 (‘BG10’).

V4L2_PIX_FMT_IPU3_SBGGR10 (‘ip3b’), V4L2_PIX_FMT_IPU3_SGBRG10 (‘ip3g’),
V4L2_PIX_FMT_IPU3_SGRBG10 (‘ip3G’), V4L2_PIX_FMT_IPU3_SRGGGB10 (‘ip3r’)

10-bit Bayer formats

Description

These four pixel formats are used by Intel IPU3 driver, they are raw sRGB / Bayer formats with 10 bits per sample with every 25 pixels packed to 32 bytes leaving 6 most significant bits padding in the last byte. The format is little endian.

In other respects this format is similar to V4L2_PIX_FMT_SRGGGB10 (‘RG10’), V4L2_PIX_FMT_SGRBG10 (‘BA10’), V4L2_PIX_FMT_SGBRG10 (‘GB10’), V4L2_PIX_FMT_SBGGR10 (‘BG10’). Below is an example of a small image in V4L2_PIX_FMT_IPU3_SBGGR10 format.

V4L2_PIX_FMT_SRGGB12 ('RG12'), V4L2_PIX_FMT_SGRBG12 ('BA12'), V4L2_PIX_FMT_SGBRG12 ('GB12'), V4L2_PIX_FMT_SBGGR12 ('BG12'),

V4L2_PIX_FMT_SGRBG12 V4L2_PIX_FMT_SGBRG12 V4L2_PIX_FMT_SBGGR12 12-bit Bayer formats expanded to 16 bits

Description

These four pixel formats are raw sRGB / Bayer formats with 12 bits per colour. Each colour component is stored in a 16-bit word, with 4 unused high bits filled with zeros. Each n-pixel row contains n/2 green samples and n/2 blue or red samples, with alternating red and blue rows. Bytes are stored in memory in little endian order. They are conventionally described as GRGR..., RGRG... GBGB..., etc. Below is an example of a small V4L2_PIX_FMT_SBGGR12 image:

Byte Order. Each cell is one byte, the 4 most significant bits in the high bytes are 0.
12-bit packed Bayer formats

Description

These four pixel formats are packed raw sRGB / Bayer formats with 12 bits per colour. Every two consecutive samples are packed into three bytes. Each of the first two bytes contain the 8 high order bits of the pixels, and the third byte contains the four least significant bits of each pixel, in the same order.

Each n-pixel row contains n/2 green samples and n/2 blue or red samples, with alternating green-red and green-blue rows. They are conventionally described as GRGR... BGBG..., RGRG... GBGB..., etc. Below is an example of a small V4L2_PIX_FMT_SBGGR12P image:

3.2.2.7 YUV Formats

YUV is the format native to TV broadcast and composite video signals. It separates the brightness information (Y) from the color information (U and V or Cb and Cr). The color information consists of red and blue color difference signals, this way the green component can be reconstructed by subtracting from the brightness component. See Colorspaces for conversion examples. YUV was chosen because early television would only transmit brightness information. To add color in a way compatible with existing receivers a new signal carrier was added to transmit the color difference signals.

Subsampling

YUV formats commonly encode images with a lower resolution for the chroma components than for the luma component. This compression technique, taking advantage of the human eye being more sensitive to luminance than color differences, is called chroma subsampling.

While many combinations of subsampling factors in the horizontal and vertical direction are possible, common factors are 1 (no subsampling), 2 and 4, with horizontal subsampling always larger than or equal to vertical subsampling. Common combinations are named as follows.

- 4:4:4: No subsampling
- 4:2:2: Horizontal subsampling by 2, no vertical subsampling
- 4:2:0: Horizontal subsampling by 2, vertical subsampling by 2
- 4:1:1: Horizontal subsampling by 4, no vertical subsampling
- 4:1:0: Horizontal subsampling by 4, vertical subsampling by 4

Subsampling the chroma component effectively creates chroma values that can be located in different spatial locations:

- The subsampled chroma value may be calculated by simply averaging the chroma value of two consecutive pixels. It effectively models the chroma of a pixel sited between the two original pixels. This is referred to as centered or interstitially sited chroma.
- The other option is to subsample chroma values in a way that place them in the same spatial sites as the pixels. This may be performed by skipping every other chroma sample (creating aliasing artifacts), or with filters using an odd number of taps. This is referred to as co-sited chroma.

The following examples show different combination of chroma sitting in a 4x4 image.

| Table 47: 4:2:2 subsampling, interstitially sited |
|-----------------|-----------------|-----------------|-----------------|
| 0               | 1               | 2               | 3               |
| 0 Y C Y         | Y C Y           | Y C Y           |
| 1 Y C Y         | Y C Y           |
| 2 Y C Y         | Y C Y           |
| 3 Y C Y         | Y C Y           |
### Packed YUV formats

Similarly to the packed RGB formats, the packed YUV formats store the Y, Cb and Cr components consecutively in memory. They may apply subsampling to the chroma components and thus differ in how they interlace the three components.

<tr>
<td>3</td>
<td>Y</td>
<td>Y</td>
<td>Y</td>
<td>Y</td>
</tr>
</tbody>
</table>

#### Note:

- In all the tables that follow, bit 7 is the most significant bit in a byte.
- ‘Y’, ‘Cb’ and ‘Cr’ denote bits of the luma, blue chroma (also known as ‘U’) and red chroma (also known as ‘V’) components respectively. ‘A’ denotes bits of the alpha component (if supported by the format), and ‘X’ denotes padding bits.
4:4:4 Subsampling

These formats do not subsample the chroma components and store each pixels as a full triplet of Y, Cb and Cr values.

The next table lists the packed YUV 4:4:4 formats with less than 8 bits per component. They are named based on the order of the Y, Cb and Cr components as seen in a 16-bit word, which is then stored in memory in little endian byte order, and on the number of bits for each component. For instance the YUV565 format stores a pixel in a 16-bit word [15:0] laid out at as [Y'4:0 Cb5:0 Cr4:0], and stored in memory in two bytes, [Cb2:0 Cr4:0] followed by [Y'4:0 Cb5:3].

Table 51: Packed YUV 4:4:4 Image Formats (less than 8bpc)

<table>
<thead>
<tr>
<th>Identifier</th>
<th>Code</th>
<th>Byte 0 in memory</th>
<th>Byte 1</th>
</tr>
</thead>
<tbody>
<tr>
<td>V4L2_PIX_FMT_YUV444</td>
<td>'Y444'</td>
<td>Cb3 Cb2 Cb1 Cb0 Cr3 Cr2 Cr1 Cr0</td>
<td>a3 a2 a1 a0 Y3 Y2 Y1 Y0</td>
</tr>
<tr>
<td>V4L2_PIX_FMT_YUV555</td>
<td>'YUVO'</td>
<td>Cb2 Cb1 Cb0 Cr3 Cr2 Cr1 Cr0 a</td>
<td>Y4 Y3 Y2 Y1 Y0 Cb4 Cb3</td>
</tr>
<tr>
<td>V4L2_PIX_FMT_YUV565</td>
<td>'YUVP'</td>
<td>Cb2 Cb1 Cb0 Cr3 Cr2 Cr1 Cr0 Y4</td>
<td>Y3 Y2 Y1 Y0 Cb5 Cb4 Cb3</td>
</tr>
</tbody>
</table>

Note: For the YUV444 and YUV555 formats, the value of alpha bits is undefined when reading from the driver, ignored when writing to the driver, except when alpha blending has been negotiated for a Video Overlay or Video Output Overlay.

The next table lists the packed YUV 4:4:4 formats with 8 bits per component. They are named based on the order of the Y, Cb and Cr components as stored in memory, and on the total number of bits per pixel. For instance, the VUYX32 format stores a pixel with Cr7:0 in the first byte, Cb7:0 in the second byte and Y'7:0 in the third byte.

Table 52: Packed YUV Image Formats (8bpc)

<table>
<thead>
<tr>
<th>Identifier</th>
<th>Code</th>
<th>Byte 0</th>
<th>Byte 1</th>
<th>Byte 2</th>
<th>Byte 3</th>
</tr>
</thead>
<tbody>
<tr>
<td>V4L2_PIX_FMT_YUV32</td>

<tr>
<td>V4L2_PIX_FMT_YUV24</td>
<td>'YUV3'</td>
<td>Y'7:0</td>
<td>Cb7:0</td>
<td>Cr7:0</td>
<td></td>
</tr>
</tbody>
</table>

Note:

- The alpha component is expected to contain a meaningful value that can be used by drivers and applications.
- The padding bits contain undefined values that must be ignored by all applications and drivers.
4:2:2 Subsampling

These formats, commonly referred to as YUYV or YUY2, subsample the chroma components horizontally by 2, storing 2 pixels in 4 bytes.

**Table 53: Packed YUV 4:2:2 Formats**

<td>Y₂</td>
<td>Cr₄</td>
<td>Y₃</td>
<td>Y₄</td>
<td>Y₅</td>
<td>Y₆</td>
<td>Y₇</td>
</tr>
</tbody>
</table>

**Note:** Do not confuse V4L2_PIX_FMT_Y41P with V4L2_PIX_FMT_YUV411P. Y41P is derived from "YUV 4:1:1 packed", while YUV411P stands for "YUV 4:1:1 planar".

**Color Sample Location:** Chroma samples are *interstitially sited* horizontally.

Planar YUV formats

Planar formats split luma and chroma data in separate memory regions. They exist in two variants:

- Semi-planar formats use two planes. The first plane is the luma plane and stores the Y components. The second plane is the chroma plane and stores the Cb and Cr components interleaved.
- Fully planar formats use three planes to store the Y, Cb and Cr components separately.

Within a plane, components are stored in pixel order, which may be linear or tiled. Padding may be supported at the end of the lines, and the line stride of the chroma planes may be constrained by the line stride of the luma plane.

Some planar formats allow planes to be placed in independent memory locations. They are identified by an ‘M’ suffix in their name (such as in V4L2_PIX_FMT_NV12M). Those formats are intended to be used only in drivers and applications that support the multi-planar API, described
in Single- and multi-planar APIs. Unless explicitly documented as supporting non-contiguous planes, formats require the planes to follow each other immediately in memory.

**Semi-Planar YUV Formats**

These formats are commonly referred to as NV formats (NV12, NV16, ...). They use two planes, and store the luma components in the first plane and the chroma components in the second plane. The Cb and Cr components are interleaved in the chroma plane, with Cb and Cr always stored in pairs. The chroma order is exposed as different formats.

For memory contiguous formats, the number of padding pixels at the end of the chroma lines is identical to the padding of the luma lines. Without horizontal subsampling, the chroma line stride (in bytes) is thus equal to twice the luma line stride. With horizontal subsampling by 2, the chroma line stride is equal to the luma line stride. Vertical subsampling doesn’t affect the line stride.

For non-contiguous formats, no constraints are enforced by the format on the relationship between the luma and chroma line padding and stride.

All components are stored with the same number of bits per component.

**Table 55: Overview of Semi-Planar YUV Formats**

**Color Sample Location:** Chroma samples are *interstitially sited* horizontally.

1. Order of chroma samples in the second plane
2. Indicates if planes have to be contiguous in memory or can be disjoint
3. Macroblock size in pixels
NV12, NV21, NV12M and NV21M

Semi-planar YUV 4:2:0 formats. The chroma plane is subsampled by 2 in each direction. Chroma lines contain half the number of pixels and the same number of bytes as luma lines, and the chroma plane contains half the number of lines of the luma plane.

NV12MT and MV12MT_16X16

Semi-planar YUV 4:2:0 formats, using macroblock tiling. The chroma plane is subsampled by 2 in each direction. Chroma lines contain half the number of pixels and the same number of bytes as luma lines, and the chroma plane contains half the number of lines of the luma plane.

V4L2_PIX_FMT_NV12MT_16X16 stores pixel in 2D 16x16 macroblocks, and stores macroblocks linearly in memory. The line stride and image height must be aligned to a multiple of 16. The layouts of the luma and chroma planes are identical.

V4L2_PIX_FMT_NV12MT stores pixels in 2D 64x32 macroblocks, and stores 2x2 groups of macroblocks in Z-order in memory, alternating Z and mirrored Z shapes horizontally. The line stride must be a multiple of 128 pixels to ensure an integer number of Z shapes. The image height must be a multiple of 32 pixels. If the vertical resolution is an odd number of macroblocks, the last row of macroblocks is stored in linear order. The layouts of the luma and chroma planes are identical.

Fig. 4: V4L2_PIX_FMT_NV12MT macroblock Z shape memory layout
Semi-planar YUV 4:2:2 formats. The chroma plane is subsampled by 2 in the horizontal direction. Chroma lines contain half the number of pixels and the same number of bytes as luma lines, and the chroma plane contains the same number of lines as the luma plane.

**Fully Planar YUV Formats**

These formats store the Y, Cb and Cr components in three separate planes. The luma plane comes first, and the order of the two chroma planes varies between formats. The two chroma planes always use the same subsampling.

For memory contiguous formats, the number of padding pixels at the end of the chroma lines is identical to the padding of the luma lines. The chroma line stride (in bytes) is thus equal to the luma line stride divided by the horizontal subsampling factor. Vertical subsampling doesn’t affect the line stride.

For non-contiguous formats, no constraints are enforced by the format on the relationship between the luma and chroma line padding and stride.

All components are stored with the same number of bits per component.

Luma-Only Formats

This family of formats only store the luma component of a Y’CbCr image. They are often referred to as greyscale formats.

Note:

- In all the tables that follow, bit 7 is the most significant bit in a byte.
- Formats are described with the minimum number of pixels needed to create a byte-aligned repeating pattern. ... indicates repetition of the pattern.
- Y’x[9:2] denotes bits 9 to 2 of the Y’ value for pixel at column x.
- 0 denotes padding bits set to 0.
### Table 69: Luma-Only Image Formats

<td>'Y16'</td>
<td>Y_0[15:8]</td>
<td>Y_0[7:0]</td>
<td>...</td>
<td>...</td>
<td>...</td>
</tr>
</tbody>
</table>

**Note:** For the Y16 and Y16_BE formats, the actual sampling precision may be lower than 16 bits. For example, 10 bits per pixel uses values in the range 0 to 1023.

### V4L2_PIX_FMT_Y8I ('Y8I')

Interleaved grey-scale image, e.g. from a stereo-pair

**Description**

This is a grey-scale image with a depth of 8 bits per pixel, but with pixels from 2 sources interleaved. Each pixel is stored in a 16-bit word. E.g. the R200 RealSense camera stores pixel from the left sensor in lower and from the right sensor in the higher 8 bits.

**Byte Order.** Each cell is one byte.

```
start + 0:  Y'00left  Y'00right  Y'01left  Y'01right  Y'02left  Y'02right  Y'03left  Y'03right
start + 8:  Y'10left  Y'10right  Y'11left  Y'11right  Y'12left  Y'12right  Y'13left  Y'13right
start + 16: Y'20left  Y'20right  Y'21left  Y'21right  Y'22left  Y'22right  Y'23left  Y'23right
start + 24: Y'30left  Y'30right  Y'31left  Y'31right  Y'32left  Y'32right  Y'33left  Y'33right
```

### V4L2_PIX_FMT_Y12I ('Y12I')

Interleaved grey-scale image, e.g. from a stereo-pair
**Description**

This is a grey-scale image with a depth of 12 bits per pixel, but with pixels from 2 sources interleaved and bit-packed. Each pixel is stored in a 24-bit word in the little-endian order. On a little-endian machine these pixels can be deinterlaced using

```c
__u8 *buf;
left0 = 0xfff & *__u16 *buf;
right0 = *__u16 *(buf + 1) >> 4;
```

**Bit-packed representation.** pixels cross the byte boundary and have a ratio of 3 bytes for each interleaved pixel.

![Y'0left[7:0] Y'0right[3:0] Y'0left[11:8] Y'0right[11:4]]

**V4L2_PIX_FMT_UV8 ('UV8')**

UV plane interleaved

**Description**

In this format there is no Y plane, Only CbCr plane. ie (UV interleaved)

**Byte Order.** Each cell is one byte.

**V4L2_PIX_FMT_M420 ('M420')**

Format with ½ horizontal and vertical chroma resolution, also known as YUV 4:2:0. Hybrid plane line-interleaved layout.

**Description**

M420 is a YUV format with ½ horizontal and vertical chroma subsampling (YUV 4:2:0). Pixels are organized as interleaved luma and chroma planes. Two lines of luma data are followed by one line of chroma data.

The luma plane has one byte per pixel. The chroma plane contains interleaved CbCr pixels subsampled by ½ in the horizontal and vertical directions. Each CbCr pair belongs to four pixels. For example, Cb0/Cr0 belongs to Y'00, Y'01, Y'10, Y'11.

All line lengths are identical: if the Y lines include pad bytes so do the CbCr lines.

**Byte Order.** Each cell is one byte.
3.2.8 HSV Formats

These formats store the color information of the image in a geometrical representation. The colors are mapped into a cylinder, where the angle is the HUE, the height is the VALUE and the distance to the center is the SATURATION. This is a very useful format for image segmentation algorithms.

**Packed HSV formats**

**Description**

The *hue* (h) is measured in degrees, the equivalence between degrees and LSBs depends on the hsv-encoding used, see *Colorsspaces*. The *saturation* (s) and the *value* (v) are measured in percentage of the cylinder: 0 being the smallest value and 255 the maximum.

The values are packed in 24 or 32 bit formats.

**Table 70: Packed HSV Image Formats**

Bit 7 is the most significant bit.

### 3.2.9 Depth Formats

Depth data provides distance to points, mapped onto the image plane

**V4L2_PIX_FMT_INZI ('INZI')**

Infrared 10-bit linked with Depth 16-bit images
Description

Proprietary multi-planar format used by Intel SR300 Depth cameras, comprise of Infrared image followed by Depth data. The pixel definition is 32-bpp, with the Depth and Infrared Data split into separate continuous planes of identical dimensions.

The first plane - Infrared data - is stored according to V4L2_PIX_FMT_Y10 greyscale format. Each pixel is 16-bit cell, with actual data stored in the 10 LSBs with values in range 0 to 1023. The six remaining MSBs are padded with zeros.

The second plane provides 16-bit per-pixel Depth data arranged in V4L2_PIX_FMT_Z16 format.

Frame Structure. Each cell is a 16-bit word with more significant data stored at higher memory address (byte order is little-endian).

V4L2_PIX_FMT_Z16 ('Z16 ')

16-bit depth data with distance values at each pixel

Description

This is a 16-bit format, representing depth data. Each pixel is a distance to the respective point in the image coordinates. Distance unit can vary and has to be negotiated with the device separately. Each pixel is stored in a 16-bit word in the little endian byte order.

Byte Order. Each cell is one byte.
V4L2_PIX_FMT_CN44 (‘CNF4’)

Depth sensor confidence information as a 4 bits per pixel packed array

**Description**

Proprietary format used by Intel RealSense Depth cameras containing depth confidence information in range 0-15 with 0 indicating that the sensor was unable to resolve any signal and 15 indicating maximum level of confidence for the specific sensor (actual error margins might change from sensor to sensor).

Every two consecutive pixels are packed into a single byte. Bits 0-3 of byte n refer to confidence value of depth pixel 2*n, bits 4-7 to confidence value of depth pixel 2*n+1.

**Bit-packed representation.**

\[
\begin{array}{c|c}
Y_01[3:0] & Y_00[3:0] \\
Y_03[3:0] & Y_02[3:0]
\end{array}
\]

### 3.2.2.11 SDR Formats

These formats are used for *SDR* interface only.

**V4L2_SDR_FMT_CU8 (‘CU08’)**

Complex unsigned 8-bit IQ sample

**Description**

This format contains sequence of complex number samples. Each complex number consist two parts, called In-phase and Quadrature (IQ). Both I and Q are represented as a 8 bit unsigned number. I value comes first and Q value after that.

**Byte Order.** Each cell is one byte.

\[
\begin{array}{c}
\text{start + 0:} & I_0 \\
\text{start + 1:} & Q_0 \\
\end{array}
\]

**V4L2_SDR_FMT_CU16LE (‘CU16’)**

Complex unsigned 16-bit little endian IQ sample

**Description**

This format contains sequence of complex number samples. Each complex number consist two parts, called In-phase and Quadrature (IQ). Both I and Q are represented as a 16 bit unsigned little endian number. I value comes first and Q value after that.

**Byte Order.** Each cell is one byte.

\[
\begin{array}{c}
\text{start + 0:} & I_0^{[7:0]} \quad I_0^{[15:8]} \\
\text{start + 2:} & Q_0^{[7:0]} \quad Q_0^{[15:8]} \\
\end{array}
\]
V4L2_SDR_FMT_CS8 (‘CS08’)

Complex signed 8-bit IQ sample

Description

This format contains sequence of complex number samples. Each complex number consist two parts, called In-phase and Quadrature (IQ). Both I and Q are represented as a 8 bit signed number. I value comes first and Q value after that.

Byte Order. Each cell is one byte.

<table>
<thead>
<tr>

<th>I₀[0]</th>
</tr>
</thead>
<tbody>
<tr>
<td>start + 1:</td>
<td>Q₀[0]</td>
</tr>
</tbody>
</table>

V4L2_SDR_FMT_CS14LE (‘CS14’)

Complex signed 14-bit little endian IQ sample

Description

This format contains sequence of complex number samples. Each complex number consist two parts, called In-phase and Quadrature (IQ). Both I and Q are represented as a 14 bit signed little endian number. I value comes first and Q value after that. 14 bit value is stored in 16 bit space with unused high bits padded with 0.

Byte Order. Each cell is one byte.

<table>

V4L2_SDR_FMT_RU12LE (‘RU12’)

Real unsigned 12-bit little endian sample

Description

This format contains sequence of real number samples. Each sample is represented as a 12 bit unsigned little endian number. Sample is stored in 16 bit space with unused high bits padded with 0.

Byte Order. Each cell is one byte.

| start + 0: | I₀[0][7:0] | I₀[0][11:8] |
V4L2_SDR_FMT_PCU16BE (‘PC16’)

Planar complex unsigned 16-bit big endian IQ sample

Description

This format contains a sequence of complex number samples. Each complex number consists of two parts called In-phase and Quadrature (IQ). Both I and Q are represented as a 16 bit unsigned big endian number stored in 32 bit space. The remaining unused bits within the 32 bit space will be padded with 0. I value starts first and Q value starts at an offset equalling half of the buffer size (i.e.) offset = buffersize/2. Out of the 16 bits, bit 15:2 (14 bit) is data and bit 1:0 (2 bit) can be any value.

Byte Order. Each cell is one byte.

<table>

### 3.2.2.13 Metadata Formats

These formats are used for the *Metadata Interface* interface only.

**V4L2_META_FMT_D4XX (‘D4XX’)**

Intel D4xx UVC Cameras Metadata

**Description**

Intel D4xx (D435 and other) cameras include per-frame metadata in their UVC payload headers, following the Microsoft(R) UVC extension proposal [1]. That means, that the private D4XX metadata, following the standard UVC header, is organised in blocks. D4XX cameras implement several standard block types, proposed by Microsoft, and several proprietary ones. Supported standard metadata types are MetadataId_CaptureStats (ID 3), MetadataId_CameraExtrinsics (ID 4), and MetadataId_CameraIntrinsics (ID 5). For their description see [1]. This document describes proprietary metadata types, used by D4xx cameras.

V4L2_META_FMT_D4XX buffers follow the metadata buffer layout of V4L2_META_FMT_UVC with the only difference, that it also includes proprietary payload header data. D4xx cameras use bulk transfers and only send one payload per frame, therefore their headers cannot be larger than 255 bytes.

Below are proprietary Microsoft style metadata types, used by D4xx cameras, where all fields are in little endian order:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Depth Control</td>
<td></td>
</tr>
<tr>
<td>_u32 ID</td>
<td>0x800000000000</td>

<td>Preset selector value, default: 0, unless changed by the user</td>
</tr>
<tr>
<td>_u32 Laser mode</td>
<td>0: off, 1: on</td>
</tr>
</tbody>
</table>

**Capture Timing**

| _u32 ID | 0x80000001 |
| _u32 Size | Size in bytes (currently 40) |
| _u32 Version | Version of this structure. The documentation herein corresponds to version xxx. The version number will be incremented when new fields are added. |
| _u32 Flags | A bitmask of flags: see [3] below |
| _u32 Frame counter | Monotonically increasing counter |
| _u32 Optical time | Time in microseconds from the beginning of a frame till its middle |
| _u32 Readout time | Time, used to read out a frame in microseconds |
| _u32 Exposure time | Frame exposure time in microseconds |
| _u32 Frame interval | In microseconds = 1000000 / framerate |
| _u32 Pipe latency | Time in microseconds from start of frame to data in USB buffer |

**Configuration**

| _u32 ID | 0x80000002 |
| _u32 Size | Size in bytes (currently 40) |
| _u32 Version | Version of this structure. The documentation herein corresponds to version xxx. The version number will be incremented when new fields are added. |
| _u32 Flags | A bitmask of flags: see [4] below |
| _u8 Hardware type | Camera hardware version [5] |
| _u8 SKU ID | Camera hardware configuration [6] |
| _u32 Cookie | Internal synchronisation |
| _u16 Format | Image format code [7] |
| _u16 Width | Width in pixels |
| _u16 Height | Height in pixels |
| _u16 Framerate | Requested frame rate per second |
| _u16 Trigger | Byte 0: bit 0: depth and RGB are synchronised, bit 1: external trigger |

[2] Depth Control flags specify which fields are valid:
0x00000001 Gain
0x00000002 Exposure
0x00000004 Laser power
0x00000008 AE mode
0x00000010 Exposure priority
0x00000020 AE ROI
0x00000040 Preset

[3] Capture Timing flags specify which fields are valid:

0x00000001 Frame counter
0x00000002 Optical time
0x00000004 Readout time
0x00000008 Exposure time
0x00000010 Frame interval
0x00000020 Pipe latency

[4] Configuration flags specify which fields are valid:

0x00000001 Hardware type
0x00000002 SKU ID
0x00000004 Cookie
0x00000008 Format
0x00000010 Width
0x00000020 Height
0x00000040 Frame rate
0x00000080 Trigger
0x00000100 Cal count

[5] Camera model:

0 DS5
1 IVCAM2

[6] 8-bit camera hardware configuration bitfield:

[1:0] depthCamera
  00: no depth
  01: standard depth
  10: wide depth
  11: reserved
[2] depthIsActive - has a laser projector
[3] RGB presence
[4] Inertial Measurement Unit (IMU) presence
[5] projectorType
  0: HPTG
  1: Princeton
[6] 0: a projector, 1: an LED
[7] reserved

[7] Image format codes per video streaming interface:

Depth:

1 Z16
2 Z
Left sensor:

1 Y8
2 UYVY
3 R8L8
4 Calibration
5 W10

Fish Eye sensor:

1 RAW8

V4L2_META_FMT_IPU3_PARAMS (‘ip3p’), V4L2_META_FMT_IPU3_3A (‘ip3s’)

3A statistics

The IPU3 ImgU 3A statistics accelerators collect different statistics over an input Bayer frame. Those statistics are obtained from the “ipu3-imgu [01] 3a stat” metadata capture video nodes, using the v4l2_meta_format interface. They are formatted as described by the ipu3_uapi_stats_3a structure.

The statistics collected are AWB (Auto-white balance) RGBS (Red, Green, Blue and Saturation measure) cells, AWB filter response, AF (Auto-focus) filter response, and AE (Auto-exposure) histogram.

The struct ipu3_uapi_4a_config saves all configurable parameters.

Pipe i struct ipu3_uapi_stats_3a {
    struct ipu3_uapi_awb_raw_buffer awb_raw_buffer;
    struct ipu3_uapi_ae_raw_buffer_aligned ae_raw_buffer[IPU3_UAPI_MAX_STRIPES];
    struct ipu3_uapi_af_raw_buffer af_raw_buffer;
    struct ipu3_uapi_awb_fr_raw_buffer awb_fr_raw_buffer;
    struct ipu3_uapi_4a_config stats_4a_config;
    __u32 ae_join_buffers;
    __u8 padding[28];
    struct ipu3_uapi_stats_3a_bubble_info_per_stripe stats_3a_bubble_per_stripe;
    struct ipu3_uapi_ff_status stats_3a_status;
};

Pipeline parameters

The pipeline parameters are passed to the “ipu3-imgu [01] parameters” metadata output video nodes, using the v4l2_meta_format interface. They are formatted as described by the ipu3_uapi_params structure.

Both 3A statistics and pipeline parameters described here are closely tied to the underlying camera sub-system (CSS) APIs. They are usually consumed and produced by dedicated user space libraries that comprise the important tuning tools, thus freeing the developers from being bothered with the low level hardware and algorithm details.

struct ipu3_uapi_params {

};

Intel IPU3 ImgU uAPI data types

struct ipu3_uapi_grid_config
Grid plane config

Definition

struct ipu3_uapi_grid_config {
    __u8 width;
    __u8 height;
    __u16 block_width_log2:3;
    __u16 block_height_log2:3;
    __u16 height_per_slice:8;
    __u16 x_start;
    __u16 y_start;
    __u16 x_end;
    __u16 y_end;
};

Members

width Grid horizontal dimensions, in number of grid blocks (cells).

height Grid vertical dimensions, in number of grid cells.

block_width_log2 Log2 of the width of each cell in pixels. for \(2^3, 2^4, 2^5, 2^6, 2^7\), values \([3, 7]\).

block_height_log2 Log2 of the height of each cell in pixels. for \(2^3, 2^4, 2^5, 2^6, 2^7\), values \([3, 7]\).

height_per_slice The number of blocks in vertical axis per slice. Default 2.

x_start X value of top left corner of Region of Interest (ROI).

y_start Y value of top left corner of ROI

x_end X value of bottom right corner of ROI

y_end Y value of bottom right corner of ROI

3.2. Part I - Video for Linux API
Description
Due to the size of total amount of collected data, most statistics create a grid-based output, and the data is then divided into “slices”.

**struct ipu3_uapi_awb_raw_buffer**

AWB raw buffer

**Definition**

```c
struct ipu3_uapi_awb_raw_buffer {
    __u8 meta_data[IPU3_UAPI_AWB_MAX_BUFFER_SIZE];
};
```

**Members**

- **meta_data** buffer to hold auto white balance meta data which is the average values for each color channel.

**struct ipu3_uapi_awb_config_s**

AWB config

**Definition**

```c
struct ipu3_uapi_awb_config_s {
    __u16 rgbs_thr_gr;
    __u16 rgbs_thr_r;
    __u16 rgbs_thr_gb;
    __u16 rgbs_thr_b;
    struct ipu3_uapi_grid_config grid;
};
```

**Members**

- **rgbs_thr_gr** gr threshold value.
- **rgbs_thr_r** Red threshold value.
- **rgbs_thr_gb** gb threshold value.
- **rgbs_thr_b** Blue threshold value.

**grid ipu3_uapi_grid_config**, the default grid resolution is 16x16 cells.

**Description**

The threshold is a saturation measure range [0, 8191], 8191 is default. Values over threshold may be optionally rejected for averaging.

**struct ipu3_uapi_awb_config**

AWB config wrapper

**Definition**

```c
struct ipu3_uapi_awb_config {
    struct ipu3_uapi_awb_config_s config;
};
```

**Members**

- **config** config for auto white balance as defined by **ipu3_uapi_awb_config_s**
struct ipu3_uapi_ae_raw_buffer

   AE global weighted histogram

Definition

struct ipu3_uapi_ae_raw_buffer {
   __u32 vals[IPU3_UAPI_AE_BINS * IPU3_UAPI_AE_COLORS];
};

Members

vals  Sum of IPU3_UAPI_AE_COLORS in cell

Description

Each histogram contains IPU3_UAPI_AE_BINS bins. Each bin has 24 bit unsigned for counting
the number of the pixel.

struct ipu3_uapi_ae_raw_buffer_aligned

   AE raw buffer

Definition

struct ipu3_uapi_ae_raw_buffer_aligned {
   struct ipu3_uapi_ae_raw_buffer buff ;
};

Members

buff  ipu3_uapi_ae_raw_buffer to hold full frame meta data.

struct ipu3_uapi_ae_grid_config

   AE weight grid

Definition

struct ipu3_uapi_ae_grid_config {
   __u8 width;
   __u8 height;
   __u8 block_width_log2:4;
   __u8 block_height_log2:4;
   __u8 reserved0:5;
   __u8 ae_en:1;
   __u8 rst_hist_array:1;
   __u8 done_rst_hist_array:1;
   __u16 x_start;
   __u16 y_start;
   __u16 x_end;
   __u16 y_end;
};

Members

width  Grid horizontal dimensions. Value: [16, 32], default 16.

height Grid vertical dimensions. Value: [16, 24], default 16.

block_width_log2 Log2 of the width of the grid cell, value: [3, 7].

block_height_log2 Log2 of the height of the grid cell, value: [3, 7]. default is 3 (cell size 8x8),
   4 cell per grid.
reserved0 reserved

**ae_en** 0: does not write to *ipu3_uapi_ae_raw_buffer_aligned* array, 1: write normally.

**rst_hist_array** write 1 to trigger histogram array reset.

**done_rst_hist_array** flag for histogram array reset done.

**x_start** X value of top left corner of ROI, default 0.

**y_start** Y value of top left corner of ROI, default 0.

**x_end** X value of bottom right corner of ROI

**y_end** Y value of bottom right corner of ROI

**Description**

The AE block accumulates 4 global weighted histograms (R, G, B, Y) over a defined ROI within the frame. The contribution of each pixel into the histogram, defined by *ipu3_uapi_ae_weight_elem* LUT, is indexed by a grid.

```
struct ipu3_uapi_ae_weight_elem
  AE weights LUT

struct ipu3_uapi_ae_weight_elem {
  __u32 cell0:4;
  __u32 cell1:4;
  __u32 cell2:4;
  __u32 cell3:4;
  __u32 cell4:4;
  __u32 cell5:4;
  __u32 cell6:4;
  __u32 cell7:4;
};
```

**Members**

**cell0** weighted histogram grid value.

**cell1** weighted histogram grid value.

**cell2** weighted histogram grid value.

**cell3** weighted histogram grid value.

**cell4** weighted histogram grid value.

**cell5** weighted histogram grid value.

**cell6** weighted histogram grid value.

**cell7** weighted histogram grid value.

**Description**

Use weighted grid value to give a different contribution factor to each cell. Precision u4, range [0, 15].

```
struct ipu3_uapi_ae_ccm
  AE coefficients for WB and CCM
```
struct ipu3_uapi_ae_ccm {
    __u16 gain_gr;
    __u16 gain_r;
    __u16 gain_b;
    __u16 gain_gb;
    __s16 mat[16];
};

Members

gain_gr  WB gain factor for the gr channels. Default 256.
gain_r  WB gain factor for the r channel. Default 256.
gain_b  WB gain factor for the b channel. Default 256.
gain_gb  WB gain factor for the gb channels. Default 256.
mat  4x4 matrix that transforms Bayer quad output from WB to RGB+Y.

Description

Default: 128, 0, 0, 0, 0, 128, 0, 0, 0, 0, 128, 0, 0, 0, 0, 0, 128,

As part of the raw frame pre-process stage, the WB and color conversion need to be applied to expose the impact of these gain operations.

struct ipu3_uapi_ae_config
    AE config

Definition

struct ipu3_uapi_ae_config {
    struct ipu3_uapi_ae_grid_config grid_cfg ;
    struct ipu3_uapi_ae_weight_elem weights[IPU3_UAPI_AE_WEIGHTS] ;
    struct ipu3_uapi_ae_ccm ae_ccm ;
};

Members

grid_cfg  config for auto exposure statistics grid. See struct ipu3_uapi_ae_grid_config
weights  IPU3_UAPI_AE_WEIGHTS is based on 32x24 blocks in the grid. Each grid cell has a corresponding value in weights LUT called grid value, global histogram is updated based on grid value and pixel value.
ae_ccm  Color convert matrix pre-processing block.

Description

Calculate AE grid from image resolution, resample ae weights.

struct ipu3_uapi_af_filter_config
    AF 2D filter for contrast measurements

Definition

struct ipu3_uapi_af_filter_config {
    struct {
       __u8 a1;
    };

3.2. Part I - Video for Linux API
Members

**y1_coeff_0** filter Y1, structure: 3x11, support both symmetry and anti-symmetry type. A12 is center, A1-A11 are neighbours. for analyzing low frequency content, used to calculate sum of gradients in x direction.

**y1_coeff_0.a1** filter1 coefficients A1, u8, default 0.
y1_coeff_0.a2  filter1 coefficients A2, u8, default 0.
y1_coeff_0.a3  filter1 coefficients A3, u8, default 0.
y1_coeff_0.a4  filter1 coefficients A4, u8, default 0.
y1_coeff_1 Struct
  y1_coeff_1.a5  filter1 coefficients A5, u8, default 0.
y1_coeff_1.a6  filter1 coefficients A6, u8, default 0.
y1_coeff_1.a7  filter1 coefficients A7, u8, default 0.
y1_coeff_1.a8  filter1 coefficients A8, u8, default 0.
y1_coeff_2 Struct
  y1_coeff_2.a9  filter1 coefficients A9, u8, default 0.
y1_coeff_2.a10 filter1 coefficients A10, u8, default 0.
y1_coeff_2.a11 filter1 coefficients A11, u8, default 0.
y1_coeff_2.a12 filter1 coefficients A12, u8, default 128.
y1_sign_vec Each bit corresponds to one coefficient sign bit, 0: positive, 1: negative, default 0.
y2_coeff_0 Y2, same structure as Y1. For analyzing high frequency content.
y2_coeff_0.a1  filter2 coefficients A1, u8, default 0.
y2_coeff_0.a2  filter2 coefficients A2, u8, default 0.
y2_coeff_0.a3  filter2 coefficients A3, u8, default 0.
y2_coeff_0.a4  filter2 coefficients A4, u8, default 0.
y2_coeff_1 Struct
  y2_coeff_1.a5  filter2 coefficients A5, u8, default 0.
y2_coeff_1.a6  filter2 coefficients A6, u8, default 0.
y2_coeff_1.a7  filter2 coefficients A7, u8, default 0.
y2_coeff_1.a8  filter2 coefficients A8, u8, default 0.
y2_coeff_2 Struct
  y2_coeff_2.a9  filter1 coefficients A9, u8, default 0.
y2_coeff_2.a10 filter1 coefficients A10, u8, default 0.
y2_coeff_2.a11 filter1 coefficients A11, u8, default 0.
y2_coeff_2.a12 filter1 coefficients A12, u8, default 128.
y2_sign_vec Each bit corresponds to one coefficient sign bit, 0: positive, 1: negative, default 0.
y_calc Pre-processing that converts Bayer quad to RGB+Y values to be used for building histogram. Range \([0, 32]\), default 8. Rule: \( y_{gen\ rate\ gr} + y_{gen\ rate\ r} + y_{gen\ rate\ b} + y_{gen\ rate\ gb} = 32 \) A single Y is calculated based on sum of Gr/R/B/Gb based on their contribution ratio.
**Linux Media Documentation**

**y_calc.y_gen_rate_gr**  Contribution ratio Gr for Y

**y_calc.y_gen_rate_r**  Contribution ratio R for Y

**y_calc.y_gen_rate_b**  Contribution ratio B for Y

**y_calc.y_gen_rate_gb**  Contribution ratio Gb for Y

**nf**  The shift right value that should be applied during the Y1/Y2 filter to make sure the total memory needed is 2 bytes per grid cell.

**nf.reserved0**  reserved

**nf.y1_nf**  Normalization factor for the convolution coeffs of y1, should be log2 of the sum of the abs values of the filter coeffs, default 7 (2^7 = 128).

**nf.reserved1**  reserved

**nf.y2_nf**  Normalization factor for y2, should be log2 of the sum of the abs values of the filter coeffs.

**nf.reserved2**  reserved

**struct ipu3_uapi_af_raw_buffer**  
AF meta data

**Definition**

```c
struct ipu3_uapi_af_raw_buffer {
  __u8 y_table[IPU3_UAPI_AF_Y_TABLE_MAX_SIZE];
};
```

**Members**

**y_table**  Each color component will be convolved separately with filter1 and filter2 and the result will be summed out and averaged for each cell.

**struct ipu3_uapi_af_config_s**  
AF config

**Definition**

```c
struct ipu3_uapi_af_config_s {
  struct ipu3_uapi_af_filter_config filter_config;
  __u8 padding[4];
  struct ipu3_uapi_grid_config grid_cfg;
};
```

**Members**

**filter_config**  AF uses Y1 and Y2 filters as configured in **ipu3_uapi_af_filter_config**

**padding**  paddings

**grid_cfg**  See **ipu3_uapi_grid_config**, default resolution 16x16. Use large grid size for large image and vice versa.

**struct ipu3_uapi_awb_fr_raw_buffer**  
AWB filter response meta data

**Definition**
struct ipu3_uapi_awb_fr_raw_buffer {
    __u8 meta_data[IPU3_UAPI_AWB_FR_BAYER_TABLE_MAX_SIZE] ;
};

Members

meta_data Statistics output on the grid after convolving with 1D filter.

struct ipu3_uapi_awb_fr_config_s
    AWB filter response config

Definition

struct ipu3_uapi_awb_fr_config_s {
    struct ipu3_uapi_grid_config grid_cfg;
    __u8 bayer_coeff[6];
    __u16 reserved1;
    __u32 bayer_sign;
    __u8 bayer_nf;
    __u8 reserved2[7];
};

Members

grid_cfg grid config, default 16x16.

bayer_coeff 1D Filter 1x11 center symmetry/anti-symmetry. coefficients defaults { 0, 0, 0, 0, 0, 128 }. Applied on whole image for each Bayer channel separately by a weighted sum of its 11x1 neighbors.

reserved1 reserved

bayer_sign sign of filter coefficients, default 0.

bayer_nf normalization factor for the convolution coeffs, to make sure total memory needed is within pre-determined range. NF should be the log2 of the sum of the abs values of the filter coeffs, range [7, 14], default 7.

reserved2 reserved

struct ipu3_uapi_4a_config
    4A config

Definition

struct ipu3_uapi_4a_config {
    struct ipu3_uapi_awb_config_s awb_config ;
    struct ipu3_uapi_ae_grid_config ae_grd_config;
    __u8 padding[20];
    struct ipu3_uapi_af_config_s af_config;
    struct ipu3_uapi_awb_fr_config_s awb_fr_config ;
};

Members

awb_config ipu3_uapi_awb_config_s, default resolution 16x16

ae_grd_config auto exposure statistics ipu3_uapi_ae_grid_config

padding paddings

3.2. Part I - Video for Linux API
**af_config** auto focus config *ipu3_uapi_af_config_s*

**awb_fr_config** *ipu3_uapi_awb_fr_config_s*, default resolution 16x16

**struct ipu3_uapi_bubble_info**

Bubble info for host side debugging

**Definition**

```c
struct ipu3_uapi_bubble_info {
    __u32 num_of_stripes;
    __u8 padding[28];
    __u32 num_sets;
    __u8 padding1[28];
    __u32 size_of_set;
    __u8 padding2[28];
    __u32 bubble_size;
    __u8 padding3[28];
};
```

**Members**

- **num_of_stripes** A single frame is divided into several parts called stripes due to limitation on line buffer memory. The separation between the stripes is vertical. Each such stripe is processed as a single frame by the ISP pipe.
- **padding** padding bytes.
- **num_sets** number of sets.
- **padding1** padding bytes.
- **size_of_set** set size.
- **padding2** padding bytes.
- **bubble_size** is the amount of padding in the bubble expressed in “sets”.
- **padding3** padding bytes.

**struct ipu3_uapi_ff_status**

Enable bits for each 3A fixed function

**Definition**

```c
struct ipu3_uapi_ff_status {
    __u32 awb_en;
    __u8 padding[28];
    __u32 ae_en;
    __u8 padding1[28];
    __u32 af_en;
    __u8 padding2[28];
    __u32 awb_fr_en;
    __u8 padding3[28];
};
```

  __u16 b;
  __u16 gb;
};
```

Members

---

3.2. Part I - Video for Linux API
gr  white balance gain for Gr channel.

r  white balance gain for R channel.

b  white balance gain for B channel.

gb white balance gain for Gb channel.

**Description**

Precision u3.13, range [0, 8). White balance correction is done by applying a multiplicative gain to each color channels prior to BNR.

```c
struct ipu3_uapi_bnr_static_config_wb_gains_thr_config
{
    __u8 gr;
    __u8 r;
    __u8 b;
    __u8 gb;
};
```

**Members**

gr  white balance threshold gain for Gr channel.

r  white balance threshold gain for R channel.

b  white balance threshold gain for B channel.

gb white balance threshold gain for Gb channel.

**Description**

Defines the threshold that specifies how different a defect pixel can be from its neighbors.(used by dynamic defect pixel correction sub block) Precision u4.4 range [0, 8].

```c
struct ipu3_uapi_bnr_static_config_thr_coeffs_config
{
    __u32 cf:13;
    __u32 reserved0:3;
    __u32 cg:5;
    __u32 ci:5;
    __u32 reserved1:1;
    __u32 r_nf:5;
};
```

**Members**

cf  Free coefficient for threshold calculation, range [0, 8191], default 0.

reserved0 reserved
cg  Gain coefficient for threshold calculation, [0, 31], default 8.
**ci** Intensity coefficient for threshold calculation. range [0, 0x1f] default 6. format: u3.2 (3 most significant bits represent whole number, 2 least significant bits represent the fractional part with each count representing 0.25) e.g. 6 in binary format is 00110, that translates to 1.5

reserved1 reserved

**r_nf** Normalization shift value for r^2 calculation, range [12, 20] where r is a radius of pixel [row, col] from center of sensor. default 14.

**Description**

Threshold used to distinguish between noise and details.

**struct** `ipu3_uapi_bnr_static_config_thr_ctrl_shd_config`

*Shading config*

**Definition**

```c
struct ipu3_uapi_bnr_static_config_thr_ctrl_shd_config {
    __u8 gr;
    __u8 r;
    __u8 b;
    __u8 gb;
};
```

**Members**

- **gr** Coefficient defines lens shading gain approximation for gr channel
- **r** Coefficient defines lens shading gain approximation for r channel
- **b** Coefficient defines lens shading gain approximation for b channel
- **gb** Coefficient defines lens shading gain approximation for gb channel

**Description**

Parameters for noise model (NM) adaptation of BNR due to shading correction. All above have precision of u3.3, default to 0.

**struct** `ipu3_uapi_bnr_static_config_opt_center_config`

*Optical center config*

**Definition**

```c
struct ipu3_uapi_bnr_static_config_opt_center_config {
    __s32 x_reset:13;
    __u32 reserved0:3;
    __s32 y_reset:13;
    __u32 reserved2:3;
};
```

**Members**

- **x_reset** Reset value of X (col start - X center). Precision s12.0.
- **reserved0** reserved
- **y_reset** Reset value of Y (row start - Y center). Precision s12.0.
- **reserved2** reserved
**Description**

Distance from corner to optical center for NM adaptation due to shading correction (should be calculated based on shading tables)

```c
struct ipu3_uapi_bnr_static_config_lut_config
    BNR square root lookup table
```

**Definition**

```c
struct ipu3_uapi_bnr_static_config_lut_config {
    __u8 values[IPU3_UAPI_BNR_LUT_SIZE];
};
```

**Members**

- **values** pre-calculated values of square root function.

**Description**

LUT implementation of square root operation.

```c
struct ipu3_uapi_bnr_static_config_bp_ctrl_config
    Detect bad pixels (bp)
```

**Definition**

```c
struct ipu3_uapi_bnr_static_config_bp_ctrl_config {
    __u32 bp_thr_gain:5;
    __u32 reserved0:2;
    __u32 defect_mode:1;
    __u32 bp_gain:6;
    __u32 reserved1:18;
    __u32 w0_coeff:4;
    __u32 reserved2:4;
    __u32 w1_coeff:4;
    __u32 reserved3:20;
};
```

**Members**

- **bp_thr_gain** Defines the threshold that specifies how different a defect pixel can be from its neighbors. Threshold is dependent on de-noise threshold calculated by algorithm. Range [4, 31], default 4.

- **reserved0** reserved

- **defect_mode** Mode of addressed defect pixels, 0 - single defect pixel is expected, 1 - 2 adjacent defect pixels are expected, default 1.

- **bp_gain** Defines how 2nd derivation that passes through a defect pixel is different from 2nd derivations that pass through neighbor pixels. u4.2, range [0, 256], default 8.

- **reserved1** reserved

- **w0_coeff** Blending coefficient of defect pixel correction. Precision u4, range [0, 8], default 8.

- **reserved2** reserved

- **w1_coeff** Enable influence of incorrect defect pixel correction to be avoided. Precision u4, range [1, 8], default 8.
reserved3 reserved

struct ipu3_uapi_bnr_static_config_dn_detect_ctrl_config
   Denoising config

Definition

struct ipu3_uapi_bnr_static_config_dn_detect_ctrl_config {
   __u32 alpha:4;
   __u32 beta:4;
   __u32 gamma:4;
   __u32 reserved0:4;
   __u32 max_inf:4;
   __u32 reserved1:7;
   __u32 gd_enable:1;
   __u32 bpc_enable:1;
   __u32 bnr_enable:1;
   __u32 ff_enable:1;
   __u32 reserved2:1;
};

Members

alpha  Weight of central element of smoothing filter.
beta  Weight of peripheral elements of smoothing filter, default 4.
gamma  Weight of diagonal elements of smoothing filter, default 4.
reserved0 reserved
max_inf  Maximum increase of peripheral or diagonal element influence relative to the pre-defined value range: [0x5, 0xa]
reserved1 reserved
gd_enable  Green disparity enable control, 0 - disable, 1 - enable.
bpc_enable  Bad pixel correction enable control, 0 - disable, 1 - enable.
bnr_enable  Bayer noise removal enable control, 0 - disable, 1 - enable.
ff_enable  Fixed function enable, 0 - disable, 1 - enable.
reserved2 reserved

Description

beta and gamma parameter define the strength of the noise removal filter. All above has precision u0.4, range [0, 0xf] format: u0.4 (no / zero bits represent whole number, 4 bits represent the fractional part with each count representing 0.0625) e.g. 0xf translates to 0.0625x15 = 0.9375

struct ipu3_uapi_bnr_static_config_opt_center_sqr_config
   BNR optical square

Definition

struct ipu3_uapi_bnr_static_config_opt_center_sqr_config {
   __u32 x_sqr_reset;
   __u32 y_sqr_reset;
};
Members

\textbf{x\_sqr\_reset} \ Reset value of \(X^2\).
\textbf{y\_sqr\_reset} \ Reset value of \(Y^2\).

Description

Please note:

1. \(X\) and \(Y\) ref to \textit{ipu3\_uapi\_bnr\_static\_config\_opt\_center\_config}

2. Both structs are used in threshold formula to calculate \(r^2\), where \(r\) is a radius of pixel [row, col] from center of sensor.

\textbf{Description}

struct \texttt{ipu3\_uapi\_bnr\_static\_config}

\texttt{BNR static config}

Definition

    __u32 gd_central_weight:4;
};

Members

**gd_red**  Shading gain coeff for gr disparity level in bright red region. Precision u0.6, default 4(0.0625).

**reserved0**  reserved

**gd_green**  Shading gain coeff for gr disparity level in bright green region. Precision u0.6, default 4(0.0625).

**reserved1**  reserved

**gd_blue**  Shading gain coeff for gr disparity level in bright blue region. Precision u0.6, default 4(0.0625).

**reserved2**  reserved

**gd_black**  Maximal green disparity level in dark region (stronger disparity assumed to be image detail). Precision u14, default 80.

**reserved3**  reserved

**gd_shading**  Change maximal green disparity level according to square distance from image center.

**reserved4**  reserved

**gd_support**  Lower bound for the number of second green color pixels in current pixel neighborhood with less than threshold difference from it.

**reserved5**  reserved

**gd_clip**  Turn green disparity clip on/off, [0, 1], default 1.

**gd_central_weight**  Central pixel weight in 9 pixels weighted sum.

Description

The shading gain coeff of red, green, blue and black are used to calculate threshold given a pixel’s color value and its coordinates in the image.

struct ipu3_uapi_dm_config

    De-mosaic parameters

Definition
struct ipu3_uapi_dm_config {

coeff_c33  Conversion matrix value, format s0.14, range [-16384, 16383].
coeff_b3   Bias 3x1 coefficient, s13.0 range [-8192, 8191].

Description

To transform each pixel from RGB to YUV (Y - brightness/luminance, UV - chroma) by applying the pixel’s values by a 3x3 matrix and adding an optional bias 3x1 vector. Here are the default values for the matrix:

```
4898, 9617, 1867, 0, -2410, -4732, 7143, 0, 10076, -8437, -1638, 0,
```

(i.e. for real number 0.299, 0.299 * 2^14 becomes 4898.)

struct ipu3_uapi_iefd_cux2
    IEFd Config Unit 2 parameters

Definition

struct ipu3_uapi_iefd_cux2 {
    __u32 x0:9;
    __u32 x1:9;
    __u32 a01:9;
    __u32 b01:5;
};

Members

x0 X0 point of Config Unit, u9.0, default 0.
x1 X1 point of Config Unit, u9.0, default 0.
a01 Slope A of Config Unit, s4.4, default 0.
b01 Slope B, always 0.

Description

Calculate weight for blending directed and non-directed denoise elements

All CU inputs are unsigned, they will be converted to signed when written to register, i.e. a01 will be written to 9 bit register in s4.4 format. The data precision s4.4 means 4 bits for integer parts and 4 bits for the fractional part, the first bit indicates positive or negative value. For userspace software (commonly the imaging library), the computation for the CU slope values should be based on the slope resolution 1/16 (binary 0.0001 - the minimal interval value), the slope value range is [-256, +255]. This applies to ipu3_uapi_iefd_cux6_ed, ipu3_uapi_iefd_cux2_1, ipu3_uapi_iefd_cux2_1, ipu3_uapi_iefd_cux4 and ipu3_uapi_iefd_cux6_rad.

Note

Each instance of Config Unit needs X coordinate of n points and slope A factor between points calculated by driver based on calibration parameters.

struct ipu3_uapi_iefd_cux6_ed
    Calculate power of non-directed sharpening element, Config Unit 6 for edge detail (ED)

obgrid_param obgrid parameters as specified by ipu3_uapi_obgrid_param

Description

The video queue “parameters” is of format V4L2_META_FMT_IPU3_PARAMS. This is a “single
plane” v4l2_meta_format using V4L2_BUF_TYPE_META_OUTPUT.

struct ipu3_uapi_params as defined below contains a lot of parameters and ipu3_uapi_flags
selects which parameters to apply.
V4L2_META_FMT_RK_ISP1_PARAMS ('rk1p'), V4L2_META_FMT_RK_ISP1_STAT_3A ('rk1s')

**Configuration parameters**

The configuration parameters are passed to the `rkisp1_params` metadata output video node, using the `v4l2_meta_format` interface. The buffer contains a single instance of the C structure `rkisp1_params_cfg` defined in `rkisp1-config.h`. So the structure can be obtained from the buffer by:

```c
struct rkisp1_params_cfg *params = (struct rkisp1_params_cfg*) buffer;
```

**3A and histogram statistics**

The ISP1 device collects different statistics over an input Bayer frame. Those statistics are obtained from the `rkisp1_stats` metadata capture video node, using the `v4l2_meta_format` interface. The buffer contains a single instance of the C structure `rkisp1_stat_buffer` defined in `rkisp1-config.h`. So the structure can be obtained from the buffer by:

```c
struct rkisp1_stat_buffer *stats = (struct rkisp1_stat_buffer*) buffer;
```

The statistics collected are Exposure, AWB (Auto-white balance), Histogram and AF (Auto-focus). See `rkisp1_stat_buffer` for details of the statistics.

The 3A statistics and configuration parameters described here are usually consumed and produced by dedicated user space libraries that comprise the important tuning tools using software control loop.

**rkisp1 uAPI data types**

```c
enum rkisp1_cif_isp_version
    ISP variants

Constants
RKISP1_V10 used at least in rk3288 and rk3399
RKISP1_V11 declared in the original vendor code, but not used
RKISP1_V12 used at least in rk3326 and px30
RKISP1_V13 used at least in rk1808
```

```c
enum rkisp1_cif_isp_exp_ctrl_autostop
    stop modes

Constants
RKISP1_CIF_ISP_EXP_CTRL_AUTOSTOP_0 continuous measurement
RKISP1_CIF_ISP_EXP_CTRL_AUTOSTOP_1 stop measuring after a complete frame
```

```c
enum rkisp1_cif_isp_exp_meas_mode
    Exposure measure mode
```

914 Chapter 3. Linux Media Infrastructure userspace API
Constants

\texttt{RKISP1\_CIF\_ISP\_EXP\_MEASURING\_MODE\_0} \ Y = 16 + 0.25R + 0.5G + 0.1094B

\texttt{RKISP1\_CIF\_ISP\_EXP\_MEASURING\_MODE\_1} \ Y = (R + G + B) \times (85/256)

\textbf{struct rkisp1\_cif\_isp\_window}

\hspace{1em} measurement window.

\textbf{Definition}

\begin{verbatim}
struct rkisp1_cif_isp_window {
  __u16 h_offs;
  __u16 v_offs;
  __u16 h_size;
  __u16 v_size;
};
\end{verbatim}

\textbf{Members}

- \texttt{h\_offs} the horizontal offset of the window from the left of the frame in pixels.
- \texttt{v\_offs} the vertical offset of the window from the top of the frame in pixels.
- \texttt{h\_size} the horizontal size of the window in pixels
- \texttt{v\_size} the vertical size of the window in pixels.

\textbf{Description}

Measurements are calculated per window inside the frame. This struct represents a window for a measurement.

\textbf{struct rkisp1\_cif\_isp\_bls\_fixed\_val}

\hspace{1em} BLS fixed subtraction values

\textbf{Definition}

\begin{verbatim}
struct rkisp1_cif_isp_bls_fixed_val {
  __s16 r;
  __s16 gr;
  __s16 gb;
  __s16 b;
};
\end{verbatim}

\textbf{Members}

- \texttt{r} Fixed (signed!) subtraction value for Bayer pattern R
- \texttt{gr} Fixed (signed!) subtraction value for Bayer pattern Gr
- \texttt{gb} Fixed (signed!) subtraction value for Bayer pattern Gb
- \texttt{b} Fixed (signed!) subtraction value for Bayer pattern B

\textbf{Description}

The values will be subtracted from the sensor values. Therefore a negative value means addition instead of subtraction!

\textbf{struct rkisp1\_cif\_isp\_bls\_config}

\hspace{1em} Configuration used by black level subtraction

\section*{3.2. Part I - Video for Linux API}
**Definition**

```c
struct rkisp1_cif_isp_bls_config {
    __u8 enable_auto;
    __u8 en_windows;
    struct rkisp1_cif_isp_window bls_window1;
    struct rkisp1_cif_isp_window bls_window2;
    __u8 bls_samples;
    struct rkisp1_cif_isp_bls_fixed_val fixed_val;
};
```

**Members**

- **enable_auto** Automatic mode activated means that the measured values are subtracted. Otherwise the fixed subtraction values will be subtracted.
- **en_windows** enabled window
- **bls_window1** Measurement window 1 size
- **bls_window2** Measurement window 2 size
- **bls_samples** Set amount of measured pixels for each Bayer position (A, B, C and D) to \(2^{\text{bls samples}}\).
- **fixed_val** Fixed subtraction values

**Definition**

```c
struct rkisp1_cif_isp_dpcc_methods_config {
    __u32 method;
    __u32 line_thresh;
    __u32 line_mad_fac;
    __u32 pg_fac;
    __u32 rnd_thresh;
    __u32 rg_fac;
};
```

**Members**

- **method** Method enable bits
- **line_thresh** Line threshold
- **line_mad_fac** Line MAD factor
- **pg_fac** Peak gradient factor
- **rnd_thresh** Rank Neighbor Difference threshold
- **rg_fac** Rank gradient factor

**Description**

Methods Configuration used by Defect Pixel Cluster Correction

**Definition**

```c
struct rkisp1_cif_isp_dpcc_config {
    Configuration used by DPCC
};
```
struct rkisp1_cif_isp_dpcc_config {
    __u32 mode;

output_mode whether use hard coded methods
set_use stage1 methods set
methods methods config
ro_limits rank order limits
rnd_offs differential rank offsets for rank neighbor difference

Description
Configuration used by Defect Pixel Cluster Correction

struct rkisp1_cif_isp_gamma_corr_curve
gamma curve point definition y-axis (output).

Definition

struct rkisp1_cif_isp_gamma_corr_curve {
    __u16 gamma_y[RKISP1_CIF_ISP_DEGAMMA_CURVE_SIZE];
};

Members
gamma_y the values for the y-axis of gamma curve points. Each value is 12 bit.

Description
The reset values define a linear curve which has the same effect as bypass. Reset values are: gamma_y[0] = 0x0000, gamma_y[1] = 0x0100, ... gamma_y[15] = 0x0f00, gamma_y[16] = 0xfff

struct rkisp1_cif_isp_gamma_curve_x_axis_pnts
De-Gamma Curve definition x increments (sampling points). gamma_dx0 is for the lower samples (1-8), gamma_dx1 is for the higher samples (9-16). The reset values for both fields is 0x44444444. This means that each sample is 4 units away from the previous one on the x-axis.

Definition

struct rkisp1_cif_isp_gamma_curve_x_axis_pnts {
    __u32 gamma_dx0;
    __u32 gamma_dx1;
};

Members

Definition

```c
struct rkisp1_cif_isp_awb_meas_config {
    struct rkisp1_cif_isp_window awb_wnd;
    __u32 awb_mode;
    __u8 max_y;
    __u8 min_y;
    __u8 max_csum;
    __u8 min_c;
    __u8 frames;
    __u8 awb_ref_cr;
    __u8 awb_ref_cb;
    __u8 enable_ymax_cmp;
};
```

Members

- **awb_wnd** white balance measurement window (in pixels)
- **awb_mode** the awb meas mode. From enum rkisp1_cif_isp_awb_mode_type.
- **max_y** only pixels values < max_y contribute to awb measurement, set to 0 to disable this feature
- **min_y** only pixels values > min_y contribute to awb measurement
- **max_csum** Chrominance sum maximum value, only consider pixels with Cb+Cr, smaller than threshold for awb measurements
- **min_c** Chrominance minimum value, only consider pixels with Cb/ Cr each greater than threshold value for awb measurements
- **frames** number of frames - 1 used for mean value calculation (ucFrames=0 means 1 Frame)
- **awb_ref_cr** reference Cr value for AWB regulation, target for AWB
- **awb_ref_cb** reference Cb value for AWB regulation, target for AWB
- **enable_ymax_cmp** enable Y_MAX compare (Not valid in RGB measurement mode.)

struct rkisp1_cif_isp_awb_gain_config
  Configuration used by auto white balance gain

Definition

```c
struct rkisp1_cif_isp_awb_gain_config {
    __u16 gain_red;
    __u16 gain_green_r;
};
```
Members

**gain_red** gain value for red component.

**gain_green_r** gain value for green component in red line.

**gain_blue** gain value for blue component.

**gain_green_b** gain value for green component in blue line.

Description

All fields in this struct are 10 bit, where: 0x100h = 1, unsigned integer value, range 0 to 4 with 8 bit fractional part.

\[
\text{out\_data\_x} = (\text{AWB\_GAIN\_X} \times \text{in\_data} + 128) \gg 8
\]

struct **rkisp1_cif_isp_flt_config**

Configuration used by ISP filtering

Definition

```c
struct rkisp1_cif_isp_flt_config {
    __u32 mode;
    __u8 grn_stage1;
    __u8 chr_h_mode;
    __u8 chr_v_mode;
    __u32 thresh_bl0;
    __u32 thresh_bl1;
    __u32 thresh_sh0;
    __u32 thresh_sh1;
    __u32 lum_weight;
    __u32 fac_sh1;
    __u32 fac_sh0;
    __u32 fac_mid;
    __u32 fac_bl0;
    __u32 fac_bl1;
};
```

Members

**mode** ISP\_FILT\_MODE register fields (from enum rkisp1_cif_isp_flt_mode)

**grn\_stage1** Green filter stage 1 select (range 0x0...0x8)

**chr\_h\_mode** Chroma filter horizontal mode

**chr\_v\_mode** Chroma filter vertical mode

**thresh\_bl0** If thresh\_bl1 < sum\_grad < thresh\_bl0 then fac\_bl0 is selected (blurring th)

**thresh\_bl1** If sum\_grad < thresh\_bl1 then fac\_bl1 is selected (blurring th)

**thresh\_sh0** If thresh\_sh0 < sum\_grad < thresh\_sh1 then thresh\_sh0 is selected (sharpening th)

**thresh\_sh1** If thresh\_sh1 < sum\_grad then thresh\_sh1 is selected (sharpening th)
**lum_weight** Parameters for luminance weight function.

**fac_sh1** filter factor for sharp1 level

**fac_sh0** filter factor for sharp0 level

**fac_mid** filter factor for mid level and for static filter mode

**fac_bl0** filter factor for blur 0 level

**fac_bl1** filter factor for blur 1 level (max blur)

**Description**

All 4 threshold fields (thresh_*) are 10 bits. All 6 factor fields (fac_*) are 6 bits.

**struct rkisp1_cif_isp_bdm_config**

Configuration used by Bayer DeMosaic

**Definition**

```c
struct rkisp1_cif_isp_bdm_config {
    __u8 demosaic_th;
};
```

**Members**

**demosaic_th** threshold for bayer demosaicing texture detection

**struct rkisp1_cif_isp_ctk_config**

Configuration used by Cross Talk correction

**Definition**

```c
struct rkisp1_cif_isp_ctk_config {
    __u16 coeff[3][3];
    __u16 ct_offset[3];
};
```

**Members**

**coeff** color correction matrix. Values are 11-bit signed fixed-point numbers with 4 bit integer and 7 bit fractional part, ranging from -8 (0x400) to +7.992 (0x3FF). 0 is represented by 0x000 and a coefficient value of 1 as 0x080.

**ct_offset** Red, Green, Blue offsets for the crosstalk correction matrix

**struct rkisp1_cif_isp_goc_config**

Configuration used by Gamma Out correction

**Definition**

```c
struct rkisp1_cif_isp_goc_config {
    __u32 mode;
    __u16 gamma_y[RKISP1_CIF_ISP_GAMMA_OUT_MAX_SAMPLES];
};
```

**Members**

**mode** goc mode (from enum rkisp1_cif_isp_goc_mode)

**gamma_y** gamma out curve y-axis for all color components
Description

The number of entries of `gamma_y` depends on the hardware revision as is reported by the `hw_revision` field of the struct `media_device_info` that is returned by `ioctl MEDIA_DEVICE_INFO`.

Versions <= V11 have RKISP1_CIF_ISP GAMMA_OUT_MAX_SAMPLES_V10 entries, versions >= V12 have RKISP1_CIF_ISP GAMMA_OUT_MAX_SAMPLES_V12 entries. RKISP1_CIF_ISP GAMMA_OUT_MAX_SAMPLES is equal to the maximum of the two.

```c
struct rkisp1_cif_isp_hst_config
    Configuration for Histogram statistics
```

### Definition

```c
define struct rkisp1_cif_isp_hst_config {
    __u32 mode;
    __u8 histogram_predivider;
    struct rkisp1_cif_isp_window meas_window;
    __u8 hist_weight[RKISP1_CIF_ISP_HISTOGRAM_WEIGHT_GRIDS_SIZE];
};
```

### Members

- **mode** histogram mode (from `enum rkisp1_cif_isp_histogram_mode`)
- **histogram_predivider** process every stepsize pixel, all other pixels are skipped
- **meas_window** coordinates of the measure window
- **hist_weight** weighting factor for sub-windows

### Description

The number of entries of `hist_weight` depends on the hardware revision as is reported by the `hw_revision` field of the struct `media_device_info` that is returned by `ioctl MEDIA_DEVICE_INFO`.

Versions <= V11 have RKISP1_CIF_ISP_HISTOGRAM_WEIGHT_GRIDS_SIZE_V10 entries, versions >= V12 have RKISP1_CIF_ISP_HISTOGRAM_WEIGHT_GRIDS_SIZE_V12 entries. RKISP1_CIF_ISP_HISTOGRAM_WEIGHT_GRIDS_SIZE is equal to the maximum of the two.

```c
struct rkisp1_cif_isp_aec_config
    Configuration for Auto Exposure statistics
```

### Definition

```c
define struct rkisp1_cif_isp_aec_config {
    __u32 mode;
    __u32 autostop;
    struct rkisp1_cif_isp_window meas_window;
};
```

### Members

- **mode** Exposure measure mode (from `enum rkisp1_cif_isp_exp_meas_mode`)
- **autostop** stop mode (from `enum rkisp1_cif_isp_exp_ctrl_autostop`)
- **meas_window** coordinates of the measure window
struct **rkisp1_cif_isp_afc_config**  
Configuration for the Auto Focus statistics

**Definition**

```c
struct rkisp1_cif_isp_afc_config {
  __u8 num_afm_win;
  struct rkisp1_cif_isp_window afm_win[RKISP1_CIF_ISP_AFM_MAX_WINDOWS];
  __u32 thres;
  __u32 var_shift;
};
```

**Members**

- **num_afm_win**  max RKISP1_CIF_ISP_AFM_MAX_WINDOWS
- **afm_win**  coordinates of the meas window
- **thres**  threshold used for minimizing the influence of noise
- **var_shift**  the number of bits for the shift operation at the end of the calculation chain.

**enum **rkisp1_cif_isp_dpf_gain_usage**
- dpf gain usage

**Constants**

- **RKISP1_CIF_ISP_DPF_GAIN_USAGE.Disabled**  don’t use any gains in preprocessing stage
- **RKISP1_CIF_ISP_DPF_GAIN_USAGE.NF_GAINS**  use only the noise function gains from registers DPF_NF_GAIN_R, ...
- **RKISP1_CIF_ISP_DPF_GAIN_USAGE.LSC_GAINS**  use only the gains from LSC module
- **RKISP1_CIF_ISP_DPF_GAIN_USAGE.NF_LSC_GAINS**  use the noise function gains and the gains from LSC module
- **RKISP1_CIF_ISP_DPF_GAIN_USAGE.AWB_GAINS**  use only the gains from AWB module
- **RKISP1_CIF_ISP_DPF_GAIN_USAGE.AWB_LSC_GAINS**  use the gains from AWB and LSC module
- **RKISP1_CIF_ISP_DPF_GAIN_USAGE.MAX**  upper border (only for an internal evaluation)

**enum **rkisp1_cif_isp_dpf_rb_filtersize**
- Red and blue filter sizes

**Constants**

- **RKISP1_CIF_ISP_DPF_RB_FILTERSIZE.13x9**  red and blue filter kernel size 13x9 (means 7x5 active pixel)
- **RKISP1_CIF_ISP_DPF_RB_FILTERSIZE.9x9**  red and blue filter kernel size 9x9 (means 5x5 active pixel)

**enum **rkisp1_cif_isp_dpf_nll_scale_mode**
- dpf noise level scale mode

**Constants**

- **RKISP1_CIF_ISP_NLL_SCALE.LINEAR**  use a linear scaling
- **RKISP1_CIF_ISP_NLL_SCALE.LOGARITHMIC**  use a logarithmic scaling
struct rkisp1_cif_isp_dpf_nll
  Noise level lookup

Definition

```c
struct rkisp1_cif_isp_dpf_nll {
  __u16 coeff[RKISP1_CIF_ISP_DPF_MAX_NLF_COEFFS];
  __u32 scale_mode;
};
```

Members

- **coeff** Noise level Lookup coefficient
- **scale_mode** dpf noise level scale mode (from `enum rkisp1_cif_isp_dpf_nll_scale_mode`)

struct rkisp1_cif_isp_dpf_rb_flt
  Red blue filter config

Definition

```c
struct rkisp1_cif_isp_dpf_rb_flt {
  __u32 fltsize;
  __u8 spatial_coeff[RKISP1_CIF_ISP_DPF_MAX_SPATIAL_COEFFS];
  __u8 r_enable;
  __u8 b_enable;
};
```

Members

- **fltsize** The filter size for the red and blue pixels (from `enum rkisp1_cif_isp_dpf_rb_filtersize`)
- **spatial_coeff** Spatial weights
- **r_enable** enable filter processing for red pixels
- **b_enable** enable filter processing for blue pixels

struct rkisp1_cif_isp_dpf_g_flt
  Green filter Configuration

Definition

```c
struct rkisp1_cif_isp_dpf_g_flt {
  __u8 spatial_coeff[RKISP1_CIF_ISP_DPF_MAX_SPATIAL_COEFFS];
  __u8 gr_enable;
  __u8 gb_enable;
};
```

Members

- **spatial_coeff** Spatial weights
- **gr_enable** enable filter processing for green pixels in green/red lines
- **gb_enable** enable filter processing for green pixels in green/blue lines

struct rkisp1_cif_isp_dpf_gain
  Noise function Configuration

Definition
struct rkisp1_cif_isp_dpf_gain {
    __u32 mode;
    __u16 nf_r_gain;
    __u16 nf_b_gain;
    __u16 nf_gr_gain;
    __u16 nf_gb_gain;
};

Members

mode dpf gain usage (from enum rkisp1_cif_isp_dpf_gain_usage)

nf_r_gain Noise function Gain that replaces the AWB gain for red pixels

nf_b_gain Noise function Gain that replaces the AWB gain for blue pixels

nf_gr_gain Noise function Gain that replaces the AWB gain for green pixels in a red line

nf_gb_gain Noise function Gain that replaces the AWB gain for green pixels in a blue line

struct rkisp1_cif_isp_dpf_config
    Configuration used by De-noising pre-filter

Definition

struct rkisp1_cif_isp_dpf_config {
    struct rkisp1_cif_isp_dpf_gain gain;
    struct rkisp1_cif_isp_dpf_g_flt g_flt;

struct rkisp1_cif_isp_awb_meas
    AWB measured values

Definition

struct rkisp1_cif_isp_awb_meas {
    u32 cnt;
    __u8 mean_y_or_g;
    __u8 mean_cb_or_b;
    __u8 mean_cr_or_r;
};

Members

cnt White pixel count, number of “white pixels” found during last measurement
mean_y_or_g Mean value of Y within window and frames, Green if RGB is selected.
mean_cb_or_b Mean value of Cb within window and frames, Blue if RGB is selected.
mean_cr_or_r Mean value of Cr within window and frames, Red if RGB is selected.

struct rkisp1_cif_isp_awb_stat
    statistics automatic white balance data

Definition
struct rkisp1_cif_isp_awb_stat {
    struct rkisp1_cif_isp_awb_meas awb_mean[RKISP1_CIF_ISP_AWB_MAX_GRID];
};

Members

awb_mean Mean measured data

struct rkisp1_cif_isp_bls_meas_val
    BLS measured values

Definition

struct rkisp1_cif_isp_bls_meas_val {
    __u16 meas_r;
    __u16 meas_gr;
    __u16 meas_gb;
    __u16 meas_b;
};

Members

meas_r Mean measured value for Bayer pattern R
meas_gr Mean measured value for Bayer pattern Gr
meas_gb Mean measured value for Bayer pattern Gb
meas_b Mean measured value for Bayer pattern B

struct rkisp1_cif_isp_ae_stat
    statistics auto exposure data

Definition

struct rkisp1_cif_isp_ae_stat {
    __u8 exp_mean[RKISP1_CIF_ISP_AE_MEAN_MAX];
    struct rkisp1_cif_isp_bls_meas_val bls_val;
};

Members

exp_mean Mean luminance value of block xx
bls_val BLS measured values

Description

The number of entries of exp_mean depends on the hardware revision as is reported by the hw_revision field of the struct media_device_info that is returned by ioctl MEDIA_IOC_DEVICE_INFO.

Versions <= V11 have RKISP1_CIF_ISP_AE_MEAN_MAX_V10 entries, versions >= V12 have RKISP1_CIF_ISP_AE_MEAN_MAX_V12 entries. RKISP1_CIF_ISP_AE_MEAN_MAX is equal to the maximum of the two.

Image is divided into 5x5 blocks on V10 and 9x9 blocks on V12.

struct rkisp1_cif_isp_af_meas_val
    AF measured values
**Definition**

```c
struct rkisp1_cif_isp_af_meas_val {
    __u32 sum;
    __u32 lum;
};
```

**Members**

- **sum**  sharpness value
- **lum**  luminance value

**struct rkisp1_cif_isp_af_stat**

statistics auto focus data

**Definition**

```c
struct rkisp1_cif_isp_af_stat {
    struct rkisp1_cif_isp_af_meas_val window[RKISP1_CIF_ISP_AFM_MAX_WINDOWS];
};
```

**Members**

- **window**  AF measured value of window x

**Description**

The module measures the sharpness in 3 windows of selectable size via register settings(ISP_AFM_* A/B/C)

**struct rkisp1_cif_isp_hist_stat**

statistics histogram data

**Definition**

```c
struct rkisp1_cif_isp_hist_stat {
    __u32 hist_bins[RKISP1_CIF_ISP_HIST_BIN_N_MAX];
};
```

**Members**

- **hist_bins**  measured bin counters. Each bin is a 20 bits unsigned fixed point type. Bits 0-4 are the fractional part and bits 5-19 are the integer part.

**Description**

The window of the measurements area is divided to 5x5 sub-windows for V10/V11 and to 9x9 sub-windows for V12. The histogram is then computed for each sub-window independently and the final result is a weighted average of the histogram measurements on all sub-windows. The window of the measurements area and the weight of each sub-window are configurable using struct **rkisp1_cif_isp_hst_config**.

The number of entries of **hist_bins** depends on the hardware revision as is reported by the hw_revision field of the struct media_device_info that is returned by ioctl MEDIA_IOC_DEVICE_INFO.
Versions <= V11 have RKISP1_CIF_ISP_HIST_BIN_N_MAX_V10 entries, versions >= V12 have RKISP1_CIF_ISP_HIST_BIN_N_MAX_V12 entries. RKISP1_CIF_ISP_HIST_BIN_N_MAX is equal to the maximum of the two.

**struct rkspl_cif_isp_stat**

Rockchip ISP1 Statistics Data

**Definition**

```
struct rkspl_cif_isp_stat {
    struct rkspl_cif_isp_awb_stat awb;
    struct rkspl_cif_isp_ae_stat ae;
    struct rkspl_cif_isp_af_stat af;
    struct rkspl_cif_isp_hist_stat hist;
};
```

**Members**

- **awb** statistics data for automatic white balance
- **ae** statistics data for auto exposure
- **af** statistics data for auto focus
- **hist** statistics histogram data

**struct rkspl_stat_buffer**

Rockchip ISP1 Statistics Meta Data

**Definition**

```
struct rkspl_stat_buffer {
    __u32 meas_type;
    __u32 frame_id;
    struct rkspl_cif_isp_stat params;
};
```

**Members**

- **meas_type** measurement types (RKISP1_CIF_ISP_STAT_* definitions)
- **frame_id** frame ID for sync
- **params** statistics data

**V4L2_META_FMT_UVC (‘UVCH’)**

UVC Payload Header Data
### Description

This format describes standard UVC metadata, extracted from UVC packet headers and provided by the UVC driver through metadata video nodes. That data includes exact copies of the standard part of UVC Payload Header contents and auxiliary timing information, required for precise interpretation of timestamps, contained in those headers. See section “2.4.3.3 Video and Still Image Payload Headers” of the “UVC 1.5 Class specification” for details.

Each UVC payload header can be between 2 and 12 bytes large. Buffers can contain multiple headers, if multiple such headers have been transmitted by the camera for the respective frame. However, the driver may drop headers when the buffer is full, when they contain no useful information (e.g. those without the SCR field or with that field identical to the previous header), or generally to perform rate limiting when the device sends a large number of headers.

Each individual block contains the following fields:

**Table 73: UVC Metadata Block**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>__u64 ts;</td>
<td>system timestamp in host byte order, measured by the driver upon reception of the payload</td>
</tr>
<tr>
<td>__u16 sof;</td>
<td>USB Frame Number in host byte order, also obtained by the driver as close as possible to the above timestamp to enable correlation between them</td>
</tr>
<tr>
<td>__u8 length;</td>
<td>length of the rest of the block, including this field</td>
</tr>
<tr>
<td>__u8 flags;</td>
<td>Flags, indicating presence of other standard UVC fields</td>
</tr>
<tr>
<td>__u8 buf[];</td>
<td>The rest of the header, possibly including UVC PTS and SCR fields</td>
</tr>
</tbody>
</table>

**V4L2_META_FMT_VSP1_HGO (‘VSPH’)**

Renesas R-Car VSP1 1-D Histogram Data

### Description

This format describes histogram data generated by the Renesas R-Car VSP1 1-D Histogram (HGO) engine.

The VSP1 HGO is a histogram computation engine that can operate on RGB, YCrCb or HSV data. It operates on a possibly cropped and subsampled input image and computes the minimum, maximum and sum of all pixels as well as per-channel histograms.

The HGO can compute histograms independently per channel, on the maximum of the three channels (RGB data only) or on the Y channel only (YCbCr only). It can additionally output the histogram with 64 or 256 bins, resulting in four possible modes of operation.

- **In 64 bins normal mode**, the HGO operates on the three channels independently to compute three 64-bins histograms. RGB, YCbCr and HSV image formats are supported.
- **In 64 bins maximum mode**, the HGO operates on the maximum of the (R, G, B) channels to compute a single 64-bins histogram. Only the RGB image format is supported.
• In 256 bins normal mode, the HGO operates on the Y channel to compute a single 256-bins histogram. Only the YCbCr image format is supported.

• In 256 bins maximum mode, the HGO operates on the maximum of the (R, G, B) channels to compute a single 256-bins histogram. Only the RGB image format is supported.

**Byte Order.** All data is stored in memory in little endian format. Each cell in the tables contains one byte.

V4L2_META_FMT_VSP1_HGT (‘VSPT’)

Renesas R-Car VSP1 2-D Histogram Data

Description

This format describes histogram data generated by the Renesas R-Car VSP1 2-D Histogram (HGT) engine.

The VSP1 HGT is a histogram computation engine that operates on HSV data. It operates on a possibly cropped and subsampled input image and computes the sum, maximum and minimum of the S component as well as a weighted frequency histogram based on the H and S components.

The histogram is a matrix of 6 Hue and 32 Saturation buckets, 192 in total. Each HSV value is added to one or more buckets with a weight between 1 and 16 depending on the Hue areas configuration. Finding the corresponding buckets is done by inspecting the H and S value independently.

The Saturation position \( n \) (0 - 31) of the bucket in the matrix is found by the expression:

\[ n = \frac{S}{8} \]

The Hue position \( m \) (0 - 5) of the bucket in the matrix depends on how the HGT Hue areas are configured. There are 6 user configurable Hue Areas which can be configured to cover overlapping Hue values:

<table>
<thead>
<tr>
<th>Area 0</th>
<th>Area 1</th>
<th>Area 2</th>
<th>Area 3</th>
<th>Area 4</th>
<th>Area 5</th>
</tr>
</thead>
<tbody>
<tr>
<td>\ /</td>
<td>\ /</td>
<td>\ /</td>
<td>\ /</td>
<td>\ /</td>
<td>\ /</td>
</tr>
<tr>
<td>X</td>
<td>X</td>
<td>X</td>
<td>X</td>
<td>X</td>
<td>X</td>
</tr>
<tr>
<td>/ \</td>
<td>/ \</td>
<td>/ \</td>
<td>/ \</td>
<td>/ \</td>
<td>/ \</td>
</tr>
<tr>
<td>5U</td>
<td>0L</td>
<td>0U</td>
<td>1L</td>
<td>1U</td>
<td>2L</td>
</tr>
</tbody>
</table>

When two consecutive areas don’t overlap (\( n+1L \) is equal to \( nU \)) the boundary value is considered as part of the lower area.

Pixels with a hue value included in the centre of an area (between \( nL \) and \( nU \) included) are attributed to that single area and given a weight of 16. Pixels with a hue value included in
the overlapping region between two areas (between \( n+1 \) and \( n \) excluded) are attributed to both areas and given a weight for each of these areas proportional to their position along the diagonal lines (rounded down).

The Hue area setup must match one of the following constrains:

\[
\begin{align*}
0L & \leq 0U \leq 1L \leq 1U \leq 2L \leq 2U \leq 3L \leq 3U \leq 4L \leq 4U \leq 5L \leq 5U \\
0U & \leq 1L \leq 1U \leq 2L \leq 2U \leq 3L \leq 3U \leq 4L \leq 4U \leq 5L \leq 5U \leq 0L
\end{align*}
\]

**Byte Order.** All data is stored in memory in little endian format. Each cell in the tables contains one byte.

**V4L2_META_FMT_VIVID ('VIVD')**

VIVID Metadata Format

**Description**

This describes metadata format used by the vivid driver.

It sets Brightness, Saturation, Contrast and Hue, each of which maps to corresponding controls of the vivid driver with respect to the range and default values.

It contains the following fields:
Table 79: VIVID Metadata

<table>
<thead>
<tr>

### 3.2.2.14 Reserved Format Identifiers

These formats are not defined by this specification, they are just listed for reference and to avoid naming conflicts. If you want to register your own format, send an e-mail to the linux-media mailing list [https://linuxtv.org/lists.php](https://linuxtv.org/lists.php) for inclusion in the videodev2.h file. If you want to share your format with other developers add a link to your documentation and send a copy to the linux-media mailing list for inclusion in this section. If you think your format should be listed in a standard format section please make a proposal on the linux-media mailing list.

<table>
<thead>
<tr>
<th>Identifier</th>
<th>Code</th>
<th>Details</th>
</tr>
</thead>
</table>
| V4L2_PIX_FMT_S5C_UYVY_JPG | 'S5CI' | Two-planar format used by Samsung S5C73MX cameras. The first plane contains interleaved JPEG and UYVY image data, followed by metadata in form of an array of offsets to the UYVY data blocks. The actual pointer array follows immediately the interleaved JPEG/UYVY data, the number of entries in this array equals the height of the UYVY image. Each entry is a 4-byte unsigned integer in big endian order and it’s an offset to a single pixel line of the UYVY image. The first plane can start either with JPEG or UYVY data chunk. The size of a single UYVY block equals the UYVY image’s width multiplied by 2. The size of a JPEG chunk depends on the image and can vary with each line.
The second plane, at an offset of 4084 bytes, contains a 4-byte offset to the pointer array in the first plane. This offset is followed by a 4-byte value indicating size of the pointer array. All numbers in the second plane are also in big endian order. Remaining data in the second plane is undefined. The information in the second plane allows to easily find location of the pointer array, which can be different for each frame. The size of the pointer array is constant for given UYVY image height.
In order to extract UYVY and JPEG frames an application can initially set a data pointer to the start of first plane and then add an offset from the first entry of the pointers table. Such a pointer indicates start of an UYVY image pixel line. Whole UYVY line can be copied to a separate buffer. These steps should be repeated for each line, i.e. the number of entries in the pointer array. Anything what’s in between the UYVY lines is JPEG data and should be concatenated to form the JPEG stream. |
| V4L2_PIX_FMT_MT21C | ‘MT21’ | Compressed two-planar YVU420 format used by Mediatek MT8173. The compression is lossless. It is an opaque intermediate format and the MDP hardware must be used to convert V4L2_PIX_FMT_MT21C to V4L2_PIX_FMT_NV12M, V4L2_PIX_FMT_YUV420M or V4L2_PIX_FMT_YVU420. |

</thead>
<tbody>
<tr>
<td>V4L2_PIX_FMT_SUNXI_TILED_NV12</td>
<td>'ST12'</td>
<td>Two-planar NV12-based format used by the video engine found on Allwinner (codenamed sunxi) platforms, with 32x32 tiles for the luminance plane and 32x64 tiles for the chrominance plane. The data in each tile is stored in linear order, within the tile bounds. Each tile follows the previous one linearly in memory (from left to right, top to bottom). The associated buffer dimensions are aligned to match an integer number of tiles, resulting in 32-aligned resolutions for the luminance plane and 16-aligned resolutions for the chrominance plane (with 2x2 subsampling).</td>
</tr>
</tbody>
</table>

### 3.2.2.15 Colorspace

‘Color’ is a very complex concept and depends on physics, chemistry and biology. Just because you have three numbers that describe the ‘red’, ‘green’ and ‘blue’ components of the color of a pixel does not mean that you can accurately display that color. A colorspace defines what it actually means to have an RGB value of e.g. (255, 0, 0). That is, which color should be reproduced on the screen in a perfectly calibrated environment.

In order to do that we first need to have a good definition of color, i.e. some way to uniquely and unambiguously define a color so that someone else can reproduce it. Human color vision is trichromatic since the human eye has color receptors that are sensitive to three different wavelengths of light. Hence the need to use three numbers to describe color. Be glad you are not a mantis shrimp as those are sensitive to 12 different wavelengths, so instead of RGB we would be using the ABCDEFGHIJKL colorspace...

Color exists only in the eye and brain and is the result of how strongly color receptors are stimulated. This is based on the Spectral Power Distribution (SPD) which is a graph showing the intensity (radiant power) of the light at wavelengths covering the visible spectrum as it enters the eye. The science of colorimetry is about the relationship between the SPD and color as perceived by the human brain.

Since the human eye has only three color receptors it is perfectly possible that different SPDs will result in the same stimulation of those receptors and are perceived as the same color, even though the SPD of the light is different.

In the 1920s experiments were devised to determine the relationship between SPDs and the perceived color and that resulted in the CIE 1931 standard that defines spectral weighting functions that model the perception of color. Specifically that standard defines functions that can take an SPD and calculate the stimulus for each color receptor. After some further mathematical transforms these stimuli are known as the CIE XYZ tristimulus values and these X, Y and Z values describe a color as perceived by a human unambiguously. These X, Y and Z values are all in the range [0...1].

The Y value in the CIE XYZ colorspace corresponds to luminance. Often the CIE XYZ colorspace is transformed to the normalized CIE xyY colorspace:

\[
\begin{align*}
    x &= X / (X + Y + Z) \\
    y &= Y / (X + Y + Z)
\end{align*}
\]
The x and y values are the chromaticity coordinates and can be used to define a color without the luminance component Y. It is very confusing to have such similar names for these colorspace. Just be aware that if colors are specified with lower case ‘x’ and ‘y’, then the CIE xyY colorspace is used. Upper case ‘X’ and ‘Y’ refer to the CIE XYZ colorspace. Also, y has nothing to do with luminance. Together x and y specify a color, and Y the luminance. That is really all you need to remember from a practical point of view. At the end of this section you will find reading resources that go into much more detail if you are interested.

A monitor or TV will reproduce colors by emitting light at three different wavelengths, the combination of which will stimulate the color receptors in the eye and thus cause the perception of color. Historically these wavelengths were defined by the red, green and blue phosphors used in the displays. These color primaries are part of what defines a colorspace.

Different display devices will have different primaries and some primaries are more suitable for some display technologies than others. This has resulted in a variety of colorspace that are used for different display technologies or uses. To define a colorspace you need to define the three color primaries (these are typically defined as x, y chromaticity coordinates from the CIE xyY colorspace) but also the white reference: that is the color obtained when all three primaries are at maximum power. This determines the relative power or energy of the primaries. This is usually chosen to be close to daylight which has been defined as the CIE D65 Illuminant.

To recapitulate: the CIE XYZ colorspace uniquely identifies colors. Other colorspace are defined by three chromaticity coordinates defined in the CIE xyY colorspace. Based on those a 3x3 matrix can be constructed that transforms CIE XYZ colors to colors in the new colorspace.

Both the CIE XYZ and the RGB colorspace that are derived from the specific chromaticity primaries are linear colorspace. But neither the eye, nor display technology is linear. Doubling the values of all components in the linear colorspace will not be perceived as twice the intensity of the color. So each colorspace also defines a transfer function that takes a linear color component value and transforms it to the non-linear component value, which is a closer match to the non-linear performance of both the eye and displays. Linear component values are denoted RGB, non-linear are denoted as R’G’B’. In general colors used in graphics are all R’G’B’, except in openGL which uses linear RGB. Special care should be taken when dealing with openGL to provide linear RGB colors or to use the built-in openGL support to apply the inverse transfer function.

The final piece that defines a colorspace is a function that transforms non-linear R’G’B’ to non-linear Y’CbCr. This function is determined by the so-called luma coefficients. There may be multiple possible Y’CbCr encodings allowed for the same colorspace. Many encodings of color prefer to use luma (Y’) and chroma (CbCr) instead of R’G’B’. Since the human eye is more sensitive to differences in luminance than in color this encoding allows one to reduce the amount of color information compared to the luma data. Note that the luma (Y’) is unrelated to the Y in the CIE XYZ colorspace. Also note that Y’CbCr is often called YCbCr or YUV even though these are strictly speaking wrong.

Sometimes people confuse Y’CbCr as being a colorspace. This is not correct, it is just an encoding of an R’G’B’ color into luma and chroma values. The underlying colorspace that is associated with the R’G’B’ color is also associated with the Y’CbCr color.

The final step is how the RGB, R’G’B’ or Y’CbCr values are quantized. The CIE XYZ colorspace where X, Y and Z are in the range [0…1] describes all colors that humans can perceive, but the transform to another colorspace will produce colors that are outside the [0…1] range. Once clamped to the [0…1] range those colors can no longer be reproduced in that colorspace. This clamping is what reduces the extent or gamut of the colorspace. How the range of [0…1] is translated to integer values in the range of [0…255] (or higher, depending on the color depth)
is called the quantization. This is not part of the colorspace definition. In practice RGB or R’G’B’ values are full range, i.e. they use the full [0...255] range. Y’CbCr values on the other hand are limited range with Y’ using [16...235] and Cb and Cr using [16...240].

Unfortunately, in some cases limited range RGB is also used where the components use the range [16...235]. And full range Y’CbCr also exists using the [0...255] range.

In order to correctly interpret a color you need to know the quantization range, whether it is R’G’B’ or Y’CbCr, the used Y’CbCr encoding and the colorspace. From that information you can calculate the corresponding CIE XYZ color and map that again to whatever colorspace your display device uses.

The colorspace definition itself consists of the three chromaticity primaries, the white reference chromaticity, a transfer function and the luma coefficients needed to transform R’G’B’ to Y’CbCr. While some colorspace standards correctly define all four, quite often the colorspace standard only defines some, and you have to rely on other standards for the missing pieces. The fact that colorspaces are often a mix of different standards also led to very confusing naming conventions where the name of a standard was used to name a colorspace when in fact that standard was part of various other colorspaces as well.

If you want to read more about colors and colorspaces, then the following resources are useful: poynton is a good practical book for video engineers, colimg has a much broader scope and describes many more aspects of color (physics, chemistry, biology, etc.). The http://www.brucelindbloom.com website is an excellent resource, especially with respect to the mathematics behind colorspace conversions. The wikipedia CIE 1931 colorspace article is also very useful.

### 3.2.2.16 Defining Colorspace in V4L2

In V4L2 colorspaces are defined by four values. The first is the colorspace identifier (enum `v4l2_colorspace`) which defines the chromaticities, the default transfer function, the default Y’CbCr encoding and the default quantization method. The second is the transfer function identifier (enum `v4l2_xfer_func`) to specify non-standard transfer functions. The third is the Y’CbCr encoding identifier (enum `v4l2_ycbcr_encoding`) to specify non-standard Y’CbCr encodings and the fourth is the quantization identifier (enum `v4l2_quantization`) to specify non-standard quantization methods. Most of the time only the colorspace field of struct `v4l2_pix_format` or struct `v4l2_pix_format_mplane` needs to be filled in.

On HSV formats the Hue is defined as the angle on the cylindrical color representation. Usually this angle is measured in degrees, i.e. 0-360. When we map this angle value into 8 bits, there are two basic ways to do it: Divide the angular value by 2 (0-179), or use the whole range, 0-255, dividing the angular value by 1.41. The enum `v4l2_hsv_encoding` specifies which encoding is used.

**Note:** The default R’G’B’ quantization is full range for all colorspaces. HSV formats are always full range.

</tbody>
</table>
3.2.2.17 Detailed Colorspace Descriptions

Colorsace SMPTE 170M (V4L2_COLORSPACE_SMPTE170M)

The **SMPTE 170M** standard defines the colorspace used by NTSC and PAL and by SDTV in general. The default transfer function is **V4L2_XFER_FUNC_709**. The default Y'CbCr encoding is **V4L2_YCBCR_ENC_601**. The default Y’CbCr quantization is limited range. The chromaticities of the primary colors and the white reference are:

<table>
<thead>
<tr>
<th>Color</th>
<th>x</th>
<th>y</th>
</tr>
</thead>
<tbody>
<tr>
<td>Red</td>
<td>0.630</td>
<td>0.340</td>
</tr>
<tr>
<td>Green</td>
<td>0.310</td>
<td>0.595</td>
</tr>
<tr>
<td>Blue</td>
<td>0.155</td>
<td>0.070</td>
</tr>
<tr>
<td>White Reference (D65)</td>
<td>0.3127</td>
<td>0.3290</td>
</tr>
</tbody>
</table>

The red, green and blue chromaticities are also often referred to as the SMPTE C set, so this colorspace is sometimes called SMPTE C as well.

The transfer function defined for SMPTE 170M is the same as the one defined in Rec. 709.

\[
L' = \begin{cases} 
-1.099(-L)^{0.45} + 0.099, & \text{for } L \leq -0.018 \\
4.5L, & \text{for } -0.018 < L < 0.018 \\
1.099L^{0.45} - 0.099, & \text{for } L \geq 0.018 
\end{cases}
\]

Inverse Transfer function:

\[
L = \begin{cases} 
-\left( \frac{L' - 0.099}{-1.099} \right)^{\frac{1}{0.45}}, & \text{for } L' \leq -0.081 \\
\frac{L'}{4.5}, & \text{for } -0.081 < L' < 0.081 \\
\left( \frac{L' + 0.099}{1.099} \right)^{\frac{1}{0.45}}, & \text{for } L' \geq 0.081 
\end{cases}
\]

The luminance (Y’) and color difference (Cb and Cr) are obtained with the following **V4L2_YCBCR_ENC_601** encoding:

\[
Y' = 0.2990R' + 0.5870G' + 0.1140B' \\
Cb = -0.1687R' - 0.3313G' + 0.5B' \\
Cr = 0.5R' - 0.4187G' - 0.0813B'
\]

Y’ is clamped to the range [0...1] and Cb and Cr are clamped to the range [-0.5...0.5]. This conversion to Y’CbCr is identical to the one defined in the **ITU BT.601** standard and this colorspace is sometimes called BT.601 as well, even though BT.601 does not mention any color primaries.

The default quantization is limited range, but full range is possible although rarely seen.
**Colors space Rec. 709 (V4L2_COLORSPACE_REC709)**

The *ITU BT.709* standard defines the colorspace used by HDTV in general. The default transfer function is `V4L2_XFER_FUNC_709`. The default Y’CbCr encoding is `V4L2_YCBCR_ENC_709`. The default Y’CbCr quantization is limited range. The chromaticities of the primary colors and the white reference are:

<table>
<thead>
<tr>
<th>Color</th>
<th>x</th>
<th>y</th>
</tr>
</thead>
<tbody>
<tr>
<td>Red</td>
<td>0.640</td>
<td>0.330</td>
</tr>
<tr>
<td>Green</td>
<td>0.300</td>
<td>0.600</td>
</tr>
<tr>
<td>Blue</td>
<td>0.150</td>
<td>0.060</td>
</tr>
<tr>
<td>White Reference</td>
<td>0.3127</td>
<td>0.3290</td>
</tr>
</tbody>
</table>

The full name of this standard is Rec. ITU-R BT.709-5.

Transfer function. Normally L is in the range [0...1], but for the extended gamut xvYCC encoding values outside that range are allowed.

\[
L' = -1.099(-L)^{0.45} + 0.099, \text{ for } L \leq -0.018 \\
L' = 4.5L, \text{ for } -0.018 < L < 0.018 \\
L' = 1.099L^{0.45} - 0.099, \text{ for } L \geq 0.018
\]

Inverse Transfer function:

\[
L = -\left(\frac{L' - 0.099}{-1.099}\right)^{\frac{1}{0.45}}, \text{ for } L' \leq -0.081 \\
L = \frac{L'}{4.5}, \text{ for } -0.081 < L' < 0.081 \\
L = \left(\frac{L' + 0.099}{1.099}\right)^{\frac{1}{0.45}}, \text{ for } L' \geq 0.081
\]

The luminance (Y’) and color difference (Cb and Cr) are obtained with the following `V4L2_YCBCR_ENC_709` encoding:

\[
Y' = 0.2126R' + 0.7152G' + 0.0722B' \\
Cb = -0.1146R' - 0.3854G' + 0.5B' \\
Cr = 0.5R' - 0.4542G' - 0.0458B'
\]

Y’ is clamped to the range [0...1] and Cb and Cr are clamped to the range [-0.5...0.5].

The default quantization is limited range, but full range is possible although rarely seen.

The `V4L2_YCBCR_ENC_709` encoding described above is the default for this colorspace, but it can be overridden with `V4L2_YCBCR_ENC_601`, in which case the BT.601 Y’CbCr encoding is used.

Two additional extended gamut Y’CbCr encodings are also possible with this colorspace:

The xvYCC 709 encoding (`V4L2_YCBCR_ENC_XV709`, *xvYCC*) is similar to the Rec. 709 encoding, but it allows for R’, G’ and B’ values that are outside the range [0...1]. The resulting Y’, Cb and Cr values are:

\[
Y' = 0.2126R' + 0.7152G' + 0.0722B' \\
Cb = -0.1146R' - 0.3854G' + 0.5B' \\
Cr = 0.5R' - 0.4542G' - 0.0458B'
\]

Y’ is clamped to the range [0...1] and Cb and Cr are clamped to the range [-0.5...0.5].

The default quantization is limited range, but full range is possible although rarely seen.

The `V4L2_YCBCR_ENC_XV709` encoding described above is the default for this colorspace, but it can be overridden with `V4L2_YCBCR_ENC_601`, in which case the BT.601 Y’CbCr encoding is used.
Cr values are scaled and offset according to the limited range formula:

\[ Y' = \frac{219}{256} \times (0.2126R' + 0.7152G' + 0.0722B') + \frac{16}{256} \]

\[ Cb = \frac{224}{256} \times (-0.1146R' - 0.3854G' + 0.5B') \]

\[ Cr = \frac{224}{256} \times (0.5R' - 0.4542G' - 0.0458B') \]

The xvYCC 601 encoding (V4L2_YCBCR_ENC_XV601, xvYCC) is similar to the BT.601 encoding, but it allows for R’, G’ and B’ values that are outside the range [0...1]. The resulting Y’, Cb and Cr values are scaled and offset according to the limited range formula:

\[ Y' = \frac{219}{256} \times (0.2990R' + 0.5870G' + 0.1140B') + \frac{16}{256} \]

\[ Cb = \frac{224}{256} \times (-0.1687R' - 0.3313G' + 0.5B') \]

\[ Cr = \frac{224}{256} \times (0.5R' - 0.4187G' - 0.0813B') \]

Y’ is clamped to the range [0...1] and Cb and Cr are clamped to the range [-0.5...0.5] and quantized without further scaling or offsets. The non-standard xvYCC 709 or xvYCC 601 encodings can be used by selecting V4L2_YCBCR_ENC_XV709 or V4L2_YCBCR_ENC_XV601. As seen by the xvYCC formulas these encodings always use limited range quantization, there is no full range variant. The whole point of these extended gamut encodings is that values outside the limited range are still valid, although they map to R’, G’ and B’ values outside the [0...1] range and are therefore outside the Rec. 709 colorspace gamut.

**Colorsace sRGB (V4L2_COLORSPACE_SRGB)**

The sRGB standard defines the colorspace used by most webcams and computer graphics. The default transfer function is V4L2_XFER_FUNC_SRGB. The default Y’CbCr encoding is V4L2_YCBCR_ENC_601. The default Y’CbCr quantization is limited range.

Note that the sYCC standard specifies full range quantization, however all current capture hardware supported by the kernel convert R’G’B’ to limited range Y’CbCr. So choosing full range as the default would break how applications interpret the quantization range.

The chromaticities of the primary colors and the white reference are:

<table>
<thead>
<tr>
<th>Color</th>
<th>x</th>
<th>y</th>
</tr>
</thead>
<tbody>
<tr>
<td>Red</td>
<td>0.640</td>
<td>0.330</td>
</tr>
<tr>
<td>Green</td>
<td>0.300</td>
<td>0.600</td>
</tr>
<tr>
<td>Blue</td>
<td>0.150</td>
<td>0.060</td>
</tr>
<tr>
<td>White Reference</td>
<td>0.3127</td>
<td>0.3290</td>
</tr>
</tbody>
</table>

These chromaticities are identical to the Rec. 709 colorspace.
Transfer function. Note that negative values for \( L \) are only used by the Y’CbCr conversion.

\[
L' = -1.055(-L)\frac{1}{255} + 0.055, \text{ for } L < -0.0031308 \\
L' = 12.92L, \text{ for } -0.0031308 \leq L \leq 0.0031308 \\
L' = 1.055L\frac{1}{255} - 0.055, \text{ for } 0.0031308 < L \leq 1
\]

Inverse Transfer function:

\[
L = \frac{1}{12.92}L', \text{ for } L' < -0.04045 \\
L = L', \text{ for } -0.04045 \leq L' \leq 0.04045 \\
L = \frac{1}{1.055}(L' + 0.055)^2, \text{ for } L' > 0.04045
\]

The luminance (Y’) and color difference (Cb and Cr) are obtained with the following V4L2_YCBCR_ENC_601 encoding as defined by sYCC:

\[
Y' = 0.2990R' + 0.5870G' + 0.1140B' \\
Cb = -0.1687R' - 0.3313G' + 0.5B' \\
Cr = 0.5R' - 0.4187G' - 0.0813B'
\]

Y’ is clamped to the range [0...1] and Cb and Cr are clamped to the range [-0.5...0.5]. This transform is identical to one defined in SMPTE 170M/BT.601. The Y’CbCr quantization is limited range.

**Colorspace opRGB (V4L2_COLORSPACE_OPRGB)**

The opRGB standard defines the colorspace used by computer graphics that use the opRGB colorspace. The default transfer function is V4L2_XFER_FUNC_OPRGB. The default Y’CbCr encoding is V4L2_YCBCR_ENC_601. The default Y’CbCr quantization is limited range.

Note that the opRGB standard specifies full range quantization, however all current capture hardware supported by the kernel convert R’G’B’ to limited range Y’CbCr. So choosing full range as the default would break how applications interpret the quantization range.

The chromaticities of the primary colors and the white reference are:

<table>
<thead>
<tr>
<th>Color</th>
<th>x</th>
<th>y</th>
</tr>
</thead>
<tbody>
<tr>
<td>Red</td>
<td>0.6400</td>
<td>0.3300</td>
</tr>
<tr>
<td>Green</td>
<td>0.2100</td>
<td>0.7100</td>
</tr>
<tr>
<td>Blue</td>
<td>0.1500</td>
<td>0.0600</td>
</tr>
<tr>
<td>White Reference (D65)</td>
<td>0.3127</td>
<td>0.3290</td>
</tr>
</tbody>
</table>

Transfer function:

\[
L' = L\frac{1}{255}
\]

Inverse Transfer function:

\[
L = L'^{(2.19921875)}
\]

The luminance (Y’) and color difference (Cb and Cr) are obtained with the following
V4L2_YCBCR_ENC_601 encoding:

\[ Y' = 0.2990R' + 0.5870G' + 0.1140B' \]
\[ Cb = -0.1687R' - 0.3313G' + 0.5B' \]
\[ Cr = 0.5R' - 0.4187G' - 0.0813B' \]

Y’ is clamped to the range [0...1] and Cb and Cr are clamped to the range [-0.5...0.5]. This transform is identical to one defined in SMPTE 170M/BT.601. The Y’CbCr quantization is limited range.

### Colorspace BT.2020 (V4L2_COLORSPACE_BT2020)

The ITU BT.2020 standard defines the colorspace used by Ultra-high definition television (UHDTV). The default transfer function is V4L2_XFER_FUNC_709. The default Y’CbCr encoding is V4L2_YCBCR_ENC_BT2020. The default Y’CbCr quantization is limited range. The chromaticities of the primary colors and the white reference are:

<table>
<thead>
<tr>
<th>Color</th>
<th>x</th>
<th>y</th>
</tr>
</thead>
<tbody>
<tr>
<td>Red</td>
<td>0.708</td>
<td>0.292</td>
</tr>
<tr>
<td>Green</td>
<td>0.170</td>
<td>0.797</td>
</tr>
<tr>
<td>Blue</td>
<td>0.131</td>
<td>0.046</td>
</tr>
<tr>
<td>White Reference (D65)</td>
<td>0.3127</td>
<td>0.3290</td>
</tr>
</tbody>
</table>

Transfer function (same as Rec. 709):

\[ L' = 4.5L, \text{ for } 0 \leq L < 0.018 \]
\[ L' = 1.099L^{0.45} - 0.099, \text{ for } 0.018 \leq L \leq 1 \]

Inverse Transfer function:

\[ L = L'/4.5, \text{ for } L' < 0.081 \]
\[ L = \left( \frac{L' + 0.099}{1.099} \right)^{1/0.45}, \text{ for } L' \geq 0.081 \]

Please note that while Rec. 709 is defined as the default transfer function by the ITU BT.2020 standard, in practice this colorspace is often used with the Transfer Function SMPTE 2084 (V4L2_XFER_FUNC_SMPTE2084). In particular Ultra HD Blu-ray discs use this combination.

The luminance (Y’) and color difference (Cb and Cr) are obtained with the following V4L2_YCBCR_ENC_BT2020 encoding:

\[ Y' = 0.2627R' + 0.6780G' + 0.0593B' \]
\[ Cb = -0.1396R' - 0.3604G' + 0.5B' \]
\[ Cr = 0.5R' - 0.4598G' - 0.0402B' \]

Y’ is clamped to the range [0...1] and Cb and Cr are clamped to the range [-0.5...0.5]. The Y’CbCr quantization is limited range.

There is also an alternate constant luminance R’G’B’ to Yc’CbcCr (V4L2_YCBCR_ENC_BT2020_CONST_LUM) encoding:
Luma:

\[ Y'c' = (0.2627R + 0.6780G + 0.0593B)' \]

\[ B' - Y'c' \leq 0 : \]
\[ Cbc = (B' - Y'c')/1.9404 \]
\[ B' - Y'c' > 0 : \]
\[ Cbc = (B' - Y'c')/1.5816 \]
\[ R' - Y'c' \leq 0 : \]
\[ Crc = (R' - Y')/1.7184 \]
\[ R' - Y'c' > 0 : \]
\[ Crc = (R' - Y')/0.9936 \]

\( Yc' \) is clamped to the range \([0...1]\) and \( Cbc \) and \( Crc \) are clamped to the range \([-0.5...0.5]\). The \( Yc'CbcCrc \) quantization is limited range.

**Colorspace DCI-P3 (V4L2_COLORSPACE_DCI_P3)**

The **SMPTE RP 431-2** standard defines the colorspace used by cinema projectors that use the DCI-P3 colorspace. The default transfer function is `V4L2_XFER_FUNC_DCI_P3`. The default \( Y'CbCr \) encoding is `V4L2_YCBCR_ENC_709`. The default \( Y'CbCr \) quantization is limited range.

---

**Note:** Note that this colorspace standard does not specify a \( Y'CbCr \) encoding since it is not meant to be encoded to \( Y'CbCr \). So this default \( Y'CbCr \) encoding was picked because it is the HDTV encoding.

The chromaticities of the primary colors and the white reference are:

<table>
<thead>
<tr>
<th>Color</th>
<th>x</th>
<th>y</th>
</tr>
</thead>
<tbody>
<tr>
<td>Red</td>
<td>0.6800</td>
<td>0.3200</td>
</tr>
<tr>
<td>Green</td>
<td>0.2650</td>
<td>0.6900</td>
</tr>
<tr>
<td>Blue</td>
<td>0.1500</td>
<td>0.0600</td>
</tr>
<tr>
<td>White Reference</td>
<td>0.3140</td>
<td>0.3510</td>
</tr>
</tbody>
</table>

Transfer function:

\[ L' = L^{\frac{1}{\gamma}} \]

Inverse Transfer function:

\[ L = L'^{\gamma(2.6)} \]

\( Y'CbCr \) encoding is not specified. V4L2 defaults to Rec. 709.
Colorspace SMPTE 240M (V4L2_COLORSPACE_SMPTE240M)

The SMPTE 240M standard was an interim standard used during the early days of HDTV (1988-1998). It has been superseded by Rec. 709. The default transfer function is V4L2_XFER_FUNC_SMPTE240M. The default Y’CbCr encoding is V4L2_YCBCR_ENC_SMPTE240M. The default Y’CbCr quantization is limited range. The chromaticities of the primary colors and the white reference are:

Table 92: SMPTE 240M Chromaticities

<table>
<thead>
<tr>
<th>Color</th>
<th>x</th>
<th>y</th>
</tr>
</thead>
<tbody>
<tr>
<td>Red</td>
<td>0.630</td>
<td>0.340</td>
</tr>
<tr>
<td>Green</td>
<td>0.310</td>
<td>0.595</td>
</tr>
<tr>
<td>Blue</td>
<td>0.155</td>
<td>0.070</td>
</tr>
<tr>
<td>White Reference (D65)</td>
<td>0.3127</td>
<td>0.3290</td>
</tr>
</tbody>
</table>

These chromaticities are identical to the SMPTE 170M colorspace.

Transfer function:

\[ L' = 4L, \text{ for } 0 \leq L < 0.0228 \]
\[ L' = 1.1115L^{0.45} - 0.1115, \text{ for } 0.0228 \leq L \leq 1 \]

Inverse Transfer function:

\[ L = \frac{L'}{4}, \text{ for } 0 \leq L' < 0.0913 \]
\[ L = \left( \frac{L' + 0.1115}{1.1115} \right)^{\frac{1}{0.45}}, \text{ for } L' \geq 0.0913 \]

The luminance (Y’) and color difference (Cb and Cr) are obtained with the following V4L2_YCBCR_ENC_SMPTE240M encoding:

\[ Y' = 0.2122R' + 0.7013G' + 0.0865B' \]
\[ Cb = -0.1161R' - 0.3839G' + 0.5B' \]
\[ Cr = 0.5R' - 0.4451G' - 0.065B' \]

Y’ is clamped to the range [0...1] and Cb and Cr are clamped to the range [-0.5...0.5]. The Y’CbCr quantization is limited range.

Colorsace NTSC 1953 (V4L2_COLORSPACE_470_SYSTEM_M)

This standard defines the colorspace used by NTSC in 1953. In practice this colorspace is obsolete and SMPTE 170M should be used instead. The default transfer function is V4L2_XFER_FUNC_709. The default Y’CbCr encoding is V4L2_YCBCR_ENC_601. The default Y’CbCr quantization is limited range. The chromaticities of the primary colors and the white reference are:
Table 93: NTSC 1953 Chromaticities

<table>
<thead>
<tr>
<th>Color</th>
<th>x</th>
<th>y</th>
</tr>
</thead>
<tbody>
<tr>
<td>Red</td>
<td>0.67</td>
<td>0.33</td>
</tr>
<tr>
<td>Green</td>
<td>0.21</td>
<td>0.71</td>
</tr>
<tr>
<td>Blue</td>
<td>0.14</td>
<td>0.08</td>
</tr>
<tr>
<td>White Reference (C)</td>
<td>0.310</td>
<td>0.316</td>
</tr>
</tbody>
</table>

**Note:** This colorspace uses Illuminant C instead of D65 as the white reference. To correctly convert an image in this colorspace to another that uses D65 you need to apply a chromatic adaptation algorithm such as the Bradford method.

The transfer function was never properly defined for NTSC 1953. The Rec. 709 transfer function is recommended in the literature:

\[
L' = 4.5L, \text{ for } 0 \leq L < 0.018
\]

\[
L' = 1.099L^{0.45} - 0.099, \text{ for } 0.018 \leq L \leq 1
\]

Inverse Transfer function:

\[
L = \frac{L'}{4.5}, \text{ for } L' < 0.081
\]

\[
L = \left( \frac{L' + 0.099}{1.099} \right)^{\frac{1}{0.45}}, \text{ for } L' \geq 0.081
\]

The luminance (Y') and color difference (Cb and Cr) are obtained with the following V4L2_YCBCR_ENC_601 encoding:

\[
Y' = 0.2990R' + 0.5870G' + 0.1140B'
\]

\[
Cb = -0.1687R' - 0.3313G' + 0.5B'
\]

\[
Cr = 0.5R' - 0.4187G' - 0.0813B'
\]

Y' is clamped to the range [0...1] and Cb and Cr are clamped to the range [-0.5...0.5]. The Y'CbCr quantization is limited range. This transform is identical to one defined in SMPTE 170M/BT.601.

**Colorspace EBU Tech. 3213 (V4L2_COLORSPACE_470_SYSTEM_BG)**

The **EBU Tech 3213** standard defines the colorspace used by PAL/SECAM in 1975. Note that this colorspace is not supported by the HDMI interface. Instead **EBU Tech 3321** recommends that Rec. 709 is used instead for HDMI. The default transfer function is V4L2_XFER_FUNC_709. The default Y’CbCr encoding is V4L2_YCBCR_ENC_601. The default Y’CbCr quantization is limited range. The chromaticities of the primary colors and the white reference are:

Table 94: EBU Tech. 3213 Chromaticities

<table>
<thead>
<tr>

The transfer function was never properly defined for this colorspace. The Rec. 709 transfer function is recommended in the literature:

\[ L' = 4.5L, \text{ for } 0 \leq L < 0.018 \]
\[ L' = 1.099L^{0.45} - 0.099, \text{ for } 0.018 \leq L \leq 1 \]

Inverse Transfer function:

\[ L = \frac{L'}{4.5}, \text{ for } L' < 0.081 \]
\[ L = \left( \frac{L' + 0.099}{1.099} \right)^{\frac{1}{0.45}}, \text{ for } L' \geq 0.081 \]

The luminance (Y') and color difference (Cb and Cr) are obtained with the following V4L2_YCBCR_ENC_601 encoding:

\[ Y' = 0.2990R' + 0.5870G' + 0.1140B' \]
\[ Cb = -0.1687R' - 0.3313G' + 0.5B' \]
\[ Cr = 0.5R' - 0.4187G' - 0.0813B' \]

Y' is clamped to the range [0...1] and Cb and Cr are clamped to the range [-0.5...0.5]. The Y'CbCr quantization is limited range. This transform is identical to one defined in SMPTE 170M/BT.601.

**Colorspace JPEG (V4L2_COLORSPACE_JPEG)**

This colorspace defines the colorspace used by most (Motion-)JPEG formats. The chromaticities of the primary colors and the white reference are identical to sRGB. The transfer function use is V4L2_XFER_FUNC_SRGB. The Y’CbCr encoding is V4L2_YCBCR_ENC_601 with full range quantization where Y’ is scaled to [0...255] and Cb/Cr are scaled to [-128...128] and then clipped to [-128...127].

**Note:** The JPEG standard does not actually store colorspace information. So if something other than sRGB is used, then the driver will have to set that information explicitly. Effectively V4L2_COLORSPACE_JPEG can be considered to be an abbreviation for V4L2_COLORSPACE_SRGB, V4L2_XFER_FUNC_SRGB, V4L2_YCBCR_ENC_601 and V4L2_QUANTIZATION_FULL_RANGE.

### 3.2.2.18 Detailed Transfer Function Descriptions

**Transfer Function SMPTE 2084 (V4L2_XFER_FUNC_SMPTE2084)**

The *SMPTE ST 2084* standard defines the transfer function used by High Dynamic Range content.

**Constants:**
\[ m1 = (2610 / 4096) / 4 \]
\[ m2 = (2523 / 4096) \times 128 \]
\[ c1 = 3424 / 4096 \]
\[ c2 = (2413 / 4096) \times 32 \]
$$c3 = (2392 / 4096) \times 32$$

**Transfer function:**
$$L' = \left(\frac{c1 + c2 \times L_{m1}}{1 + c3 \times L_{m1}}\right)^{m2}$$

**Inverse Transfer function:**
$$L = \left(\frac{\max(L'^{1/m2} - c1, 0)}{c2 - c3 \times L'^{1/m2}}\right)^{1/m1}$$

Take care when converting between this transfer function and non-HDR transfer functions: the linear RGB values \([0...1]\) of HDR content map to a luminance range of 0 to 10000 cd/m\(^2\) whereas the linear RGB values of non-HDR (aka Standard Dynamic Range or SDR) map to a luminance range of 0 to 100 cd/m\(^2\).

To go from SDR to HDR you will have to divide \(L\) by 100 first. To go in the other direction you will have to multiply \(L\) by 100. Of course, this clamps all luminance values over 100 cd/m\(^2\) to 100 cd/m\(^2\).

There are better methods, see e.g. `colimg` for more in-depth information about this.

### 3.2.3 Input/Output

The V4L2 API defines several different methods to read from or write to a device. All drivers exchanging data with applications must support at least one of them.

The classic I/O method using the `read()` and `write()` function is automatically selected after opening a V4L2 device. When the driver does not support this method attempts to read or write will fail at any time.

Other methods must be negotiated. To select the streaming I/O method with memory mapped or user buffers applications call the `ioctl VIDIOC_REQBUFS` ioctl. The asynchronous I/O method is not defined yet.

Video overlay can be considered another I/O method, although the application does not directly receive the image data. It is selected by initiating video overlay with the `VIDIOC_S_FMT` ioctl. For more information see [Video Overlay Interface](#).

Generally exactly one I/O method, including overlay, is associated with each file descriptor. The only exceptions are applications not exchanging data with a driver (“panel applications”, see [Opening and Closing Devices](#)) and drivers permitting simultaneous video capturing and overlay using the same file descriptor, for compatibility with V4L and earlier versions of V4L2.

`VIDIOC_S_FMT` and `ioctl VIDIOC_REQBUFS` would permit this to some degree, but for simplicity drivers need not support switching the I/O method (after first switching away from read/write) other than by closing and reopening the device.

The following sections describe the various I/O methods in more detail.

#### 3.2.3.1 Read/Write

Input and output devices support the `read()` and `write()` function, respectively, when the `V4L2_CAP_READWRITE` flag in the capabilities field of struct `v4l2_capability` returned by the `ioctl VIDIOC_QUERYCAP` ioctl is set.

Drivers may need the CPU to copy the data, but they may also support DMA to or from user memory, so this I/O method is not necessarily less efficient than other methods merely exchanging buffer pointers. It is considered inferior though because no meta-information like frame counters or timestamps are passed. This information is necessary to recognize frame dropping and to synchronize with other data streams. However this is also the simplest I/O
method, requiring little or no setup to exchange data. It permits command line stunts like this (the vidctrl tool is fictitious):

```
$ vidctrl /dev/video --input=0 --format=YUYV --size=352x288
$ dd if=/dev/video of=myimage.422 bs=202752 count=1
```

To read from the device applications use the `read()` function, to write the `write()` function. Drivers must implement one I/O method if they exchange data with applications, but it need not be this.\(^1\) When reading or writing is supported, the driver must also support the `select()` and `poll()` function.\(^2\)

### 3.2.3.2 Streaming I/O (Memory Mapping)

Input and output devices support this I/O method when the `V4L2_CAP_STREAMING` flag in the `capabilities` field of `struct v4l2_capability` returned by the `ioctl VIDIOC_QUERYCAP` ioctl is set. There are two streaming methods, to determine if the memory mapping flavor is supported applications must call the `ioctl VIDIOC_REQBUFS` ioctl with the memory type set to `V4L2_MEMORY_MMAP`.

Streaming is an I/O method where only pointers to buffers are exchanged between application and driver, the data itself is not copied. Memory mapping is primarily intended to map buffers in device memory into the application’s address space. Device memory can be for example the video memory on a graphics card with a video capture add-on. However, being the most efficient I/O method available for a long time, many other drivers support streaming as well, allocating buffers in DMA-able main memory.

A driver can support many sets of buffers. Each set is identified by a unique buffer type value. The sets are independent and each set can hold a different type of data. To access different sets at the same time different file descriptors must be used.\(^1\)

To allocate device buffers applications call the `ioctl VIDIOC_REQBUFS` ioctl with the desired number of buffers and buffer type, for example `V4L2_BUF_TYPE_VIDEO_CAPTURE`. This ioctl can also be used to change the number of buffers or to free the allocated memory, provided none of the buffers are still mapped.

Before applications can access the buffers they must map them into their address space with the `mmap()` function. The location of the buffers in device memory can be determined with the `ioctl VIDIOC_QUERYBUF` ioctl. In the single-planar API case, the `m.offset` and `length` returned in a `struct v4l2_buffer` are passed as sixth and second parameter to the `mmap()` function. When using the multi-planar API, `struct v4l2_buffer` contains an array of `struct v4l2_plane` structures, each containing its own `m.offset` and `length`. When using the multi-planar API, every plane of every buffer has to be mapped separately, so the number of calls to `mmap()` should be equal to number of buffers times number of planes in each buffer. The offset and length values must not be modified. Remember, the buffers are allocated in physical memory, as opposed to virtual memory, which can be swapped out to disk. Applications should free the buffers as soon as possible with the `munmap()` function.

---

\(^1\) It would be desirable if applications could depend on drivers supporting all I/O interfaces, but as much as the complex memory mapping I/O can be inadequate for some devices we have no reason to require this interface, which is most useful for simple applications capturing still images.

\(^2\) At the driver level `select()` and `poll()` are the same, and `select()` is too important to be optional.

\(^1\) One could use one file descriptor and set the buffer type field accordingly when calling `ioctl VIDIOC_QBUF, VIDIOC_DQBUF` etc., but it makes the `select()` function ambiguous. We also like the clean approach of one file descriptor per logical stream. Video overlay for example is also a logical stream, although the CPU is not needed for continuous operation.
**Example: Mapping buffers in the single-planar API**

```c
struct v4l2_requestbuffers reqbuf;
struct {
    void *start;
    size_t length;
} *buffers;
unsigned int i;

memset(&reqbuf, 0, sizeof(reqbuf));
reqbuf.type = V4L2_BUF_TYPE_VIDEO_CAPTURE;
reqbuf.memory = V4L2_MEMORY_MMAP;
reqbuf.count = 20;

if (-1 == ioctl(fd, VIDIOC_REQBUFS, &reqbuf)) {
    if (errno == EINVAL)
        printf("Video capturing or mmap-streaming is not supported\n");
    else
        perror("VIDIOC_REQBUFS");
    exit(EXIT_FAILURE);
}

/* We want at least five buffers. */

if (reqbuf.count < 5) {
    /* You may need to free the buffers here. */
    printf("Not enough buffer memory\n");
    exit(EXIT_FAILURE);
}

buffers = calloc(reqbuf.count, sizeof(*buffers));
assert(buffers != NULL);

for (i = 0; i < reqbuf.count; i++) {
    struct v4l2_buffer buffer;

    memset(&buffer, 0, sizeof(buffer));
    buffer.type = reqbuf.type;
    buffer.memory = V4L2_MEMORY_MMAP;
    buffer.index = i;

    if (-1 == ioctl(fd, VIDIOC_QUERYBUF, &buffer)) {
        perror("VIDIOC_QUERYBUF");
        exit(EXIT_FAILURE);
    }

    buffers[i].length = buffer.length; /* remember for munmap() */

    buffers[i].start = mmap(NULL, buffer.length,
                PROT_READ | PROT_WRITE, /* recommended */
                MAP_SHARED, /* recommended */
                fd, buffer.m.offset);

    if (MAP_FAILED == buffers[i].start) {
        /* If you do not exit here you should unmap() and free()
         the buffers mapped so far. */
    }
}
```

3.2. Part I - Video for Linux API 955
Example: Mapping buffers in the multi-planar API

```c
struct v4l2_requestbuffers reqbuf;
/* Our current format uses 3 planes per buffer */
#define FMT_NUM_PLANES = 3

struct {
    void *start[FMT_NUM_PLANES];
    size_t length[FMT_NUM_PLANES];
} *buffers;
unsigned int i, j;

memset(&reqbuf, 0, sizeof(reqbuf));
reqbuf.type = V4L2_BUF_TYPE_VIDEO_CAPTURE_MPLANE;
reqbuf.memory = V4L2_MEMORY_MMAP;
reqbuf.count = 20;

if (ioctl(fd, VIDIOC_REQBUFS, &reqbuf) < 0) {
    if (errno == EINVAL) {
        printf("Video capturing or mmap-streaming is not supported\n");
    } else {
        perror("VIDIOC_REQBUFS");
        exit(EXIT_FAILURE);
    }
}
/* We want at least five buffers. */

if (reqbuf.count < 5) {
    /* You may need to free the buffers here. */
    printf("Not enough buffer memory\n");
    exit(EXIT_FAILURE);
}

buffers = calloc(reqbuf.count, sizeof(*buffers));
assert(buffers != NULL);

for (i = 0; i < reqbuf.count; i++) {
    struct v4l2_buffer buffer;
    struct v4l2_plane planes[FMT_NUM_PLANES];

    memset(&buffer, 0, sizeof(buffer));
    buffer.type = reqbuf.type;
    buffer.memory = V4L2_MEMORY_MMAP;
    buffer.index = i;
    ```

Conceptually streaming drivers maintain two buffer queues, an incoming and an outgoing queue. They separate the synchronous capture or output operation locked to a video clock from the application which is subject to random disk or network delays and preemption by other processes, thereby reducing the probability of data loss. The queues are organized as FIFOs, buffers will be output in the order enqueued in the incoming FIFO, and were captured in the order dequeued from the outgoing FIFO.

The driver may require a minimum number of buffers enqueued at all times to function, apart of this no limit exists on the number of buffers applications can enqueue in advance, or dequeue and process. They can also enqueue in a different order than buffers have been dequeued, and the driver can fill enqueued empty buffers in any order.\(^2\) The index number of a buffer (struct v4l2_buffer index) plays no role here, it only identifies the buffer.

Initially all mapped buffers are in dequeued state, inaccessible by the driver. For capturing applications it is customary to first enqueue all mapped buffers, then to start capturing and enter the read loop. Here the application waits until a filled buffer can be dequeued, and re-enqueues the buffer when the data is no longer needed. Output applications fill and enqueue buffers, when enough buffers are stacked up the output is started with VIDIOC_STREAMON.

---

\(^2\) Random enqueue order permits applications processing images out of order (such as video codecs) to return buffers earlier, reducing the probability of data loss. Random fill order allows drivers to reuse buffers on a LIFO-basis, taking advantage of caches holding scatter-gather lists and the like.
the write loop, when the application runs out of free buffers, it must wait until an empty buffer
can be dequeued and reused.

To enqueue and dequeue a buffer applications use the `VIVIOC_QBUF` and `VIDIOC_DQBUF` ioctl.
The status of a buffer being mapped, enqueued, full or empty can be determined at any time
using the `ioctl VIVIOC_QUERYBUF` ioctl. Two methods exist to suspend execution of the application
until one or more buffers can be dequeued. By default `VIDIOC_DQBUF` blocks when no buffer
is in the outgoing queue. When the `O_NONBLOCK` flag was given to the `open()` function,
`VIDIOC_DQBUF` returns immediately with an `EAGAIN` error code when no buffer is available.
The `select()` or `poll()` functions are always available.

To start and stop capturing or output applications call the `VIDIOC_STREAMON` and `VIDIOC_STREAMOFF`
ioctl.

Drivers implementing memory mapping I/O must support the `VIDIOC_REQBUFS`,
`VIDIOC_QUERYBUF`, `VIVIOC_QBUF`, `VIDIOC_DQBUF`, `VIDIOC_STREAMON` and `VIDIOC_STREAMOFF`
ioctls, the `mmap()`, `munmap()`, `select()` and `poll()` function.\(^3\)

[capture example]

### 3.2.3.3 Streaming I/O (User Pointers)

Input and output devices support this I/O method when the `V4L2_CAP_STREAMING` flag in
the capabilities field of struct `v4l2_capability` returned by the `ioctl VIVIOC_QUERYCAP`
ioctl is set. If the particular user pointer method (not only memory mapping) is supported
must be determined by calling the `ioctl VVIDIOC_REQBUFS` ioctl with the memory type set to
`V4L2_MEMORY_USERPTR`.

This I/O method combines advantages of the read/write and memory mapping methods. Buffers
(planes) are allocated by the application itself, and can reside for example in virtual or shared
memory. Only pointers to data are exchanged, these pointers and meta-information are passed
in struct `v4l2_buffer` (or in struct `v4l2_plane` in the multi-planar API case). The driver must
be switched into user pointer I/O mode by calling the `ioctl VVIDIOC_REQBUFS` with the desired
buffer type. No buffers (planes) are allocated beforehand, consequently they are not indexed
and cannot be queried like mapped buffers with the `VIDIOC_QUERYBUF` ioctl.

#### Example: Initiating streaming I/O with user pointers

```c
struct v4l2_requestbuffers reqbuf;

memset (&reqbuf, 0, sizeof (reqbuf));
reqbuf.type = V4L2_BUF_TYPE_VIDEO_CAPTURE;
reqbuf.memory = V4L2_MEMORY_USERPTR;

if (ioctl (fd, VIDIOC_REQBUFS, &reqbuf) == -1) {
    if (errno == EINVAL)        
        printf ("Video capturing or user pointer streaming is not supported
        
    else
        perror ("VIDIOC_REQBUFS");
```

\(^3\) At the driver level `select()` and `poll()` are the same, and `select()` is too important to be optional. The rest
should be evident.
exit (EXIT_FAILURE);
}

Buffer (plane) addresses and sizes are passed on the fly with the `VIDIOC_QBUF` ioctl. Although buffers are commonly cycled, applications can pass different addresses and sizes at each `VIDIOC_QBUF` call. If required by the hardware the driver swaps memory pages within physical memory to create a continuous area of memory. This happens transparently to the application in the virtual memory subsystem of the kernel. When buffer pages have been swapped out to disk they are brought back and finally locked in physical memory for DMA.\(^1\)

Filled or displayed buffers are dequeued with the `VIDIOC_DQBUF` ioctl. The driver can unlock the memory pages at any time between the completion of the DMA and this ioctl. The memory is also unlocked when `VIDIOC_STREAMOFF` is called, `ioctl VIDIOC_REQBUFS`, or when the device is closed. Applications must take care not to free buffers without dequeuing. Firstly, the buffers remain locked for longer, wasting physical memory. Secondly the driver will not be notified when the memory is returned to the application’s free list and subsequently reused for other purposes, possibly completing the requested DMA and overwriting valuable data.

For capturing applications it is customary to enqueue a number of empty buffers, to start capturing and enter the read loop. Here the application waits until a filled buffer can be dequeued, and re-enqueues the buffer when the data is no longer needed. Output applications fill and enqueue buffers, when enough buffers are stacked up output is started. In the write loop, when the application runs out of free buffers it must wait until an empty buffer can be dequeued and reused. Two methods exist to suspend execution of the application until one or more buffers can be dequeued. By default `VIDIOC_DQBUF` blocks when no buffer is in the outgoing queue. When the `O_NONBLOCK` flag was given to the `open()` function, `VIDIOC_DQBUF` returns immediately with an `EAGAIN` error code when no buffer is available. The `select()` or `poll()` function are always available.

To start and stop capturing or output applications call the `VIDIOC_STREAMON` and `VIDIOC_STREAMOFF` ioctl.

---

**Note:** `VIDIOC_STREAMOFF` removes all buffers from both queues and unlocks all buffers as a side effect. Since there is no notion of doing anything “now” on a multitasking system, if an application needs to synchronize with another event it should examine the struct `v4l2_buffer` timestamp of captured or outputted buffers.

Drivers implementing user pointer I/O must support the `VIDIOC_REQBUFS, VIDIOC_QBUF, VIDIOC_DQBUF, VIDIOC_STREAMON` and `VIDIOC_STREAMOFF` ioctls, the `select()` and `poll()` function.\(^2\)

---

\(^1\) We expect that frequently used buffers are typically not swapped out. Anyway, the process of swapping, locking or generating scatter-gather lists may be time consuming. The delay can be masked by the depth of the incoming buffer queue, and perhaps by maintaining caches assuming a buffer will be soon enqueued again. On the other hand, to optimize memory usage drivers can limit the number of buffers locked in advance and recycle the most recently used buffers first. Of course, the pages of empty buffers in the incoming queue need not be saved to disk. Output buffers must be saved on the incoming and outgoing queue because an application may share them with other processes.

\(^2\) At the driver level `select()` and `poll()` are the same, and `select()` is too important to be optional. The rest should be evident.
3.2.3.4 Streaming I/O (DMA buffer importing)

The DMABUF framework provides a generic method for sharing buffers between multiple devices. Device drivers that support DMABUF can export a DMA buffer to userspace as a file descriptor (known as the exporter role), import a DMA buffer from userspace using a file descriptor previously exported for a different or the same device (known as the importer role), or both. This section describes the DMABUF importer role API in V4L2.

Refer to DMABUF exporting for details about exporting V4L2 buffers as DMABUF file descriptors.

Input and output devices support the streaming I/O method when the V4L2_CAP_STREAMING flag in the capabilities field of struct v4l2_capability returned by the VIDIOC_QUERYCAP ioctl is set. Whether importing DMA buffers through DMABUF file descriptors is supported is determined by calling the VIDIOC_REQBUFS ioctl with the memory type set to V4L2_MEMORY_DMABUF.

This I/O method is dedicated to sharing DMA buffers between different devices, which may be V4L devices or other video-related devices (e.g. DRM). Buffers (planes) are allocated by a driver on behalf of an application. Next, these buffers are exported to the application as file descriptors using an API which is specific for an allocator driver. Only such file descriptor are exchanged. The descriptors and meta-information are passed in struct v4l2_buffer (or in struct v4l2_plane in the multi-planar API case). The driver must be switched into DMABUF I/O mode by calling the VIDIOC_REQBUFS with the desired buffer type.

Example: Initiating streaming I/O with DMABUF file descriptors

```c
struct v4l2_requestbuffers reqbuf;

memset(&reqbuf, 0, sizeof(reqbuf));
reqbuf.type = V4L2_BUF_TYPE_VIDEO_CAPTURE;
reqbuf.memory = V4L2_MEMORY_DMABUF;
reqbuf.count = 1;

if (ioctl(fd, VIDIOC_REQBUFS, &reqbuf) == -1) {
    if (errno == EINVAL)
        printf("Video capturing or DMABUF streaming is not supported\n");
    else
        perror("VIDIOC_REQBUFS");
    exit(EXIT_FAILURE);
}
```

The buffer (plane) file descriptor is passed on the fly with the VIDIOC_QBUF ioctl. In case of multiplanar buffers, every plane can be associated with a different DMABUF descriptor. Although buffers are commonly cycled, applications can pass a different DMABUF descriptor at each VIDIOC_QBUF call.
Example: Queueing DMABUF using single plane API

```c
int buffer_queue(int v4lfd, int index, int dmafd)
{
    struct v4l2_buffer buf;

    memset(&buf, 0, sizeof buf);
    buf.type = V4L2_BUF_TYPE_VIDEO_CAPTURE;
    buf.memory = V4L2_MEMORY_DMABUF;
    buf.index = index;
    buf.m.fd = dmafd;

    if (ioctl(v4lfd, VIDIOC_QBUF, &buf) == -1) {
        perror("VIDIOC_QBUF");
        return -1;
    }

    return 0;
}
```

Example 3.6. Queueing DMABUF using multi plane API

```c
int buffer_queue_mp(int v4lfd, int index, int dmafd[], int n_planes)
{
    struct v4l2_buffer buf;
    struct v4l2_plane planes[VIDEO_MAX_PLANES];
    int i;

    memset(&buf, 0, sizeof buf);
    buf.type = V4L2_BUF_TYPE_VIDEO_CAPTURE_MPLANE;
    buf.memory = V4L2_MEMORY_DMABUF;
    buf.index = index;
    buf.m.planes = planes;
    buf.length = n_planes;

    memset(&planes, 0, sizeof planes);

    for (i = 0; i < n_planes; ++i)
        buf.m.planes[i].m.fd = dmafd[i];

    if (ioctl(v4lfd, VIDIOC_QBUF, &buf) == -1) {
        perror("VIDIOC_QBUF");
        return -1;
    }

    return 0;
}
```

Captured or displayed buffers are dequeued with the `VIDIOC_DQBUF` ioctl. The driver can unlock the buffer at any time between the completion of the DMA and this ioctl. The memory is also unlocked when `VIDIOC_STREAMOFF` is called, `VIDIOC_REQBUFS`, or when the device is closed.

For capturing applications it is customary to enqueue a number of empty buffers, to start capturing and enter the read loop. Here the application waits until a filled buffer can be dequeued,
and re-enqueues the buffer when the data is no longer needed. Output applications fill and enqueue buffers, when enough buffers are stacked up output is started. In the write loop, when the application runs out of free buffers it must wait until an empty buffer can be dequeued and reused. Two methods exist to suspend execution of the application until one or more buffers can be dequeued. By default `VIDIOC_DQBUF` blocks when no buffer is in the outgoing queue. When the `O_NONBLOCK` flag was given to the `open()` function, `VIDIOC_DQBUF` returns immediately with an EAGAIN error code when no buffer is available. The `select()` and `poll()` functions are always available.

To start and stop capturing or displaying applications call the `VIDIOC_STREAMON` and `VIDIOC_STREAMOFF` ioctls.

Note: `VIDIOC_STREAMOFF` removes all buffers from both queues and unlocks all buffers as a side effect. Since there is no notion of doing anything “now” on a multitasking system, if an application needs to synchronize with another event it should examine the struct `v4l2_buffer` timestamp of captured or outputted buffers.

Drivers implementing DMABUF importing I/O must support the `VIDIOC_REQBUFS`, `VIDIOC_QBUF`, `VIDIOC_DQBUF`, `VIDIOC_STREAMON` and `VIDIOC_STREAMOFF` ioctls, and the `select()` and `poll()` functions.

### 3.2.3.5 Asynchronous I/O

This method is not defined yet.

### 3.2.3.6 Buffers

A buffer contains data exchanged by application and driver using one of the Streaming I/O methods. In the multi-planar API, the data is held in planes, while the buffer structure acts as a container for the planes. Only pointers to buffers (planes) are exchanged, the data itself is not copied. These pointers, together with meta-information like timestamps or field parity, are stored in a struct `v4l2_buffer`, argument to the `ioctl VIDIOC_QUERYBUF, VIDIOC_QBUF and VIDIOC_DQBUF` ioctl. In the multi-planar API, some plane-specific members of struct `v4l2_buffer`, such as pointers and sizes for each plane, are stored in struct `v4l2_plane` instead. In that case, struct `v4l2_buffer` contains an array of plane structures.

Dequeued video buffers come with timestamps. The driver decides at which part of the frame and with which clock the timestamp is taken. Please see flags in the masks `V4L2_BUF_FLAG_TIMESTAMP_MASK` and `V4L2_BUF_FLAG_TSTAMP_SRC_MASK` in `Buffer Flags`. These flags are always valid and constant across all buffers during the whole video stream. Changes in these flags may take place as a side effect of `VIDIOC_S_INPUT` or `VIDIOC_S_OUTPUT` however. The `V4L2_BUF_FLAG_TIMESTAMP_COPY` timestamp type which is used by e.g. on mem-to-mem devices is an exception to the rule: the timestamp source flags are copied from the OUTPUT video buffer to the CAPTURE video buffer.
Interactions between formats, controls and buffers

V4L2 exposes parameters that influence the buffer size, or the way data is laid out in the buffer. Those parameters are exposed through both formats and controls. One example of such a control is the V4L2_CID_ROTATE control that modifies the direction in which pixels are stored in the buffer, as well as the buffer size when the selected format includes padding at the end of lines.

The set of information needed to interpret the content of a buffer (e.g. the pixel format, the line stride, the tiling orientation or the rotation) is collectively referred to in the rest of this section as the buffer layout.

Controls that can modify the buffer layout shall set the V4L2_CTRL_FLAG_MODIFY_LAYOUT flag.

Modifying formats or controls that influence the buffer size or layout require the stream to be stopped. Any attempt at such a modification while the stream is active shall cause the ioctl setting the format or the control to return the EBUSY error code. In that case drivers shall also set the V4L2_CTRL_FLAG_GRABBED flag when calling VIDIOC_QUERYCTRL() or VIDIOC_QUERY_EXT_CTRL() for such a control while the stream is active.

Note: The VIDIOC_S_SELECTION() ioctl can, depending on the hardware (for instance if the device doesn’t include a scaler), modify the format in addition to the selection rectangle. Similarly, the VIDIOC_S_INPUT(), VIDIOC_S_OUTPUT(), VIDIOC_S_STD() and VIDIOC_S_DV_TIMINGS() ioctls can also modify the format and selection rectangles. When those ioctls result in a buffer size or layout change, drivers shall handle that condition as they would handle it in the VIDIOC_S_FMT() ioctl in all cases described in this section.

Controls that only influence the buffer layout can be modified at any time when the stream is stopped. As they don’t influence the buffer size, no special handling is needed to synchronize those controls with buffer allocation and the V4L2_CTRL_FLAG_GRABBED flag is cleared once the stream is stopped.

Formats and controls that influence the buffer size interact with buffer allocation. The simplest way to handle this is for drivers to always require buffers to be reallocated in order to change those formats or controls. In that case, to perform such changes, userspace applications shall first stop the video stream with the VIDIOC_STREAMOFF() ioctl if it is running and free all buffers with the VIDIOC_REQBUFS() ioctl if they are allocated. After freeing all buffers the V4L2_CTRL_FLAG_GRABBED flag for controls is cleared. The format or controls can then be modified, and buffers shall then be reallocated and the stream restarted. A typical ioctl sequence is

1. VIDIOC_STREAMOFF
2. VIDIOC_REQBUFS(0)
3. VIDIOC_S_EXT_CTRLS
4. VIDIOC_S_FMT
5. VIDIOC_REQBUFS(n)
6. VIDIOC_QBUF
7. VIDIOC_STREAMON
The second VIDIOC_REQBUFS() call will take the new format and control value into account to compute the buffer size to allocate. Applications can also retrieve the size by calling the VIDIOC_G_FMT() ioctl if needed.

Note: The API doesn’t mandate the above order for control (3.) and format (4.) changes. Format and controls can be set in a different order, or even interleaved, depending on the device and use case. For instance some controls might behave differently for different pixel formats, in which case the format might need to be set first.

When reallocation is required, any attempt to modify format or controls that influences the buffer size while buffers are allocated shall cause the format or control set ioctl to return the EBUSY error. Any attempt to queue a buffer too small for the current format or controls shall cause the VIDIOC_QBUF() ioctl to return a EINVAL error.

Buffer reallocation is an expensive operation. To avoid that cost, drivers can (and are encouraged to) allow format or controls that influence the buffer size to be changed with buffers allocated. In that case, a typical ioctl sequence to modify format and controls is

1. VIDIOC_STREAMOFF
2. VIDIOC_S_EXT_CTRLS
3. VIDIOC_S_FMT
4. VIDIOC_QBUF
5. VIDIOC_STREAMON

For this sequence to operate correctly, queued buffers need to be large enough for the new format or controls. Drivers shall return a ENOSPC error in response to format change (VIDIOC_S_FMT()) or control changes (VIDIOC_S_CTRL() or VIDIOC_S_EXT_CTRLS()) if buffers too small for the new format are currently queued. As a simplification, drivers are allowed to return an EBUSY error from these ioctl if any buffer is currently queued, without checking the queued buffers sizes.

Additionally, drivers shall return an EINVAL error from the VIDIOC_QBUF() ioctl if the buffer being queued is too small for the current format or controls. Together, these requirements ensure that queued buffers will always be large enough for the configured format and controls.

Userspace applications can query the buffer size required for a given format and controls by first setting the desired control values and then trying the desired format. The VIDIOC_TRY_FMT() ioctl will return the required buffer size.

1. VIDIOC_S_EXT_CTRLS(x)
2. VIDIOC_TRY_FMT()
3. VIDIOC_S_EXT_CTRLS(y)
4. VIDIOC_TRY_FMT()

The VIDIOC_CREATE_BUFS() ioctl can then be used to allocate buffers based on the queried sizes (for instance by allocating a set of buffers large enough for all the desired formats and controls, or by allocating separate set of appropriately sized buffers for each use case).

v4l2_buffer
### struct v4l2_buffer

Table 95: struct v4l2_buffer

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>__u32 index</td>
<td>Number of the buffer, set by the application except when calling <code>VIDIOC_DQBUF</code>, then it is set by the driver. This field can range from zero to the number of buffers allocated with the <code>ioctl VIDIOC_REQBUFS</code> ioctl (struct v4l2_requestbuffers count), plus any buffers allocated with <code>ioctl VIDIOC_CREATE_BUFS</code> minus one.</td>
</tr>
<tr>
<td>__u32 type</td>
<td>Type of the buffer, same as struct v4l2_format type or struct v4l2_requestbuffers type, set by the application. See v4l2_buf_type</td>
</tr>
<tr>
<td>__u32 bytesused</td>
<td>The number of bytes occupied by the data in the buffer. It depends on the negotiated data format and may change with each buffer for compressed variable size data like JPEG images. Drivers must set this field when type refers to a capture stream, applications when it refers to an output stream. If the application sets this to 0 for an output stream, then bytesused will be set to the size of the buffer (see the length field of this struct) by the driver. For multiplanar formats this field is ignored and the planes pointer is used instead.</td>
</tr>
<tr>
<td>__u32 flags</td>
<td>Flags set by the application or driver, see Buffer Flags.</td>
</tr>
<tr>
<td>__u32 field</td>
<td>Indicates the field order of the image in the buffer, see v4l2_field. This field is not used when the buffer contains VBI data. Drivers must set it when type refers to a capture stream, applications when it refers to an output stream.</td>
</tr>
<tr>
<td>struct timeval timestamp</td>
<td>For capture streams this is time when the first data byte was captured, as returned by the clock_gettime() function for the relevant clock id; see V4L2_BUF_FLAG_TIMESTAMP_* in Buffer Flags. For output streams the driver stores the time at which the last data byte was actually sent out in the timestamp field. This permits applications to monitor the drift between the video and system clock. For output streams that use V4L2_BUF_FLAG_TIMESTAMP_COPY the application has to fill in the timestamp which will be copied by the driver to the capture stream.</td>
</tr>
<tr>
<td>struct v4l2_timecode timecode</td>
<td>When the V4L2_BUF_FLAG_TIMECODE flag is set in flags, this structure contains a frame timecode. In V4L2_FIELD_ALTERNATE mode the top and bottom field contain the same timecode. Timecodes are intended to help video editing and are typically recorded on video tapes, but also embedded in compressed formats like MPEG. This field is independent of the timestamp and sequence fields.</td>
</tr>
<tr>
<td>__u32 sequence</td>
<td>Set by the driver, counting the frames (not fields!) in sequence. This field is set for both input and output devices.</td>
</tr>
</tbody>
</table>

Continued on next page
**Table 95 – continued from previous page**

In **V4L2_FIELD_ALTERNATE** mode the top and bottom field have the same sequence number. The count starts at zero and includes dropped or repeated frames. A dropped frame was received by an input device but could not be stored due to lack of free buffer space. A repeated frame was displayed again by an output device because the application did not pass new data in time.

**Note:** This may count the frames received e.g. over USB, without taking into account the frames dropped by the remote hardware due to limited compression throughput or bus bandwidth. These devices identify by not enumerating any video standards, see [Video Standards](#).

<table>
<thead>
<tr>
<th>__u32</th>
<th>memory</th>
<th>This field must be set by applications and/or drivers in accordance with the selected I/O method. See v4l2_memory</th>
</tr>
</thead>
<tbody>
<tr>
<td>union {</td>
<td>m</td>
<td></td>
</tr>
<tr>
<td>__u32</td>
<td>offset</td>
<td>For the single-planar API and when memory is V4L2_MEMORY_MMAP this is the offset of the buffer from the start of the device memory. The value is returned by the driver and apart of serving as parameter to the mmap() function not useful for applications. See <a href="#">Streaming I/O (Memory Mapping)</a> for details</td>
</tr>
<tr>
<td>unsigned long</td>
<td>userptr</td>
<td>For the single-planar API and when memory is V4L2_MEMORY_USERPTR this is a pointer to the buffer (casted to unsigned long type) in virtual memory, set by the application. See <a href="#">Streaming I/O (User Pointers)</a> for details</td>
</tr>
<tr>
<td>struct v4l2_plane *planes</td>
<td>When using the multi-planar API, contains a userspace pointer to an array of struct v4l2_plane. The size of the array should be put in the length field of this struct v4l2_buffer structure.</td>
<td></td>
</tr>
<tr>
<td>int</td>
<td>fd</td>
<td>For the single-plane API and when memory is V4L2_MEMORY_DMABUF this is the file descriptor associated with a DMABUF buffer</td>
</tr>
<tr>
<td>}</td>
<td></td>
<td></td>
</tr>
<tr>
<td>__u32</td>
<td>length</td>
<td>Size of the buffer (not the payload) in bytes for the single-planar API. This is set by the driver based on the calls to <code>ioctl VIDIOC_REQBUFS</code> and/or <code>ioctl VIDIOC_CREATE_BUFS</code>. For the multi-planar API the application sets this to the number of elements in the planes array. The driver will fill in the actual number of valid elements in that array.</td>
</tr>
<tr>
<td>__u32</td>
<td>reserved2</td>
<td>A place holder for future extensions. Drivers and applications must set this to 0</td>
</tr>
</tbody>
</table>

Continued on next page
__u32 request_fd

The file descriptor of the request to queue the buffer to. If the flag V4L2_BUF_FLAG_REQUEST_FD is set, then the buffer will be queued to this request. If the flag is not set, then this field will be ignored.

The V4L2_BUF_FLAG_REQUEST_FD flag and this field are only used by ioctl VIDIOC_QBUF and ignored by other ioctls that take a v4l2_buffer as argument.

Applications should not set V4L2_BUF_FLAG_REQUEST_FD for any ioctls other than VIDIOC_QBUF.

If the device does not support requests, then EBADR will be returned. If requests are supported but an invalid request file descriptor is given, then EINVAL will be returned.

### v4l2_plane

```c
struct v4l2_plane
```

<table>
<thead>
<tr>
<th>__u32</th>
<th>bytesused</th>
</tr>
</thead>
</table>
|       | The number of bytes occupied by data in the plane (its payload). Drivers must set this field when type refers to a capture stream, applications when it refers to an output stream. If the application sets this to 0 for an output stream, then bytesused will be set to the size of the plane (see the length field of this struct) by the driver.

**Note:** Note that the actual image data starts at data_offset which may not be 0.

<table>
<thead>
<tr>
<th>__u32</th>
<th>length</th>
</tr>
</thead>
</table>
|       | Size in bytes of the plane (not its payload). This is set by the driver based on the calls to ioctl VIDIOC_REQBUFS and/or ioctl VIDIOC_CREATE_BUFS.

union {

  | m |
  |    |
  |

  | __u32 | mem_offset |
  |       |           |
  |       | When the memory type in the containing struct v4l2_buffer is V4L2_MEMORY_MMAP, this is the value that should be passed to mmap(), similar to the offset field in struct v4l2_buffer.

  | unsigned long | userptr |
  |              |        |
  |              | When the memory type in the containing struct v4l2_buffer is V4L2_MEMORY_USERPTR, this is a userspace pointer to the memory allocated for this plane by an application.

  | int | fd |
  |    |    |
  |    | When the memory type in the containing struct v4l2_buffer is V4L2_MEMORY_DMABUF, this is a file descriptor associated with a DMABUF buffer, similar to the fd field in struct v4l2_buffer.

} |
Table 96 – continued from previous page

| V4L2_BUF_TYPE_META_OUTPUT           | 14 | Buffer for metadata output, see Metadata Interface. |
### Buffer Flags

<table>
<thead>
<tr>
<th>Buffer Flag</th>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>V4L2_BUF_FLAG_MAPPED</td>
<td>0x00000001</td>
<td>The buffer resides in device memory and has been mapped into the application’s address space, see <a href="https://www.example.com">Streaming I/O (Memory Mapping)</a> for details. Drivers set or clear this flag when the <code>ioctl VIDIOC_QUERYBUF, VIDIOC_QBUF, VIDIOC_DQBUF</code> ioctl is called. Set by the driver.</td>
</tr>
<tr>
<td>V4L2_BUF_FLAG_QUEUED</td>
<td>0x00000002</td>
<td>Internally drivers maintain two buffer queues, an incoming and outgoing queue. When this flag is set, the buffer is currently on the incoming queue. It automatically moves to the outgoing queue after the buffer has been filled (capture devices) or displayed (output devices). Drivers set or clear this flag when the VIDIOC_QUERYBUF ioctl is called. After (successful) calling the VIDIOC_QBUF ioctl it is always set and after VIDIOC_DQBUF always cleared.</td>
</tr>
<tr>
<td>V4L2_BUF_FLAG_DONE</td>
<td>0x00000004</td>
<td>When this flag is set, the buffer is currently on the outgoing queue, ready to be dequeued from the driver. Drivers set or clear this flag when the VIDIOC_QUERYBUF ioctl is called. After calling the VIDIOC_QBUF or VIDIOC_DQBUF it is always cleared. Of course a buffer cannot be on both queues at the same time, the V4L2_BUF_FLAG_QUEUED and V4L2_BUF_FLAG_DONE flag are mutually exclusive. They can be both cleared however, then the buffer is in “dequeued” state, in the application domain so to say.</td>
</tr>
<tr>
<td>V4L2_BUF_FLAG_ERROR</td>
<td>0x00000040</td>
<td>When this flag is set, the buffer has been dequeued successfully, although the data might have been corrupted. This is recoverable, streaming may continue as normal and the buffer may be reused normally. Drivers set this flag when the VIDIOC_DQBUF ioctl is called.</td>
</tr>
<tr>
<td>V4L2_BUF_FLAG_IN_REQUEST</td>
<td>0x00000080</td>
<td>This buffer is part of a request that hasn’t been queued yet.</td>
</tr>
<tr>
<td>V4L2_BUF_FLAG_NO_CACHE_INVALIDATE</td>
<td>0x00000800</td>
<td>Caches do not have to be invalidated for this buffer. Typically applications shall use this flag if the data captured in the buffer is not going to be touched by the CPU, instead the buffer will, probably, be passed on to a DMA-capable hardware unit for further processing or output. This flag is ignored unless the queue is used for memory mapping streaming I/O and reports V4L2_BUF_CAP_SUPPORTS_MMAP_CACHE_HINTS capability.</td>
</tr>
<tr>
<td>V4L2_BUF_FLAG_NO_CACHE_CLEAN</td>
<td>0x00001000</td>
<td>Caches do not have to be cleaned for this buffer. Typically applications shall use this flag for output buffers if the data in this buffer has not been created by the CPU but by some DMA-capable unit, in which case caches have not been used. This flag is ignored unless the queue is used for memory mapping streaming I/O and reports V4L2_BUF_CAP_SUPPORTS_MMAP_CACHE_HINTS capability.</td>
</tr>
<tr>
<td>V4L2_BUF_FLAG_M2M_HOLD_CAPTURE_BUF</td>
<td>0x00000200</td>
<td>Only valid if struct v4l2_requestbuffers flag V4L2_BUF_CAP_SUPPORTS_M2M_HOLD_CAPTURE_BUF is set. It is typically used with stateless decoders where multiple output buffers each decode to a slice of the decoded frame. Applications can set this flag when queueing the output buffer to prevent the driver from dequeuing the capture buffer after the output buffer has been decoded (i.e. the capture buffer is 'held'). If the timestamp of this output buffer differs from that of the previous output buffer, then that indicates the start of a new frame and the previously held capture buffer is dequeued.</td>
</tr>
<tr>
<td>V4L2_BUF_FLAG_LAST</td>
<td>0x00100000</td>
<td>Last buffer produced by the hardware. mem2mem codec drivers set this flag on the capture queue for the last buffer when the ioctl VIDIOC_QUERYBUF or VIDIOC_DQBUF ioctl is called. Due to hardware limitations, the last buffer may be empty. In this case the driver will set the bytesused field to 0, regardless of the format. Any subsequent call to the VIDIOC_DQBUF ioctl will not block anymore, but return an EPIPE error code.</td>
</tr>
<tr>
<td>V4L2_BUF_FLAG_REQUEST_FD</td>
<td>0x00800000</td>
<td>The request_fd field contains a valid file descriptor.</td>
</tr>
<tr>
<td>V4L2_BUF_FLAG_TIMESTAMP_MASK</td>
<td>0x0000e000</td>
<td>Mask for timestamp types below. To test the timestamp type, mask out bits not belonging to timestamp type by performing a logical and operation with buffer flags and timestamp mask.</td>
</tr>
<tr>
<td>V4L2_BUF_FLAG_TIMESTAMP_UNKNOWN</td>
<td>0x00000000</td>
<td>Unknown timestamp type. This type is used by drivers before Linux 3.9 and may be either monotonic (see below) or realtime (wall clock). Monotonic clock has been favoured in embedded systems whereas most of the drivers use the realtime clock. Either kinds of timestamps are available in user space via clock_gettime() using clock IDs CLOCK_MONOTONIC and CLOCK_REALTIME, respectively.</td>
</tr>
<tr>
<td>V4L2_BUF_FLAG_TIMESTAMP_MONOTONIC</td>
<td>0x00002000</td>
<td>The buffer timestamp has been taken from the CLOCK_MONOTONIC clock. To access the same clock outside V4L2, use clock_gettime().</td>
</tr>
<tr>
<td>V4L2_BUF_FLAG_TIMESTAMP_COPY</td>
<td>0x00004000</td>
<td>The CAPTURE buffer timestamp has been taken from the corresponding OUTPUT buffer. This flag applies only to mem2mem devices.</td>
</tr>
</tbody>
</table>

### 3.2.3.7 Field Order

We have to distinguish between progressive and interlaced video. Progressive video transmits all lines of a video image sequentially. Interlaced video divides an image into two fields, containing only the odd and even lines of the image, respectively. Alternating the so called odd and even field are transmitted, and due to a small delay between fields a cathode ray TV displays the lines interleaved, yielding the original frame. This curious technique was invented because at refresh rates similar to film the image would fade out too quickly. Transmitting fields reduces the flicker without the necessity of doubling the frame rate and with it the bandwidth required for each channel.

It is important to understand a video camera does not expose one frame at a time, merely transmitting the frames separated into fields. The fields are in fact captured at two different instances in time. An object on screen may well move between one field and the next. For applications analysing motion it is of paramount importance to recognize which field of a frame is older, the *temporal order*.

When the driver provides or accepts images field by field rather than interleaved, it is also important applications understand how the fields combine to frames. We distinguish between top (aka odd) and bottom (aka even) fields, the *spatial order*: The first line of the top field is the first line of an interlaced frame, the first line of the bottom field is the second line of that frame.

However because fields were captured one after the other, arguing whether a frame commences with the top or bottom field is pointless. Any two successive top and bottom, or bottom and top fields yield a valid frame. Only when the source was progressive to begin with, e. g. when transferring film to video, two fields may come from the same frame, creating a natural order.
Counter to intuition the top field is not necessarily the older field. Whether the older field contains the top or bottom lines is a convention determined by the video standard. Hence the distinction between temporal and spatial order of fields. The diagrams below should make this clearer.

In V4L it is assumed that all video cameras transmit fields on the media bus in the same order they were captured, so if the top field was captured first (is the older field), the top field is also transmitted first on the bus.

All video capture and output devices must report the current field order. Some drivers may permit the selection of a different order, to this end applications initialize the field field of struct \texttt{v4l2\_pix\_format} before calling the \texttt{VIDIOC\_S\_FMT} ioctl. If this is not desired it should have the value \texttt{V4L2\_FIELD\_ANY} (0).

\textbf{enum v4l2\_field}

\begin{center}
\begin{tabular}{|c|p{5in}|}
\hline
\texttt{V4L2\_FIELD\_ANY} & 0 & Applications request this field order when any field format is acceptable. Drivers choose depending on hardware capabilities or e.g. the requested image size, and return the actual field order. Drivers must never return \texttt{V4L2\_FIELD\_ANY}. If multiple field orders are possible the driver must choose one of the possible field orders during \texttt{VIDIOC\_S\_FMT} or \texttt{VIDIOC\_TRY\_FMT}. struct \texttt{v4l2\_buffer\_field} can never be \texttt{V4L2\_FIELD\_ANY}. \\
\hline
\texttt{V4L2\_FIELD\_NONE} & 1 & Images are in progressive (frame-based) format, not interlaced (field-based). \\
\hline
\texttt{V4L2\_FIELD\_TOP} & 2 & Images consist of the top (aka odd) field only. \\
\hline
\texttt{V4L2\_FIELD\_BOTTOM} & 3 & Images consist of the bottom (aka even) field only. Applications may wish to prevent a device from capturing interlaced images because they will have "comb" or "feathering" artefacts around moving objects. \\
\hline
\texttt{V4L2\_FIELD\_INTERLACED} & 4 & Images contain both fields, interleaved line by line. The temporal order of the fields (whether the top or bottom field is older) depends on the current video standard. In M/NTSC the bottom field is the older field. In all other standards the top field is the older field. \\
\hline
\texttt{V4L2\_FIELD\_SEQ\_TB} & 5 & Images contain both fields, the top field lines are stored first in memory, immediately followed by the bottom field lines. Fields are always stored in temporal order, the older one first in memory. Image sizes refer to the frame, not fields. \\
\hline
\texttt{V4L2\_FIELD\_SEQ\_BT} & 6 & Images contain both fields, the bottom field lines are stored first in memory, immediately followed by the top field lines. Fields are always stored in temporal order, the older one first in memory. Image sizes refer to the frame, not fields. \\
\hline
\end{tabular}
\end{center}

Field Order, Bottom Field First Transmitted

3.2.4 Interfaces

3.2.4.1 Video Capture Interface

Video capture devices sample an analog video signal and store the digitized images in memory. Today nearly all devices can capture at full 25 or 30 frames/second. With this interface applications can control the capture process and move images from the driver into user space.

Conventionally V4L2 video capture devices are accessed through character device special files named /dev/video and /dev/video0 to /dev/video63 with major number 81 and minor numbers 0 to 63. /dev/video is typically a symbolic link to the preferred video device.

Note: The same device file names are used for video output devices.

Querying Capabilities

Devices supporting the video capture interface set the V4L2_CAP_VIDEO_CAPTURE or V4L2_CAP_VIDEO_CAPTURE_MPLANE flag in the capabilities field of struct v4l2_capability returned by the ioctl VIDIOC_QUERYCAP ioctl. As secondary device functions they may also support the video overlay (V4L2_CAP_VIDEO_OVERLAY) and the raw VBI capture (V4L2_CAP_VBI_CAPTURE) interface. At least one of the read/write or streaming I/O methods must be supported. Tuners and audio inputs are optional.

Fig. 7: Field Order, Bottom Field First Transmitted
Supplemental Functions

Video capture devices shall support audio input, Tuners and Modulators, controls, cropping and scaling and streaming parameter ioctls as needed. The video input ioctls must be supported by all video capture devices.

Image Format Negotiation

The result of a capture operation is determined by cropping and image format parameters. The former select an area of the video picture to capture, the latter how images are stored in memory, i.e. in RGB or YUV format, the number of bits per pixel or width and height. Together they also define how images are scaled in the process.

As usual these parameters are not reset at open() time to permit Unix tool chains, programming a device and then reading from it as if it was a plain file. Well written V4L2 applications ensure they really get what they want, including cropping and scaling.

Cropping initialization at minimum requires to reset the parameters to defaults. An example is given in Image Cropping, Insertion and Scaling – the CROP API.

To query the current image format applications set the type field of a struct v4l2_format to V4L2_BUF_TYPE_VIDEO_CAPTURE or V4L2_BUF_TYPE_VIDEO_CAPTURE_MPLANE and call the VIDIOC_G_FMT ioctl with a pointer to this structure. Drivers fill the struct v4l2_pix_format pix or the struct v4l2_pix_format_mplane pix_mp member of the fmt union.

To request different parameters applications set the type field of a struct v4l2_format as above and initialize all fields of the struct v4l2_pix_format vbi member of the fmt union, or better just modify the results of VIDIOC_G_FMT, and call the VIDIOC_S_FMT ioctl with a pointer to this structure. Drivers may adjust the parameters and finally return the actual parameters as VIDIOC_G_FMT does.

Like VIDIOC_S_FMT the VIDIOC_TRY_FMT ioctl can be used to learn about hardware limitations without disabling I/O or possibly time consuming hardware preparations.

The contents of struct v4l2_pix_format and struct v4l2_pix_format_mplane are discussed in Image Formats. See also the specification of the VIDIOC_G_FMT, VIDIOC_S_FMT and VIDIOC_TRY_FMT ioctls for details. Video capture devices must implement both the VIDIOC_G_FMT and VIDIOC_S_FMT ioctl, even if VIDIOC_S_FMT ignores all requests and always returns default parameters as VIDIOC_G_FMT does. VIDIOC_TRY_FMT is optional.

Reading Images

A video capture device may support the read() function and/or streaming (memory mapping or user pointer) I/O. See Input/Output for details.
3.2.4.2 Video Overlay Interface

Also known as Framebuffer Overlay or Previewing.

Video overlay devices have the ability to genlock (TV-)video into the (VGA-)video signal of a graphics card, or to store captured images directly in video memory of a graphics card, typically with clipping. This can be considerable more efficient than capturing images and displaying them by other means. In the old days when only nuclear power plants needed cooling towers this used to be the only way to put live video into a window.

Video overlay devices are accessed through the same character special files as video capture devices.

**Note:** The default function of a /dev/video device is video capturing. The overlay function is only available after calling the `VIDIOC_S_FMT` ioctl.

The driver may support simultaneous overlay and capturing using the read/write and streaming I/O methods. If so, operation at the nominal frame rate of the video standard is not guaranteed. Frames may be directed away from overlay to capture, or one field may be used for overlay and the other for capture if the capture parameters permit this.

Applications should use different file descriptors for capturing and overlay. This must be supported by all drivers capable of simultaneous capturing and overlay. Optionally these drivers may also permit capturing and overlay with a single file descriptor for compatibility with V4L and earlier versions of V4L2.¹

A common application of two file descriptors is the X11 Xv/V4L interface driver and a V4L2 application. While the X server controls video overlay, the application can take advantage of memory mapping and DMA.

¹ In the opinion of the designers of this API, no driver writer taking the efforts to support simultaneous capturing and overlay will restrict this ability by requiring a single file descriptor, as in V4L and earlier versions of V4L2. Making this optional means applications depending on two file descriptors need backup routines to be compatible with all drivers, which is considerable more work than using two fds in applications which do not. Also two fd’s fit the general concept of one file descriptor for each logical stream. Hence as a complexity trade-off drivers must support two file descriptors and may support single fd operation.
Querying Capabilities

Devices supporting the video overlay interface set the V4L2_CAP_VIDEO_OVERLAY flag in the capabilities field of struct v4l2_capability returned by the ioctl VIDIOC_QUERYCAP ioctl. The overlay I/O method specified below must be supported. Tuners and audio inputs are optional.

Supplemental Functions

Video overlay devices shall support audio input, Tuners and Modulators, controls, cropping and scaling and streaming parameter ioctls as needed. The video input and video standard ioctls must be supported by all video overlay devices.

Setup

Before overlay can commence applications must program the driver with frame buffer parameters, namely the address and size of the frame buffer and the image format, for example RGB 5:6:5. The VIDIOC_G_FBUF and VIDIOC_S_FBUF ioctls are available to get and set these parameters, respectively. The VIDIOC_S_FBUF ioctl is privileged because it allows to set up DMA into physical memory, bypassing the memory protection mechanisms of the kernel. Only the superuser can change the frame buffer address and size. Users are not supposed to run TV applications as root or with SUID bit set. A small helper application with suitable privileges should query the graphics system and program the V4L2 driver at the appropriate time.

Some devices add the video overlay to the output signal of the graphics card. In this case the frame buffer is not modified by the video device, and the frame buffer address and pixel format are not needed by the driver. The VIDIOC_S_FBUF ioctl is not privileged. An application can check for this type of device by calling the VIDIOC_G_FBUF ioctl.

A driver may support any (or none) of five clipping/blending methods:

1. Chroma-keying displays the overlaid image only where pixels in the primary graphics surface assume a certain color.
2. A bitmap can be specified where each bit corresponds to a pixel in the overlaid image. When the bit is set, the corresponding video pixel is displayed, otherwise a pixel of the graphics surface.
3. A list of clipping rectangles can be specified. In these regions no video is displayed, so the graphics surface can be seen here.
4. The framebuffer has an alpha channel that can be used to clip or blend the framebuffer with the video.
5. A global alpha value can be specified to blend the framebuffer contents with video images.

When simultaneous capturing and overlay is supported and the hardware prohibits different image and frame buffer formats, the format requested first takes precedence. The attempt to
Linux Media Documentation

capture (VIDIOC_S_FMT) or overlay (VIDIOC_S_FBUF) may fail with an EBUSY error code or return accordingly modified parameters.

Overlay Window

The overlaid image is determined by cropping and overlay window parameters. The former select an area of the video picture to capture, the latter how images are overlaid and clipped. Cropping initialization at minimum requires to reset the parameters to defaults. An example is given in Image Cropping, Insertion and Scaling – the CROP API.

The overlay window is described by a struct v4l2_window. It defines the size of the image, its position over the graphics surface and the clipping to be applied. To get the current parameters applications set the type field of a struct v4l2_format to V4L2_BUF_TYPE_VIDEO_OVERLAY and call the VIDIOC_G_FMT ioctl. The driver fills the struct v4l2_window substructure named win. It is not possible to retrieve a previously programmed clipping list or bitmap.

To program the overlay window applications set the type field of a struct v4l2_format to V4L2_BUF_TYPE_VIDEO_OVERLAY, initialize the win substructure and call the VIDIOC_S_FMT ioctl. The driver adjusts the parameters against hardware limits and returns the actual parameters as VIDIOC_G_FMT does. Like VIDIOC_S_FMT, the VIDIOC_TRY_FMT ioctl can be used to learn about driver capabilities without actually changing driver state. Unlike VIDIOC_S_FMT this also works after the overlay has been enabled.

The scaling factor of the overlaid image is implied by the width and height given in struct v4l2_window and the size of the cropping rectangle. For more information see Image Cropping, Insertion and Scaling – the CROP API.

When simultaneous capturing and overlay is supported and the hardware prohibits different image and window sizes, the size requested first takes precedence. The attempt to capture or overlay as well (VIDIOC_S_FMT) may fail with an EBUSY error code or return accordingly modified parameters.

v4l2_window

struct v4l2_window

struct v4l2_rect w Size and position of the window relative to the top, left corner of the frame buffer defined with VIDIOC_S_FBUF. The window can extend the frame buffer width and height, the x and y coordinates can be negative, and it can lie completely outside the frame buffer. The driver clips the window accordingly, or if that is not possible, modifies its size and/or position.

eenum v4l2_field field Applications set this field to determine which video field shall be overlaid, typically one of V4L2_FIELD_ANY (0), V4L2_FIELD_TOP, V4L2_FIELD_BOTTOM or V4L2_FIELD_INTERLACED. Drivers may have to choose a different field order and return the actual setting here.

__u32 chromakey When chroma-keying has been negotiated with VIDIOC_S_FBUF applications set this field to the desired pixel value for the chroma key. The format is the same as the pixel format of the framebuffer (struct v4l2_framebuffer fmt.pixelformat field), with bytes in host order. E. g. for V4L2_PIX_FMT_BGR24 the value should be 0xRRGGBB on a little endian, 0xBBGGR on a big endian host.
struct v4l2_clip * clips When chroma-keying has not been negotiated and VIDIOC_G_FBUF indicated this capability, applications can set this field to point to an array of clipping rectangles.

Like the window coordinates w, clipping rectangles are defined relative to the top, left corner of the frame buffer. However clipping rectangles must not extend the frame buffer width and height, and they must not overlap. If possible applications should merge adjacent rectangles. Whether this must create x-y or y-x bands, or the order of rectangles, is not defined. When clip lists are not supported the driver ignores this field. Its contents after calling VIDIOC_S_FMT are undefined.

__u32 clipcount When the application set the clips field, this field must contain the number of clipping rectangles in the list. When clip lists are not supported the driver ignores this field, its contents after calling VIDIOC_S_FMT are undefined. When clip lists are supported but no clipping is desired this field must be set to zero.

void * bitmap When chroma-keying has not been negotiated and VIDIOC_G_FBUF indicated this capability, applications can set this field to point to a clipping bit mask.

It must be of the same size as the window, w.width and w.height. Each bit corresponds to a pixel in the overlaid image, which is displayed only when the bit is set. Pixel coordinates translate to bits like:

```
((__u8 *) bitmap)[w.width * y + x / 8] & (1 << (x & 7))
```

where 0 ≤ x < w.width and 0 ≤ y < w.height.²

When a clipping bit mask is not supported the driver ignores this field, its contents after calling VIDIOC_S_FMT are undefined. When a bit mask is supported but no clipping is desired this field must be set to NULL.

Applications need not create a clip list or bit mask. When they pass both, or despite negotiating chroma-keying, the results are undefined. Regardless of the chosen method, the clipping abilities of the hardware may be limited in quantity or quality. The results when these limits are exceeded are undefined.³

__u8 global_alpha The global alpha value used to blend the framebuffer with video images, if global alpha blending has been negotiated (V4L2_FBUF_FLAG_GLOBAL_ALPHA, see VIDIOC_S_FBUF, Frame Buffer Flags).

Note: This field was added in Linux 2.6.23, extending the structure. However the VIDIOC_[G|S|TRY]_FMT ioctls, which take a pointer to a v4l2_format parent structure with padding bytes at the end, are not affected.

² Should we require w.width to be a multiple of eight?
³ When the image is written into frame buffer memory it will be undesirable if the driver clips out less pixels than expected, because the application and graphics system are not aware these regions need to be refreshed. The driver should clip out more pixels or not write the image at all.

v4l2_clip
struct v4l2_clip

struct v4l2_rect c Coordinates of the clipping rectangle, relative to the top, left corner of the frame buffer. Only window pixels outside all clipping rectangles are displayed.

struct v4l2_clip * next Pointer to the next clipping rectangle, NULL when this is the last rectangle. Drivers ignore this field, it cannot be used to pass a linked list of clipping rectangles.

v4l2_rect

Enabling Overlay

To start or stop the frame buffer overlay applications call the ioctl VIDIOC_OVERLAY ioctl.

3.2.4.3 Video Output Interface

Video output devices encode stills or image sequences as analog video signal. With this interface applications can control the encoding process and move images from user space to the driver.

Conventionally V4L2 video output devices are accessed through character device special files named /dev/video and /dev/video0 to /dev/video63 with major number 81 and minor numbers 0 to 63. /dev/video is typically a symbolic link to the preferred video device.

Note: The same device file names are used also for video capture devices.

4 The X Window system defines “regions” which are vectors of struct BoxRec { short x1, y1, x2, y2; } with width = x2 - x1 and height = y2 - y1, so one cannot pass X11 clip lists directly.
Querying Capabilities

Devices supporting the video output interface set the V4L2_CAP_VIDEO_OUTPUT or V4L2_CAP_VIDEO_OUTPUT_MPLANE flag in the capabilities field of struct v4l2_capability returned by the ioctl VIDIOC_QUERYCAP ioctl. As secondary device functions they may also support the raw VBI output (V4L2_CAP_VBI_OUTPUT) interface. At least one of the read/write or streaming I/O methods must be supported. Modulators and audio outputs are optional.

Supplemental Functions

Video output devices shall support audio output, modulator, controls, cropping and scaling and streaming parameter ioctls as needed. The video output ioctls must be supported by all video output devices.

Image Format Negotiation

The output is determined by cropping and image format parameters. The former select an area of the video picture where the image will appear, the latter how images are stored in memory, i.e. in RGB or YUV format, the number of bits per pixel or width and height. Together they also define how images are scaled in the process.

As usual these parameters are not reset at open() time to permit Unix tool chains, programming a device and then writing to it as if it was a plain file. Well written V4L2 applications ensure they really get what they want, including cropping and scaling.

Cropping initialization at minimum requires to reset the parameters to defaults. An example is given in Image Cropping, Insertion and Scaling – the CROP API.

To query the current image format applications set the type field of a struct v4l2_format to V4L2_BUF_TYPE_VIDEO_OUTPUT or V4L2_BUF_TYPE_VIDEO_OUTPUT_MPLANE and call the VIDIOC_G_FMT ioctl with a pointer to this structure. Drivers fill the struct v4l2_pix_format pix or the struct v4l2_pix_format_mplane pix_mp member of the fmt union.

To request different parameters applications set the type field of a struct v4l2_format as above and initialize all fields of the struct v4l2_pix_format vbi member of the fmt union, or better just modify the results of VIDIOC_G_FMT, and call the VIDIOC_S_FMT ioctl with a pointer to this structure. Drivers may adjust the parameters and finally return the actual parameters as VIDIOC_G_FMT does.

Like VIDIOC_S_FMT the VIDIOC_TRY_FMT ioctl can be used to learn about hardware limitations without disabling I/O or possibly time consuming hardware preparations.

The contents of struct v4l2_pix_format and struct v4l2_pix_format_mplane are discussed in Image Formats. See also the specification of the VIDIOC_G_FMT, VIDIOC_S_FMT and VIDIOC_TRY_FMT ioctls for details. Video output devices must implement both the VIDIOC_G_FMT and VIDIOC_S_FMT ioctl, even if VIDIOC_S_FMT ignores all requests and always returns default parameters as VIDIOC_G_FMT does. VIDIOC_TRY_FMT is optional.
Linux Media Documentation

Writing Images

A video output device may support the `write()` function and/or streaming (memory mapping or user pointer) I/O. See *Input/Output* for details.

3.2.4.4 Video Output Overlay Interface

**Also known as On-Screen Display (OSD)**

Some video output devices can overlay a framebuffer image onto the outgoing video signal. Applications can set up such an overlay using this interface, which borrows structures and ioctls of the *Video Overlay* interface.

The OSD function is accessible through the same character special file as the *Video Output* function.

**Note:** The default function of such a /dev/video device is video capturing or output. The OSD function is only available after calling the `VIDIOC_S_FMT` ioctl.

Querying Capabilities

Devices supporting the *Video Output Overlay* interface set the V4L2_CAP_VIDEO_OUTPUT_OVERLAY flag in the capabilities field of struct v4l2_capability returned by the `ioctl VIDIOC_QUERYCAP` ioctl.

Framebuffer

Contrary to the *Video Overlay* interface the framebuffer is normally implemented on the TV card and not the graphics card. On Linux it is accessible as a framebuffer device (/dev/fbN). Given a V4L2 device, applications can find the corresponding framebuffer device by calling the `VIDIOC_G_FBUF` ioctl. It returns, amongst other information, the physical address of the framebuffer in the base field of struct v4l2_framebuffer. The framebuffer device ioctl `FBIOGET_FSCREENINFO` returns the same address in the smem_start field of struct fb_fix_screeninfo. The `FBIOGET_FSCREENINFO` ioctl and struct `fb_fix_screeninfo` are defined in the `linux/fb.h` header file.

The width and height of the framebuffer depends on the current video standard. A V4L2 driver may reject attempts to change the video standard (or any other ioctl which would imply a framebuffer size change) with an EBUSY error code until all applications closed the framebuffer device.
Example: Finding a framebuffer device for OSD

```c
#include <linux/fb.h>

struct v4l2_framebuffer fbuf;
unsigned int i;
int fb_fd;

if (-1 == ioctl(fd, VIDIOC_G_FBUF, &fbuf)) {
    perror("VIDIOC_G_FBUF");
    exit(EXIT_FAILURE);
}

for (i = 0; i < 30; i++) {
    char dev_name[16];
    struct fb_fix_screeninfo si;

    snprintf(dev_name, sizeof(dev_name), "/dev/fb%u", i);

    fb_fd = open(dev_name, O_RDWR);
    if (-1 == fb_fd) {
        switch (errno) {
            case ENOENT: /* no such file */
            case ENXIO: /* no driver */
                continue;
            default:
                perror("open");
                exit(EXIT_FAILURE);
        }
    }

    if (0 == ioctl(fb_fd, FBIOGET_FSCREENINFO, &si)) {
        if (si.smem_start == (unsigned long)fbuf.base)
            break;
    } else {
        /* Apparently not a framebuffer device. */
    }

    close(fb_fd);
    fb_fd = -1;
}
/* fb_fd is the file descriptor of the framebuffer device
   for the video output overlay, or -1 if no device was found. */
```
### Overlay Window and Scaling

The overlay is controlled by source and target rectangles. The source rectangle selects a subsection of the framebuffer image to be overlaid, the target rectangle an area in the outgoing video signal where the image will appear. Drivers may or may not support scaling, and arbitrary sizes and positions of these rectangles. Further drivers may support any (or none) of the clipping/blending methods defined for the Video Overlay interface.

A struct `v4l2_window` defines the size of the source rectangle, its position in the framebuffer and the clipping/blending method to be used for the overlay. To get the current parameters applications set the type field of a struct `v4l2_format` to `V4L2_BUF_TYPE_VIDEO_OUTPUT_OVERLAY` and call the `VIDIOC_G_FMT` ioctl. The driver fills the struct `v4l2_window` substructure named `win`. It is not possible to retrieve a previously programmed clipping list or bitmap. To program the source rectangle applications set the type field of a struct `v4l2_format` to `V4L2_BUF_TYPE_VIDEO_OUTPUT_OVERLAY`, initialize the `win` substructure and call the `VIDIOC_S_FMT` ioctl. The driver adjusts the parameters against hardware limits and returns the actual parameters as `VIDIOC_G_FMT` does. Like `VIDIOC_S_FMT`, the `VIDIOC_TRY_FMT` ioctl can be used to learn about driver capabilities without actually changing driver state. Unlike `VIDIOC_S_FMT` this also works after the overlay has been enabled.

A struct `v4l2_crop` defines the size and position of the target rectangle. The scaling factor of the overlay is implied by the width and height given in struct `v4l2_window` and struct `v4l2_crop`. The cropping API applies to Video Output and Video Output Overlay devices in the same way as to Video Capture and Video Overlay devices, merely reversing the direction of the data flow. For more information see *Image Cropping, Insertion and Scaling – the CROP API*.

### Enabling Overlay

There is no `V4L2` ioctl to enable or disable the overlay, however the framebuffer interface of the driver may support the `FBIOBLANK` ioctl.

### 3.2.4.5 Video Memory-To-Memory Interface

A `V4L2` memory-to-memory device can compress, decompress, transform, or otherwise convert video data from one format into another format, in memory. Such memory-to-memory devices set the `V4L2_CAP_VIDEO_M2M` or `V4L2_CAP_VIDEO_M2M_MPLANE` capability. Examples of memory-to-memory devices are codecs, scalers, deinterlacers or format converters (i.e. converting from YUV to RGB).

A memory-to-memory video node acts just like a normal video node, but it supports both output (sending frames from memory to the hardware) and capture (receiving the processed frames from the hardware into memory) stream I/O. An application will have to setup the stream I/O for both sides and finally call `VIDIOC_STREAMON` for both capture and output to start the hardware.

Memory-to-memory devices function as a shared resource: you can open the video node multiple times, each application setting up their own properties that are local to the file handle, and each can use it independently from the others. The driver will arbitrate access to the hardware and reprogram it whenever another file handler gets access. This is different from the usual video node behavior where the video properties are global to the device (i.e. changing something through one file handle is visible through another file handle).
One of the most common memory-to-memory device is the codec. Codecs are more complicated than most and require additional setup for their codec parameters. This is done through codec controls. See Codec Control Reference. More details on how to use codec memory-to-memory devices are given in the following sections.

**Memory-to-Memory Stateful Video Decoder Interface**

A stateful video decoder takes complete chunks of the bytestream (e.g. Annex-B H.264/HEVC stream, raw VP8/9 stream) and decodes them into raw video frames in display order. The decoder is expected not to require any additional information from the client to process these buffers.

Performing software parsing, processing etc. of the stream in the driver in order to support this interface is strongly discouraged. In case such operations are needed, use of the Stateless Video Decoder Interface (in development) is strongly advised.

**Conventions and Notations Used in This Document**

1. The general V4L2 API rules apply if not specified in this document otherwise.

2. The meaning of words “must”, “may”, “should”, etc. is as per RFC 2119.

3. All steps not marked “optional” are required.

4. VIDIOC_G_EXT_CTRLS() and VIDIOC_S_EXT_CTRLS() may be used interchangeably with VIDIOC_G_CTRL() and VIDIOC_S_CTRL(), unless specified otherwise.

5. Single-planar API (see Single- and multi-planar APIs) and applicable structures may be used interchangeably with multi-planar API, unless specified otherwise, depending on decoder capabilities and following the general V4L2 guidelines.

6. $i = [a..b]:$ sequence of integers from a to b, inclusive, i.e. $i = [0..2]: i = 0, 1, 2$.

7. Given an OUTPUT buffer A, then $A'$ represents a buffer on the CAPTURE queue containing data that resulted from processing buffer A.

**Glossary**

**CAPTURE** the destination buffer queue; for decoders, the queue of buffers containing decoded frames; for encoders, the queue of buffers containing an encoded bytestream; V4L2_BUF_TYPE_VIDEO_CAPTURE or V4L2_BUF_TYPE_VIDEO_CAPTURE_MPLANE; data is captured from the hardware into CAPTURE buffers.

**client** the application communicating with the decoder or encoder implementing this interface.

**coded format** encoded/compressed video bytestream format (e.g. H.264, VP8, etc.); see also: raw format.

**coded height** height for given coded resolution.

**coded resolution** stream resolution in pixels aligned to codec and hardware requirements; typically visible resolution rounded up to full macroblocks; see also: visible resolution.

**coded width** width for given coded resolution.
**decode order** the order in which frames are decoded; may differ from display order if the coded format includes a feature of frame reordering; for decoders, **OUTPUT** buffers must be queued by the client in decode order; for encoders **CAPTURE** buffers must be returned by the encoder in decode order.

**destination** data resulting from the decode process; see **CAPTURE**.

**display order** the order in which frames must be displayed; for encoders, **OUTPUT** buffers must be queued by the client in display order; for decoders, **CAPTURE** buffers must be returned by the decoder in display order.

**DPB** Decoded Picture Buffer; an H.264/HEVC term for a buffer that stores a decoded raw frame available for reference in further decoding steps.

**EOS** end of stream.

**IDR** Instantaneous Decoder Refresh; a type of a keyframe in an H.264/HEVC-encoded stream, which clears the list of earlier reference frames (DPBs).

**keyframe** an encoded frame that does not reference frames decoded earlier, i.e. can be decoded fully on its own.

**macroblock** a processing unit in image and video compression formats based on linear block transforms (e.g. H.264, VP8, VP9); codec-specific, but for most of popular codecs the size is 16x16 samples (pixels).

**OUTPUT** the source buffer queue; for decoders, the queue of buffers containing an encoded bytestream; for encoders, the queue of buffers containing raw frames; **V4L2_BUF_TYPE_VIDEO_OUTPUT** or **V4L2_BUF_TYPE_VIDEO_OUTPUT_MPLANE**; the hardware is fed with data from **OUTPUT** buffers.

**PPS** Picture Parameter Set; a type of metadata entity in an H.264/HEVC bytestream.

**raw format** uncompressed format containing raw pixel data (e.g. YUV, RGB formats).

**resume point** a point in the bytestream from which decoding may start/continue, without any previous state/data present, e.g.: a keyframe (VP8/VP9) or SPS/PPS/IDR sequence (H.264/HEVC); a resume point is required to start decode of a new stream, or to resume decoding after a seek.

**source** data fed to the decoder or encoder; see **OUTPUT**.

**source height** height in pixels for given source resolution; relevant to encoders only.

**source resolution** resolution in pixels of source frames being source to the encoder and subject to further cropping to the bounds of visible resolution; relevant to encoders only.

**source width** width in pixels for given source resolution; relevant to encoders only.

**SPS** Sequence Parameter Set; a type of metadata entity in an H.264/HEVC bytestream.

**stream metadata** additional (non-visual) information contained inside encoded bytestream; for example: coded resolution, visible resolution, codec profile.

**visible height** height for given visible resolution; display height.

**visible resolution** stream resolution of the visible picture, in pixels, to be used for display purposes; must be smaller or equal to coded resolution; display resolution.

**visible width** width for given visible resolution; display width.
### Querying Capabilities

1. To enumerate the set of coded formats supported by the decoder, the client may call `VIDIOC_ENUM_FMT()` on `OUTPUT`.
   - The full set of supported formats will be returned, regardless of the format set on `CAPTURE`.
   - Check the flags field of `v4l2_fmdesc` for more information about the decoder’s capabilities with respect to each coded format. In particular whether or not the decoder has a full-fledged bytestream parser and if the decoder supports dynamic resolution changes.

2. To enumerate the set of supported raw formats, the client may call `VIDIOC_ENUM_FMT()` on `CAPTURE`.
   - Only the formats supported for the format currently active on `OUTPUT` will be returned.
In order to enumerate raw formats supported by a given coded format, the client must first set that coded format on OUTPUT and then enumerate formats on CAPTURE.

3. The client may use `VIDIOC_ENUM_FRAMESIZES()` to detect supported resolutions for a given format, passing desired pixel format in `v4l2_frmsizeenum pixel_format`.
   - Values returned by `VIDIOC_ENUM_FRAMESIZES()` for a coded pixel format will include all possible coded resolutions supported by the decoder for given coded pixel format.
   - Values returned by `VIDIOC_ENUM_FRAMESIZES()` for a raw pixel format will include all possible frame buffer resolutions supported by the decoder for given raw pixel format and the coded format currently set on OUTPUT.

4. Supported profiles and levels for the coded format currently set on OUTPUT, if applicable, may be queried using their respective controls via `VIDIOC_QUERYCTRL()`.

**Initialization**

1. Set the coded format on OUTPUT via `VIDIOC_S_FMT()`.
   - **Required fields:**
     - **type** a `V4L2_BUF_TYPE_*` enum appropriate for OUTPUT.
     - **pixel_format** a coded pixel format.
     - **width, height** coded resolution of the stream; required only if it cannot be parsed from the stream for the given coded format; otherwise the decoder will use this resolution as a placeholder resolution that will likely change as soon as it can parse the actual coded resolution from the stream.
     - **sizeimage** desired size of OUTPUT buffers; the decoder may adjust it to match hardware requirements.
   - **other fields** follow standard semantics.
   - **Return fields:**
     - **sizeimage** adjusted size of OUTPUT buffers.
     - The CAPTURE format will be updated with an appropriate frame buffer resolution instantly based on the width and height returned by `VIDIOC_S_FMT()`. However, for coded formats that include stream resolution information, after the decoder is done parsing the information from the stream, it will update the CAPTURE format with new values and signal a source change event, regardless of whether they match the values set by the client or not.

   **Important:** Changing the OUTPUT format may change the currently set CAPTURE format. How the new CAPTURE format is determined is up to the decoder and the client must ensure it matches its needs afterwards.

2. Allocate source (bytestream) buffers via `VIDIOC_REQBUFS()` on OUTPUT.
   - **Required fields:**
     - **count** requested number of buffers to allocate; greater than zero.
type a V4L2_BUF_TYPE_* enum appropriate for OUTPUT.

memory follows standard semantics.

- **Return fields:**
  - count the actual number of buffers allocated.

**Warning:** The actual number of allocated buffers may differ from the count given. The client must check the updated value of count after the call returns.

Alternatively, VIDIOC_CREATE_BUFS() on the OUTPUT queue can be used to have more control over buffer allocation.

- **Required fields:**
  - count requested number of buffers to allocate; greater than zero.
  - type a V4L2_BUF_TYPE_* enum appropriate for OUTPUT.
  - memory follows standard semantics.
  - format follows standard semantics.

- **Return fields:**
  - count adjusted to the number of allocated buffers.

**Warning:** The actual number of allocated buffers may differ from the count given. The client must check the updated value of count after the call returns.

3. Start streaming on the OUTPUT queue via VIDIOC_STREAMON().

4. **This step only applies to coded formats that contain resolution information in the stream.** Continue queuing/dequeuing bytestream buffers to/from the OUTPUT queue via VIDIOC_QBUF() and VIDIOC_DQBUF(). The buffers will be processed and returned to the client in order, until required metadata to configure the CAPTURE queue are found. This is indicated by the decoder sending a V4L2_EVENT_SOURCE_CHANGE event with changes set to V4L2_EVENT_SRC_CH_RESOLUTION.

  - It is not an error if the first buffer does not contain enough data for this to occur. Processing of the buffers will continue as long as more data is needed.
  - If data in a buffer that triggers the event is required to decode the first frame, it will not be returned to the client, until the initialization sequence completes and the frame is decoded.
  - If the client has not set the coded resolution of the stream on its own, calling VIDIOC_G_FMT(), VIDIOC_S_FMT(), VIDIOC_TRY_FMT() or VIDIOC_REQBUFS() on the CAPTURE queue will not return the real values for the stream until a V4L2_EVENT_SOURCE_CHANGE event with changes set to V4L2_EVENT_SRC_CH_RESOLUTION is signaled.

**Important:** Any client query issued after the decoder queues the event will return values applying to the just parsed stream, including queue formats, selection rectangles and
controls.

**Note:** A client capable of acquiring stream parameters from the bytestream on its own may attempt to set the width and height of the OUTPUT format to non-zero values matching the coded size of the stream, skip this step and continue with the Capture Setup sequence. However, it must not rely on any driver queries regarding stream parameters, such as selection rectangles and controls, since the decoder has not parsed them from the stream yet. If the values configured by the client do not match those parsed by the decoder, a *Dynamic Resolution Change* will be triggered to reconfigure them.

**Note:** No decoded frames are produced during this phase.

5. Continue with the *Capture Setup* sequence.

**Capture Setup**

1. Call VIDIOC_G_FMT() on the CAPTURE queue to get format for the destination buffers parsed/decoded from the bytestream.

   - **Required fields:**
     - `type` a V4L2_BUF_TYPE_* enum appropriate for CAPTURE.
   
   - **Return fields:**
     - `width, height` frame buffer resolution for the decoded frames.
     - `pixelformat` pixel format for decoded frames.
     - `num_planes (for _MPLANE type only)` number of planes for pixelformat.
     - `sizeimage, bytesperline` as per standard semantics; matching frame buffer format.

   **Note:** The value of `pixelformat` may be any pixel format supported by the decoder for the current stream. The decoder should choose a preferred/optimal format for the default configuration. For example, a YUV format may be preferred over an RGB format if an additional conversion step would be required for the latter.

2. **Optional.** Acquire the visible resolution via VIDIOC_G_SELECTION().

   - **Required fields:**
     - `type` a V4L2_BUF_TYPE_* enum appropriate for CAPTURE.
     - `target` set to V4L2_SEL_TGT_COMPOSE.
   
   - **Return fields:**
     - `r.left, r.top, r.width, r.height` the visible rectangle; it must fit within the frame buffer resolution returned by VIDIOC_G_FMT() on CAPTURE.
     - The following selection targets are supported on CAPTURE:
V4L2_SEL_TGT_CROP_BOUNDS corresponds to the coded resolution of the stream.

V4L2_SEL_TGT_CROP_DEFAULT the rectangle covering the part of the CAPTURE buffer that contains meaningful picture data (visible area); width and height will be equal to the visible resolution of the stream.

V4L2_SEL_TGT_CROP the rectangle within the coded resolution to be output to CAPTURE; defaults to V4L2_SEL_TGT_CROP_DEFAULT; read-only on hardware without additional compose/scaling capabilities.

V4L2_SEL_TGT_COMPOSE_BOUNDS the maximum rectangle within a CAPTURE buffer, which the cropped frame can be composed into; equal to V4L2_SEL_TGT_CROP if the hardware does not support compose/scaling.

V4L2_SEL_TGT_COMPOSE_DEFAULT equal to V4L2_SEL_TGT_CROP.

V4L2_SEL_TGT_COMPOSE the rectangle inside a CAPTURE buffer into which the cropped frame is written; defaults to V4L2_SEL_TGT_COMPOSE_DEFAULT; read-only on hardware without additional compose/scaling capabilities.

V4L2_SEL_TGT_COMPOSE_PADDED the rectangle inside a CAPTURE buffer which is overwritten by the hardware; equal to V4L2_SEL_TGT_COMPOSE if the hardware does not write padding pixels.

Warning: The values are guaranteed to be meaningful only after the decoder successfully parses the stream metadata. The client must not rely on the query before that happens.

3. Optional. Enumerate CAPTURE formats via VIDIOC_ENUM_FMT() on the CAPTURE queue. Once the stream information is parsed and known, the client may use this ioctl to discover which raw formats are supported for given stream and select one of them via VIDIOC_S_FMT().

Important: The decoder will return only formats supported for the currently established coded format, as per the OUTPUT format and/or stream metadata parsed in this initialization sequence, even if more formats may be supported by the decoder in general. In other words, the set returned will be a subset of the initial query mentioned in the Querying Capabilities section.

For example, a decoder may support YUV and RGB formats for resolutions 1920x1088 and lower, but only YUV for higher resolutions (due to hardware limitations). After parsing a resolution of 1920x1088 or lower, VIDIOC_ENUM_FMT() may return a set of YUV and RGB pixel formats, but after parsing resolution higher than 1920x1088, the decoder will not return RGB, unsupported for this resolution.

However, subsequent resolution change event triggered after discovering a resolution change within the same stream may switch the stream into a lower resolution and VIDIOC_ENUM_FMT() would return RGB formats again in that case.

4. Optional. Set the CAPTURE format via VIDIOC_S_FMT() on the CAPTURE queue. The client may choose a different format than selected/suggested by the decoder in VIDIOC_G_FMT().
   • Required fields:
type a V4L2_BUF_TYPE_* enum appropriate for CAPTURE.

pixelformat a raw pixel format.

width, height frame buffer resolution of the decoded stream; typically unchanged from what was returned with VIDIOC_G_FMT(), but it may be different if the hardware supports composition and/or scaling.

- Setting the CAPTURE format will reset the compose selection rectangles to their default values, based on the new resolution, as described in the previous step.

5. **Optional.** Set the compose rectangle via VIDIOC_S_SELECTION() on the CAPTURE queue if it is desired and if the decoder has compose and/or scaling capabilities.

- **Required fields:**
  - type a V4L2_BUF_TYPE_* enum appropriate for CAPTURE.
  - target set to V4L2_SEL_TGT.Compose.
  - r.left, r.top, r.width, r.height the rectangle inside a CAPTURE buffer into which the cropped frame is written; defaults to V4L2_SEL_TGT.Compose_DEFAULT; read-only on hardware without additional compose/scaling capabilities.

- **Return fields:**
  - r.left, r.top, r.width, r.height the visible rectangle; it must fit within the frame buffer resolution returned by VIDIOC_G_FMT() on CAPTURE.

**Warning:** The decoder may adjust the compose rectangle to the nearest supported one to meet codec and hardware requirements. The client needs to check the adjusted rectangle returned by VIDIOC_S_SELECTION().

6. If all the following conditions are met, the client may resume the decoding instantly:

- sizeimage of the new format (determined in previous steps) is less than or equal to the size of currently allocated buffers,

- the number of buffers currently allocated is greater than or equal to the minimum number of buffers acquired in previous steps. To fulfill this requirement, the client may use VIDIOC_CREATE_BUFS() to add new buffers.

In that case, the remaining steps do not apply and the client may resume the decoding by one of the following actions:

- if the CAPTURE queue is streaming, call VIDIOC_DECODER_CMD() with the V4L2_DEC_CMD_START command,

- if the CAPTURE queue is not streaming, call VIDIOC_STREAMON() on the CAPTURE queue.

However, if the client intends to change the buffer set, to lower memory usage or for any other reasons, it may be achieved by following the steps below.

7. **If the CAPTURE queue is streaming**, keep queuing and dequeuing buffers on the CAPTURE queue until a buffer marked with the V4L2_BUF_FLAG_LAST flag is dequeued.

8. **If the CAPTURE queue is streaming**, call VIDIOC_STREAMOFF() on the CAPTURE queue to stop streaming.
Warning: The OUTPUT queue must remain streaming. Calling VIDIOC_STREAMOFF() on it would abort the sequence and trigger a seek.

9. **If the CAPTURE queue has buffers allocated**, free the CAPTURE buffers using VIDIOC_REQBUFS().

   • **Required fields:**
     
     count set to 0.
     
     type a V4L2_BUF_TYPE_* enum appropriate for CAPTURE.
     
     memory follows standard semantics.

10. Allocate CAPTURE buffers via VIDIOC_REQBUFS() on the CAPTURE queue.

    • **Required fields:**
      
      count requested number of buffers to allocate; greater than zero.
      
      type a V4L2_BUF_TYPE_* enum appropriate for CAPTURE.
      
      memory follows standard semantics.

    • **Return fields:**
      
      count actual number of buffers allocated.

Warning: The actual number of allocated buffers may differ from the count given. The client must check the updated value of count after the call returns.

**Note:** To allocate more than the minimum number of buffers (for pipeline depth), the client may query the V4L2_CID_MIN_BUFFERS_FOR_CAPTURE control to get the minimum number of buffers required, and pass the obtained value plus the number of additional buffers needed in the count field to VIDIOC_REQBUFS().

Alternatively, VIDIOC_CREATE_BUFS() on the CAPTURE queue can be used to have more control over buffer allocation. For example, by allocating buffers larger than the current CAPTURE format, future resolution changes can be accommodated.

    • **Required fields:**
      
      count requested number of buffers to allocate; greater than zero.
      
      type a V4L2_BUF_TYPE_* enum appropriate for CAPTURE.
      
      memory follows standard semantics.
      
      format a format representing the maximum framebuffer resolution to be accommodated by newly allocated buffers.

    • **Return fields:**
      
      count adjusted to the number of allocated buffers.
Warning: The actual number of allocated buffers may differ from the count given. The client must check the updated value of count after the call returns.

Note: To allocate buffers for a format different than parsed from the stream metadata, the client must proceed as follows, before the metadata parsing is initiated:

- set width and height of the OUTPUT format to desired coded resolution to let the decoder configure the CAPTURE format appropriately,
- query the CAPTURE format using VIDIOC_G_FMT() and save it until this step.

The format obtained in the query may be then used with VIDIOC_CREATE_BUFS() in this step to allocate the buffers.

11. Call VIDIOC_STREAMON() on the CAPTURE queue to start decoding frames.

Decoding

This state is reached after the Capture Setup sequence finishes successfully. In this state, the client queues and dequeues buffers to both queues via VIDIOC_QBUF() and VIDIOC_DQBUF(), following the standard semantics.

The content of the source OUTPUT buffers depends on the active coded pixel format and may be affected by codec-specific extended controls, as stated in the documentation of each format.

Both queues operate independently, following the standard behavior of V4L2 buffer queues and memory-to-memory devices. In addition, the order of decoded frames dequeued from the CAPTURE queue may differ from the order of queuing coded frames to the OUTPUT queue, due to properties of the selected coded format, e.g. frame reordering.

The client must not assume any direct relationship between CAPTURE and OUTPUT buffers and any specific timing of buffers becoming available to dequeue. Specifically:

- a buffer queued to OUTPUT may result in no buffers being produced on CAPTURE (e.g. if it does not contain encoded data, or if only metadata syntax structures are present in it),
- a buffer queued to OUTPUT may result in more than one buffer produced on CAPTURE (if the encoded data contained more than one frame, or if returning a decoded frame allowed the decoder to return a frame that preceded it in decode, but succeeded it in the display order),
- a buffer queued to OUTPUT may result in a buffer being produced on CAPTURE later into decode process, and/or after processing further OUTPUT buffers, or be returned out of order, e.g. if display reordering is used,
- buffers may become available on the CAPTURE queue without additional buffers queued to OUTPUT (e.g. during drain or EOS), because of the OUTPUT buffers queued in the past whose decoding results are only available at later time, due to specifics of the decoding process.

Note: To allow matching decoded CAPTURE buffers with OUTPUT buffers they originated from, the client can set the timestamp field of the v4l2_buffer struct when queuing an OUTPUT
buffer. The CAPTURE buffer(s), which resulted from decoding that OUTPUT buffer will have their timestamp field set to the same value when dequeued.

In addition to the straightforward case of one OUTPUT buffer producing one CAPTURE buffer, the following cases are defined:

- one OUTPUT buffer generates multiple CAPTURE buffers: the same OUTPUT timestamp will be copied to multiple CAPTURE buffers.
- multiple OUTPUT buffers generate one CAPTURE buffer: timestamp of the OUTPUT buffer queued first will be copied.
- the decoding order differs from the display order (i.e. the CAPTURE buffers are out-of-order compared to the OUTPUT buffers): CAPTURE timestamps will not retain the order of OUTPUT timestamps.

During the decoding, the decoder may initiate one of the special sequences, as listed below. The sequences will result in the decoder returning all the CAPTURE buffers that originated from all the OUTPUT buffers processed before the sequence started. Last of the buffers will have the `V4L2_BUF_FLAG_LAST` flag set. To determine the sequence to follow, the client must check if there is any pending event and:

- if a `V4L2_EVENT_SOURCE_CHANGE` event with changes set to `V4L2_EVENT_SRC_CH_RESOLUTION` is pending, the `Dynamic Resolution Change` sequence needs to be followed,
- if a `V4L2_EVENT_EOS` event is pending, the `End of Stream` sequence needs to be followed.

Some of the sequences can be intermixed with each other and need to be handled as they happen. The exact operation is documented for each sequence.

Should a decoding error occur, it will be reported to the client with the level of details depending on the decoder capabilities. Specifically:

- the CAPTURE buffer that contains the results of the failed decode operation will be returned with the `V4L2_BUF_FLAG_ERROR` flag set,
- if the decoder is able to precisely report the OUTPUT buffer that triggered the error, such buffer will be returned with the `V4L2_BUF_FLAG_ERROR` flag set.

In case of a fatal failure that does not allow the decoding to continue, any further operations on corresponding decoder file handle will return the `-EIO` error code. The client may close the file handle and open a new one, or alternatively reinitialize the instance by stopping streaming on both queues, releasing all buffers and performing the Initialization sequence again.

**Seek**

Seek is controlled by the OUTPUT queue, as it is the source of coded data. The seek does not require any specific operation on the CAPTURE queue, but it may be affected as per normal decoder operation.

1. Stop the OUTPUT queue to begin the seek sequence via `VIDIOC_STREAMOFF()`.
   - **Required fields:**
     - `type` a `V4L2_BUF_TYPE_*` enum appropriate for OUTPUT.
• The decoder will drop all the pending OUTPUT buffers and they must be treated as returned to the client (following standard semantics).

2. Restart the OUTPUT queue via VIDIOC_STREAMON().

   • **Required fields:**
     - `type` a V4L2_BUF_TYPE_* enum appropriate for OUTPUT.
     - The decoder will start accepting new source bytestream buffers after the call returns.

3. Start queuing buffers containing coded data after the seek to the OUTPUT queue until a suitable resume point is found.

   **Note:** There is no requirement to begin queuing coded data starting exactly from a resume point (e.g. SPS or a keyframe). Any queued OUTPUT buffers will be processed and returned to the client until a suitable resume point is found. While looking for a resume point, the decoder should not produce any decoded frames into CAPTURE buffers.

Some hardware is known to mishandle seeks to a non-resume point. Such an operation may result in an unspecified number of corrupted decoded frames being made available on the CAPTURE queue. Drivers must ensure that no fatal decoding errors or crashes occur, and implement any necessary handling and workarounds for hardware issues related to seek operations.

**Warning:** In case of the H.264/HEVC codec, the client must take care not to seek over a change of SPS/PPS. Even though the target frame could be a keyframe, the stale SPS/PPS inside decoder state would lead to undefined results when decoding. Although the decoder must handle that case without a crash or a fatal decode error, the client must not expect a sensible decode output.

If the hardware can detect such corrupted decoded frames, then corresponding buffers will be returned to the client with the V4L2_BUF_FLAG_ERROR set. See the Decoding section for further description of decode error reporting.

4. After a resume point is found, the decoder will start returning CAPTURE buffers containing decoded frames.

   **Important:** A seek may result in the Dynamic Resolution Change sequence being initiated, due to the seek target having decoding parameters different from the part of the stream decoded before the seek. The sequence must be handled as per normal decoder operation.

**Warning:** It is not specified when the CAPTURE queue starts producing buffers containing decoded data from the OUTPUT buffers queued after the seek, as it operates independently from the OUTPUT queue.

The decoder may return a number of remaining CAPTURE buffers containing decoded frames originating from the OUTPUT buffers queued before the seek sequence is performed.
The VIDIOC_STREAMOFF operation discards any remaining queued OUTPUT buffers, which means that not all of the OUTPUT buffers queued before the seek sequence may have matching CAPTURE buffers produced. For example, given the sequence of operations on the OUTPUT queue:

QBUF(A), QBUF(B), STREAMOFF(), STREAMON(), QBUF(G), QBUF(H),

any of the following results on the CAPTURE queue is allowed:

{A', B', G', H'}, {A', G', H'}, {G', H'}.

To determine the CAPTURE buffer containing the first decoded frame after the seek, the client may observe the timestamps to match the CAPTURE and OUTPUT buffers or use V4L2_DEC_CMD_STOP and V4L2_DEC_CMD_START to drain the decoder.

**Note:** To achieve instantaneous seek, the client may restart streaming on the CAPTURE queue too to discard decoded, but not yet dequeued buffers.

### Dynamic Resolution Change

Streams that include resolution metadata in the bytestream may require switching to a different resolution during the decoding.

**Note:** Not all decoders can detect resolution changes. Those that do set the V4L2_FMT_FLAG_DYN_RESOLUTION flag for the coded format when VIDIOC_ENUM_FMT() is called.

The sequence starts when the decoder detects a coded frame with one or more of the following parameters different from those previously established (and reflected by corresponding queries):

- coded resolution (OUTPUT width and height),
- visible resolution (selection rectangles),
- the minimum number of buffers needed for decoding,
- bit-depth of the bitstream has been changed.

Whenever that happens, the decoder must proceed as follows:

1. After encountering a resolution change in the stream, the decoder sends a V4L2_EVENT_SOURCE_CHANGE event with changes set to V4L2_EVENT_SRC_CH_RESOLUTION.

   **Important:** Any client query issued after the decoder queues the event will return values applying to the stream after the resolution change, including queue formats, selection rectangles and controls.

2. The decoder will then process and decode all remaining buffers from before the resolution change point.
• The last buffer from before the change must be marked with the V4L2_BUF_FLAG_LAST flag, similarly to the Drain sequence above.

**Warning:** The last buffer may be empty (with v4l2_buffer bytesused = 0) and in that case it must be ignored by the client, as it does not contain a decoded frame.

**Note:** Any attempt to dequeue more CAPTURE buffers beyond the buffer marked with V4L2_BUF_FLAG_LAST will result in a -EPIPE error from VIDIOC_DQBUF().

The client must continue the sequence as described below to continue the decoding process.

1. Dequeue the source change event.

**Important:** A source change triggers an implicit decoder drain, similar to the explicit Drain sequence. The decoder is stopped after it completes. The decoding process must be resumed with either a pair of calls to VIDIOC_STREAMOFF() and VIDIOC_STREAMON() on the CAPTURE queue, or a call to VIDIOC_DECODER_CMD() with the V4L2_DEC_CMD_START command.

2. Continue with the Capture Setup sequence.

**Note:** During the resolution change sequence, the OUTPUT queue must remain streaming. Calling VIDIOC_STREAMOFF() on the OUTPUT queue would abort the sequence and initiate a seek.

In principle, the OUTPUT queue operates separately from the CAPTURE queue and this remains true for the duration of the entire resolution change sequence as well.

The client should, for best performance and simplicity, keep queuing/dequeuing buffers to/from the OUTPUT queue even while processing this sequence.

**Drain**

To ensure that all queued OUTPUT buffers have been processed and related CAPTURE buffers are given to the client, the client must follow the drain sequence described below. After the drain sequence ends, the client has received all decoded frames for all OUTPUT buffers queued before the sequence was started.

1. Begin drain by issuing VIDIOC_DECODER_CMD().

   **Required fields:**
   
   - **cmd** set to V4L2_DEC_CMD_STOP.
   - **flags** set to 0.
   - **pts** set to 0.
### Warning: The sequence can be only initiated if both OUTPUT and CAPTURE queues are streaming. For compatibility reasons, the call to VIDIOC_DECODER_CMD() will not fail even if any of the queues is not streaming, but at the same time it will not initiate the Drain sequence and so the steps described below would not be applicable.

2. Any OUTPUT buffers queued by the client before the VIDIOC_DECODER_CMD() was issued will be processed and decoded as normal. The client must continue to handle both queues independently, similarly to normal decode operation. This includes:

   - handling any operations triggered as a result of processing those buffers, such as the Dynamic Resolution Change sequence, before continuing with the drain sequence,
   - queuing and dequeueing CAPTURE buffers, until a buffer marked with the V4L2_BUF_FLAG_LAST flag is dequeued,

### Warning: The last buffer may be empty (with v4l2_buffer bytesused = 0) and in that case it must be ignored by the client, as it does not contain a decoded frame.

### Note: Any attempt to dequeue more CAPTURE buffers beyond the buffer marked with V4L2_BUF_FLAG_LAST will result in a -EPIPE error from VIDIOC_DQBUF().

   - dequeuing processed OUTPUT buffers, until all the buffers queued before the V4L2_DEC_CMD_STOP command are dequeued,
   - dequeuing the V4L2_EVENT_EOS event, if the client subscribed to it.

### Note: For backwards compatibility, the decoder will signal a V4L2_EVENT_EOS event when the last frame has been decoded and all frames are ready to be dequeued. It is a deprecated behavior and the client must not rely on it. The V4L2_BUF_FLAG_LAST buffer flag should be used instead.

3. Once all the OUTPUT buffers queued before the V4L2_DEC_CMD_STOP call are dequeued and the last CAPTURE buffer is dequeued, the decoder is stopped and it will accept, but not process, any newly queued OUTPUT buffers until the client issues any of the following operations:

   - V4L2_DEC_CMD_START - the decoder will not be reset and will resume operation normally, with all the state from before the drain,
   - a pair of VIDIOC_STREAMOFF() and VIDIOC_STREAMON() on the CAPTURE queue - the decoder will resume the operation normally, however any CAPTURE buffers still in the queue will be returned to the client,
   - a pair of VIDIOC_STREAMOFF() and VIDIOC_STREAMON() on the OUTPUT queue - any pending source buffers will be returned to the client and the Seek sequence will be triggered.

### Note: Once the drain sequence is initiated, the client needs to drive it to completion, as
Linux Media Documentation

described by the steps above, unless it aborts the process by issuing VIDIOC_STREAMOFF() on any of the OUTPUT or CAPTURE queues. The client is not allowed to issue V4L2_DEC_CMD_START or V4L2_DEC_CMD_STOP again while the drain sequence is in progress and they will fail with -EBUSY error code if attempted.

Although not mandatory, the availability of decoder commands may be queried using VIDIOC_TRY_DECODER_CMD().

End of Stream

If the decoder encounters an end of stream marking in the stream, the decoder will initiate the Drain sequence, which the client must handle as described above, skipping the initial VIDIOC_DECODER_CMD().

Commit Points

Setting formats and allocating buffers trigger changes in the behavior of the decoder.

1. Setting the format on the OUTPUT queue may change the set of formats supported/advertised on the CAPTURE queue. In particular, it also means that the CAPTURE format may be reset and the client must not rely on the previously set format being preserved.

2. Enumerating formats on the CAPTURE queue always returns only formats supported for the current OUTPUT format.

3. Setting the format on the CAPTURE queue does not change the list of formats available on the OUTPUT queue. An attempt to set a CAPTURE format that is not supported for the currently selected OUTPUT format will result in the decoder adjusting the requested CAPTURE format to a supported one.

4. Enumerating formats on the OUTPUT queue always returns the full set of supported coded formats, irrespectively of the current CAPTURE format.

5. While buffers are allocated on any of the OUTPUT or CAPTURE queues, the client must not change the format on the OUTPUT queue. Drivers will return the -EBUSY error code for any such format change attempt.

To summarize, setting formats and allocation must always start with the OUTPUT queue and the OUTPUT queue is the master that governs the set of supported formats for the CAPTURE queue.

Memory-to-Memory Stateful Video Encoder Interface

A stateful video encoder takes raw video frames in display order and encodes them into a bytestream. It generates complete chunks of the bytestream, including all metadata, headers, etc. The resulting bytestream does not require any further post-processing by the client.

Performing software stream processing, header generation etc. in the driver in order to support this interface is strongly discouraged. In case such operations are needed, use of the Stateless Video Encoder Interface (in development) is strongly advised.
Conventions and Notations Used in This Document

1. The general V4L2 API rules apply if not specified in this document otherwise.
2. The meaning of words “must”, “may”, “should”, etc. is as per RFC 2119.
3. All steps not marked “optional” are required.
4. `VIDIOC_G_EXT_CTRLS()` and `VIDIOC_S_EXT_CTRLS()` may be used interchangeably with `VIDIOC_G_CTRL()` and `VIDIOC_S_CTRL()`, unless specified otherwise.
5. Single-planar API (see Single- and multi-planar APIs) and applicable structures may be used interchangeably with multi-planar API, unless specified otherwise, depending on encoder capabilities and following the general V4L2 guidelines.
6. i = [a..b]: sequence of integers from a to b, inclusive, i.e. i = [0..2]: i = 0, 1, 2.
7. Given an OUTPUT buffer A, then A’ represents a buffer on the CAPTURE queue containing data that resulted from processing buffer A.

State Machine

![Fig. 9: Encoder State Machine](image-url)
Querying Capabilities

1. To enumerate the set of coded formats supported by the encoder, the client may call VIDIOC_ENUM_FMT() on CAPTURE.
   - The full set of supported formats will be returned, regardless of the format set on OUTPUT.

2. To enumerate the set of supported raw formats, the client may call VIDIOC_ENUM_FMT() on OUTPUT.
   - Only the formats supported for the format currently active on CAPTURE will be returned.
   - In order to enumerate raw formats supported by a given coded format, the client must first set that coded format on CAPTURE and then enumerate the formats on OUTPUT.

3. The client may use VIDIOC_ENUM_FRAMESIZES() to detect supported resolutions for a given format, passing the desired pixel format in v4l2_frmsizeenum pixel_format.
   - Values returned by VIDIOC_ENUM_FRAMESIZES() for a coded pixel format will include all possible coded resolutions supported by the encoder for the given coded pixel format.
   - Values returned by VIDIOC_ENUM_FRAMESIZES() for a raw pixel format will include all possible frame buffer resolutions supported by the encoder for the given raw pixel format and coded format currently set on CAPTURE.

4. The client may use VIDIOC_ENUM_FRAMEINTERVALS() to detect supported frame intervals for a given format and resolution, passing the desired pixel format in v4l2_frmsizeenum pixel_format and the resolution in v4l2_frmsizeenum width and v4l2_frmsizeenum height.
   - Values returned by VIDIOC_ENUM_FRAMEINTERVALS() for a coded pixel format and coded resolution will include all possible frame intervals supported by the encoder for the given coded pixel format and resolution.
   - Values returned by VIDIOC_ENUM_FRAMEINTERVALS() for a raw pixel format and resolution will include all possible frame intervals supported by the encoder for the given raw pixel format and resolution and for the coded format, coded resolution and coded frame interval currently set on CAPTURE.
   - Support for VIDIOC_ENUM_FRAMEINTERVALS() is optional. If it is not implemented, then there are no special restrictions other than the limits of the codec itself.

5. Supported profiles and levels for the coded format currently set on CAPTURE, if applicable, may be queried using their respective controls via VIDIOC_QUERYCTRL().

6. Any additional encoder capabilities may be discovered by querying their respective controls.
Initialization

1. Set the coded format on the CAPTURE queue via VIDIOC_S_FMT().
   - **Required fields:**
     - `type` a V4L2_BUF_TYPE_* enum appropriate for CAPTURE.
     - `pixelformat` the coded format to be produced.
     - `sizeimage` desired size of CAPTURE buffers; the encoder may adjust it to match hardware requirements.
     - `width`, `height` ignored (read-only).
     - `other fields` follow standard semantics.
   - **Return fields:**
     - `sizeimage` adjusted size of CAPTURE buffers.
     - `width`, `height` the coded size selected by the encoder based on current state, e.g. OUTPUT format, selection rectangles, etc. (read-only).

   **Important:** Changing the CAPTURE format may change the currently set OUTPUT format. How the new OUTPUT format is determined is up to the encoder and the client must ensure it matches its needs afterwards.

2. **Optional.** Enumerate supported OUTPUT formats (raw formats for source) for the selected coded format via VIDIOC_ENUM_FMT().
   - **Required fields:**
     - `type` a V4L2_BUF_TYPE_* enum appropriate for OUTPUT.
     - `other fields` follow standard semantics.
   - **Return fields:**
     - `pixelformat` raw format supported for the coded format currently selected on the CAPTURE queue.
     - `other fields` follow standard semantics.

3. Set the raw source format on the OUTPUT queue via VIDIOC_S_FMT().
   - **Required fields:**
     - `type` a V4L2_BUF_TYPE_* enum appropriate for OUTPUT.
     - `pixelformat` raw format of the source.
     - `width`, `height` source resolution.
     - `other fields` follow standard semantics.
   - **Return fields:**
     - `width`, `height` may be adjusted to match encoder minimums, maximums and alignment requirements, as required by the currently selected formats, as reported by VIDIOC_ENUM_FRAMESIZES().
**other fields** follow standard semantics.

- Setting the OUTPUT format will reset the selection rectangles to their default values, based on the new resolution, as described in the next step.

4. Set the raw frame interval on the OUTPUT queue via VIDIOC_S_PARM(). This also sets the coded frame interval on the CAPTURE queue to the same value.

  - **Required fields:**
    
    **type** a V4L2_BUF_TYPE_* enum appropriate for OUTPUT.
    
    **parm.output** set all fields except parm.output.timeperframe to 0.
    
    **parm.output.timeperframe** the desired frame interval; the encoder may adjust it to match hardware requirements.

  - **Return fields:**
    
    **parm.output.timeperframe** the adjusted frame interval.

---

**Important:** Changing the OUTPUT frame interval also sets the framerate that the encoder uses to encode the video. So setting the frame interval to 1/24 (or 24 frames per second) will produce a coded video stream that can be played back at that speed. The frame interval for the OUTPUT queue is just a hint, the application may provide raw frames at a different rate. It can be used by the driver to help schedule multiple encoders running in parallel.

In the next step the CAPTURE frame interval can optionally be changed to a different value. This is useful for off-line encoding were the coded frame interval can be different from the rate at which raw frames are supplied.

---

**Important:** timeperframe deals with *frames*, not fields. So for interlaced formats this is the time per two fields, since a frame consists of a top and a bottom field.

---

**Note:** It is due to historical reasons that changing the OUTPUT frame interval also changes the coded frame interval on the CAPTURE queue. Ideally these would be independent settings, but that would break the existing API.

---

5. **Optional** Set the coded frame interval on the CAPTURE queue via VIDIOC_S_PARM(). This is only necessary if the coded frame interval is different from the raw frame interval, which is typically the case for off-line encoding. Support for this feature is signalled by the V4L2_FMT_FLAG_ENC_CAP_FRAME_INTERVAL format flag.

  - **Required fields:**
    
    **type** a V4L2_BUF_TYPE_* enum appropriate for CAPTURE.
    
    **parm.capture** set all fields except parm.capture.timeperframe to 0.
    
    **parm.capture.timeperframe** the desired coded frame interval; the encoder may adjust it to match hardware requirements.

  - **Return fields:**
    
    **parm.capture.timeperframe** the adjusted frame interval.
**Important:** Changing the CAPTURE frame interval sets the framerate for the coded video. It does not set the rate at which buffers arrive on the CAPTURE queue, that depends on how fast the encoder is and how fast raw frames are queued on the OUTPUT queue.

**Important:** `timeperframe` deals with frames, not fields. So for interlaced formats this is the time per two fields, since a frame consists of a top and a bottom field.

**Note:** Not all drivers support this functionality, in that case just set the desired coded frame interval for the OUTPUT queue.

However, drivers that can schedule multiple encoders based on the OUTPUT frame interval must support this optional feature.

6. **Optional.** Set the visible resolution for the stream metadata via `VIDIOC_S_SELECTION()` on the OUTPUT queue if it is desired to be different than the full OUTPUT resolution.

   - **Required fields:**
     - `type` a `V4L2_BUF_TYPE_*` enum appropriate for OUTPUT.
     - `target` set to `V4L2_SEL_TGT_CROP`.
     - `r.left, r.top, r.width, r.height` visible rectangle; this must fit within the `V4L2_SEL_TGT_CROP_BOUNDS` rectangle and may be subject to adjustment to match codec and hardware constraints.

   - **Return fields:**
     - `r.left, r.top, r.width, r.height` visible rectangle adjusted by the encoder.

   - The following selection targets are supported on OUTPUT:
     - `V4L2_SEL_TGT_CROP_BOUNDS` equal to the full source frame, matching the active OUTPUT format.
     - `V4L2_SEL_TGT_CROP_DEFAULT` equal to `V4L2_SEL_TGT_CROP_BOUNDS`.
     - `V4L2_SEL_TGT_CROP` rectangle within the source buffer to be encoded into the CAPTURE stream; defaults to `V4L2_SEL_TGT_CROP_DEFAULT`.

**Note:** A common use case for this selection target is encoding a source video with a resolution that is not a multiple of a macroblock, e.g. the common 1920x1080 resolution may require the source buffers to be aligned to 1920x1088 for codecs with 16x16 macroblock size. To avoid encoding the padding, the client needs to explicitly configure this selection target to 1920x1080.

**Warning:** The encoder may adjust the crop/compose rectangles to the nearest supported ones to meet codec and hardware requirements. The client needs to check the adjusted rectangle returned by `VIDIOC_S_SELECTION()`.
7. Allocate buffers for both OUTPUT and CAPTURE via VIDIOC_REQBUFS(). This may be performed in any order.

- **Required fields:**
  - `count` requested number of buffers to allocate; greater than zero.
  - `type` a V4L2_BUF_TYPE_* enum appropriate for OUTPUT or CAPTURE.
  - other fields follow standard semantics.

- **Return fields:**
  - `count` actual number of buffers allocated.

**Warning:** The actual number of allocated buffers may differ from the `count` given. The client must check the updated value of `count` after the call returns.

**Note:** To allocate more than the minimum number of OUTPUT buffers (for pipeline depth), the client may query the V4L2_CID_MIN_BUFFERS_FOR_OUTPUT control to get the minimum number of buffers required, and pass the obtained value plus the number of additional buffers needed in the `count` field to VIDIOC_REQBUFS(). Alternatively, VIDIOC_CREATE_BUFS() can be used to have more control over buffer allocation.

- **Required fields:**
  - `count` requested number of buffers to allocate; greater than zero.
  - `type` a V4L2_BUF_TYPE_* enum appropriate for OUTPUT.
  - other fields follow standard semantics.

- **Return fields:**
  - `count` adjusted to the number of allocated buffers.

8. Begin streaming on both OUTPUT and CAPTURE queues via VIDIOC_STREAMON(). This may be performed in any order. The actual encoding process starts when both queues start streaming.

**Note:** If the client stops the CAPTURE queue during the encode process and then restarts it again, the encoder will begin generating a stream independent from the stream generated before the stop. The exact constraints depend on the coded format, but may include the following implications:

- encoded frames produced after the restart must not reference any frames produced before the stop, e.g. no long term references for H.264/HEVC,
- any headers that must be included in a standalone stream must be produced again, e.g. SPS and PPS for H.264/HEVC.
Encoding

This state is reached after the Initialization sequence finishes successfully. In this state, the client queues and dequeues buffers to both queues via VIDIOC_QBUF() and VIDIOC_DQBUF(), following the standard semantics.

The content of encoded CAPTURE buffers depends on the active coded pixel format and may be affected by codec-specific extended controls, as stated in the documentation of each format.

Both queues operate independently, following standard behavior of V4L2 buffer queues and memory-to-memory devices. In addition, the order of encoded frames dequeued from the CAPTURE queue may differ from the order of queuing raw frames to the OUTPUT queue, due to properties of the selected coded format, e.g. frame reordering.

The client must not assume any direct relationship between CAPTURE and OUTPUT buffers and any specific timing of buffers becoming available to dequeue. Specifically:

- a buffer queued to OUTPUT may result in more than one buffer produced on CAPTURE (for example, if returning an encoded frame allowed the encoder to return a frame that preceded it in display, but succeeded it in the decode order; however, there may be other reasons for this as well),
- a buffer queued to OUTPUT may result in a buffer being produced on CAPTURE later into encode process, and/or after processing further OUTPUT buffers, or be returned out of order, e.g. if display reordering is used,
- buffers may become available on the CAPTURE queue without additional buffers queued to OUTPUT (e.g. during drain or EOS), because of the OUTPUT buffers queued in the past whose encoding results are only available at later time, due to specifics of the encoding process,
- buffers queued to OUTPUT may not become available to dequeue instantly after being encoded into a corresponding CAPTURE buffer, e.g. if the encoder needs to use the frame as a reference for encoding further frames.

Note: To allow matching encoded CAPTURE buffers with OUTPUT buffers they originated from, the client can set the timestamp field of the v4l2_buffer struct when queuing an OUTPUT buffer. The CAPTURE buffer(s), which resulted from encoding that OUTPUT buffer will have their timestamp field set to the same value when dequeued.

In addition to the straightforward case of one OUTPUT buffer producing one CAPTURE buffer, the following cases are defined:

- one OUTPUT buffer generates multiple CAPTURE buffers: the same OUTPUT timestamp will be copied to multiple CAPTURE buffers,
- the encoding order differs from the presentation order (i.e. the CAPTURE buffers are out-of-order compared to the OUTPUT buffers): CAPTURE timestamps will not retain the order of OUTPUT timestamps.

Note: To let the client distinguish between frame types (keyframes, intermediate frames; the exact list of types depends on the coded format), the CAPTURE buffers will have corresponding flag bits set in their v4l2_buffer struct when dequeued. See the documentation of v4l2_buffer and each coded pixel format for exact list of flags and their meanings.
Should an encoding error occur, it will be reported to the client with the level of details depending on the encoder capabilities. Specifically:

- the CAPTURE buffer (if any) that contains the results of the failed encode operation will be returned with the V4L2_BUF_FLAG_ERROR flag set,
- if the encoder is able to precisely report the OUTPUT buffer(s) that triggered the error, such buffer(s) will be returned with the V4L2_BUF_FLAG_ERROR flag set.

**Note:** If a CAPTURE buffer is too small then it is just returned with the V4L2_BUF_FLAG_ERROR flag set. More work is needed to detect that this error occurred because the buffer was too small, and to provide support to free existing buffers that were too small.

In case of a fatal failure that does not allow the encoding to continue, any further operations on corresponding encoder file handle will return the -EIO error code. The client may close the file handle and open a new one, or alternatively reinitialize the instance by stopping streaming on both queues, releasing all buffers and performing the Initialization sequence again.

**Encoding Parameter Changes**

The client is allowed to use VIDIOC_S_CTRL() to change encoder parameters at any time. The availability of parameters is encoder-specific and the client must query the encoder to find the set of available controls.

The ability to change each parameter during encoding is encoder-specific, as per the standard semantics of the V4L2 control interface. The client may attempt to set a control during encoding and if the operation fails with the -EBUSY error code, the CAPTURE queue needs to be stopped for the configuration change to be allowed. To do this, it may follow the Drain sequence to avoid losing the already queued/encoded frames.

The timing of parameter updates is encoder-specific, as per the standard semantics of the V4L2 control interface. If the client needs to apply the parameters exactly at specific frame, using the Request API (Request API) should be considered, if supported by the encoder.

**Drain**

To ensure that all the queued OUTPUT buffers have been processed and the related CAPTURE buffers are given to the client, the client must follow the drain sequence described below. After the drain sequence ends, the client has received all encoded frames for all OUTPUT buffers queued before the sequence was started.

1. Begin the drain sequence by issuing VIDIOC_ENCODER_CMD().

   - **Required fields:**
     - **cmd** set to V4L2_ENC_CMD_STOP.
     - **flags** set to 0.
     - **pts** set to 0.
Warning: The sequence can be only initiated if both OUTPUT and CAPTURE queues are streaming. For compatibility reasons, the call to VIDIOC_ENCODER_CMD() will not fail even if any of the queues is not streaming, but at the same time it will not initiate the Drain sequence and so the steps described below would not be applicable.

2. Any OUTPUT buffers queued by the client before the VIDIOC_ENCODER_CMD() was issued will be processed and encoded as normal. The client must continue to handle both queues independently, similarly to normal encode operation. This includes:
   - queuing and dequeuing CAPTURE buffers, until a buffer marked with the V4L2_BUF_FLAG_LAST flag is dequeued,

   Warning: The last buffer may be empty (with v4l2_buffer bytesused = 0) and in that case it must be ignored by the client, as it does not contain an encoded frame.

   Note: Any attempt to dequeue more CAPTURE buffers beyond the buffer marked with V4L2_BUF_FLAG_LAST will result in a -EPIPE error from VIDIOC_DQBUF().

   - dequeuing processed OUTPUT buffers, until all the buffers queued before the V4L2_ENC_CMD_STOP command are dequeued,
   - dequeuing the V4L2_EVENT_EOS event, if the client subscribes to it.

   Note: For backwards compatibility, the encoder will signal a V4L2_EVENT_EOS event when the last frame has been encoded and all frames are ready to be dequeued. It is deprecated behavior and the client must not rely on it. The V4L2_BUF_FLAG_LAST buffer flag should be used instead.

3. Once all OUTPUT buffers queued before the V4L2_ENC_CMD_STOP call are dequeued and the last CAPTURE buffer is dequeued, the encoder is stopped and it will accept, but not process any newly queued OUTPUT buffers until the client issues any of the following operations:
   - V4L2_ENC_CMD_START - the encoder will not be reset and will resume operation normally, with all the state from before the drain,
   - a pair of VIDIOC_STREAMOFF() and VIDIOC_STREAMON() on the CAPTURE queue - the encoder will be reset (see the Reset sequence) and then resume encoding,
   - a pair of VIDIOC_STREAMOFF() and VIDIOC_STREAMON() on the OUTPUT queue - the encoder will resume operation normally, however any source frames queued to the OUTPUT queue between V4L2_ENC_CMD_STOP and VIDIOC_STREAMOFF() will be discarded.

   Note: Once the drain sequence is initiated, the client needs to drive it to completion, as described by the steps above, unless it aborts the process by issuing VIDIOC_STREAMOFF() on any of the OUTPUT or CAPTURE queues. The client is not allowed to issue V4L2_ENC_CMD_START or V4L2_ENC_CMD_STOP again while the drain sequence is in progress and they will fail with -EBUSY error code if attempted.
For reference, handling of various corner cases is described below:

- In case of no buffer in the OUTPUT queue at the time the V4L2_ENC_CMD_STOP command was issued, the drain sequence completes immediately and the encoder returns an empty CAPTURE buffer with the V4L2_BUF_FLAG_LAST flag set.

- In case of no buffer in the CAPTURE queue at the time the drain sequence completes, the next time the client queues a CAPTURE buffer it is returned at once as an empty buffer with the V4L2_BUF_FLAG_LAST flag set.

- If VIDIOC_STREAMOFF() is called on the CAPTURE queue in the middle of the drain sequence, the drain sequence is canceled and all CAPTURE buffers are implicitly returned to the client.

- If VIDIOC_STREAMOFF() is called on the OUTPUT queue in the middle of the drain sequence, the drain sequence completes immediately and next CAPTURE buffer will be returned empty with the V4L2_BUF_FLAG_LAST flag set.

Although not mandatory, the availability of encoder commands may be queried using VIDIOC_TRY_ENCODER_CMD().

Reset

The client may want to request the encoder to reinitialize the encoding, so that the following stream data becomes independent from the stream data generated before. Depending on the coded format, that may imply that:

- encoded frames produced after the restart must not reference any frames produced before the stop, e.g. no long term references for H.264/HEVC,

- any headers that must be included in a standalone stream must be produced again, e.g. SPS and PPS for H.264/HEVC.

This can be achieved by performing the reset sequence.

1. Perform the Drain sequence to ensure all the in-flight encoding finishes and respective buffers are dequeued.

2. Stop streaming on the CAPTURE queue via VIDIOC_STREAMOFF(). This will return all currently queued CAPTURE buffers to the client, without valid frame data.

3. Start streaming on the CAPTURE queue via VIDIOC_STREAMON() and continue with regular encoding sequence. The encoded frames produced into CAPTURE buffers from now on will contain a standalone stream that can be decoded without the need for frames encoded before the reset sequence, starting at the first OUTPUT buffer queued after issuing the V4L2_ENC_CMD_STOP of the Drain sequence.

This sequence may be also used to change encoding parameters for encoders without the ability to change the parameters on the fly.
Commit Points

Setting formats and allocating buffers triggers changes in the behavior of the encoder.

1. Setting the format on the CAPTURE queue may change the set of formats supported/advertised on the OUTPUT queue. In particular, it also means that the OUTPUT format may be reset and the client must not rely on the previously set format being preserved.

2. Enumerating formats on the OUTPUT queue always returns only formats supported for the current CAPTURE format.

3. Setting the format on the OUTPUT queue does not change the list of formats available on the CAPTURE queue. An attempt to set the OUTPUT format that is not supported for the currently selected CAPTURE format will result in the encoder adjusting the requested OUTPUT format to a supported one.

4. Enumerating formats on the CAPTURE queue always returns the full set of supported coded formats, irrespective of the current OUTPUT format.

5. While buffers are allocated on any of the OUTPUT or CAPTURE queues, the client must not change the format on the CAPTURE queue. Drivers will return the -EBUSY error code for any such format change attempt.

To summarize, setting formats and allocation must always start with the CAPTURE queue and the CAPTURE queue is the master that governs the set of supported formats for the OUTPUT queue.

Memory-to-memory Stateless Video Decoder Interface

A stateless decoder is a decoder that works without retaining any kind of state between processed frames. This means that each frame is decoded independently of any previous and future frames, and that the client is responsible for maintaining the decoding state and providing it to the decoder with each decoding request. This is in contrast to the stateful video decoder interface, where the hardware and driver maintain the decoding state and all the client has to do is to provide the raw encoded stream and dequeue decoded frames in display order.

This section describes how user-space (“the client”) is expected to communicate with stateless decoders in order to successfully decode an encoded stream. Compared to stateful codecs, the decoder/client sequence is simpler, but the cost of this simplicity is extra complexity in the client which is responsible for maintaining a consistent decoding state.

Stateless decoders make use of the Request API. A stateless decoder must expose the V4L2_BUF_CAP_SUPPORTS_REQUESTS capability on its OUTPUT queue when VIDIOC_REQBUFS() or VIDIOC_CREATE_BUFS() are invoked.

Depending on the encoded formats supported by the decoder, a single decoded frame may be the result of several decode requests (for instance, H.264 streams with multiple slices per frame). Decoders that support such formats must also expose the V4L2_BUF_CAP_SUPPORTS_M2M_HOLD_CAPTURE_BUF capability on their OUTPUT queue.
Querying capabilities

1. To enumerate the set of coded formats supported by the decoder, the client calls VIDIOC_ENUM_FMT() on the OUTPUT queue.
   - The driver must always return the full set of supported OUTPUT formats, irrespective of the format currently set on the CAPTURE queue.
   - Simultaneously, the driver must restrain the set of values returned by codec-specific capability controls (such as H.264 profiles) to the set actually supported by the hardware.

2. To enumerate the set of supported raw formats, the client calls VIDIOC_ENUM_FMT() on the CAPTURE queue.
   - The driver must return only the formats supported for the format currently active on the OUTPUT queue.
   - Depending on the currently set OUTPUT format, the set of supported raw formats may depend on the value of some codec-dependent controls. The client is responsible for making sure that these controls are set before querying the CAPTURE queue. Failure to do so will result in the default values for these controls being used, and a returned set of formats that may not be usable for the media the client is trying to decode.

3. The client may use VIDIOC_ENUM_FRAMESIZES() to detect supported resolutions for a given format, passing desired pixel format in v4l2_frmsizeenum's pixel_format.

4. Supported profiles and levels for the current OUTPUT format, if applicable, may be queried using their respective controls via VIDIOC_QUERYCTRL().

Initialization

1. Set the coded format on the OUTPUT queue via VIDIOC_S_FMT().
   - **Required fields:**
     - type a V4L2_BUF_TYPE_* enum appropriate for OUTPUT.
     - pixelformat a coded pixel format.
     - width, height coded width and height parsed from the stream.
     - other fields follow standard semantics.

   **Note:** Changing the OUTPUT format may change the currently set CAPTURE format. The driver will derive a new CAPTURE format from the OUTPUT format being set, including resolution, colorimetry parameters, etc. If the client needs a specific CAPTURE format, it must adjust it afterwards.

2. Call VIDIOC_S_EXT_CTRLS() to set all the controls (parsed headers, etc.) required by the OUTPUT format to enumerate the CAPTURE formats.

3. Call VIDIOC_G_FMT() for CAPTURE queue to get the format for the destination buffers parsed/decoded from the bytestream.
   - **Required fields:**
type a V4L2_BUF_TYPE_* enum appropriate for CAPTURE.

- **Returned fields:**
  - `width, height` frame buffer resolution for the decoded frames.
  - `pixelformat` pixel format for decoded frames.
  - `num_planes` (for _MPLANE type only) number of planes for pixelformat.
  - `sizeimage, bytesperline` as per standard semantics; matching frame buffer format.

**Note:** The value of pixelformat may be any pixel format supported for the OUTPUT format, based on the hardware capabilities. It is suggested that the driver chooses the preferred/optimal format for the current configuration. For example, a YUV format may be preferred over an RGB format, if an additional conversion step would be required for RGB.

4. **[optional]** Enumerate CAPTURE formats via VIDIOC_ENUM_FMT() on the CAPTURE queue. The client may use this ioctl to discover which alternative raw formats are supported for the current OUTPUT format and select one of them via VIDIOC_S_FMT().

**Note:** The driver will return only formats supported for the currently selected OUTPUT format and currently set controls, even if more formats may be supported by the decoder in general.

For example, a decoder may support YUV and RGB formats for resolutions 1920x1088 and lower, but only YUV for higher resolutions (due to hardware limitations). After setting a resolution of 1920x1088 or lower as the OUTPUT format, VIDIOC_ENUM_FMT() may return a set of YUV and RGB pixel formats, but after setting a resolution higher than 1920x1088, the driver will not return RGB pixel formats, since they are unsupported for this resolution.

5. **[optional]** Choose a different CAPTURE format than suggested via VIDIOC_S_FMT() on CAPTURE queue. It is possible for the client to choose a different format than selected/suggested by the driver in VIDIOC_G_FMT().

- **Required fields:**
  - `type` a V4L2_BUF_TYPE_* enum appropriate for CAPTURE.
  - `pixelformat` a raw pixel format.
  - `width, height` frame buffer resolution of the decoded stream; typically unchanged from what was returned with VIDIOC_G_FMT(), but it may be different if the hardware supports composition and/or scaling.

After performing this step, the client must perform step 3 again in order to obtain up-to-date information about the buffers size and layout.

6. Allocate source (bytestream) buffers via VIDIOC_REQBUFS() on OUTPUT queue.

- **Required fields:**
  - `count` requested number of buffers to allocate; greater than zero.
  - `type` a V4L2_BUF_TYPE_* enum appropriate for OUTPUT.
  - `memory` follows standard semantics.
• **Return fields:**
  
  - `count` actual number of buffers allocated.
  
  • If required, the driver will adjust `count` to be equal or bigger to the minimum of required number of OUTPUT buffers for the given format and requested count. The client must check this value after the ioctl returns to get the actual number of buffers allocated.

7. Allocate destination (raw format) buffers via `VIDIOC_REQBUFS()` on the CAPTURE queue.

• **Required fields:**
  
  - `count` requested number of buffers to allocate; greater than zero. The client is responsible for deducing the minimum number of buffers required for the stream to be properly decoded (taking e.g. reference frames into account) and pass an equal or bigger number.
  
  - `type` a V4L2_BUF_TYPE_* enum appropriate for CAPTURE.
  
  - `memory` follows standard semantics. V4L2_MEMORY_USERPTR is not supported for CAPTURE buffers.

• **Return fields:**
  
  - `count` adjusted to allocated number of buffers, in case the codec requires more buffers than requested.
  
  • The driver must adjust count to the minimum of required number of CAPTURE buffers for the current format, stream configuration and requested count. The client must check this value after the ioctl returns to get the number of buffers allocated.

8. **Allocate requests (likely one per OUTPUT buffer) via** `MEDIA_IOC_REQUEST_ALLOC()` on the media device.

9. **Start streaming on both OUTPUT and CAPTURE queues via** `VIDIOC_STREAMON()`.

### Decoding

For each frame, the client is responsible for submitting at least one request to which the following is attached:

• The amount of encoded data expected by the codec for its current configuration, as a buffer submitted to the OUTPUT queue. Typically, this corresponds to one frame worth of encoded data, but some formats may allow (or require) different amounts per unit.

• All the metadata needed to decode the submitted encoded data, in the form of controls relevant to the format being decoded.

The amount of data and contents of the source OUTPUT buffer, as well as the controls that must be set on the request, depend on the active coded pixel format and might be affected by codec-specific extended controls, as stated in documentation of each format.

If there is a possibility that the decoded frame will require one or more decode requests after the current one in order to be produced, then the client must set the V4L2_BUF_FLAG_M2M_HOLD_CAPTURE_BUF flag on the OUTPUT buffer. This will result in the (potentially partially) decoded CAPTURE buffer not being made available for dequeueing, and reused for the next decode request if the timestamp of the next OUTPUT buffer has not changed.
A typical frame would thus be decoded using the following sequence:

1. Queue an OUTPUT buffer containing one unit of encoded bytestream data for the decoding request, using VIDIOC_QBUF().
   - **Required fields**:
     - **index** index of the buffer being queued.
     - **type** type of the buffer.
     - **bytesused** number of bytes taken by the encoded data frame in the buffer.
     - **flags** the V4L2_BUF_FLAG_REQUEST_FD flag must be set. Additionally, if we are not sure that the current decode request is the last one needed to produce a fully decoded frame, then V4L2_BUF_FLAG_M2M_HOLD_CAPTURE_BUF must also be set.
     - **request_fd** must be set to the file descriptor of the decoding request.
     - **timestamp** must be set to a unique value per frame. This value will be propagated into the decoded frame’s buffer and can also be used to use this frame as the reference of another. If using multiple decode requests per frame, then the timestamps of all the OUTPUT buffers for a given frame must be identical. If the timestamp changes, then the currently held CAPTURE buffer will be made available for dequeuing and the current request will work on a new CAPTURE buffer.

2. Set the codec-specific controls for the decoding request, using VIDIOC_S_EXT_CTRLS().
   - **Required fields**:
     - **which** must be V4L2_CTRL_WHICH_REQUEST_VAL.
     - **request_fd** must be set to the file descriptor of the decoding request.
     - **other fields** other fields are set as usual when setting controls. The controls array must contain all the codec-specific controls required to decode a frame.

**Note:** It is possible to specify the controls in different invocations of VIDIOC_S_EXT_CTRLS(), or to overwrite a previously set control, as long as request_fd and which are properly set. The controls state at the moment of request submission is the one that will be considered.

**Note:** The order in which steps 1 and 2 take place is interchangeable.

3. Submit the request by invoking MEDIA_REQUEST_IOC_QUEUE() on the request FD.
   - If the request is submitted without an OUTPUT buffer, or if some of the required controls are missing from the request, then MEDIA_REQUEST_IOC_QUEUE() will return -ENOENT. If more than one OUTPUT buffer is queued, then it will return -EINVAL. MEDIA_REQUEST_IOC_QUEUE() returning non-zero means that no CAPTURE buffer will be produced for this request.

CAPTURE buffers must not be part of the request, and are queued independently. They are returned in decode order (i.e. the same order as coded frames were submitted to the OUTPUT queue).
Runtime decoding errors are signaled by the dequeued CAPTURE buffers carrying the V4L2_BUF_FLAG_ERROR flag. If a decoded reference frame has an error, then all following decoded frames that refer to it also have the V4L2_BUF_FLAG_ERROR flag set, although the decoder will still try to produce (likely corrupted) frames.

**Buffer management while decoding**

Contrary to stateful decoders, a stateless decoder does not perform any kind of buffer management: it only guarantees that dequeued CAPTURE buffers can be used by the client for as long as they are not queued again. “Used” here encompasses using the buffer for compositing or display.

A dequeued capture buffer can also be used as the reference frame of another buffer.

A frame is specified as reference by converting its timestamp into nanoseconds, and storing it into the relevant member of a codec-dependent control structure. The v4l2_timeval_to_ns() function must be used to perform that conversion. The timestamp of a frame can be used to reference it as soon as all its units of encoded data are successfully submitted to the OUTPUT queue.

A decoded buffer containing a reference frame must not be reused as a decoding target until all the frames referencing it have been decoded. The safest way to achieve this is to refrain from queueing a reference buffer until all the decoded frames referencing it have been dequeued. However, if the driver can guarantee that buffers queued to the CAPTURE queue are processed in queued order, then user-space can take advantage of this guarantee and queue a reference buffer when the following conditions are met:

1. All the requests for frames affected by the reference frame have been queued, and
2. A sufficient number of CAPTURE buffers to cover all the decoded referencing frames have been queued.

When queuing a decoding request, the driver will increase the reference count of all the resources associated with reference frames. This means that the client can e.g. close the DMABUF file descriptors of reference frame buffers if it won’t need them afterwards.

**Seeking**

In order to seek, the client just needs to submit requests using input buffers corresponding to the new stream position. It must however be aware that resolution may have changed and follow the dynamic resolution change sequence in that case. Also depending on the codec used, picture parameters (e.g. SPS/PPS for H.264) may have changed and the client is responsible for making sure that a valid state is sent to the decoder.

The client is then free to ignore any returned CAPTURE buffer that comes from the pre-seek position.
Pausing

In order to pause, the client can just cease queuing buffers onto the OUTPUT queue. Without source bytestream data, there is no data to process and the codec will remain idle.

Dynamic resolution change

If the client detects a resolution change in the stream, it will need to perform the initialization sequence again with the new resolution:

1. If the last submitted request resulted in a CAPTURE buffer being held by the use of the V4L2_BUF_FLAG_M2M_HOLD_CAPTURE_BUF flag, then the last frame is not available on the CAPTURE queue. In this case, a V4L2_DEC_CMD_FLUSH command shall be sent. This will make the driver dequeue the held CAPTURE buffer.

2. Wait until all submitted requests have completed and dequeue the corresponding output buffers.

3. Call VIDIOC_STREAMOFF() on both the OUTPUT and CAPTURE queues.

4. Free all CAPTURE buffers by calling VIDIOC_REQBUFS() on the CAPTURE queue with a buffer count of zero.

5. Perform the initialization sequence again (minus the allocation of OUTPUT buffers), with the new resolution set on the OUTPUT queue. Note that due to resolution constraints, a different format may need to be picked on the CAPTURE queue.

Drain

If the last submitted request resulted in a CAPTURE buffer being held by the use of the V4L2_BUF_FLAG_M2M_HOLD_CAPTURE_BUF flag, then the last frame is not available on the CAPTURE queue. In this case, a V4L2_DEC_CMD_FLUSH command shall be sent. This will make the driver dequeue the held CAPTURE buffer.

After that, in order to drain the stream on a stateless decoder, the client just needs to wait until all the submitted requests are completed.

3.2.4.6 Raw VBI Data Interface

VBI is an abbreviation of Vertical Blanking Interval, a gap in the sequence of lines of an analog video signal. During VBI no picture information is transmitted, allowing some time while the electron beam of a cathode ray tube TV returns to the top of the screen. Using an oscilloscope you will find here the vertical synchronization pulses and short data packages ASK modulated\(^1\) onto the video signal. These are transmissions of services such as Teletext or Closed Caption.

Subject of this interface type is raw VBI data, as sampled off a video signal, or to be added to a signal for output. The data format is similar to uncompressed video images, a number of lines times a number of samples per line, we call this a VBI image.

Conventionally V4L2 VBI devices are accessed through character device special files named /dev/vbi and /dev/vbi0 to /dev/vbi31 with major number 81 and minor numbers 224 to 255.

\(^1\) ASK: Amplitude-Shift Keying. A high signal level represents a ‘1’ bit, a low level a ‘0’ bit.
/dev/vbi is typically a symbolic link to the preferred VBI device. This convention applies to both input and output devices.

To address the problems of finding related video and VBI devices VBI capturing and output is also available as device function under /dev/video. To capture or output raw VBI data with these devices applications must call the VIDIOC_S_FMT ioctl. Accessed as /dev/vbi, raw VBI capturing or output is the default device function.

**Querying Capabilities**

Devices supporting the raw VBI capturing or output API set the V4L2_CAP_VBI_CAPTURE or V4L2_CAP_VBI_OUTPUT flags, respectively, in the capabilities field of struct v4l2_capability returned by the ioctl VIDIOC_QUERYCAP ioctl. At least one of the read/write, streaming or asynchronous I/O methods must be supported. VBI devices may or may not have a tuner or modulator.

**Supplemental Functions**

VBI devices shall support video input or output, tuner or modulator, and controls ioctls as needed. The video standard ioctls provide information vital to program a VBI device, therefore must be supported.

**Raw VBI Format Negotiation**

Raw VBI sampling abilities can vary, in particular the sampling frequency. To properly interpret the data V4L2 specifies an ioctl to query the sampling parameters. Moreover, to allow for some flexibility applications can also suggest different parameters.

As usual these parameters are not reset at open() time to permit Unix tool chains, programming a device and then reading from it as if it was a plain file. Well written V4L2 applications should always ensure they really get what they want, requesting reasonable parameters and then checking if the actual parameters are suitable.

To query the current raw VBI capture parameters applications set the type field of a struct v4l2_format to V4L2_BUF_TYPE_VBI_CAPTURE or V4L2_BUF_TYPE_VBI_OUTPUT, and call the VIDIOC_G_FMT ioctl with a pointer to this structure. Drivers fill the struct v4l2_vbi_format vbi member of the fmt union.

To request different parameters applications set the type field of a struct v4l2_format as above and initialize all fields of the struct v4l2_vbi_format vbi member of the fmt union, or better just modify the results of VIDIOC_G_FMT, and call the VIDIOC_S_FMT ioctl with a pointer to this structure. Drivers return an EINVAL error code only when the given parameters are ambiguous, otherwise they modify the parameters according to the hardware capabilities and return the actual parameters. When the driver allocates resources at this point, it may return an EBUSY error code to indicate the returned parameters are valid but the required resources are currently not available. That may happen for instance when the video and VBI areas to capture would overlap, or when the driver supports multiple opens and another process already requested VBI capturing or output. Anyway, applications must expect other resource allocation points which may return EBUSY, at the ioctl VIDIOC_STREAMON, VIDIOC_STREAMOFF ioctl and the first read(), write() and select() calls.
VBI devices must implement both the `VIDIOC_G_FMT` and `VIDIOC_S_FMT` ioctl, even if `VIDIOC_S_FMT` ignores all requests and always returns default parameters as `VIDIOC_G_FMT` does. `VIDIOC_TRY_FMT` is optional.

**v4l2_vbi_format**

Table 99: struct v4l2_vbi_format

</tr>
<tr>
<td>__u32</td>
<td><strong>flags</strong></td>
</tr>
</tbody>
</table>

Drivers should be as flexibility as possible. For example, it may be possible to extend or move the VBI capture window down to the picture area, implementing a ‘full field mode’ to capture data service transmissions embedded in the picture.

An application can set the first or second count value to zero if no data is required from the respective field; count[1] if the scanning system is progressive, i.e. not interlaced. The corresponding start value shall be ignored by the application and driver. Anyway, drivers may not support single field capturing and return both count values non-zero. Both count values set to zero, or line numbers are outside the bounds depicted, or a field image covering lines of two fields, are invalid and shall not be returned by the driver.

To initialize the start and count fields, applications must first determine the current video standard selection. The v4l2_std_id or the framelines field of struct v4l2_standard can be evaluated for this purpose.

</tbody>
</table>

Table 100: Raw VBI Format Flags

<table>
<thead>
<tr>
<th>V4L2_VBI_UNSINC</th>
<th>0x0001</th>
<th>This flag indicates hardware which does not properly distinguish between fields. Normally the VBI image stores the first field (lower scanning line numbers) first in memory. This may be a top or bottom field depending on the video standard. When this flag is set the first or second field may be stored first, however the fields are still in correct temporal order with the older field first in memory.</th>
</tr>
</thead>
<tbody>
<tr>
<td>V4L2_VBI_INTERLACED</td>
<td>0x0002</td>
<td>By default the two field images will be passed sequentially; all lines of the first field followed by all lines of the second field (compare Field Order V4L2_FIELD_SEQ_TB and V4L2_FIELD_SEQ_BT, whether the top or bottom field is first in memory depends on the video standard). When this flag is set, the two fields are interlaced (cf. V4L2_FIELD_INTERLACED). The first line of the first field followed by the first line of the second field, then the two second lines, and so on. Such a layout may be necessary when the hardware has been programmed to capture or output interlaced video images and is unable to separate the fields for VBI capturing at the same time. For simplicity setting this flag implies that both count values are equal and non-zero.</td>
</tr>
</tbody>
</table>

Remember the VBI image format depends on the selected video standard, therefore the application must choose a new standard or query the current standard first. Attempts to read or write data ahead of format negotiation, or after switching the video standard which may invalidate the negotiated VBI parameters, should be refused by the driver. A format change during active I/O is not permitted.

**Reading and writing VBI images**

To assure synchronization with the field number and easier implementation, the smallest unit of data passed at a time is one frame, consisting of two fields of VBI images immediately following in memory.

The total size of a frame computes as follows:

\[
(count[0] + count[1]) \times \text{samples_per_line} \times \text{sample size in bytes}
\]

The sample size is most likely always one byte, applications must check the sample_format field though, to function properly with other drivers.

---

2 A few devices may be unable to sample VBI data at all but can extend the video capture window to the VBI region.

4 The valid values are shown at Figure 4.2. ITU-R 525 line numbering (M/NTSC and M/PAL) and Figure 4.3. ITU-R 625 line numbering.

3 Most VBI services transmit on both fields, but some have different semantics depending on the field number. These cannot be reliably decoded or encoded when V4L2_VBI_UNSINC is set.
Fig. 10: **Figure 4.1. Line synchronization**

Fig. 11: **Figure 4.2. ITU-R 525 line numbering (M/NTSC and M/PAL)**
AVBI devices may support read/write and/or streaming (memory mapping or user pointer) I/O. The latter bears the possibility of synchronizing video and VBI data by using buffer timestamps. Remember the VIDIOC_STREAMON ioctl and the first read(), write() and select() call can be resource allocation points returning an EBUSY error code if the required hardware resources are temporarily unavailable, for example the device is already in use by another process.

3.2.4.7 Sliced VBI Data Interface

VBI stands for Vertical Blanking Interval, a gap in the sequence of lines of an analog video signal. During VBI no picture information is transmitted, allowing some time while the electron beam of a cathode ray tube TV returns to the top of the screen.

Sliced VBI devices use hardware to demodulate data transmitted in the VBI. V4L2 drivers shall not do this by software, see also the raw VBI interface. The data is passed as short packets of fixed size, covering one scan line each. The number of packets per video frame is variable.

Sliced VBI capture and output devices are accessed through the same character special files as raw VBI devices. When a driver supports both interfaces, the default function of a /dev/vbi device is raw VBI capturing or output, and the sliced VBI function is only available after calling the VIDIOC_S_FMT ioctl as defined below. Likewise a /dev/video device may support the sliced VBI API, however the default function here is video capturing or output. Different file descriptors must be used to pass raw and sliced VBI data simultaneously, if this is supported by the driver.

Querying Capabilities

Devices supporting the sliced VBI capturing or output API set the V4L2_CAP_SLICED_VBI_CAPTURE or V4L2_CAP_SLICED_VBI_OUTPUT flag respectively, in the capabilities field of struct v4l2_capability returned by the ioctl VIDIOC_QUERYCAP ioctl. At least one of the read/write, streaming or asynchronous I/O methods must be supported. Sliced VBI devices may have a tuner or modulator.
Supplemental Functions

Sliced VBI devices shall support video input or output and tuner or modulator ioctls if they have these capabilities, and they may support User Controls ioctls. The video standard ioctls provide information vital to program a sliced VBI device, therefore must be supported.

Sliced VBI Format Negotiation

To find out which data services are supported by the hardware applications can call the VIDIOC_G_SLICED_VBI_CAP ioctl. All drivers implementing the sliced VBI interface must support this ioctl. The results may differ from those of the VIDIOC_S_FMT ioctl when the number of VBI lines the hardware can capture or output per frame, or the number of services it can identify on a given line are limited. For example on PAL line 16 the hardware may be able to look for a VPS or Teletext signal, but not both at the same time.

To determine the currently selected services applications set the type field of struct v4l2_format to V4L2_BUF_TYPE_SLICED_VBI_CAPTURE or V4L2_BUF_TYPE_SLICED_VBI_OUTPUT, and the VIDIOC_G_FMT ioctl fills the fmt.sliced member, a struct v4l2_sliced_vbi_format.

Applications can request different parameters by initializing or modifying the fmt.sliced member and calling the VIDIOC_S_FMT ioctl with a pointer to the struct v4l2_format structure.

The sliced VBI API is more complicated than the raw VBI API because the hardware must be told which VBI service to expect on each scan line. Not all services may be supported by the hardware on all lines (this is especially true for VBI output where Teletext is often unsupported and other services can only be inserted in one specific line). In many cases, however, it is sufficient to just set the service_set field to the required services and let the driver fill the service_lines array according to hardware capabilities. Only if more precise control is needed should the programmer set the service_lines array explicitly.

The VIDIOC_S_FMT ioctl modifies the parameters according to hardware capabilities. When the driver allocates resources at this point, it may return an EBUSY error code if the required resources are temporarily unavailable. Other resource allocation points which may return EBUSY can be the ioctl VIDIOC_STREAMON, VIDIOC_STREAMOFF ioctl and the first read(), write() and select() call.

v4l2_sliced_vbi_format

<table>
<thead>
<tr>
<th>__u16</th>
<th>service_set</th>
</tr>
</thead>
<tbody>
<tr>
<td>If service_set is non-zero when passed with VIDIOC_S_FMT or VIDIOC_TRY_FMT, the service_lines array will be filled by the driver according to the services specified in this field. For example, if service_set is initialized with V4L2_SLICED_TELETEXT_B</td>
<td>V4L2_SLICED_WSS_625, a driver for the cx25840 video decoder sets lines 7-22 of both fields1 to V4L2_SLICED_TELETEXT_B and line 23 of the first field to V4L2_SLICED_WSS_625. If service_set is set to zero, then the values of service_lines will be used instead. On return the driver sets this field to the union of all elements of the returned service_lines array. It may contain less services than requested, perhaps just one, if the hardware cannot handle more services simultaneously. It may be empty (zero) if none of the requested services are supported by the hardware.</td>
</tr>
</tbody>
</table>

Continued on next page
Applications initialize this array with sets of data services the driver shall look for or insert on the respective scan line. Subject to hardware capabilities drivers return the requested set, a subset, which may be just a single service, or an empty set. When the hardware cannot handle multiple services on the same line the driver shall choose one. No assumptions can be made on which service the driver chooses.

Data services are defined in Sliced VBI services. Array indices map to ITU-R line numbers as follows:

<table>
<thead>
<tr>
<th>Element</th>
<th>525 line systems</th>
<th>625 line systems</th>
</tr>
</thead>
<tbody>
<tr>
<td>service_lines[0][1]</td>
<td>1</td>
<td>1</td>
</tr>
<tr>
<td>service_lines[0][23]</td>
<td>23</td>
<td>23</td>
</tr>
<tr>
<td>service_lines[1][1]</td>
<td>264</td>
<td>314</td>
</tr>
<tr>
<td>service_lines[1][23]</td>
<td>286</td>
<td>336</td>
</tr>
</tbody>
</table>

Drivers must set service_lines[0][0] and service_lines[1][0] to zero. The V4L2_VBI_ITU_525_F1_START, V4L2_VBI_ITU_525_F2_START, V4L2_VBI_ITU_625_F1_START and V4L2_VBI_ITU_625_F2_START defines give the start line numbers for each field for each 525 or 625 line format as a convenience. Don’t forget that ITU line numbering starts at 1, not 0.

Symbol | Value | Reference | Lines, usually | Payload |
---|---|---|---|---|
V4L2_SLICED_TELETEXT_B (Teletext System B) | 0x0001 | ETS 300 706, ITU BT.653 | PAL/SECAM line 7-22, 320-335 (second field 7-22) | Last 42 of the 45 byte Teletext packet, that is without clock run-in and framing code, lsb first transmitted. |
V4L2_SLICED_VPS | 0x0400 | ETS 300 231 | PAL line 16 | Byte number 3 to 15 according to Figure 9 of ETS 300 231, lsb first transmitted. |
V4L2_SLICED_CAPTION_525 | 0x1000 | CEA 608-E | NTSC line 21, 284 (second field 21) | Two bytes in transmission order, including parity bit, lsb first transmitted. |
V4L2_SLICED_WSS_625 | 0x4000 | ITU BT.1119, EN 300 294 | PAL/SECAM line 23 | See V4L2_SLICED_WSS_625 payload below. |
V4L2_SLICED_VBI_525 | 0x1000 | | Set of services applicable to 525 line systems. |
V4L2_SLICED_VBI_625 | 0x4401 | | Set of services applicable to 625 line systems. |

Drivers may return an EINVAL error code when applications attempt to read or write data without prior format negotiation, after switching the video standard (which may invalidate the negotiated VBI parameters) and after switching the video input (which may change the video standard as a side effect). The VIDIOC_S_FMT ioctl may return an EBUSY error code when applications attempt to change the format while i/o is in progress (between a ioctl VIDIOC_STREAMON, VIDIOC_DQBUF and VIDIOC_DQBUF call, and after the first read() or write() call).

1 According to ETS 300 706 lines 6-22 of the first field and lines 5-22 of the second field may carry Teletext data.
2 See also Figure 4.2. ITU-R 525 line numbering (M/NTSC and M/PAL) and Figure 4.3. ITU-R 625 line numbering.
V4L2_SLICED_WSS_625 payload

The payload for V4L2_SLICED_WSS_625 is:

<table>
<thead>
<tr>
<th>Byte</th>
<th>0</th>
<th>1</th>
</tr>
</thead>
<tbody>
<tr>
<td>Bit</td>
<td>msb</td>
<td>lsb</td>
</tr>
<tr>
<td>7</td>
<td>6</td>
<td>5</td>
</tr>
</tbody>
</table>

Reading and writing sliced VBI data

A single read() or write() call must pass all data belonging to one video frame. That is an array of struct v4l2_sliced_vbi_data structures with one or more elements and a total size not exceeding io_size bytes. Likewise in streaming I/O mode one buffer of io_size bytes must contain data of one video frame. The id of unused struct v4l2_sliced_vbi_data elements must be zero.

v4l2_sliced_vbi_data

struct v4l2_sliced_vbi_data

<table>
<thead>
<tr>
<th>_u32</th>
<th>id</th>
<th>A flag from Sliced VBI services identifying the type of data in this packet. Only a single bit must be set. When the id of a captured packet is zero, the packet is empty and the contents of other fields are undefined. Applications shall ignore empty packets. When the id of a packet for output is zero the contents of the data field are undefined and the driver must no longer insert data on the requested field and line.</th>
</tr>
</thead>
<tbody>
<tr>
<td>_u32</td>
<td>field</td>
<td>The video field number this data has been captured from, or shall be inserted at. 0 for the first field, 1 for the second field.</td>
</tr>
<tr>
<td>_u32</td>
<td>line</td>
<td>The field (as opposed to frame) line number this data has been captured from, or shall be inserted at. See Figure 4.2. ITU-R 525 line numbering (M/NTSC and M/PAL) and Figure 4.3. ITU-R 625 line numbering for valid values. Sliced VBI capture devices can set the line number of all packets to 0 if the hardware cannot reliably identify scan lines. The field number must always be valid.</td>
</tr>
<tr>
<td>_u32</td>
<td>reserved</td>
<td>This field is reserved for future extensions. Applications and drivers must set it to zero.</td>
</tr>
<tr>
<td>_u8</td>
<td>data[48]</td>
<td>The packet payload. See Sliced VBI services for the contents and number of bytes passed for each data type. The contents of padding bytes at the end of this array are undefined, drivers and applications shall ignore them.</td>
</tr>
</tbody>
</table>

Packets are always passed in ascending line number order, without duplicate line numbers. The write() function and the ioctl VIDIOC_QBUF, VIDIOC_DQBUF ioctl must return an EINVAL error code when applications violate this rule. They must also return an EINVAL error code when applications pass an incorrect field or line number, or a combination of field, line and id which has not been negotiated with the VIDIOC_G_FMT or VIDIOC_S_FMT ioctl. When the line numbers are unknown the driver must pass the packets in transmitted order. The driver can insert empty packets with id set to zero anywhere in the packet array.

3.2. Part I - Video for Linux API
To assure synchronization and to distinguish from frame dropping, when a captured frame does not carry any of the requested data services drivers must pass one or more empty packets. When an application fails to pass VBI data in time for output, the driver must output the last VPS and WSS packet again, and disable the output of Closed Caption and Teletext data, or output data which is ignored by Closed Caption and Teletext decoders.

A sliced VBI device may support read/write and/or streaming (memory mapping and/or user pointer) I/O. The latter bears the possibility of synchronizing video and VBI data by using buffer timestamps.

**Sliced VBI Data in MPEG Streams**

If a device can produce an MPEG output stream, it may be capable of providing negotiated sliced VBI services as data embedded in the MPEG stream. Users or applications control this sliced VBI data insertion with the `V4L2_CID_MPEG_STREAM_VBI_FMT` control.

If the driver does not provide the `V4L2_CID_MPEG_STREAM_VBI_FMT` control, or only allows that control to be set to `V4L2_MPEG_STREAM_VBI_FMT_NONE`, then the device cannot embed sliced VBI data in the MPEG stream.

The `V4L2_CID_MPEG_STREAM_VBI_FMT` control does not implicitly set the device driver to capture nor cease capturing sliced VBI data. The control only indicates to embed sliced VBI data in the MPEG stream, if an application has negotiated sliced VBI service be captured.

It may also be the case that a device can embed sliced VBI data in only certain types of MPEG streams: for example in an MPEG-2 PS but not an MPEG-2 TS. In this situation, if sliced VBI data insertion is requested, the sliced VBI data will be embedded in MPEG stream types when supported, and silently omitted from MPEG stream types where sliced VBI data insertion is not supported by the device.

The following subsections specify the format of the embedded sliced VBI data.

**MPEG Stream Embedded, Sliced VBI Data Format: NONE**

The `V4L2_MPEG_STREAM_VBI_FMT_NONE` embedded sliced VBI format shall be interpreted by drivers as a control to cease embedding sliced VBI data in MPEG streams. Neither the device nor driver shall insert “empty” embedded sliced VBI data packets in the MPEG stream when this format is set. No MPEG stream data structures are specified for this format.

**MPEG Stream Embedded, Sliced VBI Data Format: IVTV**

The `V4L2_MPEG_STREAM_VBI_FMT_IVTV` embedded sliced VBI format, when supported, indicates to the driver to embed up to 36 lines of sliced VBI data per frame in an MPEG-2 Private Stream 1 PES packet encapsulated in an MPEG-2 Program Pack in the MPEG stream.

**Historical context:** This format specification originates from a custom, embedded, sliced VBI data format used by the ivtv driver. This format has already been informally specified in the kernel sources in the file `Documentation/userspace-api/media/drivers/cx2341x-uapi.rst`. The maximum size of the payload and other aspects of this format are driven by the CX23415 MPEG decoder’s capabilities and limitations with respect to extracting, decoding, and displaying sliced VBI data embedded within an MPEG stream.
This format’s use is not exclusive to the ivtv driver nor exclusive to CX2341x devices, as the sliced VBI data packet insertion into the MPEG stream is implemented in driver software. At least the cx18 driver provides sliced VBI data insertion into an MPEG-2 PS in this format as well.

The following definitions specify the payload of the MPEG-2 Private Stream 1 PES packets that contain sliced VBI data when \texttt{V4L2\_MPEG\_STREAM\_VBI\_FMT\_IVTV} is set. (The MPEG-2 Private Stream 1 PES packet header and encapsulating MPEG-2 Program Pack header are not detailed here. Please refer to the MPEG-2 specifications for details on those packet headers.)

The payload of the MPEG-2 Private Stream 1 PES packets that contain sliced VBI data is specified by struct \texttt{v4l2\_mpeg\_vbi\_fmt\_ivtv}. The payload is variable length, depending on the actual number of lines of sliced VBI data present in a video frame. The payload may be padded at the end with unspecified fill bytes to align the end of the payload to a 4-byte boundary. The payload shall never exceed 1552 bytes (2 fields with 18 lines/field with 43 bytes of data/line and a 4 byte magic number).

3.2.4.8 Radio Interface

This interface is intended for AM and FM (analog) radio receivers and transmitters.

Conventionally V4L2 radio devices are accessed through character device special files named /dev/radio and /dev/radio0 to /dev/radio63 with major number 81 and minor numbers 64 to 127.

Querying Capabilities

Devices supporting the radio interface set the V4L2_CAP_RADIO and V4L2_CAP_TUNER or V4L2_CAP_MODULATOR flag in the capabilities field of struct v4l2_capability returned by the ioctl VIDIOC_QUERYCAP ioctl. Other combinations of capability flags are reserved for future extensions.

Supplemental Functions

Radio devices can support controls, and must support the tuner or modulator ioctls.

They do not support the video input or output, audio input or output, video standard, cropping and scaling, compression and streaming parameter, or overlay ioctls. All other ioctls and I/O methods are reserved for future extensions.

Programming

Radio devices may have a couple audio controls (as discussed in User Controls) such as a volume control, possibly custom controls. Further all radio devices have one tuner or modulator (these are discussed in Tuners and Modulators) with index number zero to select the radio frequency and to determine if a monaural or FM stereo program is received/emitted. Drivers switch automatically between AM and FM depending on the selected frequency. The VIDIOC_G_TUNER or VIDIOC_G_MODULATOR ioctl reports the supported frequency range.
3.2.4.9 RDS Interface

The Radio Data System transmits supplementary information in binary format, for example the station name or travel information, on an inaudible audio subcarrier of a radio program. This interface is aimed at devices capable of receiving and/or transmitting RDS information.

For more information see the core RDS standard IEC 62106 and the RBDS standard NRSC-4-B.

**Note:** Note that the RBDS standard as is used in the USA is almost identical to the RDS standard. Any RDS decoder/encoder can also handle RBDS. Only some of the fields have slightly different meanings. See the RBDS standard for more information.

The RBDS standard also specifies support for MMBS (Modified Mobile Search). This is a proprietary format which seems to be discontinued. The RDS interface does not support this format. Should support for MMBS (or the so-called ‘E blocks’ in general) be needed, then please contact the linux-media mailing list: [https://linuxtv.org/lists.php](https://linuxtv.org/lists.php).

**Querying Capabilities**

Devices supporting the RDS capturing API set the `V4L2_CAP_RDS_CAPTURE` flag in the capabilities field of struct `v4l2_capability` returned by the `ioctl VIDIOC_QUERYCAP` ioctl. Any tuner that supports RDS will set the `V4L2_TUNER_CAP_RDS` flag in the capability field of struct `v4l2_tuner`. If the driver only passes RDS blocks without interpreting the data the `V4L2_TUNER_CAP_RDS_BLOCK_IO` flag has to be set, see *Reading RDS data*. For future use the flag `V4L2_TUNER_CAP_RDS_CONTROLS` has also been defined. However, a driver for a radio tuner with this capability does not yet exist, so if you are planning to write such a driver you should discuss this on the linux-media mailing list: [https://linuxtv.org/lists.php](https://linuxtv.org/lists.php).

Whether an RDS signal is present can be detected by looking at the `rxsubchans` field of struct `v4l2_tuner`: the `V4L2_TUNER_SUB_RDS` will be set if RDS data was detected.

Devices supporting the RDS output API set the `V4L2_CAP_RDS_OUTPUT` flag in the capabilities field of struct `v4l2_capability` returned by the `ioctl VIDIOC_QUERYCAP` ioctl. Any modulator that supports RDS will set the `V4L2_TUNER_CAP_RDS` flag in the capability field of struct `v4l2_modulator`. In order to enable the RDS transmission one must set the `V4L2_TUNER_SUB_RDS` bit in the `txsubchans` field of struct `v4l2_modulator`. If the driver only passes RDS blocks without interpreting the data the `V4L2_TUNER_CAP_RDS_BLOCK_IO` flag has to be set. If the tuner is capable of handling RDS entities like program identification codes and radio text, the flag `V4L2_TUNER_CAP_RDS_CONTROLS` should be set, see *Writing RDS data* and *FM Transmitter Control Reference*. 
Reading RDS data

RDS data can be read from the radio device with the `read()` function. The data is packed in groups of three bytes.

Writing RDS data

RDS data can be written to the radio device with the `write()` function. The data is packed in groups of three bytes, as follows:

RDS data structures

v4l2_rds_data

| Table 102: struct v4l2_rds_data |

3.2.4.10 Software Defined Radio Interface (SDR)

SDR is an abbreviation of Software Defined Radio, the radio device which uses application software for modulation or demodulation. This interface is intended for controlling and data streaming of such devices.

SDR devices are accessed through character device special files named /dev/swradio0 to /dev/swradio255 with major number 81 and dynamically allocated minor numbers 0 to 255.

Querying Capabilities

Devices supporting the SDR receiver interface set the V4L2_CAP_SDR_CAPTURE and V4L2_CAP_TUNER flag in the capabilities field of struct v4l2_capability returned by the ioctl VIDIOC_QUERYCAP ioctl. That flag means the device has an Analog to Digital Converter (ADC), which is a mandatory element for the SDR receiver.

Devices supporting the SDR transmitter interface set the V4L2_CAP_SDR_OUTPUT and V4L2_CAP_MODULATOR flag in the capabilities field of struct v4l2_capability returned by the ioctl VIDIOC_QUERYCAP ioctl. That flag means the device has a Digital to Analog Converter (DAC), which is a mandatory element for the SDR transmitter.

At least one of the read/write, streaming or asynchronous I/O methods must be supported.

Supplemental Functions

SDR devices can support controls, and must support the Tuners and Modulators ioctls. Tuner ioctls are used for setting the ADC/DAC sampling rate (sampling frequency) and the possible radio frequency (RF).

The V4L2_TUNER_SDR tuner type is used for setting SDR device ADC/DAC frequency, and the V4L2_TUNER_RF tuner type is used for setting radio frequency. The tuner index of the RF tuner (if any) must always follow the SDR tuner index. Normally the SDR tuner is #0 and the RF tuner is #1.

The ioctl VIDIOC_S_HW_FREQ_SEEK ioctl is not supported.

Data Format Negotiation

The SDR device uses the Data Formats ioctls to select the capture and output format. Both the sampling resolution and the data streaming format are bound to that selectable format. In addition to the basic Data Formats ioctls, the ioctl VIDIOC_ENUM_FMT ioctl must be supported as well.

To use the Data Formats ioctls applications set the type field of a struct v4l2_format to V4L2_BUF_TYPE_SDR_CAPTURE or V4L2_BUF_TYPE_SDR_OUTPUT and use the struct v4l2_sdr_format sdr member of the fmt union as needed per the desired operation. Currently there are two fields, pixelformat and buffersize, of struct v4l2_sdr_format which are used. Content of the pixelformat is V4L2 FourCC code of the data format. The buffersize field is maximum buffer size in bytes required for data transfer, set by the driver in order to inform application.

v4l2_sdr_format
Table 105: struct v4l2_sdr_format

<table>
<thead>
<tr>

<td>This array is reserved for future extensions. Drivers and applications must set it to zero.</td>
</tr>
</tbody>
</table>

An SDR device may support read/write and/or streaming (memory mapping or user pointer) I/O.

### 3.2.4.11 Touch Devices

Touch devices are accessed through character device special files named /dev/v4l-touch0 to /dev/v4l-touch255 with major number 81 and dynamically allocated minor numbers 0 to 255.

#### Overview

Sensors may be Optical, or Projected Capacitive touch (PCT).

Processing is required to analyse the raw data and produce input events. In some systems, this may be performed on the ASIC and the raw data is purely a side-channel for diagnostics or tuning. In other systems, the ASIC is a simple analogue front end device which delivers touch data at high rate, and any touch processing must be done on the host.

For capacitive touch sensing, the touchscreen is composed of an array of horizontal and vertical conductors (alternatively called rows/columns, X/Y lines, or tx/rx). Mutual Capacitance measured is at the nodes where the conductors cross. Alternatively, Self Capacitance measures the signal from each column and row independently.

A touch input may be determined by comparing the raw capacitance measurement to a no-touch reference (or “baseline”) measurement:

\[
\text{Delta} = \text{Raw} - \text{Reference}
\]

The reference measurement takes account of variations in the capacitance across the touch sensor matrix, for example manufacturing irregularities, environmental or edge effects.

#### Querying Capabilities

Devices supporting the touch interface set the V4L2_CAP_VIDEO_CAPTURE flag and the V4L2_CAP_TOUCH flag in the capabilities field of v4l2_capability returned by the ioctl VIDIOC_QUERYCAP ioctl.

At least one of the read/write or streaming I/O methods must be supported.

The formats supported by touch devices are documented in Touch Formats.
Data Format Negotiation

A touch device may support any I/O method.

3.2.4.12 Event Interface

The V4L2 event interface provides a means for a user to get immediately notified on certain conditions taking place on a device. This might include start of frame or loss of signal events, for example. Changes in the value or state of a V4L2 control can also be reported through events.

To receive events, the events the user is interested in first must be subscribed using the `ioctl VIDIOC_SUBSCRIBE_EVENT, VIDIOC_UNSUBSCRIBE_EVENT` ioctl. Once an event is subscribed, the events of subscribed types are dequeueable using the `ioctl VIDIOC_DQEVENT` ioctl. Events may be unsubscribed using `VIDIOC_UNSUBSCRIBE_EVENT` ioctl. The special event type `V4L2_EVENT_ALL` may be used to unsubscribe all the events the driver supports.

The event subscriptions and event queues are specific to file handles. Subscribing an event on one file handle does not affect other file handles.

The information on dequeueable events is obtained by using select or poll system calls on video devices. The V4L2 events use POLLPRI events on poll system call and exceptions on select system call.

Starting with kernel 3.1 certain guarantees can be given with regards to events:

1. Each subscribed event has its own internal dedicated event queue. This means that flooding of one event type will not interfere with other event types.
2. If the internal event queue for a particular subscribed event becomes full, then the oldest event in that queue will be dropped.
3. Where applicable, certain event types can ensure that the payload of the oldest event that is about to be dropped will be merged with the payload of the next oldest event. Thus ensuring that no information is lost, but only an intermediate step leading up to that information. See the documentation for the event you want to subscribe to whether this is applicable for that event or not.

3.2.4.13 Sub-device Interface

The complex nature of V4L2 devices, where hardware is often made of several integrated circuits that need to interact with each other in a controlled way, leads to complex V4L2 drivers. The drivers usually reflect the hardware model in software, and model the different hardware components as software blocks called sub-devices.

V4L2 sub-devices are usually kernel-only objects. If the V4L2 driver implements the media device API, they will automatically inherit from media entities. Applications will be able to enumerate the sub-devices and discover the hardware topology using the media entities, pads and links enumeration API.

In addition to make sub-devices discoverable, drivers can also choose to make them directly configurable by applications. When both the sub-device driver and the V4L2 device driver support this, sub-devices will feature a character device node on which ioctl can be called to

- query, read and write sub-devices controls
• subscribe and unsubscribe to events and retrieve them
• negotiate image formats on individual pads

Sub-device character device nodes, conventionally named /dev/v4l-subdev*, use major number 81.

Drivers may opt to limit the sub-device character devices to only expose operations that do not modify the device state. In such a case the sub-devices are referred to as read-only in the rest of this documentation, and the related restrictions are documented in individual ioctl.

**Controls**

Most V4L2 controls are implemented by sub-device hardware. Drivers usually merge all controls and expose them through video device nodes. Applications can control all sub-devices through a single interface.

Complex devices sometimes implement the same control in different pieces of hardware. This situation is common in embedded platforms, where both sensors and image processing hardware implement identical functions, such as contrast adjustment, white balance or faulty pixels correction. As the V4L2 controls API doesn’t support several identical controls in a single device, all but one of the identical controls are hidden.

Applications can access those hidden controls through the sub-device node with the V4L2 control API described in *User Controls*. The ioctl behave identically as when issued on V4L2 device nodes, with the exception that they deal only with controls implemented in the sub-device.

Depending on the driver, those controls might also be exposed through one (or several) V4L2 device nodes.

**Events**

V4L2 sub-devices can notify applications of events as described in *Event Interface*. The API behaves identically as when used on V4L2 device nodes, with the exception that it only deals with events generated by the sub-device. Depending on the driver, those events might also be reported on one (or several) V4L2 device nodes.

**Pad-level Formats**

---

**Warning:** Pad-level formats are only applicable to very complex devices that need to expose low-level format configuration to user space. Generic V4L2 applications do not need to use the API described in this section.

**Note:** For the purpose of this section, the term *format* means the combination of media bus data format, frame width and frame height.
Image formats are typically negotiated on video capture and output devices using the format and selection ioctls. The driver is responsible for configuring every block in the video pipeline according to the requested format at the pipeline input and/or output.

For complex devices, such as often found in embedded systems, identical image sizes at the output of a pipeline can be achieved using different hardware configurations. One such example is shown on Image Format Negotiation on Pipelines, where image scaling can be performed on both the video sensor and the host image processing hardware.

![Image Format Negotiation on Pipelines](image.png)

The sensor scaler is usually of less quality than the host scaler, but scaling on the sensor is required to achieve higher frame rates. Depending on the use case (quality vs. speed), the pipeline must be configured differently. Applications need to configure the formats at every point in the pipeline explicitly.

Drivers that implement the media API can expose pad-level image format configuration to applications. When they do, applications can use the `VIDIOC_SUBDEV_G_FMT` and `VIDIOC_SUBDEV_S_FMT` ioctls to negotiate formats on a per-pad basis.
Applications are responsible for configuring coherent parameters on the whole pipeline and making sure that connected pads have compatible formats. The pipeline is checked for formats mismatch at `VIDIOC_STREAMON` time, and an EPIPE error code is then returned if the configuration is invalid.

Pad-level image format configuration support can be tested by calling the `ioctl VIDIOC_SUBDEV_G_FMT, VIDIOC_SUBDEV_S_FMT` ioctl on pad 0. If the driver returns an EINVAL error code pad-level format configuration is not supported by the sub-device.

**Format Negotiation**

Acceptable formats on pads can (and usually do) depend on a number of external parameters, such as formats on other pads, active links, or even controls. Finding a combination of formats on all pads in a video pipeline, acceptable to both application and driver, can’t rely on formats enumeration only. A format negotiation mechanism is required.

Central to the format negotiation mechanism are the get/set format operations. When called with the which argument set to `V4L2_SUBDEV_FORMAT_TRY`, the `VIDIOC_SUBDEV_G_FMT` and `VIDIOC_SUBDEV_S_FMT` ioctls operate on a set of formats parameters that are not connected to the hardware configuration. Modifying those ‘try’ formats leaves the device state untouched (this applies to both the software state stored in the driver and the hardware state stored in the device itself).

While not kept as part of the device state, try formats are stored in the sub-device file handles. A `VIDIOC_SUBDEV_G_FMT` call will return the last try format set on the same sub-device file handle. Several applications querying the same sub-device at the same time will thus not interact with each other.

To find out whether a particular format is supported by the device, applications use the `VIDIOC_SUBDEV_S_FMT` ioctl. Drivers verify and, if needed, change the requested format based on device requirements and return the possibly modified value. Applications can then choose to try a different format or accept the returned value and continue.

Formats returned by the driver during a negotiation iteration are guaranteed to be supported by the device. In particular, drivers guarantee that a returned format will not be further changed if passed to an `VIDIOC_SUBDEV_S_FMT` call as-is (as long as external parameters, such as formats on other pads or links’ configuration are not changed).

Drivers automatically propagate formats inside sub-devices. When a try or active format is set on a pad, corresponding formats on other pads of the same sub-device can be modified by the driver. Drivers are free to modify formats as required by the device. However, they should comply with the following rules when possible:

- Formats should be propagated from sink pads to source pads. Modifying a format on a source pad should not modify the format on any sink pad.
- Sub-devices that scale frames using variable scaling factors should reset the scale factors to default values when sink pads formats are modified. If the 1:1 scaling ratio is supported, this means that source pads formats should be reset to the sink pads formats.

Formats are not propagated across links, as that would involve propagating them from one sub-device file handle to another. Applications must then take care to configure both ends of every link explicitly with compatible formats. Identical formats on the two ends of a link are guaranteed to be compatible. Drivers are free to accept different formats matching device requirements as being compatible.
Sample Pipeline Configuration shows a sample configuration sequence for the pipeline described in Image Format Negotiation on Pipelines (table columns list entity names and pad numbers).

Table 106: Sample Pipeline Configuration

<table>
<thead>
<tr>
<th>Sensor/0 format</th>
<th>Frontend/0 format</th>
<th>Frontend/1 format</th>
<th>Scaler/0 compose selection rectangle</th>
<th>Scaler/1 format</th>
</tr>
</thead>
<tbody>
<tr>
<td>2048x1536 SGRBG8_1X8</td>
<td>(default)</td>
<td>(default)</td>
<td>(default)</td>
<td>(default)</td>
</tr>
</tbody>
</table>

1. Initial state. The sensor source pad format is set to its native 3MP size and V4L2_MBUS_FMT_SGRBG8_1X8 media bus code. Formats on the host frontend and scaler sink and source pads have the default values, as well as the compose rectangle on the scaler’s sink pad.

2. The application configures the frontend sink pad format’s size to 2048x1536 and its media bus code to V4L2_MBUS_FMT_SGRBG_1X8. The driver propagates the format to the frontend source pad.

3. The application configures the scaler sink pad format’s size to 2046x1534 and the media bus code to V4L2_MBUS_FMT_SGRBG_1X8 to match the frontend source size and media bus code. The media bus code on the sink pad is set to V4L2_MBUS_FMT_SGRBG_1X8. The driver propagates the size to the compose selection rectangle on the scaler’s sink pad, and the format to the scaler source pad.

4. The application configures the size of the compose selection rectangle of the scaler’s sink pad 1280x960. The driver propagates the size to the scaler’s source pad format.

When satisfied with the try results, applications can set the active formats by setting the which argument to V4L2_SUBDEV_FORMAT_ACTIVE. Active formats are changed exactly as try formats by drivers. To avoid modifying the hardware state during format negotiation, applications should negotiate try formats first and then modify the active settings using the try formats returned during the last negotiation iteration. This guarantees that the active format will be applied as-is by the driver without being modified.

Selections: cropping, scaling and composition

Many sub-devices support cropping frames on their input or output pads (or possible even on both). Cropping is used to select the area of interest in an image, typically on an image sensor or a video decoder. It can also be used as part of digital zoom implementations to select the area of the image that will be scaled up.

Crop settings are defined by a crop rectangle and represented in a struct `v4l2_rect` by the coordinates of the top left corner and the rectangle size. Both the coordinates and sizes are expressed in pixels.
As for pad formats, drivers store try and active rectangles for the selection targets Common selection definitions.

On sink pads, cropping is applied relative to the current pad format. The pad format represents the image size as received by the sub-device from the previous block in the pipeline, and the crop rectangle represents the sub-image that will be transmitted further inside the sub-device for processing.

The scaling operation changes the size of the image by scaling it to new dimensions. The scaling ratio isn’t specified explicitly, but is implied from the original and scaled image sizes. Both sizes are represented by struct v4l2_rect.

Scaling support is optional. When supported by a subdev, the crop rectangle on the subdev’s sink pad is scaled to the size configured using the VIDIOC_SUBDEV_S_SELECTION IOCTL using V4L2_SEL_TGT_COMPOSE selection target on the same pad. If the subdev supports scaling but not composing, the top and left values are not used and must always be set to zero.

On source pads, cropping is similar to sink pads, with the exception that the source size from which the cropping is performed, is the COMPOSE rectangle on the sink pad. In both sink and source pads, the crop rectangle must be entirely contained inside the source image size for the crop operation.

The drivers should always use the closest possible rectangle the user requests on all selection targets, unless specifically told otherwise. V4L2_SEL_FLAG_GE and V4L2_SEL_FLAG_LE flags may be used to round the image size either up or down. Selection flags

Types of selection targets

Actual targets

Actual targets (without a postfix) reflect the actual hardware configuration at any point of time. There is a BOUNDS target corresponding to every actual target.

BOUNDS targets

BOUNDS targets is the smallest rectangle that contains all valid actual rectangles. It may not be possible to set the actual rectangle as large as the BOUNDS rectangle, however. This may be because e.g. a sensor’s pixel array is not rectangular but cross-shaped or round. The maximum size may also be smaller than the BOUNDS rectangle.

Order of configuration and format propagation

Inside subdevs, the order of image processing steps will always be from the sink pad towards the source pad. This is also reflected in the order in which the configuration must be performed by the user: the changes made will be propagated to any subsequent stages. If this behaviour is not desired, the user must set V4L2_SEL_FLAG_KEEP_CONFIG flag. This flag causes no propagation of the changes are allowed in any circumstances. This may also cause the accessed rectangle to be adjusted by the driver, depending on the properties of the underlying hardware.
The coordinates to a step always refer to the actual size of the previous step. The exception to this rule is the sink compose rectangle, which refers to the sink compose bounds rectangle — if it is supported by the hardware.

1. Sink pad format. The user configures the sink pad format. This format defines the parameters of the image the entity receives through the pad for further processing.

2. Sink pad actual crop selection. The sink pad crop defines the crop performed to the sink pad format.

3. Sink pad actual compose selection. The size of the sink pad compose rectangle defines the scaling ratio compared to the size of the sink pad crop rectangle. The location of the compose rectangle specifies the location of the actual sink compose rectangle in the sink compose bounds rectangle.

4. Source pad actual crop selection. Crop on the source pad defines crop performed to the image in the sink compose bounds rectangle.

5. Source pad format. The source pad format defines the output pixel format of the subdev, as well as the other parameters with the exception of the image width and height. Width and height are defined by the size of the source pad actual crop selection.

Accessing any of the above rectangles not supported by the subdev will return EINVAL. Any rectangle referring to a previous unsupported rectangle coordinates will instead refer to the previous supported rectangle. For example, if sink crop is not supported, the compose selection will refer to the sink pad format dimensions instead.

In the above example, the subdev supports cropping on its sink pad. To configure it, the user sets the media bus format on the subdev’s sink pad. Now the actual crop rectangle can be set on the sink pad — the location and size of this rectangle reflect the location and size of a rectangle to be cropped from the sink format. The size of the sink crop rectangle will also be the size of the format of the subdev’s source pad.

In this example, the subdev is capable of first cropping, then scaling and finally cropping for two source pads individually from the resulting scaled image. The location of the scaled image in the cropped image is ignored in sink compose target. Both of the locations of the source crop rectangles refer to the sink scaling rectangle, independently cropping an area at location specified by the source crop rectangle from it.

The subdev driver supports two sink pads and two source pads. The images from both of the sink pads are individually cropped, then scaled and further composed on the composition bounds rectangle. From that, two independent streams are cropped and sent out of the subdev from the source pads.

Table 108: v4l2_mbus_framefmt Flags

| V4L2_MBUS_FRAME_FMT_SET_CSC | 0x0001 | Set by the application. It is only used for source pads and is ignored for sink pads. If set, then request the subdevice to do colorspace conversion from the received colorspace to the requested colorspace values. If the colorimetry field (colorspace, xfer_func, ycbcr_enc, hsv_enc or quantization) is set to *_DEFAULT, then that colorimetry setting will remain unchanged from what was received. So in order to change the quantization, only the quantization field shall be set to non default value (V4L2_QUANTIZATION_FULL_RANGE or V4L2_QUANTIZATION_LIM_RANGE) and all other colorimetry fields shall be set to *_DEFAULT. To check which conversions are supported by the hardware for the current media bus frame format, see Subdev Media Bus Code Enumerate Flags. |

Media Bus Pixel Codes

The media bus pixel codes describe image formats as flowing over physical buses (both between separate physical components and inside SoC devices). This should not be confused with the V4L2 pixel formats that describe, using four character codes, image formats as stored in memory.

While there is a relationship between image formats on buses and image formats in memory (a raw Bayer image won’t be magically converted to JPEG just by storing it to memory), there is no one-to-one correspondence between them.

The media bus pixel codes document parallel formats. Should the pixel data be transported over a serial bus, the media bus pixel code that describes a parallel format that transfers a sample on a single clock cycle is used. For instance, both MEDIA_BUS_FMT_BGR888_1X24 and MEDIA_BUS_FMT_BGR888_3X8 are used on parallel busses for transferring an 8 bits per sample BGR data, whereas on serial busses the data in this format is only referred to using MEDIA_BUS_FMT_BGR888_1X24. This is because there is effectively only a single way to transport that format on the serial busses.

Packed RGB Formats

Those formats transfer pixel data as red, green and blue components. The format code is made of the following information.

- The red, green and blue components order code, as encoded in a pixel sample. Possible values are RGB and BGR.
- The number of bits per component, for each component. The values can be different for all components. Common values are 555 and 565.
• The number of bus samples per pixel. Pixels that are wider than the bus width must be transferred in multiple samples. Common values are 1 and 2.

• The bus width.

• For formats where the total number of bits per pixel is smaller than the number of bus samples per pixel times the bus width, a padding value stating if the bytes are padded in their most high order bits (PADHI) or low order bits (PADLO). A “C” prefix is used for component-wise padding in the most high order bits (CPADHI) or low order bits (CPADLO) of each separate component.

• For formats where the number of bus samples per pixel is larger than 1, an endianness value stating if the pixel is transferred MSB first (BE) or LSB first (LE).

For instance, a format where pixels are encoded as 5-bits red, 5-bits green and 5-bit blue values padded on the high bit, transferred as 2 8-bit samples per pixel with the most significant bits (padding, red and half of the green value) transferred first will be named MEDIA_BUS_FMT_RGB555_2X8_PADHI_BE.

The following table lists existing packed RGB formats.

On LVDS buses, usually each sample is transferred serialized in seven time slots per pixel clock, on three (18-bit) or four (24-bit) differential data pairs at the same time. The remaining bits are used for control signals as defined by SPWG/PSWG/VESA or JEIDA standards. The 24-bit RGB format serialized in seven time slots on four lanes using JEIDA defined bit mapping will be named MEDIA_BUS_FMT_RGB8888_1X7X4_JEIDA, for example.

Bayer Formats

Those formats transfer pixel data as red, green and blue components. The format code is made of the following information.

- The red, green and blue components order code, as encoded in a pixel sample. The possible values are shown in Figure 4.8 Bayer Patterns.
- The number of bits per pixel component. All components are transferred on the same number of bits. Common values are 8, 10 and 12.
- The compression (optional). If the pixel components are ALAW- or DPCM-compressed, a mention of the compression scheme and the number of bits per compressed pixel component.
- The number of bus samples per pixel. Pixels that are wider than the bus width must be transferred in multiple samples. Common values are 1 and 2.
- The bus width.
- For formats where the total number of bits per pixel is smaller than the number of bus samples per pixel times the bus width, a padding value stating if the bytes are padded in their most high order bits (PADHI) or low order bits (PADLO).
- For formats where the number of bus samples per pixel is larger than 1, an endianness value stating if the pixel is transferred MSB first (BE) or LSB first (LE).

For instance, a format with uncompressed 10-bit Bayer components arranged in a red, green, green, blue pattern transferred as 2 8-bit samples per pixel with the least significant bits transferred first will be named MEDIA_BUS_FMT_SRGGB10_2X8_PADHI_LE.

Packed YUV Formats

Those data formats transfer pixel data as (possibly downscaled) Y, U and V components. Some formats include dummy bits in some of their samples and are collectively referred to as “YDYC” (Y-Dummy-Y-Chroma) formats. One cannot rely on the values of these dummy bits as those are undefined.

The format code is made of the following information.

- The Y, U and V components order code, as transferred on the bus. Possible values are YUYV, UYVY, VYU and VYUY for formats with no dummy bit, and YDYUVDYV, YDYVYDYU, YUYDYVVD and YVYDYUDY for YDYC formats.
- The number of bits per pixel component. All components are transferred on the same number of bits. Common values are 8, 10 and 12.
- The number of bus samples per pixel. Pixels that are wider than the bus width must be transferred in multiple samples. Common values are 0.5 (encoded as 0.5; in this case two pixels are transferred per bus sample), 1, 1.5 (encoded as 1.5) and 2.
3.2. Part I - Video for Linux API

The bus width. When the bus width is larger than the number of bits per pixel component, several components are packed in a single bus sample. The components are ordered as specified by the order code, with components on the left of the code transferred in the high order bits. Common values are 8 and 16.

For instance, a format where pixels are encoded as 8-bit YUV values downsampling to 4:2:2 and transferred as 2 8-bit bus samples per pixel in the U, Y, V, Y order will be named MEDIA_BUS_FMT_UVYV8_2X8.

**YUV Formats** lists existing packed YUV formats and describes the organization of each pixel data in each sample. When a format pattern is split across multiple samples each of the samples in the pattern is described.

The role of each bit transferred over the bus is identified by one of the following codes:

- $y_x$ for luma component bit number $x$
- $u_x$ for blue chroma component bit number $x$
- $v_x$ for red chroma component bit number $x$
- $a_x$ for alpha component bit number $x$
- for non-available bits (for positions higher than the bus width)
- $d$ for dummy bits

HSV/HSL Formats

Those formats transfer pixel data as RGB values in a cylindrical-coordinate system using Hue-Saturation-Value or Hue-Saturation-Lightness components. The format code is made of the following information:

- The hue, saturation, value or lightness and optional alpha components order code, as encoded in a pixel sample. The only currently supported value is AHSV.

- The number of bits per component, for each component. The values can be different for all components. The only currently supported value is 8888.

- The number of bus samples per pixel. Pixels that are wider than the bus width must be transferred in multiple samples. The only currently supported value is 1.

- The bus width.

- For formats where the total number of bits per pixel is smaller than the number of bus samples per pixel times the bus width, a padding value stating if the bytes are padded in their most high order bits (PADHI) or low order bits (PADLO).

- For formats where the number of bus samples per pixel is larger than 1, an endianness value stating if the pixel is transferred MSB first (BE) or LSB first (LE).

The following table lists existing HSV/HSL formats.
### Table 117: HSV/HSL formats

<td></td>
</tr>
</tbody>
</table>

**JPEG Compressed Formats**

Those data formats consist of an ordered sequence of 8-bit bytes obtained from JPEG compression process. Additionally to the _JPEG postfix the format code is made of the following information.

- The number of bus samples per entropy encoded byte.
- The bus width.

For instance, for a JPEG baseline process and an 8-bit bus width the format will be named `MEDIA_BUS_FMT_JPEG_1X8`.

The following table lists existing JPEG compressed formats.

<table>
<thead>
<tr>
<th>Identifier</th>

<td>This format should be used when the same driver handles both sides of the link and the bus format is a fixed metadata format that is not configurable from userspace. Width and height will be set to 0 for this format.</td>
</tr>
</tbody>
</table>

3.2.4.14 Metadata Interface

Metadata refers to any non-image data that supplements video frames with additional information. This may include statistics computed over the image, frame capture parameters supplied by the image source or device specific parameters for specifying how the device processes images. This interface is intended for transfer of metadata between the userspace and the hardware and control of that operation.

The metadata interface is implemented on video device nodes. The device can be dedicated to metadata or can support both video and metadata as specified in its reported capabilities.

Querying Capabilities

Device nodes supporting the metadata capture interface set the V4L2_CAP_META_CAPTURE flag in the device_caps field of the v4l2_capability structure returned by the VIDIOC_QUERYCAP() ioctl. That flag means the device can capture metadata to memory. Similarly, device nodes supporting metadata output interface set the V4L2_CAP_META_OUTPUT flag in the device_caps field of v4l2_capability structure. That flag means the device can read metadata from memory.

At least one of the read/write or streaming I/O methods must be supported.

Data Format Negotiation

The metadata device uses the Data Formats ioctl to select the capture format. The metadata buffer content format is bound to that selected format. In addition to the basic Data Formats ioctl, the VIDIOC_ENUM_FMT() ioctl must be supported as well.

To use the Data Formats ioctl applications set the type field of the v4l2_format structure to V4L2_BUF_TYPE_META_CAPTURE or to V4L2_BUF_TYPE_META_OUTPUT and use the v4l2_meta_format meta member of the fmt union as needed per the desired operation. Both drivers and applications must set the remainder of the v4l2_format structure to 0.

v4l2_meta_format

</tbody>
</table>
3.2.5 Libv4l Userspace Library

3.2.5.1 Introduction

libv4l is a collection of libraries which adds a thin abstraction layer on top of video4linux2 devices. The purpose of this (thin) layer is to make it easy for application writers to support a wide variety of devices without having to write separate code for different devices in the same class.

An example of using libv4l is provided by `v4l2grab`.

libv4l consists of 3 different libraries:

**libv4lconvert**

libv4lconvert is a library that converts several different pixelformats found in V4L2 drivers into a few common RGB and YUY formats.

Later on libv4lconvert was expanded to also be able to do various video processing functions to improve webcam video quality. The video processing is split in to 2 parts: libv4lconvert/control and libv4lconvert/processing.

The control part is used to offer video controls which can be used to control the video processing functions made available by libv4lconvert/processing. These controls are stored application wide (until reboot) by using a persistent shared memory object.

libv4lconvert/processing offers the actual video processing functionality.

**libv4l1**

This library offers functions that can be used to quickly make v4l1 applications work with v4l2 devices. These functions work exactly like the normal open/close/etc, except that libv4l1 does full emulation of the v4l1 api on top of v4l2 drivers, in case of v4l1 drivers it will just pass calls through.

Since those functions are emulations of the old V4L1 API, it shouldn’t be used for new applications.
**libv4l2**

This library should be used for all modern V4L2 applications.

It provides handles to call V4L2 open/ioclt/close/poll methods. Instead of just providing the raw output of the device, it enhances the calls in the sense that it will use libv4lconvert to provide more video formats and to enhance the image quality.

In most cases, libv4l2 just passes the calls directly through to the v4l2 driver, intercepting the calls to `VIDIOC_TRY_FMT`, `VIDIOC_G_FMT`, `VIDIOC_S_FMT`, `VIDIOC_ENUM_FRAMEFORMATS` and `VIDIOC_ENUM_FRAMEINTERVALS` in order to emulate the formats `V4L2_PIX_FMT_BGR24`, `V4L2_PIX_FMT_RGB24`, `V4L2_PIX_FMT_YUV420`, and `V4L2_PIX_FMT_YVU420`, if they aren’t available in the driver. `VIDIOC_ENUM_FMT` keeps enumerating the hardware supported formats, plus the emulated formats offered by libv4l at the end.

**Libv4l device control functions**

The common file operation methods are provided by libv4l.

Those functions operate just like the gcc function `dup()` and V4L2 functions `open()`, `close()`, `ioctl()`, `read()`, `mmap()` and `munmap()`:

```c
int v4l2_open(const char *file, int oflag, ...)  
operates like the open() function.

int v4l2_close(int fd)  
operates like the close() function.

int v4l2_dup(int fd)  
operates like the libc dup() function, duplicating a file handler.

int v4l2_ioctl(int fd, unsigned long int request, ...)  
operates like the ioctl() function.

int v4l2_read(int fd, void* buffer, size_t n)  
operates like the read() function.

void v4l2_mmap(void *start, size_t length, int prot, int flags, int fd, int64_t offset);  
operates like the munmap() function.

int v4l2_munmap(void *start, size_t length);  
operates like the munmap() function.
```

Those functions provide additional control:

```c
int v4l2_fd_open(int fd, int v4l2_flags)  
opens an already opened fd for further use through v4l2lib and possibly modify libv4l2’s default behavior through the v4l2_flags argument. Currently, v4l2_flags can be V4L2_DISABLE_CONVERSION, to disable format conversion.

int v4l2_set_control(int fd, int cid, int value)  
This function takes a value of 0 - 65535, and then scales that range to the actual range of the given v4l control id, and then if the cid exists and is not locked sets the cid to the scaled value.
```
int **v4l2_get_control**(int *fd, int cid)

This function returns a value of 0 - 65535, scaled to from the actual range of the given v4l control id. When the cid does not exist, could not be accessed for some reason, or some error occurred 0 is returned.

v4l1compat.so wrapper library

This library intercepts calls to open(), close(), ioctl(), mmap() and munmap() operations and redirects them to the libv4l counterparts, by using LD_PRELOAD=/usr/lib/v4l1compat.so. It also emulates V4L1 calls via V4L2 API.

It allows usage of binary legacy applications that still don’t use libv4l.

### 3.2.6 Changes

The following chapters document the evolution of the V4L2 API, errata or extensions. They are also intended to help application and driver writers to port or update their code.

#### 3.2.6.1 Differences between V4L and V4L2

The Video For Linux API was first introduced in Linux 2.1 to unify and replace various TV and radio device related interfaces, developed independently by driver writers in prior years. Starting with Linux 2.5 the much improved V4L2 API replaces the V4L API. The support for the old V4L calls were removed from Kernel, but the library *Libv4l Userspace Library* supports the conversion of a V4L API system call into a V4L2 one.

**Opening and Closing Devices**

For compatibility reasons the character device file names recommended for V4L2 video capture, overlay, radio and raw vbi capture devices did not change from those used by V4L. They are listed in Interfaces and below in V4L Device Types, Names and Numbers.

The teletext devices (minor range 192-223) have been removed in V4L2 and no longer exist. There is no hardware available anymore for handling pure teletext. Instead raw or sliced VBI is used.

The V4L videodev module automatically assigns minor numbers to drivers in load order, depending on the registered device type. We recommend that V4L2 drivers by default register devices with the same numbers, but the system administrator can assign arbitrary minor numbers using driver module options. The major device number remains 81.

<table>
<thead>
<tr>
<th>Device Type</th>
<th>File Name</th>
<th>Minor Numbers</th>
</tr>
</thead>
<tbody>
<tr>
<td>Video capture and overlay</td>
<td>/dev/video and /dev/bttv0, /dev/video0 to /dev/video63</td>
<td>0-63</td>
</tr>
<tr>
<td>Radio receiver</td>
<td>/dev/radio, /dev/radio0 to /dev/radio63</td>
<td>64-127</td>
</tr>
<tr>
<td>Raw VBI capture</td>
<td>/dev/vbi, /dev/vbi0 to /dev/vbi31</td>
<td>224-255</td>
</tr>
</tbody>
</table>

Table 122: V4L Device Types, Names and Numbers
V4L prohibits (or used to prohibit) multiple opens of a device file. V4L2 drivers may support multiple opens, see *Opening and Closing Devices* for details and consequences.

V4L drivers respond to V4L2 ioctl with an EINVAL error code.

### Querying Capabilities

The V4L VIDIOCGCAP ioctl is equivalent to V4L2’s `ioctl VIDIOC_QUERYCAP`.

The name field in struct `video_capability` became `card` in struct `v4l2_capability`, `type` was replaced by `capabilities`. Note V4L2 does not distinguish between device types like this, better think of basic video input, video output and radio devices supporting a set of related functions like video capturing, video overlay and VBI capturing. See *Opening and Closing Devices* for an introduction.

<table>
<thead>
<tr>
<th>Type</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>VID_TYPE_CAPTURE</td>
<td>The video capture interface is supported.</td>
</tr>

<td>Applications can enumerate the supported image formats with the <code>ioctl VIDIOC_ENUM_FMT</code> ioctl to determine if the device supports MPEG streams.</td>
</tr>
<tr>
<td>VID_TYPE_MJPEG_ENCODER</td>
<td></td>
<td>See above.</td>
</tr>
<tr>
<td>VID_TYPE_MJPEG_ENCODER</td>
<td></td>
<td>See above.</td>
</tr>
</tbody>
</table>

The audios field was replaced by capabilities flag V4L2_CAP_AUDIO, indicating if the device has any audio inputs or outputs. To determine their number applications can enumerate audio inputs with the `VIDIOC_G_AUDIO` ioctl. The audio ioctls are described in Audio Inputs and Outputs.

The maxwidth, maxheight, minwidth and minheight fields were removed. Calling the `VIDIOC_S_FMT` or `VIDIOC_TRY_FMT` ioctl with the desired dimensions returns the closest size possible, taking into account the current video standard, cropping and scaling limitations.

**Video Sources**

V4L provides the VIDIOC_GCHAN and VIDIOC_SCHAN ioctl using struct video_channel to enumerate the video inputs of a V4L device. The equivalent V4L2 ioctls are `ioctl VIDIOC_ENUMINPUT`, `VIDIOC_G_INPUT` and `VIDIOC_S_INPUT` using struct v4l2_input as discussed in Video Inputs and Outputs.

The channel field counting inputs was renamed to index, the video input types were renamed as follows:

<table>
<thead>
<tr>
<th>struct video_channel type</th>
<th>struct v4l2_input type</th>
</tr>
</thead>
<tbody>
<tr>
<td>VIDEO_TYPE_TV</td>
<td>V4L2_INPUT_TYPE_TUNER</td>
</tr>
<tr>
<td>VIDEO_TYPE_CAMERA</td>
<td>V4L2_INPUT_TYPE_CAMERA</td>
</tr>
</tbody>
</table>
Unlike the tuners field expressing the number of tuners of this input, V4L2 assumes each video input is connected to at most one tuner. However a tuner can have more than one input, i.e. RF connectors, and a device can have multiple tuners. The index number of the tuner associated with the input, if any, is stored in field tuner of struct v4l2_input. Enumeration of tuners is discussed in *Tuners and Modulators*.

The redundant VIDEO_VC_TUNER flag was dropped. Video inputs associated with a tuner are of type V4L2_INPUT_TYPE_TUNER. The VIDEO_VC_AUDIO flag was replaced by the audioset field. V4L2 considers devices with up to 32 audio inputs. Each set bit in the audioset field represents one audio input this video input combines with. For information about audio inputs and how to switch between them see *Audio Inputs and Outputs*.

The norm field describing the supported video standards was replaced by std. The V4L specification mentions a flag VIDEO_VC_NORM indicating whether the standard can be changed. This flag was a later addition together with the norm field and has been removed in the meantime.

V4L2 has a similar, albeit more comprehensive approach to video standards, see *Video Standards* for more information.

### Tuning

The V4L VIDIOC_GTUNER and VIDIOC_STUNER ioctl and struct video_tuner can be used to enumerate the tuners of a V4L TV or radio device. The equivalent V4L2 ioctls are VIDIOC_G_TUNER and VIDIOC_S_TUNER using struct v4l2_tuner. Tuners are covered in *Tuners and Modulators*.

The tuner field counting tuners was renamed to index. The fields name, rangelow and rangehigh remained unchanged.

The VIDEO_TUNER_PAL, VIDEO_TUNER_NTSC and VIDEO_TUNER_SECAM flags indicating the supported video standards were dropped. This information is now contained in the associated struct v4l2_input. No replacement exists for the VIDEO_TUNER_SECAM flag indicating whether the video standard can be switched. The mode field to select a different video standard was replaced by a whole new set of ioctls and structures described in *Video Standards*. Due to its ubiquity it should be mentioned the BTTV driver supports several standards in addition to the regular VIDEO_MODE_PAL (0), VIDEO_MODE_NTSC, VIDEO_MODE_SECAM and VIDEO_MODE_AUTO (3). Namely N/PAL Argentina, M/PAL, N/PAL, and NTSC Japan with numbers 3-6 (sic).

The VIDEO_TUNER_STEREO_ON flag indicating stereo reception became V4L2_TUNER_SUB_STEREO in field rxsubchans. This field also permits the detection of monaural and bilingual audio, see the definition of struct v4l2_tuner for details. Presently no replacement exists for the VIDEO_TUNER_RDS_ON and VIDEO_TUNER_MBS_ON flags.

The VIDEO_TUNER_LOW flag was renamed to V4L2_TUNER_CAP_LOW in the struct v4l2_tuner capability field.

The VIDIOC_FREQ and VIDIOC_SFREQ ioctl to change the tuner frequency where renamed to VIDIOC_G_FREQUENCY and VIDIOC_S_FREQUENCY. They take a pointer to a struct v4l2_frequency instead of an unsigned long integer.
Image Properties

V4L2 has no equivalent of the VIDIOC_PICT and VIDIOC_S_PICT ioctl and struct video_picture. The following fields where replaced by V4L2 controls accessible with the ioctls VIDIOC_QUERYCTRL, VIDIOC_QUERY_EXT_CTRL and VIDIOC_QUERYMENU, VIDIOC_G_CTRL and VIDIOC_S_CTRL ioctls:

<table>
<thead>
<tr>
<th>struct video_picture</th>
<th>V4L2 Control ID</th>
</tr>
</thead>
<tbody>
<tr>
<td>brightness</td>
<td>V4L2_CID_BRIGHTNESS</td>
</tr>
<tr>
<td>hue</td>
<td>V4L2_CID_HUE</td>
</tr>
<tr>
<td>colour</td>
<td>V4L2_CID_SATURATION</td>
</tr>
<tr>
<td>contrast</td>
<td>V4L2_CID_CONTRAST</td>
</tr>
<tr>
<td>whiteness</td>
<td>V4L2_CID_WHITENESS</td>
</tr>
</tbody>
</table>

The V4L picture controls are assumed to range from 0 to 65535 with no particular reset value. The V4L2 API permits arbitrary limits and defaults which can be queried with the ioctls VIDIOC_QUERYCTRL, VIDIOC_QUERY_EXT_CTRL and VIDIOC_QUERYMENU ioctl. For general information about controls see User Controls.

The depth (average number of bits per pixel) of a video image is implied by the selected image format. V4L2 does not explicitly provide such information assuming applications recognizing the format are aware of the image depth and others need not know. The palette field moved into the struct v4l2_pix_format:

<table>
<thead>
<tr>
<th>struct video_picture palette</th>
<th>struct v4l2_pix_format pixfmt</th>
</tr>
</thead>
<tbody>
<tr>
<td>VIDEO_PALETTE_GREY</td>
<td>V4L2_PIX_FMT_GREY</td>
</tr>
<tr>
<td>VIDEO_PALETTE_HI240</td>
<td>V4L2_PIX_FMT_HI240^{3}</td>
</tr>
<tr>
<td>VIDEO_PALETTE_RGB565</td>
<td>V4L2_PIX_FMT_RGB565</td>
</tr>
<tr>
<td>VIDEO_PALETTE_RGB555</td>
<td>V4L2_PIX_FMT_RGB555</td>
</tr>
<tr>
<td>VIDEO_PALETTE_RGB24</td>
<td>V4L2_PIX_FMT_BGR24</td>
</tr>
<tr>
<td>VIDEO_PALETTE_RGB32</td>
<td>V4L2_PIX_FMT_BGR32^{4}</td>
</tr>
<tr>
<td>VIDEO_PALETTE_YUV422</td>
<td>V4L2_PIX_FMT_YUV422</td>
</tr>
<tr>
<td>VIDEO_PALETTE_YUV442</td>
<td>V4L2_PIX_FMT_YUV442</td>
</tr>
<tr>
<td>VIDEO_PALETTE_YUV40Y</td>
<td>V4L2_PIX_FMT_YUV40Y</td>
</tr>
<tr>
<td>VIDEO_PALETTE_YUV401</td>
<td>None</td>
</tr>
<tr>
<td>VIDEO_PALETTE_YUV411</td>
<td>V4L2_PIX_FMT_YUV41P^{5b}</td>
</tr>
<tr>
<td>VIDEO_PALETTE_RAW</td>
<td>None</td>
</tr>
<tr>
<td>VIDEO_PALETTE_YUV422P</td>
<td>V4L2_PIX_FMT_YUV422P</td>
</tr>
<tr>
<td>VIDEO_PALETTE_YUV411P</td>
<td>V4L2_PIX_FMT_YUV411P^{5b}</td>
</tr>
<tr>
<td>VIDEO_PALETTE_YUV420P</td>
<td>V4L2_PIX_FMT_YUV420P</td>
</tr>
<tr>
<td>VIDEO_PALETTE_YUV410P</td>
<td>V4L2_PIX_FMT_YUV410P</td>
</tr>
</tbody>
</table>

V4L2 image formats are defined in Image Formats. The image format can be selected with the VIDIOC_S_FMT ioctl.

^{3} This is a custom format used by the BTTV driver, not one of the V4L2 standard formats.

^{4} Presumably all V4L RGB formats are little-endian, although some drivers might interpret them according to machine endianness. V4L2 defines little-endian, big-endian and red/blue swapped variants. For details see RGB Formats.

^{5} VIDEO_PALETTE_YUV422 and VIDEO_PALETTE_YUVV are the same formats. Some V4L drivers respond to one,
Audio

The VIDIOC_G_AUDIO and VIDIOC_S_AUDIO ioctl and struct video_audio are used to enumerate the audio inputs of a V4L device. The equivalent V4L2 ioctls are VIDIOC_G_AUDIO and VIDIOC_S_AUDIO using struct v4l2_audio as discussed in Audio Inputs and Outputs.

The audio “channel number” field counting audio inputs was renamed to index.

On VIDIOC_S_AUDIO the mode field selects one of the VIDEO_SOUND_MONO, VIDEO_SOUND_STEREO, VIDEO_SOUND_LANG1 or VIDEO_SOUND_LANG2 audio demodulation modes. When the current audio standard is BTSC VIDEO_SOUND_LANG2 refers to SAP and VIDEO_SOUND_LANG1 is meaningless. Also undocumented in the V4L specification, there is no way to query the selected mode. On VIDIOC_G_AUDIO the driver returns the actually received audio programmes in this field. In the V4L2 API this information is stored in the struct v4l2_tuner rxsubchans and audmode fields, respectively. See Tuners and Modulators for more information on tuners. Related to audio modes struct v4l2_audio also reports if this is a mono or stereo input, regardless if the source is a tuner.

The following fields where replaced by V4L2 controls accessible with the ioctls VIDIOC_QUERYCTRL, VIDIOC_QUERY_EXT_CTRL and VIDIOC_QUERYMENU, VIDIOC_G_CTRL and VIDIOC_S_CTRL ioctls:

<table>
<thead>
<tr>
<th>struct video_audio</th>
<th>V4L2 Control ID</th>
</tr>
</thead>
<tbody>
<tr>
<td>volume</td>
<td>V4L2_CID_AUDIO_VOLUME</td>
</tr>
<tr>
<td>bass</td>
<td>V4L2_CID_AUDIO_BASS</td>
</tr>
<tr>
<td>treble</td>
<td>V4L2_CID_AUDIO_TREBLE</td>
</tr>
<tr>
<td>balance</td>
<td>V4L2_CID_AUDIO_BALANCE</td>
</tr>
</tbody>
</table>

To determine which of these controls are supported by a driver V4L provides the flags VIDEO_AUDIO_VOLUME, VIDEO_AUDIO_BASS, VIDEO_AUDIO_TREBLE and VIDEO_AUDIO_BALANCE. In the V4L2 API the ioctls VIDIOC_QUERYCTRL, VIDIOC_QUERY_EXT_CTRL and VIDIOC_QUERYMENU ioctl reports if the respective control is supported. Accordingly the VIDEO_AUDIO_MUTABLE and VIDEO_AUDIO_MUTE flags where replaced by the boolean V4L2_CID_AUDIO_MUTE control.

All V4L2 controls have a step attribute replacing the struct video_audio step field. The V4L audio controls are assumed to range from 0 to 65535 with no particular reset value. The V4L2 API permits arbitrary limits and defaults which can be queried with the ioctls VIDIOC_QUERYCTRL, VIDIOC_QUERY_EXT_CTRL and VIDIOC_QUERYMENU ioctl. For general information about controls see User Controls.

---

6. Not to be confused with V4L2_PIX_FMT_YUV411P, which is a planar format.
7. V4L explains this as: “RAW capture (BT848)”
8. Not to be confused with V4L2_PIX_FMT_Y41P, which is a packed format.
Frame Buffer Overlay

The V4L2 ioctls equivalent to VIDIOCGBUF and VIDIOCSFBUF are VIDIOC_G_FBUF and VIDIOC_S_FBUF. The base field of struct video_buffer remained unchanged, except V4L2 defines a flag to indicate non-destructive overlays instead of a NULL pointer. All other fields moved into the struct v4l2_pix_format fmt substructure of struct v4l2_framebuffer. The depth field was replaced by pixelformat. See RGB Formats for a list of RGB formats and their respective color depths.

Instead of the special ioctls VIDIOCGBWIN and VIDIOCSWIN V4L2 uses the general-purpose data format negotiation ioctls VIDIOC_G_FMT and VIDIOC_S_FMT. They take a pointer to a struct v4l2_format as argument. Here the win member of the fmt union is used, a struct v4l2_window.

The x, y, width and height fields of struct video_window moved into struct v4l2_rect substructure w of struct v4l2_window. The chromakey, clips, and clipcount fields remained unchanged. Struct video_clip was renamed to struct v4l2_clip, also containing a struct v4l2_rect, but the semantics are still the same.

The VIDEO_WINDOW_INTERLACE flag was dropped. Instead applications must set the field field to V4L2_FIELD_ANY or V4L2_FIELD_INTERLACED. The VIDEO_WINDOW_CHROMAKEY flag moved into struct v4l2_framebuffer, under the new name V4L2_FBUF_FLAG_CHROMAKEY.

In V4L, storing a bitmap pointer in clips and setting clipcount to VIDEO_CLIP_BITMAP (-1) requests bitmap clipping, using a fixed size bitmap of 1024 x 625 bits. Struct v4l2_window has a separate bitmap pointer field for this purpose and the bitmap size is determined by w.width and w.height.

The VIDIOC CAPTURE ioctl to enable or disable overlay was renamed to ioctl VIDIOC_OVERLAY.

Cropping

To capture only a subsection of the full picture V4L defines the VIDIOCGBCAPTURE and VIDIOCSRCAPTURE ioctls using struct video_capture. The equivalent V4L2 ioctls are VIDIOC_G_CROP and VIDIOC_S_CROP using struct v4l2_crop, and the related ioctl VIDIOC_CROPCAP ioctl. This is a rather complex matter, see Image Cropping, Insertion and Scaling – the CROP API for details.

The x, y, width and height fields moved into struct v4l2_rect substructure c of struct v4l2_crop. The decimation field was dropped. In the V4L2 API the scaling factor is implied by the size of the cropping rectangle and the size of the captured or overlaid image.

The VIDEO_CAPTURE_ODD and VIDEO_CAPTURE_EVEN flags to capture only the odd or even field, respectively, were replaced by V4L2_FIELD_TOP and V4L2_FIELD_BOTTOM in the field named field of struct v4l2_pix_format and struct v4l2_window. These structures are used to select a capture or overlay format with the VIDIOC_S_FMT ioctl.
Reading Images, Memory Mapping

Capturing using the read method

There is no essential difference between reading images from a V4L or V4L2 device using the read() function, however V4L2 drivers are not required to support this I/O method. Applications can determine if the function is available with the ioctl VIDIOC_QUERYCAP ioctl. All V4L2 devices exchanging data with applications must support the select() and poll() functions.

To select an image format and size, V4L provides the VIDIOCSPICT and VIDIOCWSWIN ioctl. V4L2 uses the general-purpose data format negotiation ioctl VIDIOC_G_FMT and VIDIOC_S_FMT. They take a pointer to a struct v4l2_pix_format as argument, here the struct v4l2_pix_format named pix of its fmt union is used.

For more information about the V4L2 read interface see Read/Write.

Capturing using memory mapping

Applications can read from V4L devices by mapping buffers in device memory, or more often just buffers allocated in DMA-able system memory, into their address space. This avoids the data copying overhead of the read method. V4L2 supports memory mapping as well, with a few differences.
The image format must be selected before buffers are allocated, with the `VIDIOC_S_FMT` ioctl. When no format is selected the driver may use the last, possibly by another application requested format.

Applications cannot change the number of buffers. The it is built into the driver, unless it has a module option to change the number when the driver module is loaded.

Applications cannot change the number of buffers. The ioctl `VIDIOC_REQBUFS` ioctl allocates the desired number of buffers, this is a required step in the initialization sequence.

Drivers map all buffers as one contiguous range of memory. The `VIDIOCGMGBUF` ioctl is available to query the number of buffers, the offset of each buffer from the start of the virtual file, and the overall amount of memory used, which can be used as arguments for the `mmap()` function.

Buffers are individually mapped. The offset and size of each buffer can be determined with the `ioctl VIDIOC_QUERYBUF` ioctl.

The `VIDIOC_CMCAPTURE` ioctl prepares a buffer for capturing. It also determines the image format for this buffer. The ioctl returns immediately, eventually with an EAGAIN error code if no video signal had been detected. When the driver supports more than one buffer applications can call the ioctl multiple times and thus have multiple outstanding capture requests.

The `VIDIOC_SYNC` ioctl suspends execution until a particular buffer has been filled.

Drivers maintain an incoming and outgoing queue. `ioctl VIDIOC_QBUF, VIDIOC_DQBUF` enqueues any empty buffer into the incoming queue. Filled buffers are dequeued from the outgoing queue with the `VIDIOC_DQBUF` ioctl. To wait until filled buffers become available this function, `select()` or `poll()` can be used. The `ioctl VIDIOC_STREAMON, VIDIOC_STREAMOFF` ioctl must be called once after enqueuing one or more buffers to start capturing. Its counterpart `VIDIOC_STREAMOFF` stops capturing and dequeues all buffers from both queues. Applications can query the signal status, if known, with the `ioctl VIDIOC_ENUMINPUT` ioctl.

For a more in-depth discussion of memory mapping and examples, see *Streaming I/O (Memory Mapping)*.

### Reading Raw VBI Data

Originally the V4L API did not specify a raw VBI capture interface, only the device file `/dev/vbi` was reserved for this purpose. The only driver supporting this interface was the BTTV driver, de-facto defining the V4L VBI interface. Reading from the device yields a raw VBI image with the following parameters:
struct v4l2_vbi_format | V4L, BTTV driver
---|---
sampling_rate | 28636363 Hz NTSC (or any other 525-line standard); 35468950 Hz PAL and SECAM (625-line standards)
offset | 
samples_per_line | 2048
sample_format | V4L2_PIX_FMT_GREY. The last four bytes (a machine endianness integer) contain a frame counter.
start[] | 10, 273 NTSC; 22, 335 PAL and SECAM
count[] | 16, 16³
flags | 0

Undocumented in the V4L specification, in Linux 2.3 the VIDIOCGVBIFMT and VIDIOCSVBIFMT ioctls using struct vbi_format were added to determine the VBI image parameters. These ioctls are only partially compatible with the V4L2 VBI interface specified in *Raw VBI Data Interface*. An offset field does not exist, sample_format is supposed to be VIDEO_PALETTE_RAW, equivalent to V4L2_PIX_FMT_GREY. The remaining fields are probably equivalent to struct v4l2_vbi_format.

Apparently only the Zoran (ZR 36120) driver implements these ioctls. The semantics differ from those specified for V4L2 in two ways. The parameters are reset on open() and VIDIOCSVBIFMT always returns an EINVAL error code if the parameters are invalid.

**Miscellaneous**

V4L2 has no equivalent of the VIDIOCGUNIT ioctl. Applications can find the VBI device associated with a video capture device (or vice versa) by reopening the device and requesting VBI data. For details see *Opening and Closing Devices*.

No replacement exists for VIDIOCKEY, and the V4L functions for microcode programming. A new interface for MPEG compression and playback devices is documented in *Extended Controls API*.

### 3.2.6.2 Changes of the V4L2 API

Soon after the V4L API was added to the kernel it was criticised as too inflexible. In August 1998 Bill Dirks proposed a number of improvements and began to work on documentation, example drivers and applications. With the help of other volunteers this eventually became the V4L2 API, not just an extension but a replacement for the V4L API. However it took another four years and two stable kernel releases until the new API was finally accepted for inclusion into the kernel in its present form.

---

³ Old driver versions used different values, eventually the custom BTTV_VBISIZE ioctl was added to query the correct values.
Early Versions

1998-08-20: First version.
1998-08-27: The select() function was introduced.
1998-09-18: The VIDIOC_NONCAP ioctl was replaced by the otherwise meaningless O_TRUNC open() flag, and the aliases O_NONCAP and O_NOIO were defined. Applications can set this flag if they intend to access controls only, as opposed to capture applications which need exclusive access. The VIDEO_STD_XXX identifiers are now ordinals instead of flags, and the video_std_construct() helper function takes id and transmission arguments.
1998-10-02: The id field was removed from struct video_standard and the color subcarrier fields were renamed. The ioctl VIDIOC_QUERYSTD, VIDIOC_SUBDEV_QUERYSTD ioctl was renamed to ioctl VIDIOC_ENUMSTD, VIDIOC_SUBDEV_ENUMSTD, VIDIOC_G_INPUT to ioctl VIDIOC_ENUMINPUT. A first draft of the Codec API was released.
1998-11-08: Many minor changes. Most symbols have been renamed. Some material changes to struct v4l2_capability.
1998-11-12: The read/write direction of some ioctls was misdefined.
1998-11-14: V4L2_PIX_FMT_RGB24 changed to V4L2_PIX_FMT_BGR24, and V4L2_PIX_FMT_RGB32 changed to V4L2_PIX_FMT_BGR32. Audio controls are now accessible with the VIDIOC_G_CTRL and VIDIOC_S_CTRL ioctls under names starting with V4L2_CID_AUDIO. The V4L2_MAJOR define was removed from videodev.h since it was only used once in the videodev kernel module. The YUV422 and YUV411 planar image formats were added.
1998-11-28: A few ioctl symbols changed. Interfaces for codecs and video output devices were added.
1999-01-14: A raw VBI capture interface was added.
1999-01-19: The VIDIOC_NEXTBUF ioctl was removed.

V4L2 Version 0.16 1999-01-31

1999-01-27: There is now one QBUF ioctl, VIDIOC_QWBUF and VIDIOC_QRBUF are gone. VIDIOC_QBUF takes a v4l2_buffer as a parameter. Added digital zoom (cropping) controls.

V4L2 Version 0.18 1999-03-16

Added a v4l to V4L2 ioctl compatibility layer to videodev.c. Driver writers, this changes how you implement your ioctl handler. See the Driver Writer’s Guide. Added some more control id codes.
V4L2 Version 0.19 1999-06-05

1999-03-18: Fill in the category and catname fields of v4l2_queryctrl objects before passing them to the driver. Required a minor change to the VIDIOC_QUERYCTRL handlers in the sample drivers.

1999-03-31: Better compatibility for v4l memory capture ioctls. Requires changes to drivers to fully support new compatibility features, see Driver Writer’s Guide and v4l2cap.c. Added new control IDs: V4L2_CID_HFLIP, _VFLIP. Changed V4L2_PIX_FMT_YUV422P to _YUV422P, and _YUV411P to _YUV411P.

1999-04-04: Added a few more control IDs.

1999-04-07: Added the button control type.

1999-05-02: Fixed a typo in videodev.h, and added the V4L2_CTRL_FLAG_GRAYED (later V4L2_CTRL_FLAG_GRABBED) flag.

1999-05-20: Definition of VIDIOC_G_CTRL was wrong causing a malfunction of this ioctl.

1999-06-05: Changed the value of V4L2_CID_WHITENESS.

V4L2 Version 0.20 (1999-09-10)

Version 0.20 introduced a number of changes which were not backward compatible with 0.19 and earlier versions. Purpose of these changes was to simplify the API, while making it more extensible and following common Linux driver API conventions.

1. Some typos in V4L2_FMT_FLAG symbols were fixed. struct v4l2_clip was changed for compatibility with v4l. (1999-08-30)

2. V4L2_TUNER_SUB_LANG1 was added. (1999-09-05)

3. All ioctl() commands that used an integer argument now take a pointer to an integer. Where it makes sense, ioctls will return the actual new value in the integer pointed to by the argument, a common convention in the V4L2 API. The affected ioctls are: VIDIOC_PREVIEW, VIDIOC_STREAMON, VIDIOC_STREAMOFF, VIDIOC_S_FREQ, VIDIOC_S_INPUT, VIDIOC_S_OUTPUT, VIDIOC_S_EFFECT. For example

   ```
   err = ioctl (fd, VIDIOC_XXX, V4L2_XXX);
   ```

   becomes

   ```
   int a = V4L2_XXX; err = ioctl(fd, VIDIOC_XXX, &a);
   ```

4. All the different get- and set-format commands were swept into one VIDIOC_G_FMT and VIDIOC_S_FMT ioctl taking a union and a type field selecting the union member as parameter. Purpose is to simplify the API by eliminating several ioctls and to allow new and driver private data streams without adding new ioctls.

   This change obsoletes the following ioctls: VIDIOC_S_INFMT, VIDIOC_G_INFMT, VIDIOC_S_OUTFMT, VIDIOC_G_OUTFMT, VIDIOC_S_VBI_FMT and VIDIOC_G_VBI_FMT. The image format struct v4l2_format was renamed to struct v4l2_pix_format, while struct v4l2_format is now the enveloping structure for all format negotiations.
5. Similar to the changes above, the VIDIOC_G_PARM and VIDIOC_S_PARM ioctls were merged with VIDIOC_G_OUTPARM and VIDIOC_S_OUTPARM. A type field in the new struct v4l2_streamparm selects the respective union member.

This change obsoletes the VIDIOC_G_OUTPARM and VIDIOC_S_OUTPARM ioctls.

6. Control enumeration was simplified, and two new control flags were introduced and one dropped. The catname field was replaced by a group field.

Drivers can now flag unsupported and temporarily unavailable controls with V4L2_CTRL_FLAG_DISABLED and V4L2_CTRL_FLAG_GRABBED respectively. The group name indicates a possibly narrower classification than the category. In other words, there may be multiple groups within a category. Controls within a group would typically be drawn within a group box. Controls in different categories might have a greater separation, or may even appear in separate windows.

7. The struct v4l2_buffer timestamp was changed to a 64 bit integer, containing the sampling or output time of the frame in nanoseconds. Additionally timestamps will be in absolute system time, not starting from zero at the beginning of a stream. The data type name for timestamps is stamp_t, defined as a signed 64-bit integer. Output devices should not send a buffer out until the time in the timestamp field has arrived. I would like to follow SGI’s lead, and adopt a multimedia timestamping system like their UST (Unadjusted System Time). See [http://web.archive.org/web/*http://reality.sgi.com/cpi-razzi_engr/lg/time/intro.html](http://web.archive.org/web/*http://reality.sgi.com/cpi-razzi_engr/lg/time/intro.html). UST uses timestamps that are 64-bit signed integers (not struct timeval’s) and given in nanosecond units. The UST clock starts at zero when the system is booted and runs continuously and uniformly. It takes a little over 292 years for UST to overflow. There is no way to set the UST clock. The regular Linux time-of-day clock can be changed periodically, which would cause errors if it were being used for timestamping a multimedia stream. A real UST style clock will require some support in the kernel that is not there yet. But in anticipation, I will change the timestamp field to a 64-bit integer, and I will change the v4l2_masterclock_gettime() function (used only by drivers) to return a 64-bit integer.

8. A sequence field was added to struct v4l2_buffer. The sequence field counts captured frames, it is ignored by output devices. When a capture driver drops a frame, the sequence number of that frame is skipped.

**V4L2 Version 0.20 incremental changes**

1999-12-23: In struct v4l2_vbi_format the reserved1 field became offset. Previously drivers were required to clear the reserved1 field.

2000-01-13: The V4L2_FMT_FLAG_NOT_INTERLACED flag was added.

2000-07-31: The linux/poll.h header is now included by videodev.h for compatibility with the original videodev.h file.

2000-11-20: V4L2_TYPE_VBI_OUTPUT and V4L2_PIX_FMT_Y41P were added.

2000-11-25: V4L2_TYPE_VBI_INPUT was added.

2000-12-04: A couple typos in symbol names were fixed.

2001-01-18: To avoid namespace conflicts the fourcc macro defined in the videodev.h header file was renamed to v4l2_fourcc.
2001-01-25: A possible driver-level compatibility problem between the videodev.h file in Linux 2.4.0 and the videodev.h file included in the videodevX patch was fixed. Users of an earlier version of videodevX on Linux 2.4.0 should recompile their V4L and V4L2 drivers.

2001-01-26: A possible kernel-level incompatibility between the videodev.h file in the videodevX patch and the videodev.h file in Linux 2.2.x with devfs patches applied was fixed.

2001-03-02: Certain V4L ioctls which pass data in both direction although they are defined with read-only parameter, did not work correctly through the backward compatibility layer. [Solution?]

2001-04-13: Big endian 16-bit RGB formats were added.

2001-09-17: New YUV formats and the VIDIOC_G_FREQUENCY and VIDIOC_S_FREQUENCY ioctls were added. (The old VIDIOC_G_FREQ and VIDIOC_S_FREQ ioctls did not take multiple tuners into account.)

2000-09-18: V4L2_BUF_TYPE_VBI was added. This may break compatibility as the VIDIOC_G_FMT and VIDIOC_S_FMT ioctls may fail now if the struct v4l2_fmt type field does not contain V4L2_BUF_TYPE_VBI. In the documentation of the struct v4l2_vbi_format`, the offset field the ambiguous phrase “rising edge” was changed to “leading edge”.

V4L2 Version 0.20 2000-11-23

A number of changes were made to the raw VBI interface.

1. Figures clarifying the line numbering scheme were added to the V4L2 API specification. The start[0] and start[1] fields no longer count line numbers beginning at zero. Rationale: a) The previous definition was unclear. b) The start[] values are ordinal numbers. c) There is no point in inventing a new line numbering scheme. We now use line number as defined by ITU-R, period. Compatibility: Add one to the start values. Applications depending on the previous semantics may not function correctly.

2. The restriction “count[0] > 0 and count[1] > 0” has been relaxed to “(count[0] + count[1]) > 0”. Rationale: Drivers may allocate resources at scan line granularity and some data services are transmitted only on the first field. The comment that both count values will usually be equal is misleading and pointless and has been removed. This change breaks compatibility with earlier versions: Drivers may return EINVAL, applications may not function correctly.

3. Drivers are again permitted to return negative (unknown) start values as proposed earlier. Why this feature was dropped is unclear. This change may break compatibility with applications depending on the start values being positive. The use of EBUSY and EINVAL error codes with the VIDIOC_S_FMT ioctl was clarified. The EBUSY error code was finally documented, and the reserved2 field which was previously mentioned only in the videodev.h header file.

4. New buffer types V4L2_TYPE_VBI_INPUT and V4L2_TYPE_VBI_OUTPUT were added. The former is an alias for the old V4L2_TYPE_VBI, the latter was missing in the videodev.h file.
**V4L2 Version 0.20 2002-07-25**

Added sliced VBI interface proposal.

**V4L2 in Linux 2.5.46, 2002-10**

Around October-November 2002, prior to an announced feature freeze of Linux 2.5, the API was revised, drawing from experience with V4L2 0.20. This unnamed version was finally merged into Linux 2.5.46.

1. As specified in *Related Devices*, drivers must make related device functions available under all minor device numbers.

2. The `open()` function requires access mode `O_RDWR` regardless of the device type. All V4L2 drivers exchanging data with applications must support the `O_NONBLOCK` flag. The `O_NOIO` flag, a V4L2 symbol which aliased the meaningless `O_TRUNC` to indicate accesses without data exchange (panel applications) was dropped. Drivers must stay in “panel mode” until the application attempts to initiate a data exchange, see *Opening and Closing Devices*.

3. The struct `v4l2_capability` changed dramatically. Note that also the size of the structure changed, which is encoded in the ioctl request code, thus older V4L2 devices will respond with an `EINVAL` error code to the new `ioctl VIDIOC_QUERYCAP` ioctl.

   There are new fields to identify the driver, a new RDS device function `V4L2_CAP_RDS_CAPTURE`, the `V4L2_CAP_AUDIO` flag indicates if the device has any audio connectors, another I/O capability `V4L2_CAP_ASYNCIO` can be flagged. In response to these changes the type field became a bit set and was merged into the flags field. `V4L2_FLAG_TUNER` was renamed to `V4L2_CAP_TUNER`, `V4L2_FLAG_PREVIEW` and `V4L2_CAP_VBI_CAPTURE` and `V4L2_CAP_VBI_OUTPUT` replaced `V4L2_FLAG_DATA_SERVICE`. `V4L2_FLAG_READ` and `V4L2_FLAG_WRITE` were merged into `V4L2_CAP_READWRITE`.

   The redundant fields `inputs`, `outputs` and `audios` were removed. These properties can be determined as described in *Video Inputs and Outputs* and *Audio Inputs and Outputs*.

   The somewhat volatile and therefore barely useful fields `maxwidth`, `maxheight`, `minwidth`, `minheight`, `maxframerate` were removed. This information is available as described in *Data Formats* and *Video Standards*.

   `V4L2_FLAG_SELECT` was removed. We believe the `select()` function is important enough to require support of it in all V4L2 drivers exchanging data with applications. The redundant `V4L2_FLAG_MONOCHROME` flag was removed, this information is available as described in *Data Formats*.

4. In struct `v4l2_input` the `assoc_audio` field and the capability field and its only flag `V4L2_INPUT_CAP_AUDIO` was replaced by the new `audio_set` field. Instead of linking one video input to one audio input this field reports all audio inputs this video input combines with.

   New fields are `tuner` (reversing the former link from tuners to video inputs), `std` and `status`.

   Accordingly struct `v4l2_output` lost its capability and `assoc_audio` fields. `audio_set`, `modulator` and `std` where added instead.
5. The struct v4l2_audio field audio was renamed to index, for consistency with other structures. A new capability flag V4L2_AUDCAP_STEREO was added to indicated if the audio input in question supports stereo sound. V4L2_AUDCAP_EFFECTS and the corresponding V4L2_AUDMODE flags where removed. This can be easily implemented using controls. (However the same applies to AVL which is still there.)

Again for consistency the struct v4l2_audioout field audio was renamed to index.

6. The struct v4l2_tuner input field was replaced by an index field, permitting devices with multiple tuners. The link between video inputs and tuners is now reversed, inputs point to their tuner. The std substructure became a simple set (more about this below) and moved into struct v4l2_input. A type field was added.

Accordingly in struct v4l2_modulator the output was replaced by an index field.

In struct v4l2_frequency the port field was replaced by a tuner field containing the respective tuner or modulator index number. A tuner type field was added and the reserved field became larger for future extensions (satellite tuners in particular).

7. The idea of completely transparent video standards was dropped. Experience showed that applications must be able to work with video standards beyond presenting the user a menu. Instead of enumerating supported standards with an ioctl applications can now refer to standards by v4l2_std_id and symbols defined in the videodev2.h header file. For details see Video Standards. The VIDIOC_G_STD and VIDIOC_S_STD now take a pointer to this type as argument. ioctl VIDIOC_QUERYSTD, VIDIOC_SUBDEV_QUERYSTD was added to autodetect the received standard, if the hardware has this capability. In struct v4l2_standard an index field was added for ioctl VIDIOC_ENUMSTD, VIDIOC_SUBDEV_ENUMSTD. A v4l2_std_id field named id was added as machine readable identifier, also replacing the transmission field. The misleading framerate field was renamed to frameperiod. The now obsolete colorstandard information, originally needed to distinguish between variations of standards, were removed.

Struct v4l2_enumstd ceased to be. ioctl VIDIOC_ENUMSTD, VIDIOC_SUBDEV_ENUMSTD now takes a pointer to a struct v4l2_standard directly. The information which standards are supported by a particular video input or output moved into struct v4l2_input and struct v4l2_output fields named std, respectively.

8. The struct v4l2_queryctrl fields category and group did not catch on and/or were not implemented as expected and therefore removed.

9. The VIDIOC_TRY_FMT ioctl was added to negotiate data formats as with VIDIOC_S_FMT, but without the overhead of programming the hardware and regardless of I/O in progress.

In struct v4l2_format the fmt union was extended to contain struct v4l2_window. All image format negotiations are now possible with VIDIOC_G_FMT, VIDIOC_S_FMT and VIDIOC_TRY_FMT; ioctl. The VIDIOC_G_WIN and VIDIOC_S_WIN ioctls to prepare for a video overlay were removed. The type field changed to type enum v4l2_buf_type and the buffer type names changed as follows.
Old defines

<table>
<thead>
<tr>
<th>enum v4l2_buf_type</th>
</tr>
</thead>
<tbody>
<tr>
<td>V4L2_BUF_TYPE_CAPTURE</td>
</tr>
<tr>
<td>V4L2_BUF_TYPE_VIDEO_CAPTURE</td>
</tr>
<tr>
<td>Omitted for now</td>
</tr>
<tr>
<td>V4L2_BUF_TYPE_CODECIN</td>
</tr>
<tr>
<td>Omitted for now</td>
</tr>
<tr>
<td>V4L2_BUF_TYPE_CODECOUT</td>
</tr>
<tr>
<td>Omitted for now</td>
</tr>
<tr>
<td>V4L2_BUF_TYPE_EFFECTSIN</td>
</tr>
<tr>
<td>Omitted for now</td>
</tr>
<tr>
<td>V4L2_BUF_TYPE_EFFECTSIN2</td>
</tr>
<tr>
<td>Omitted for now</td>
</tr>
<tr>
<td>V4L2_BUF_TYPE_EFFECTSOUT</td>
</tr>
<tr>
<td>Omitted for now</td>
</tr>
<tr>
<td>V4L2_BUF_TYPE_VIDEOOUT</td>
</tr>
<tr>

<tr>
<td>V4L2_BUF_TYPE_SLICED_VBI_CAPTURE</td>
</tr>
<tr>
<td>V4L2_BUF_TYPE_SLICED_VBI_OUTPUT</td>
</tr>
<tr>
<td>V4L2_BUF_TYPE_PRIVATE_BASE</td>
</tr>
<tr>
<td>V4L2_BUF_TYPE_PRIVATE (but this is deprecated)</td>
</tr>
</tbody>
</table>

10. In struct v4l2_fmtdesc a enum v4l2_buf_type field named type was added as in struct v4l2_format. The VIDIOC_ENUM_FBUFFMT ioctl is no longer needed and was removed. These calls can be replaced by ioctl VIDIOC_ENUM_FMT with type V4L2_BUF_TYPE_VIDEO_OVERLAY.

11. In struct v4l2_pix_format the depth field was removed, assuming applications which recognize the format by its four-character-code already know the color depth, and others do not care about it. The same rationale lead to the removal of the V4L2_FMT_FLAG_COMPRESSED flag. The V4L2_FMT_FLAG_SWCONVCOMPRESSED flag was removed because drivers are not supposed to convert images in kernel space. A user library of conversion functions should be provided instead. The V4L2_FMT_FLAG_BYTESPERLINE flag was redundant. Applications can set the bytesperline field to zero to get a reasonable default. Since the remaining flags were replaced as well, the flags field itself was removed.

The interlace flags were replaced by a enum v4l2_field value in a newly added field field.

Old flag                  | enum v4l2_field  
----------------------------|----------------
V4L2_FMT_FLAG_NOT_INTERLACED | ?
V4L2_FMT_FLAG_INTERLACED = V4L2_FMT_FLAG_COMBINED    | V4L2_FIELD_INTERLACED
V4L2_FMT_FLAG_TOPFIELD = V4L2_FMT_FLAG_ODDFIELD       | V4L2_FIELD_TOP
V4L2_FMT_FLAG_BOTFIELD = V4L2_FMT_FLAG_EVENFIELD      | V4L2_FIELD_BOTTOM
-                                                                 |
-                                                                 |
-                                                                 |

The color space flags were replaced by a enum v4l2_colorspace value in a newly added colorspace field, where one of V4L2_COLORSPACE_SMPTE170M, V4L2_COLORSPACE_BT878, V4L2_COLORSPACE_470_SYSTEM_M or V4L2_COLORSPACE_470_SYSTEM_BG replaces V4L2_FMT_CS_601YUV.

12. In struct v4l2_requestbuffers the type field was properly defined as enum v4l2_buf_type. Buffer types changed as mentioned above. A new memory field of type enum v4l2_memory was added to distinguish between I/O methods using buffers allocated by the driver or the application. See Input/Output for details.
13. In struct v4l2_buffer the type field was properly defined as enum v4l2_buf_type. Buffer types changed as mentioned above. A field of type enum v4l2_field was added to indicate if a buffer contains a top or bottom field. The old field flags were removed. Since no unadjusted system time clock was added to the kernel as planned, the timestamp field changed back from type stamp_t, an unsigned 64 bit integer expressing the sample time in nanoseconds, to struct timeval. With the addition of a second memory mapping method the offset field moved into union m, and a new memory field of type enum v4l2_memory was added to distinguish between I/O methods. See Input/Output for details. The V4L2_BUF_REQ_CONTIG flag was used by the V4L compatibility layer; after changes to this code it was no longer needed. The V4L2_BUF_ATTR_DEVICEMEM flag would indicate if the buffer was indeed allocated in device memory rather than DMA-able system memory. It was barely useful and so was removed.

14. In struct v4l2_framebuffer the base[3] array anticipating double- and triple-buffering in off-screen video memory, however without defining a synchronization mechanism, was replaced by a single pointer. The V4L2_FBUF_CAP_SCALEUP and V4L2_FBUF_CAP_SCALEDOWN flags were removed. Applications can determine this capability more accurately using the new cropping and scaling interface. The V4L2_FBUF_CAP_CLIPPING flag was replaced by V4L2_FBUF_CAP_LIST_CLIPPING and V4L2_FBUF_CAP_BITMAP_CLIPPING.

15. In struct v4l2_clip the x, y, width and height field moved into a c substructure of type struct v4l2_rect. The x and y fields were renamed to left and top, i.e. offsets to a context dependent origin.

16. In struct v4l2_window the x, y, width and height field moved into a w substructure as above. A field of type enum v4l2_field was added to distinguish between field and frame (interlaced) overlay.

17. The digital zoom interface, including struct v4l2_zoomcap, struct v4l2_zoom, V4L2_ZOOM_NONCAP and V4L2_ZOOM_WHILESTREAMING was replaced by a new cropping and scaling interface. The previously unused struct v4l2_cropcap and struct v4l2_crop where redefined for this purpose. See Image Cropping, Insertion and Scaling – the CROP API for details.

18. In struct v4l2_vbi_format the SAMPLE_FORMAT field now contains a four-character-code as used to identify video image formats and V4L2_PIX_FMT_GREY replaces the V4L2_VBI_SF_UBYTE define. The reserved field was extended.

19. In struct v4l2_captureparm the type of the timeperframe field changed from unsigned long to struct v4l2_fract. This allows the accurate expression of multiples of the NTSC-M frame rate 30000 / 1001. A new field readbuffers was added to control the driver behaviour in read I/O mode.

Similar changes were made to struct v4l2_outputparm.

20. The struct v4l2_performance and VIDIOC_G_PERF ioctl were dropped. Except when using the read/write I/O method, which is limited anyway, this information is already available to applications.

21. The example transformation from RGB to YcbCr color space in the old V4L2 documentation was inaccurate, this has been corrected in Image Formats.
V4L2 2003-06-19

1. A new capability flag V4L2_CAP_RADIO was added for radio devices. Prior to this change radio devices would identify solely by having exactly one tuner whose type field reads V4L2_TUNER_RADIO.

2. An optional driver access priority mechanism was added, see Application Priority for details.

3. The audio input and output interface was found to be incomplete.

   Previously the VIDI OC_G_AUDIO ioctl would enumerate the available audio inputs. An ioctl to determine the current audio input, if more than one combines with the current video input, did not exist. So VIDI OC_G_AUDIO was renamed to VIDI OC_G_AUDIO_OL D, this ioctl was removed on Kernel 2.6.39. The ioctl VIDI OC_ENUMAUDIO ioctl was added to enumerate audio inputs, while VIDI OC_G_AUDIO now reports the current audio input.

   The same changes were made to VIDI OC_G_AUDOUT and VIDI OC_ENUMAUDOUT.

   Until further the “videodev” module will automatically translate between the old and new ioctls, but drivers and applications must be updated to successfully compile again.

4. The ioctl VIDI OC_OVERLAY ioctl was incorrectly defined with write-read parameter. It was changed to write-only, while the write-read version was renamed to VIDI OC_0VERLAY_OL D. The old ioctl was removed on Kernel 2.6.39. Until further the “videodev” kernel module will automatically translate to the new version, so drivers must be recompiled, but not applications.

5. Video Overlay Interface incorrectly stated that clipping rectangles define regions where the video can be seen. Correct is that clipping rectangles define regions where no video shall be displayed and so the graphics surface can be seen.

6. The VIDI OC_S_PARM and VIDI OC_S_CTRL ioctls were defined with write-only parameter, inconsistent with other ioctls modifying their argument. They were changed to write-read, while a _OL D suffix was added to the write-only versions. The old ioctls were removed on Kernel 2.6.39. Drivers and applications assuming a constant parameter need an update.

V4L2 2003-11-05

1. In RGB Formats the following pixel formats were incorrectly transferred from Bill Dirks’ V4L2 specification. Descriptions below refer to bytes in memory, in ascending address order.

<table>
<thead>
<tr>
<th>Symbol</th>
<th>In this document prior to revision 0.5</th>
<th>Corrected</th>
</tr>
</thead>
</table>

   The V4L2_PIX_FMT_BGR24 example was always correct.

   In Image Properties the mapping of the V4L VIDEO_PALETTE_RGB24 and VIDEO_PALETTE_RGB32 formats to V4L2 pixel formats was accordingly corrected.
2. Unrelated to the fixes above, drivers may still interpret some V4L2 RGB pixel formats differently. These issues have yet to be addressed, for details see RGB Formats.

V4L2 in Linux 2.6.6, 2004-05-09

1. The `ioctl VIDIOC_CROPCAP` ioctl was incorrectly defined with read-only parameter. It is now defined as write-read ioctl, while the read-only version was renamed to VIDIOC_CROPCAP_OLD. The old ioctl was removed on Kernel 2.6.39.

V4L2 in Linux 2.6.8

1. A new field `input` (former reserved[0]) was added to the struct v4l2_buffer. Purpose of this field is to alternate between video inputs (e.g. cameras) in step with the video capturing process. This function must be enabled with the new V4L2_BUF_FLAG_INPUT flag. The `flags` field is no longer read-only.

V4L2 spec erratum 2004-08-01

1. The return value of the V4L2 open() function was incorrectly documented.
2. Audio output ioctls end in -AUDOUT, not -AUDIOOUT.
3. In the Current Audio Input example the VIDIOC_G_AUDIO ioctl took the wrong argument.
4. The documentation of the `ioctl VIDIOC_QBUF, VIDIOC_DQBUF` and VIDIOC_DQBUF ioctls did not mention the struct v4l2_buffer memory field. It was also missing from examples. Also on the VIDIOC_DQBUF page the EIO error code was not documented.

V4L2 in Linux 2.6.14

1. A new sliced VBI interface was added. It is documented in Sliced VBI Data Interface and replaces the interface first proposed in V4L2 specification 0.8.

V4L2 in Linux 2.6.15

1. The `ioctl VIDIOC_LOG_STATUS` ioctl was added.
2. New video standards V4L2_STD_NTSC_443, V4L2_STD_SECAM_LC, V4L2_STD_SECAM_DK (a set of SECAM D, K and K1), and V4L2_STD_ATSC (a set of V4L2_STD_ATSC_8_VSB and V4L2_STD_ATSC_16_VSB) were defined. Note the V4L2_STD_525_60 set now includes V4L2_STD_NTSC_443. See also typedef v4l2_std_id.
3. The VIDIOC_G_COMP and VIDIOC_S_COMP ioctl were renamed to VIDIOC_G_MPEGCOMP and VIDIOC_S_MPEGCOMP respectively. Their argument was replaced by a struct v4l2_mpeg_compression pointer. (The VIDIOC_G_MPEGCOMP and VIDIOC_S_MPEGCOMP ioctls where removed in Linux 2.6.25.)
V4L2 spec erratum 2005-11-27

The capture example in Video Capture Example called the VIDIOC_S_CROP ioctl without checking if cropping is supported. In the video standard selection example in Video Standards the VIDIOC_S_STD call used the wrong argument type.

V4L2 spec erratum 2006-01-10

1. The V4L2_IN_ST_COLOR_KILL flag in struct v4l2_input not only indicates if the color killer is enabled, but also if it is active. (The color killer disables color decoding when it detects no color in the video signal to improve the image quality.)

2. VIDIOC_S_PARM is a write-read ioctl, not write-only as stated on its reference page. The ioctl changed in 2003 as noted above.

V4L2 spec erratum 2006-02-03

1. In struct v4l2_captureparam and struct v4l2_outputparam the timeperframe field gives the time in seconds, not microseconds.

V4L2 spec erratum 2006-02-04

1. The clips field in struct v4l2_window must point to an array of struct v4l2_clip, not a linked list, because drivers ignore the struct v4l2_clip. next pointer.

V4L2 in Linux 2.6.17

1. New video standard macros were added: V4L2_STD_NTSC_M_KR (NTSC M South Korea), and the sets V4L2_STD_MN, V4L2_STD_B, V4L2_STD_GH and V4L2_STD_DK. The V4L2_STD_NTSC and V4L2_STD_SECAM sets now include V4L2_STD_NTSC_M_KR and V4L2_STD_SECAM_LC respectively.

2. A new V4L2_TUNER_MODE_LANG1_LANG2 was defined to record both languages of a bilingual program. The use of V4L2_TUNER_MODE_STEREO for this purpose is deprecated now. See the VIDIOC_G_TUNER section for details.

V4L2 spec erratum 2006-09-23 (Draft 0.15)

1. In various places V4L2_BUF_TYPE_SLICED_VBI_CAPTURE and V4L2_BUF_TYPE_SLICED_VBI_OUTPUT of the sliced VBI interface were not mentioned along with other buffer types.

2. In VIDIOC_G_AUDIO it was clarified that the struct v4l2_audio mode field is a flags field.

3. ioctl VIDIOC_QUERYCAP did not mention the sliced VBI and radio capability flags.

4. In VIDIOC_G_FREQUENCY it was clarified that applications must initialize the tuner type field of struct v4l2_frequency before calling VIDIOC_S_FREQUENCY.
5. The reserved array in struct v4l2_requestbuffers has 2 elements, not 32.

6. In Video Output Interface and Raw VBI Data Interface the device file names /dev/vout which never caught on were replaced by /dev/video.

7. With Linux 2.6.15 the possible range for VBI device minor numbers was extended from 224-239 to 224-255. Accordingly device file names /dev/vbi0 to /dev/vbi31 are possible now.

**V4L2 in Linux 2.6.18**

1. New ioctls VIDIOC_G_EXT_CTRLS, VIDIOC_S_EXT_CTRLS and VIDIOC_TRY_EXT_CTRLS were added, a flag to skip unsupported controls with ioctls VIDIOC_QUERYCTRL, VIDIOC_QUERY_EXT_CTRL and VIDIOC_QUERYMENU, new control types V4L2_CTRL_TYPE_INTEGER64 and V4L2_CTRL_TYPE_CTRL_CLASS (enum v4l2_ctrl_type), and new control flags V4L2_CTRL_FLAG_READ_ONLY, V4L2_CTRL_FLAG_UPDATE, V4L2_CTRL_FLAG_INACTIVE and V4L2_CTRL_FLAG_SLIDER (Control Flags). See Extended Controls API for details.

**V4L2 in Linux 2.6.19**

1. In struct v4l2_sliced_vbi_cap a buffer type field was added replacing a reserved field. Note on architectures where the size of enum types differs from int types the size of the structure changed. The VIDIOC_G_SLICED_VBI_CAP ioctl was redefined from being read-only to write-read. Applications must initialize the type field and clear the reserved fields now. These changes may break the compatibility with older drivers and applications.

2. The ioctls ioctl VIDIOC_ENUM_FRAMESIZES and ioctl VIDIOC_ENUM_FRAMEINTERVALS were added.

3. A new pixel format V4L2_PIX_FMT_RGB444 (RGB Formats) was added.

**V4L2 spec erratum 2006-10-12 (Draft 0.17)**

1. V4L2_PIX_FMT_HM12 (Reserved Image Formats) is a YUV 4:2:0, not 4:2:2 format.

**V4L2 in Linux 2.6.21**

1. The videodev2.h header file is now dual licensed under GNU General Public License version two or later, and under a 3-clause BSD-style license.
V4L2 in Linux 2.6.22

1. Two new field orders V4L2_FIELD_INTERLACED_TB and V4L2_FIELD_INTERLACED_BT were added. See enum v4l2_field for details.

2. Three new clipping/blending methods with a global or straight or inverted local alpha value were added to the video overlay interface. See the description of the VIDI OC_G_FBUF and VIDI OC_S_FBUF ioctls for details.

A new global_alpha field was added to struct v4l2_window, extending the structure. This may break compatibility with applications using a struct v4l2_window directly. However the VIDI OC_G/S/TR Y_FMT ioctls, which take a pointer to a struct v4l2_format parent structure with padding bytes at the end, are not affected.

3. The format of the chromakey field in struct v4l2_window changed from “host order RGB32” to a pixel value in the same format as the framebuffer. This may break compatibility with existing applications. Drivers supporting the “host order RGB32” format are not known.

V4L2 in Linux 2.6.24

1. The pixel formats V4L2_PIX_FMT_PAL8, V4L2_PIX_FMT_YUV444, V4L2_PIX_FMT_YUV555, V4L2_PIX_FMT_YUV565 and V4L2_PIX_FMT_YUV32 were added.

V4L2 in Linux 2.6.25

1. The pixel formats V4L2_PIX_FMT_Y16 and V4L2_PIX_FMT_SBGGR16 were added.

2. New controls V4L2_CID_POWER_LINE_FREQUENCY, V4L2_CID_HUE_AUTO, V4L2_CID_WHITE_BALANCE_TEMPERATURE, V4L2_CID_SHARPNESS and V4L2_CID_BACKL I GHT_COMPENSATION were added. The controls V4L2_CID_BLACK_LEVEL, V4L2_CID_WHITENESS, V4L2_CID_HCENTER and V4L2_CID_VCENTER were deprecated.

4. The VIDI OC_G_MPEGCOMP and VIDI OC_S_MPEGCOMP ioctls, which were superseded by the extended controls interface in Linux 2.6.18, where finally removed from the videodev2.h header file.

V4L2 in Linux 2.6.26

1. The pixel formats V4L2_PIX_FMT_Y16 and V4L2_PIX_FMT_SBGGR16 were added.

2. Added user controls V4L2_CID_CHROMA_AGC and V4L2_CID_COLOR_KILLER.
V4L2 in Linux 2.6.27

1. The `ioctl VIDIOC_S_HW_FREQ_SEEK` ioctl and the V4L2_CAP_Hw_FREQ_SEEK capability were added.

V4L2 in Linux 2.6.28

1. Added V4L2_MPEG_AUDIO_ENCODING_AAC and V4L2_MPEG_AUDIO_ENCODING_AC3 MPEG audio encodings.
2. Added V4L2_MPEG_VIDEO_ENCODING_MPEG_4_AVC MPEG video encoding.
3. The pixel formats V4L2_PIX_FMT_SGRBG10 and V4L2_PIX_FMT_SGRBG10DPCM8 were added.

V4L2 in Linux 2.6.29

1. The `VIDIOC_G_CHIP_IDENT` ioctl was renamed to `VIDIOC_G_CHIP_IDENT_OLD` and `VIDIOCDBG_G_CHIP_IDENT` was introduced in its place. The old struct `v4l2_chip_ident` was renamed to `struct v4l2_chip_ident_old`.
2. The pixel formats V4L2_PIX_FMT_VYUY, V4L2_PIX_FMT_NV16 and V4L2_PIX_FMT_NV61 were added.
3. Added camera controls V4L2_CID_ZOOM_ABSOLUTE, V4L2_CID_ZOOM_RELATIVE, V4L2_CID_ZOOM_CONTINUOUS and V4L2_CID_PRIVACY.

V4L2 in Linux 2.6.30

1. New control flag V4L2_CTRL_FLAG_WRITE_ONLY was added.
2. New control V4L2_CID_C0L0RFX was added.

V4L2 in Linux 2.6.32

1. In order to be easier to compare a V4L2 API and a kernel version, now V4L2 API is numbered using the Linux Kernel version numeration.
2. Finalized the RDS capture API. See RDS Interface for more information.
3. Added new capabilities for modulators and RDS encoders.
4. Add description for libv4l API.
5. Added support for string controls via new type V4L2_CTRL_TYPE_STRING.
7. Added FM Modulator (FM TX) Extended Control Class: V4L2_CTRL_CLASS_FM_TX and their Control IDs.

**V4L2 in Linux 2.6.33**

1. Added support for Digital Video timings in order to support HDTV receivers and transmitters.

**V4L2 in Linux 2.6.34**

1. Added `V4L2_CID_IRIS_ABSOLUTE` and `V4L2_CID_IRIS_RELATIVE` controls to the Camera controls class.

**V4L2 in Linux 2.6.37**

1. Remove the vtx (videotext/teletext) API. This API was no longer used and no hardware exists to verify the API. Nor were any userspace applications found that used it. It was originally scheduled for removal in 2.6.35.

**V4L2 in Linux 2.6.39**

1. The old `VIDIOC_*_OLD` symbols and V4L1 support were removed.
2. Multi-planar API added. Does not affect the compatibility of current drivers and applications. See multi-planar API for details.

**V4L2 in Linux 3.1**

1. `VIDIOC_QUERYCAP` now returns a per-subsystem version instead of a per-driver one.
   - Standardize an error code for invalid ioctl.
   - Added `V4L2_CTRL_TYPE_BITMASK`.

**V4L2 in Linux 3.2**

1. `V4L2_CTRL_FLAG_VOLATILE` was added to signal volatile controls to userspace.
2. Add selection API for extended control over cropping and composing. Does not affect the compatibility of current drivers and applications. See selection API for details.
### V4L2 in Linux 3.3

1. Added `V4L2_CID_ALPHA_COMPONENT` control to the *User controls class*.
2. Added the `device_caps` field to `struct v4l2_capabilities` and added the new `V4L2_CAP_DEVICE_CAPS` capability.

### V4L2 in Linux 3.4

1. Added *JPEG compression control class*.

### V4L2 in Linux 3.5

1. Added integer menus, the new type will be `V4L2_CTRL_TYPE_INTEGER_MENU`.
4. Added `V4L2_CID_COLORFX_CBCR` control.

### V4L2 in Linux 3.6

1. Replaced input in struct `v4l2_buffer` by reserved2 and removed `V4L2_BUF_FLAG_INPUT`.
3. Added support for frequency band enumerations: `ioctl VIDIOC_ENUM_FREQ_BANDS`.

---

3.2. Part I - Video for Linux API 1083
V4L2 in Linux 3.9

1. Added timestamp types to flags field in struct v4l2_buffer. See Buffer Flags.
2. Added V4L2_EVENT_CTRL_CH_RANGE control event changes flag. See Control Changes.

V4L2 in Linux 3.10

1. Removed obsolete and unused DV_PRESET ioctls VIDIOC_G_DV_PRESET, VIDIOC_S_DV_PRESET, VIDIOC_QUERY_DV_PRESET and VIDIOC_ENUM_DV_PRESET. Remove the related v4l2_input/output capability flags V4L2_IN_CAP_PRESETS and V4L2_OUT_CAP_PRESETS.
2. Added new debugging ioctl ioctl VIDIOC_DBG_G_CHIP_INFO.

V4L2 in Linux 3.11

1. Remove obsolete VIDIOC_DBG_G_CHIP_IDENT ioctl.

V4L2 in Linux 3.14

1. In struct v4l2_rect, the type of width and height fields changed from _s32 to _u32.

V4L2 in Linux 3.15

V4L2 in Linux 3.16

1. Added event V4L2_EVENT_SOURCE_CHANGE.

V4L2 in Linux 3.17

1. Extended struct v4l2_pix_format. Added format flags.
2. Added compound control types and VIDIOC_QUERY_EXT_CTRL.

V4L2 in Linux 3.18

1. Added V4L2_CID_PAN_SPEED and V4L2_CID_TILT_SPEED camera controls.
V4L2 in Linux 3.19

1. Rewrote Colorspace chapter, added new `enum v4l2_ycbcr_encoding` and `enum v4l2_quantization` fields to `struct v4l2_pix_format`, `struct v4l2_pix_format_mplane` and `struct v4l2_mbus_framefmt`.

V4L2 in Linux 4.4

1. Renamed `V4L2_TUNER_ADC` to `V4L2_TUNER_SDR`. The use of `V4L2_TUNER_ADC` is deprecated now.
2. Added `V4L2_CID_RF_TUNER_RF_GAIN` RF Tuner control.

Relation of V4L2 to other Linux multimedia APIs

X Video Extension

The X Video Extension (abbreviated XVideo or just Xv) is an extension of the X Window system, implemented for example by the XFree86 project. Its scope is similar to V4L2, an API to video capture and output devices for X clients. Xv allows applications to display live video in a window, send window contents to a TV output, and capture or output still images in XPixmaps\(^1\). With their implementation XFree86 makes the extension available across many operating systems and architectures.

Because the driver is embedded into the X server Xv has a number of advantages over the V4L2 video overlay interface. The driver can easily determine the overlay target, i.e. visible graphics memory or off-screen buffers for a destructive overlay. It can program the RAMDAC for a non-destructive overlay, scaling or color-keying, or the clipping functions of the video capture hardware, always in sync with drawing operations or windows moving or changing their stacking order.

To combine the advantages of Xv and V4L a special Xv driver exists in XFree86 and XOrg, just programming any overlay capable Video4Linux device it finds. To enable it `/etc/X11/XF86Config` must contain these lines:

```
Section "Module"
  Load "v4l"
EndSection
```

As of XFree86 4.2 this driver still supports only V4L ioctl's, however it should work just fine with all V4L2 devices through the V4L2 backward-compatibility layer. Since V4L2 permits multiple opens it is possible (if supported by the V4L2 driver) to capture video while an X client requested video overlay. Restrictions of simultaneous capturing and overlay are discussed in Video Overlay Interface apply.

Only marginally related to V4L2, XFree86 extended Xv to support hardware YUV to RGB conversion and scaling for faster video playback, and added an interface to MPEG-2 decoding hardware. This API is useful to display images captured with V4L2 devices.

\(^1\) This is not implemented in XFree86.
Digital Video

V4L2 does not support digital terrestrial, cable or satellite broadcast. A separate project aiming at digital receivers exists. You can find its homepage at https://linuxtv.org. The Linux DVB API has no connection to the V4L2 API except that drivers for hybrid hardware may support both.

Audio Interfaces

[to do - OSS/ALSA]

Experimental API Elements

The following V4L2 API elements are currently experimental and may change in the future.

- `ioctl VIDIOC_DBG_G_REGISTER, VIDIOC_DBG_S_REGISTER` and `VIDIOC_DBG_S_REGISTER`.
- `ioctl VIDIOC_DBG_G_CHIP_INFO`.

Obsolete API Elements

The following V4L2 API elements were superseded by new interfaces and should not be implemented in new drivers.

- `VIDIOC_G_MPEGCOMP` and `VIDIOC_S_MPEGCOMP`.
- `VIDIOC_G_DV_PRESET, VIDIOC_S_DV_PRESET, VIDIOC_ENUM_DV_PRESETS` and `VIDIOC_QUERY_DV_PRESET`.
- `VIDIOC_SUBDEV_G_CROP` and `VIDIOC_SUBDEV_S_CROP`.

3.2.7 Function Reference

3.2.7.1 V4L2 close()

Name

v4l2-close - Close a V4L2 device
**Synopsis**

```c
#include <unistd.h>

int close(int fd)
```

**Arguments**

- `fd` File descriptor returned by `open()`.

**Description**

Closes the device. Any I/O in progress is terminated and resources associated with the file descriptor are freed. However data format parameters, current input or output, control values or other properties remain unchanged.

**Return Value**

The function returns 0 on success, -1 on failure and the `errno` is set appropriately. Possible error codes:

- **EBADF**  `fd` is not a valid open file descriptor.

---

### 3.2.7.2 V4L2 ioctl()

**Name**

v4l2-ioctl - Program a V4L2 device

**Synopsis**

```c
#include <sys/ioctl.h>

int ioctl(int fd, int request, void *argp)
```

**Arguments**

- `fd` File descriptor returned by `open()`.
- `request` V4L2 ioctl request code as defined in the `videodev2.h` header file, for example VIDIOC_QUERYCAP.
- `argp` Pointer to a function parameter, usually a structure.
Description

The `ioctl()` function is used to program V4L2 devices. The argument `fd` must be an open file descriptor. An ioctl request has encoded in it whether the argument is an input, output or read/write parameter, and the size of the argument `argp` in bytes. Macros and defines specifying V4L2 ioctl requests are located in the `videodev2.h` header file. Applications should use their own copy, not include the version in the kernel sources on the system they compile on. All V4L2 ioctl requests, their respective function and parameters are specified in `Function Reference`.

Return Value

On success 0 is returned, on error -1 and the `errno` variable is set appropriately. The generic error codes are described at the `Generic Error Codes` chapter.

When an ioctl that takes an output or read/write parameter fails, the parameter remains unmodified.

3.2.7.3 ioctl VIDIOC_CREATE_BUFS

Name

VIDIOC_CREATE_BUFS - Create buffers for Memory Mapped or User Pointer or DMA Buffer I/O

Synopsis

```
VIDIOC_CREATE_BUFS
int ioctl(int fd, VIDIOC_CREATE_BUFS, struct v4l2_create_buffers *argp)
```

Arguments

- `fd` File descriptor returned by `open()`.
- `argp` Pointer to struct `v4l2_create_buffers`.

Description

This ioctl is used to create buffers for `memory mapped` or `user pointer` or `DMA buffer` I/O. It can be used as an alternative or in addition to the `ioctl VIDIOC_REQBUFS` ioctl, when a tighter control over buffers is required. This ioctl can be called multiple times to create buffers of different sizes.

To allocate the device buffers applications must initialize the relevant fields of the struct `v4l2_create_buffers` structure. The count field must be set to the number of requested buffers, the memory field specifies the requested I/O method and the reserved array must be zeroed.
The format field specifies the image format that the buffers must be able to handle. The application has to fill in this struct `v4l2_format`. Usually this will be done using the `VIDIOC_TRY_FMT` or `VIDIOC_G_FMT` ioctls to ensure that the requested format is supported by the driver. Based on the format’s type field the requested buffer size (for single-planar) or plane sizes (for multi-planar formats) will be used for the allocated buffers. The driver may return an error if the size(s) are not supported by the hardware (usually because they are too small).

The buffers created by this ioctl will have as minimum size the size defined by the `format.pix.sizeimage` field (or the corresponding fields for other format types). Usually if the `format.pix.sizeimage` field is less than the minimum required for the given format, then an error will be returned since drivers will typically not allow this. If it is larger, then the value will be used as-is. In other words, the driver may reject the requested size, but if it is accepted the driver will use it unchanged.

When the ioctl is called with a pointer to this structure the driver will attempt to allocate up to the requested number of buffers and store the actual number allocated and the starting index in the `count` and the `index` fields respectively. On return `count` can be smaller than the number requested.

`v4l2_create_buffers`
Table 124: struct v4l2_create_buffers

| __u32  | index | The starting buffer index, returned by the driver. |
| __u32  | count | The number of buffers requested or granted. If count == 0, then ioctl VIDIOC_CREATE_BUFS will set index to the current number of created buffers, and it will check the validity of memory and format.type. If those are invalid -1 is returned and errno is set to EINVAL error code, otherwise ioctl VIDIOC_CREATE_BUFS returns 0. It will never set errno to EBUSY error code in this particular case. |
| __u32  | memory | Applications set this field to V4L2_MEMORY_MMAP, V4L2_MEMORY_DMABUF or V4L2_MEMORY_USERPTR. See v4l2_memory struct v4l2_format format | Filled in by the application, preserved by the driver. |
| __u32  | capabilities | Set by the driver. If 0, then the driver doesn’t support capabilities. In that case all you know is that the driver is guaranteed to support V4L2_MEMORY_MMAP and might support other v4l2_memory types. It will not support any other capabilities. See here for a list of the capabilities. If you want to just query the capabilities without making any other changes, then set count to 0, memory to V4L2 MEMORY_MMAP and format.type to the buffer type. |
| __u32  | reserved[7] | A place holder for future extensions. Drivers and applications must set the array to zero. |

**Return Value**

On success 0 is returned, on error -1 and the errno variable is set appropriately. The generic error codes are described at the *Generic Error Codes* chapter.

**ENOMEM** No memory to allocate buffers for memory mapped I/O.

**EINVAL** The buffer type (format.type field), requested I/O method (memory) or format (format field) is not valid.
3.2.7.4 ioctl VIDIOC_CROPCAP

Name

VIDIOC_CROPCAP - Information about the video cropping and scaling abilities

Synopsis

VIDIOC_CROPCAP

int ioctl(int fd, VIDIOC_CROPCAP, struct v4l2_cropcap *argp)

Arguments

fd  File descriptor returned by open().
argp  Pointer to struct v4l2_cropcap.

Description

Applications use this function to query the cropping limits, the pixel aspect of images and to calculate scale factors. They set the type field of a v4l2_cropcap structure to the respective buffer (stream) type and call the ioctl VIDIOC_CROPCAP ioctl with a pointer to this structure. Drivers fill the rest of the structure. The results are constant except when switching the video standard. Remember this switch can occur implicit when switching the video input or output.

This ioctl must be implemented for video capture or output devices that support cropping and/or scaling and/or have non-square pixels, and for overlay devices.

v4l2_cropcap
### struct v4l2_cropcap

<table>

</tr>
<tr>
<td><code>struct v4l2_rect</code></td>
<td><code>defrect</code></td>
</tr>
<tr>
<td><code>struct v4l2_fраст</code></td>
<td><code>pixelaspect</code></td>
</tr>
</tbody>
</table>

**Note:** Unfortunately in the case of multiplanar buffer types (`V4L2_BUF_TYPE_VIDEO_CAPTURE_MPLANE` and `V4L2_BUF_TYPE_VIDEO_OUTPUT_MPLANE`) this API was messed up with regards to how the `V4L2_cropcap` type field should be filled in. Some drivers only accepted the _MPLANE_ buffer type while other drivers only accepted a non-multiplanar buffer type (i.e. without the _MPLANE_ at the end).

Starting with kernel 4.13 both variations are allowed.
Table 126: struct v4l2_rect

<td>__u32</td>
<td>width</td>
<td>Width of the rectangle, in pixels.</td>
</tr>
<tr>
<td>__u32</td>
<td>height</td>
<td>Height of the rectangle, in pixels.</td>
</tr>
</tbody>
</table>

**Return Value**

On success 0 is returned, on error -1 and the errno variable is set appropriately. The generic error codes are described at the *Generic Error Codes* chapter.

EINVAL The struct v4l2_cropcap type is invalid.

ENODATA Cropping is not supported for this input or output.

### 3.2.7.5 ioctl VIDIOC_DBG_G_CHIP_INFO

**Name**

VIDIOC_DBG_G_CHIP_INFO - Identify the chips on a TV card

**Synopsis**

```c
VIDIOC_DBG_G_CHIP_INFO
int ioctl(int fd, VIDIOC_DBG_G_CHIP_INFO, struct v4l2_dbg_chip_info *argp)
```

**Arguments**

- **fd** File descriptor returned by `open()`.
- **argp** Pointer to struct v4l2_dbg_chip_info.

**Description**

**Note:** This is an *Experimental API Elements* interface and may change in the future.

For driver debugging purposes this ioctl allows test applications to query the driver about the chips present on the TV card. Regular applications must not use it. When you found a chip specific bug, please contact the linux-media mailing list (https://linuxtv.org/lists.php) so it can be fixed.

Additionally the Linux kernel must be compiled with the `CONFIG_VIDEO_ADV_DEBUG` option to enable this ioctl.
To query the driver applications must initialize the `match.type` and `match.addr` or `match.name` fields of a `struct v4l2_dbg_chip_info` and call `ioctl VIDIOC_DBG_G_CHIP_INFO` with a pointer to this structure. On success the driver stores information about the selected chip in the `name` and `flags` fields.

When `match.type` is `V4L2_CHIP_MATCH_BRIDGE`, `match.addr` selects the nth bridge ‘chip’ on the TV card. You can enumerate all chips by starting at zero and incrementing `match.addr` by one until `ioctl VIDIOC_DBG_G_CHIP_INFO` fails with an EINVAL error code. The number zero always selects the bridge chip itself, e. g. the chip connected to the PCI or USB bus. Non-zero numbers identify specific parts of the bridge chip such as an AC97 register block.

When `match.type` is `V4L2_CHIP_MATCH_SUBDEV`, `match.addr` selects the nth sub-device. This allows you to enumerate over all sub-devices.

On success, the `name` field will contain a chip name and the `flags` field will contain `V4L2_CHIP_FL_READABLE` if the driver supports reading registers from the device or `V4L2_CHIP_FL_WRITABLE` if the driver supports writing registers to the device.

We recommended the v4l2-dbg utility over calling this ioctl directly. It is available from the LinuxTV v4l-dvb repository; see [https://linuxtv.org/repo/](https://linuxtv.org/repo/) for access instructions.

<td>V4L2_CHIP_MATCH_SUBDEV</td>
<td>4</td>
<td>Match the nth sub-device.</td>
</tr>
</tbody>
</table>

Return Value

On success 0 is returned, on error -1 and the errno variable is set appropriately. The generic error codes are described at the Generic Error Codes chapter.

EINVAL The match_type is invalid or no device could be matched.

3.2.7.6 ioctl VIDIOC_DBG_G_REGISTER, VIDIOC_DBG_S_REGISTER

Name

VIDIOC_DBG_G_REGISTER · VIDIOC_DBG_S_REGISTER - Read or write hardware registers

Synopsis

VIDIOC_DBG_G_REGISTER

int ioctl(int fd, VIDIOC_DBG_G_REGISTER, struct v4l2_dbg_register *argp)

VIDIOC_DBG_S_REGISTER

int ioctl(int fd, VIDIOC_DBG_S_REGISTER, const struct v4l2_dbg_register *argp)

Arguments

fd File descriptor returned by open().

argp Pointer to struct v4l2_dbg_register.

Description

Note: This is an Experimental API Elements interface and may change in the future.

For driver debugging purposes these ioctls allow test applications to access hardware registers directly. Regular applications must not use them.

Since writing or even reading registers can jeopardize the system security, its stability and damage the hardware, both ioctls require superuser privileges. Additionally the Linux kernel must be compiled with the CONFIG_VIDEO_ADV_DEBUG option to enable these ioctls.

To write a register applications must initialize all fields of a struct v4l2_dbg_register except for size and call VIDIOC_DBG_S_REGISTER with a pointer to this structure. The match.type and
match.addr or match.name fields select a chip on the TV card, the reg field specifies a register number and the val field the value to be written into the register.

To read a register applications must initialize the match.type, match.addr or match.name and reg fields, and call VIDIOC_DBG_G_REGISTER with a pointer to this structure. On success the driver stores the register value in the val field and the size (in bytes) of the value in size.

When match.type is V4L2_CHIP_MATCH_BRIDGE, match.addr selects the nth non-sub-device chip on the TV card. The number zero always selects the host chip, e. g. the chip connected to the PCI or USB bus. You can find out which chips are present with the ioctl VIDIOC_DBG_G_CHIP_INFO ioctl.

When match.type is V4L2_CHIP_MATCH_SUBDEV, match.addr selects the nth sub-device.

These ioctls are optional, not all drivers may support them. However when a driver supports these ioctls it must also support ioctl VIDIOC_DBG_G_CHIP_INFO. Conversely it may support VIDIOC_DBG_G_CHIP_INFO but not these ioctls.

VIDIOC_DBG_G_REGISTER and VIDIOC_DBG_S_REGISTER were introduced in Linux 2.6.21, but their API was changed to the one described here in kernel 2.6.29.

We recommended the v4l2-dbgs utility over calling these ioctls directly. It is available from the LinuxTV v4l-dvb repository; see https://linuxtv.org/repo/ for access instructions.

</tr>
</tbody>
</table>

**Return Value**

On success 0 is returned, on error -1 and the errno variable is set appropriately. The generic error codes are described at the *Generic Error Codes* chapter.

**EPERM** Insufficient permissions. Root privileges are required to execute these ioctls.

### 3.2.7.7 ioctl VIDIOC_DECODER_CMD, VIDIOC_TRY_DECODER_CMD

**Name**

VIDIOC_DECODER_CMD - VIDIOC_TRY_DECODER_CMD - Execute an decoder command

**Synopsis**

```c
VIDIOC_DECODER_CMD
int ioctl(int fd, VIDIOC_DECODER_CMD, struct v4l2_decoder_cmd *argp)

VIDIOC_TRY_DECODER_CMD
int ioctl(int fd, VIDIOC_TRY_DECODER_CMD, struct v4l2_decoder_cmd *argp)
```

**Arguments**

- **fd** File descriptor returned by `open()`.
- **argp** pointer to struct `v4l2_decoder_cmd`.

**Description**

These ioctls control an audio/video (usually MPEG-) decoder. VIDIOC_DECODER_CMD sends a command to the decoder; VIDIOC_TRY_DECODER_CMD can be used to try a command without actually executing it. To send a command applications must initialize all fields of a struct `v4l2_decoder_cmd` and call VIDIOC_DECODER_CMD or VIDIOC_TRY_DECODER_CMD with a pointer to this structure.

The cmd field must contain the command code. Some commands use the flags field for additional information.

A `write()` or `ioctl VIDIOC_STREAMON, VIDIOC_STREAMOFF` call sends an implicit START command to the decoder if it has not been started yet. Applies to both queues of mem2mem decoders.
A close() or VIDIOC_STREAMOFF call of a streaming file descriptor sends an implicit immediate STOP command to the decoder, and all buffered data is discarded. Applies to both queues of mem2mem decoders.

In principle, these ioctls are optional, not all drivers may support them. They were introduced in Linux 3.3. They are, however, mandatory for stateful mem2mem decoders (as further documented in Memory-to-Memory Stateful Video Decoder Interface).

**v4l2_decoder_cmd**

Table 133: struct v4l2_decoder_cmd

</tr>
<tr>
<td>union { (anonymous)</td>
<td>Structure containing additional data for the V4L2_DEC_CMD_START command.</td>
</tr>
<tr>
<td>__s32 speed</td>
<td>Playback speed and direction. The playback speed is defined as speed/1000 of the normal speed. So 1000 is normal playback. Negative numbers denote reverse playback, so -1000 does reverse playback at normal speed. Speeds -1, 0 and 1 have special meanings: speed 0 is shorthand for 1000 (normal playback). A speed of 1 steps just one frame forward, a speed of -1 steps just one frame back.</td>
</tr>
<tr>
<td>__u32 format</td>
<td>Format restrictions. This field is set by the driver, not the application. Possible values are V4L2_DEC_START_FMT_NONE if there are no format restrictions or V4L2_DEC_START_FMT_GOP if the decoder operates on full GOPs (Group Of Pictures). This is usually the case for reverse playback: the decoder needs full GOPs, which it can then play in reverse order. So to implement reverse playback the application must feed the decoder the last GOP in the video file, then the GOP before that, etc. etc.</td>

1098 Chapter 3. Linux Media Infrastructure userspace API
Table 134: Decoder Commands

<table>
<thead>
<tr>
<th>Command</th>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>V4L2_DEC_CMD_START</td>
<td>0</td>
<td>Start the decoder. When the decoder is already running or paused, this command will just change the playback speed. That means that calling V4L2_DEC_CMD_START when the decoder was paused will <em>not</em> resume the decoder. You have to explicitly call V4L2_DEC_CMD_RESUME for that. This command has one flag: V4L2_DEC_CMD_START_MUTE_AUDIO. If set, then audio will be muted when playing back at a non-standard speed. For a device implementing the Memory-to-Memory Stateful Video Decoder Interface, once the drain sequence is initiated with the V4L2_DEC_CMD_STOP command, it must be driven to completion before this command can be invoked. Any attempt to invoke the command while the drain sequence is in progress will trigger an EBUSY error code. The command may be also used to restart the decoder in case of an implicit stop initiated by the decoder itself, without the V4L2_DEC_CMD_STOP being called explicitly. See Memory-to-Memory Stateful Video Decoder Interface for more details.</td>
</tr>
<tr>
<td>V4L2_DEC_CMD_STOP</td>
<td>1</td>
<td>Stop the decoder. When the decoder is already stopped, this command does nothing. This command has two flags: if V4L2_DEC_CMD_STOP_TO_BLACK is set, then the decoder will set the picture to black after it stopped decoding. Otherwise the last image will repeat. If V4L2_DEC_CMD_STOP_IMMEDIATELY is set, then the decoder stops immediately (ignoring the pts value), otherwise it will keep decoding until timestamp &gt;= pts or until the last of the pending data from its internal buffers was decoded. For a device implementing the Memory-to-Memory Stateful Video Decoder Interface, the command will initiate the drain sequence as documented in Memory-to-Memory Stateful Video Decoder Interface. No flags or other arguments are accepted in this case. Any attempt to invoke the command again before the sequence completes will trigger an EBUSY error code.</td>
</tr>
<tr>
<td>V4L2_DEC_CMD_PAUSE</td>
<td>2</td>
<td>Pause the decoder. When the decoder has not been started yet, the driver will return an EPERM error code. When the decoder is already paused, this command does nothing. This command has one flag: if V4L2_DEC_CMD_PAUSE_TO_BLACK is set, then set the decoder output to black when paused.</td>
</tr>
<tr>
<td>V4L2_DEC_CMD_RESUME</td>
<td>3</td>
<td>Resume decoding after a PAUSE command. When the decoder has not been started yet, the driver will return an EPERM error code. When the decoder is already running, this command does nothing. No flags are defined for this command.</td>
</tr>
</tbody>
</table>

Continued on next page
Table 134 – continued from previous page

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>V4L2_DEC_CMD_FLUSH</td>
<td>Flush any held capture buffers. Only valid for stateless decoders. This command is typically used when the application reached the end of the stream and the last output buffer had the V4L2_BUF_FLAG_M2M_HOLD_CAPTURE_BUF flag set. This would prevent dequeuing the capture buffer containing the last decoded frame. So this command can be used to explicitly flush that final decoded frame. This command does nothing if there are no held capture buffers.</td>
</tr>
</tbody>
</table>

**Return Value**

On success 0 is returned, on error -1 and the **errno** variable is set appropriately. The generic error codes are described at the *Generic Error Codes* chapter.

**EBUSY** A drain sequence of a device implementing the *Memory-to-Memory Stateful Video Decoder Interface* is still in progress. It is not allowed to issue another decoder command until it completes.

**EINVAL** The **cmd** field is invalid.

**EPERM** The application sent a PAUSE or RESUME command when the decoder was not running.

3.2.7.8 ioctl VIDIOC_DQEVENT

**Name**

VIDIOC_DQEVENT - Dequeue event

**Synopsis**

```c
int ioctl(int fd, VIDIOC_DQEVENT, struct v4l2_event *argp)
```

**Arguments**

- **fd** File descriptor returned by open().
- **argp** Pointer to struct v4l2_event.
Description

Dequeue an event from a video device. No input is required for this ioctl. All the fields of the struct v4l2_event structure are filled by the driver. The file handle will also receive exceptions which the application may get by e.g. using the select system call.

<table>
<thead>
<tr>
<th>Event Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>V4L2_EVENT_EOS</td>
<td>This event is triggered when the end of a stream is reached. This is typically used with MPEG decoders to report to the application when the last of the MPEG stream has been decoded.</td>
</tr>
<tr>
<td>V4L2_EVENT_CTRL</td>
<td>This event requires that the id matches the control ID from which you want to receive events. This event is triggered if the control’s value changes, if a button control is pressed or if the control’s flags change. This event has a struct v4l2_event_ctrl associated with it. This struct contains much of the same information as struct v4l2_queryctrl and struct v4l2_control. If the event is generated due to a call to VIDIOC_S_CTRL or VIDIOC_S_EXT_CTRLS, then the event will not be sent to the file handle that called the ioctl function. This prevents nasty feedback loops. If you want to get the event, then set the V4L2_EVENT_SUB_FL_ALLOW_FEEDBACK flag. This event type will ensure that no information is lost when more events are raised than there is room internally. In that case the struct v4l2_event_ctrl of the second-oldest event is kept, but the changes field of the second-oldest event is ORed with the changes field of the oldest event.</td>
</tr>
<tr>
<td>V4L2_EVENT_FRAME_SYNC</td>
<td>Triggered immediately when the reception of a frame has begun. This event has a struct v4l2_event_frame_sync associated with it. If the hardware needs to be stopped in the case of a buffer underrun it might not be able to generate this event. In such cases the frame_sequence field in struct v4l2_event_frame_sync will not be incremented. This causes two consecutive frame sequence numbers to have n times frame interval in between them.</td>
</tr>

<th>V4L2_EVENT_SRC_CH_RESOLUTION</th>
<th>0x0001</th>
</tr>
</thead>
<tbody>
<tr>
<td>This event gets triggered when a resolution change is detected at an input. This can come from an input connector or from a video decoder. Applications will have to query the new resolution (if any, the signal may also have been lost). For stateful decoders follow the guidelines in Memory-to-Memory Stateful Video Decoder Interface. Video Capture devices have to query the new timings using <code>ioctl VIDIOC_QUERY DV_TIMINGS</code> or <code>VIDIOC_QUERYSTD</code>. Important: even if the new video timings appear identical to the old ones, receiving this event indicates that there was an issue with the video signal and you must stop and restart streaming (<code>VIDIOC_STREAMOFF</code> followed by <code>VIDIOC_STREAMON</code>). The reason is that many Video Capture devices are not able to recover from a temporary loss of signal and so restarting streaming I/O is required in order for the hardware to synchronize to the video signal.</td>
<td></td>
</tr>
</tbody>
</table>

Return Value

On success 0 is returned, on error -1 and the `errno` variable is set appropriately. The generic error codes are described at the Generic Error Codes chapter.

3.2.7.9 `ioctl VIDIOC_DV_TIMINGS_CAP, VIDIOC_SUBDEV_DV_TIMINGS_CAP`

Name

VIDIOC_DV_TIMINGS_CAP - VIDIOC_SUBDEV_DV_TIMINGS_CAP - The capabilities of the Digital Video receiver/transmitter

Synopsis

**VIDIOC_DV_TIMINGS_CAP**

```c
int ioctl(int fd, VIDIOC_DV_TIMINGS_CAP, struct v4l2_dv_timings_cap *argp)
```

**VIDIOC_SUBDEV_DV_TIMINGS_CAP**

```c
int ioctl(int fd, VIDIOC_SUBDEV_DV_TIMINGS_CAP, struct v4l2_dv_timings_cap *argp)
```
**Arguments**

*fd* File descriptor returned by `open()`.

*argp* Pointer to `struct v4l2_dv_timings_cap`.

**Description**

To query the capabilities of the DV receiver/transmitter applications initialize the `pad` field to 0, zero the reserved array of `struct v4l2_dv_timings_cap` and call the `VIDIOC_DV_TIMINGS_CAP` ioctl on a video node and the driver will fill in the structure.

**Note:** Drivers may return different values after switching the video input or output.

When implemented by the driver DV capabilities of subdevices can be queried by calling the `VIDIOC_SUBDEV_DV_TIMINGS_CAP` ioctl directly on a subdevice node. The capabilities are specific to inputs (for DV receivers) or outputs (for DV transmitters), applications must specify the desired pad number in the `struct v4l2_dv_timings_cap` pad field and zero the reserved array. Attempts to query capabilities on a pad that doesn’t support them will return an `EINVAL` error code.

3.2.7.10 ioctl VIDIOC_ENCODER_CMD, VIDIOC_TRY_ENCODER_CMD

Name

VIDIOC_ENCODER_CMD - VIDIOC_TRY_ENCODER_CMD - Execute an encoder command
Synopsis

VIDIOC_ENCODER_CMD

int ioctl(int fd, VIDIOC_ENCODER_CMD, struct v4l2_encoder_cmd *argp)

VIDIOC_TRY_ENCODER_CMD

int ioctl(int fd, VIDIOC_TRY_ENCODER_CMD, struct v4l2_encoder_cmd *argp)

Arguments

fd  File descriptor returned by open().

argp  Pointer to struct v4l2_encoder_cmd.

Description

These ioctlS control an audio/video (usually MPEG-) encoder. VIDIOC_ENCODER_CMD sends a command to the encoder; VIDIOC_TRY_ENCODER_CMD can be used to try a command without actually executing it.

To send a command applications must initialize all fields of a struct v4l2_encoder_cmd and call VIDIOC_ENCODER_CMD or VIDIOC_TRY_ENCODER_CMD with a pointer to this structure.

The cmd field must contain the command code. Some commands use the flags field for additional information.

After a STOP command, read() calls will read the remaining data buffered by the driver. When the buffer is empty, read() will return zero and the next read() call will restart the encoder.

A read() or VIDIOC_STREAMON call sends an implicit START command to the encoder if it has not been started yet. Applies to both queues of mem2mem encoders.

A close() or VIDIOC_STREAMOFF call of a streaming file descriptor sends an implicit immediate STOP to the encoder, and all buffered data is discarded. Applies to both queues of mem2mem encoders.

These ioctlS are optional, not all drivers may support them. They were introduced in Linux 2.6.21. They are, however, mandatory for stateful mem2mem encoders (as further documented in Memory-to-Memory Stateful Video Encoder Interface).

</tr>
</tbody>
</table>
Return Value

On success 0 is returned, on error -1 and the errno variable is set appropriately. The generic error codes are described at the *Generic Error Codes* chapter.

**EBUSY** A drain sequence of a device implementing the *Memory-to-Memory Stateful Video Encoder Interface* is still in progress. It is not allowed to issue another encoder command until it completes.

**EINVAL** The cmd field is invalid.

**EPERM** The application sent a PAUSE or RESUME command when the encoder was not running.

### 3.2.7.11 ioctl VIDIOC_ENUMAUDIO

**Name**

VIDIOC_ENUMAUDIO - Enumerate audio inputs

**Synopsis**

```c
int ioctl(int fd, VIDIOC_ENUMAUDIO, struct v4l2_audio *argp)
```

**Arguments**

- **fd** File descriptor returned by `open()`.
- **argp** Pointer to struct `v4l2_audio`.

**Description**

To query the attributes of an audio input applications initialize the index field and zero out the reserved array of a struct `v4l2_audio` and call the `ioctl VIDIOC_ENUMAUDIO` ioctl with a pointer to this structure. Drivers fill the rest of the structure or return an EINVAL error code when the index is out of bounds. To enumerate all audio inputs applications shall begin at index zero, incrementing by one until the driver returns EINVAL.

See `VIDIOC_G_AUDIO` for a description of struct `v4l2_audio`. 

---

1110 Chapter 3. Linux Media Infrastructure userspace API
Return Value

On success 0 is returned, on error -1 and the errno variable is set appropriately. The generic error codes are described at the Generic Error Codes chapter.

EINVAL  The number of the audio input is out of bounds.

3.2.7.12 ioctl VIDIOC_ENUMAUDOUT

Name

VIDIOC_ENUMAUDOUT - Enumerate audio outputs

Synopsis

VIDIOC_ENUMAUDOUT

int ioctl(int fd, VIDIOC_ENUMAUDOUT, struct v4l2_audioout *argp)

Arguments

fd  File descriptor returned by open().

argp  Pointer to struct v4l2_audioout.

Description

To query the attributes of an audio output applications initialize the index field and zero out the reserved array of a struct v4l2_audioout and call the VIDIOC_G_AUDOUT ioctl with a pointer to this structure. Drivers fill the rest of the structure or return an EINVAL error code when the index is out of bounds. To enumerate all audio outputs applications shall begin at index zero, incrementing by one until the driver returns EINVAL.

Note:  Connectors on a TV card to loop back the received audio signal to a sound card are not audio outputs in this sense.

See VIDIOC_G_AUDIOout for a description of struct v4l2_audioout.
Return Value

On success 0 is returned, on error -1 and the errno variable is set appropriately. The generic error codes are described at the Generic Error Codes chapter.

EINVAL The number of the audio output is out of bounds.

3.2.7.13 ioctl VIDIOC_ENUM_DV_TIMINGS, VIDIOC_SUBDEV_ENUM_DV_TIMINGS

Name

VIDIOC_ENUM_DV_TIMINGS - VIDIOC_SUBDEV_ENUM_DV_TIMINGS - Enumerate supported Digital Video timings

Synopsis

VIDIOC_ENUM_DV_TIMINGS
int ioctl(int fd, VIDIOC_ENUM_DV_TIMINGS, struct v4l2_enum_dv_timings *argp)

VIDIOC_SUBDEV_ENUM_DV_TIMINGS
int ioctl(int fd, VIDIOC_SUBDEV_ENUM_DV_TIMINGS, struct v4l2_enum_dv_timings *argp)

Arguments

fd File descriptor returned by open().

argp Pointer to struct v4l2_enum_dv_timings.

Description

While some DV receivers or transmitters support a wide range of timings, others support only a limited number of timings. With this ioctl applications can enumerate a list of known supported timings. Call ioctl VIDIOC_DV_TIMINGS_CAP, VIDIOC_SUBDEV_DV_TIMINGS_CAP to check if it also supports other standards or even custom timings that are not in this list.

To query the available timings, applications initialize the index field, set the pad field to 0, zero the reserved array of struct v4l2_enum_dv_timings and call the VIDIOC_ENUM_DV_TIMINGS ioctl on a video node with a pointer to this structure. Drivers fill the rest of the structure or return an EINVAL error code when the index is out of bounds. To enumerate all supported DV timings, applications shall begin at index zero, incrementing by one until the driver returns EINVAL.

Note: Drivers may enumerate a different set of DV timings after switching the video input or output.
When implemented by the driver DV timings of subdevices can be queried by calling the `VIDIOC_SUBDEV_ENUM_DV_TIMINGS` ioctl directly on a subdevice node. The DV timings are specific to inputs (for DV receivers) or outputs (for DV transmitters), applications must specify the desired pad number in the struct `v4l2_enum_dv_timings pad` field. Attempts to enumerate timings on a pad that doesn’t support them will return an EINVAL error code.

### v4l2_enum_dv_timings

| __u32  | index  | Number of the DV timings, set by the application. |
| __u32  | pad    | Pad number as reported by the media controller API. This field is only used when operating on a subdevice node. When operating on a video node applications must set this field to zero. |
| __u32  | reserved[2] | Reserved for future extensions. Drivers and applications must set the array to zero. |

| struct | v4l2_dv_timings | timings | The timings. |

#### Return Value

On success 0 is returned, on error -1 and the `errno` variable is set appropriately. The generic error codes are described at the [Generic Error Codes](#) chapter.

**EINVAL** The struct `v4l2_enum_dv_timings index` is out of bounds or the pad number is invalid.

**ENODATA** Digital video presets are not supported for this input or output.

### 3.2.7.14 ioctl VIDIOC_ENUM_FMT

#### Name

VIDIOC_ENUM_FMT - Enumerate image formats

#### Synopsis

```
VIDIOC_ENUM_FMT
int ioctl(int fd, VIDIOC_ENUM_FMT, struct v4l2_fmtdesc *argp)
```
Arguments

**fd**  File descriptor returned by `open()`.

**argp**  Pointer to struct `v4l2FmtDesc`.

Description

To enumerate image formats applications initialize the `type`, `mbus_code` and `index` fields of `struct v4l2FmtDesc` and call the `ioctl VIDIOC_ENUM_FMT` ioctl with a pointer to this structure. Drivers fill the rest of the structure or return an `EINVAL` error code. All formats are enumerable by beginning at index zero and incrementing by one until `EINVAL` is returned. If applicable, drivers shall return formats in preference order, where preferred formats are returned before (that is, with lower index value) less-preferred formats.

Depending on the `V4L2_CAP_IO_MC` capability, the `mbus_code` field is handled differently:

1) `V4L2_CAP_IO_MC` is not set (also known as a ‘video-node-centric’ driver)

   Applications shall initialize the `mbus_code` field to zero and drivers shall ignore the value of the field.

   Drivers shall enumerate all image formats.

   **Note:** After switching the input or output the list of enumerated image formats may be different.

2) `V4L2_CAP_IO_MC` is set (also known as an ‘MC-centric’ driver)

   If the `mbus_code` field is zero, then all image formats shall be enumerated.

   If the `mbus_code` field is initialized to a valid (non-zero) **media bus format code**, then drivers shall restrict enumeration to only the image formats that can produce (for video output devices) or be produced from (for video capture devices) that media bus code. If the `mbus_code` is unsupported by the driver, then `EINVAL` shall be returned.

   Regardless of the value of the `mbus_code` field, the enumerated image formats shall not depend on the active configuration of the video device or device pipeline.

`v4l2FmtDesc`

</tr>
</tbody>
</table>

Return Value

On success 0 is returned, on error -1 and the `errno` variable is set appropriately. The generic error codes are described at the `Generic Error Codes` chapter.

EINVAL The struct `v4l2_fmtdesc` type is not supported or the index is out of bounds.

If `V4L2_CAP_I0_MC` is set and the specified `mbus_code` is unsupported, then also return this error code.

3.2.7.15 ioctl VIDIOC_ENUM_FRAMESIZES

Name

VIDIOC_ENUM_FRAMESIZES - Enumerate frame sizes
**Synopsis**

**VIDIOC_ENUM_FRAMESIZES**

```c
int ioctl(int fd, VIDIOC_ENUM_FRAMESIZES, struct v4l2_frmsizeenum *argp)
```

**Arguments**

- `fd` File descriptor returned by `open()`.
- `argp` Pointer to struct `v4l2_frmsizeenum` that contains an index and pixel format and receives a frame width and height.

**Description**

This ioctl allows applications to enumerate all frame sizes (i.e. width and height in pixels) that the device supports for the given pixel format.

The supported pixel formats can be obtained by using the `ioctl VIDIOC_ENUM_FMT` function. The return value and the content of the `v4l2_frmsizeenum.type` field depend on the type of frame sizes the device supports. Here are the semantics of the function for the different cases:

- **Discrete**: The function returns success if the given index value (zero-based) is valid. The application should increase the index by one for each call until `EINVAL` is returned. The `v4l2_frmsizeenum.type` field is set to `V4L2_FRMSIZE_TYPE_DISCRETE` by the driver. Of the union only the discrete member is valid.

- **Step-wise**: The function returns success if the given index value is zero and `EINVAL` for any other index value. The `v4l2_frmsizeenum.type` field is set to `V4L2_FRMSIZE_TYPE_STEPWISE` by the driver. Of the union only the stepwise member is valid.

- **Continuous**: This is a special case of the step-wise type above. The function returns success if the given index value is zero and `EINVAL` for any other index value. The `v4l2_frmsizeenum.type` field is set to `V4L2_FRMSIZE_TYPE_CONTINUOUS` by the driver. Of the union only the stepwise member is valid and the `step_width` and `step_height` values are set to 1.

When the application calls the function with index zero, it must check the type field to determine the type of frame size enumeration the device supports. Only for the `V4L2_FRMSIZE_TYPE_DISCRETE` type does it make sense to increase the index value to receive more frame sizes.

**Note**: The order in which the frame sizes are returned has no special meaning. In particular does it not say anything about potential default format sizes.

Applications can assume that the enumeration data does not change without any interaction from the application itself. This means that the enumeration data is consistent if the application does not perform any other ioctl calls while it runs the frame size enumeration.
**Structs**

In the structs below, *IN* denotes a value that has to be filled in by the application, *OUT* denotes values that the driver fills in. The application should zero out all members except for the *IN* fields.

| V4L2_FRMSIZE_TYPE_CONTINUOUS 2 | Continuous frame size. |
| V4L2_FRMSIZE_TYPE_STEPWISE 3 | Step-wise defined frame size. |
Return Value

On success 0 is returned, on error -1 and the errno variable is set appropriately. The generic error codes are described at the Generic Error Codes chapter.

3.2.7.16 ioctl VIDIOC_ENUM_FRAMEINTERVALS

Name

VIDIOC_ENUM_FRAMEINTERVALS - Enumerate frame intervals

Synopsis

VIDIOC_ENUM_FRAMEINTERVALS

int ioctl(int fd, VIDIOC_ENUM_FRAMEINTERVALS, struct v4l2_frmivalenum *argp)

Arguments

fd  File descriptor returned by open().

argp  Pointer to struct v4l2_frmivalenum that contains a pixel format and size and receives a frame interval.

Description

This ioctl allows applications to enumerate all frame intervals that the device supports for the given pixel format and frame size.

The supported pixel formats and frame sizes can be obtained by using the ioctl VIDIOC_ENUM_FMT and ioctl VIDIOC_ENUM_FRAMESIZES functions.

The return value and the content of the v4l2_frmivalenum.type field depend on the type of frame intervals the device supports. Here are the semantics of the function for the different cases:

- **Discrete**: The function returns success if the given index value (zero-based) is valid. The application should increase the index by one for each call until EINVAL is returned. The v4l2_frmivalenum.type field is set to V4L2_FRMIVAL_TYPE_DISCRETE by the driver. Of the union only the discrete member is valid.

- **Step-wise**: The function returns success if the given index value is zero and EINVAL for any other index value. The v4l2_frmivalenum.type field is set to V4L2_FRMIVAL_TYPE_STEPWISE by the driver. Of the union only the stepwise member is valid.

- **Continuous**: This is a special case of the step-wise type above. The function returns success if the given index value is zero and EINVAL for any other index value. The v4l2_frmivalenum.type field is set to V4L2_FRMIVAL_TYPE_CONTINUOUS by the driver. Of the union only the stepwise member is valid and the step value is set to 1.
When the application calls the function with index zero, it must check the type field to determine the type of frame interval enumeration the device supports. Only for the `V4L2_FRMIVAL_TYPE_DISCRETE` type does it make sense to increase the index value to receive more frame intervals.

**Note:** The order in which the frame intervals are returned has no special meaning. In particular does it not say anything about potential default frame intervals.

Applications can assume that the enumeration data does not change without any interaction from the application itself. This means that the enumeration data is consistent if the application does not perform any other ioctl calls while it runs the frame interval enumeration.

**Note:** **Frame intervals and frame rates:** The V4L2 API uses frame intervals instead of frame rates. Given the frame interval the frame rate can be computed as follows:

\[
\text{frame rate} = \frac{1}{\text{frame interval}}
\]

**Structs**

In the structs below, `IN` denotes a value that has to be filled in by the application, `OUT` denotes values that the driver fills in. The application should zero out all members except for the `IN` fields.

| V4L2_FRMIVAL_TYPE_STEPWISE | 3 | Step-wise defined frame interval. |

Return Value

On success 0 is returned, on error -1 and the errno variable is set appropriately. The generic error codes are described at the Generic Error Codes chapter.

3.2.7.17 ioctl VIDIOC_ENUM_FREQ_BANDS

Name

VIDIOC_ENUM_FREQ_BANDS - Enumerate supported frequency bands
Synopsis

VIDIOC_ENUM_FREQ_BANDS

int ioctl(int fd, VIDIOC_ENUM_FREQ_BANDS, struct v4l2_frequency_band *argp)

Arguments

fd   File descriptor returned by open().
argp  Pointer to struct v4l2_frequency_band.

Description

Enumerates the frequency bands that a tuner or modulator supports. To do this applications initialize the tuner, type and index fields, and zero out the reserved array of a struct v4l2_frequency_band and call the ioctl VIDIOC_ENUM_FREQ_BANDS ioctl with a pointer to this structure.

This ioctl is supported if the V4L2_TUNER_CAP_FREQ_BANDS capability of the corresponding tuner/modulator is set.

v4l2_frequency_band
### Table 160: struct v4l2_frequency_band

| _u32 | tuner | The tuner or modulator index number. This is the same value as in the struct v4l2_input tuner field and the struct v4l2_tuner index field, or the struct v4l2_output modulator field and the struct v4l2_modulator index field. |
| _u32 | type | The tuner type. This is the same value as in the struct v4l2_tuner type field. The type must be set to V4L2_TUNER_RADIO for /dev/radioX device nodes, and to V4L2_TUNER_ANALOG_TV for all others. Set this field to V4L2_TUNER_RADIO for modulators (currently only radio modulators are supported). See v4l2_tuner_type |
| _u32 | index | Identifies the frequency band, set by the application. |
| _u32 | capability | The tuner/modulator capability flags for this frequency band, see Tuner and Modulator Capability Flags. The V4L2_TUNER_CAP_LOW or V4L2_TUNER_CAP_1HZ capability must be the same for all frequency bands of the selected tuner/modulator. So either all bands have that capability set, or none of them have that capability. |
| _u32 | rangelow | The lowest tunable frequency in units of 62.5 kHz, or if the capability flag V4L2_TUNER_CAP_LOW is set, in units of 62.5 Hz, for this frequency band. A 1 Hz unit is used when the capability flag V4L2_TUNER_CAP_1HZ is set. |
| _u32 | rangehigh | The highest tunable frequency in units of 62.5 kHz, or if the capability flag V4L2_TUNER_CAP_LOW is set, in units of 62.5 Hz, for this frequency band. A 1 Hz unit is used when the capability flag V4L2_TUNER_CAP_1HZ is set. |
| _u32 | modulation | The supported modulation systems of this frequency band. See Band Modulation Systems. |
| _u32 | reserved[9] | Reserved for future extensions. Applications and drivers must set the array to zero. |

### Table 161: Band Modulation Systems

| V4L2_BAND_MODULATION_VSB | 0x02 | Vestigial Sideband modulation, used for analog TV. |
| V4L2_BAND_MODULATION_FM | 0x04 | Frequency Modulation, commonly used for analog radio. |
| V4L2_BAND_MODULATION_AM | 0x08 | Amplitude Modulation, commonly used for analog radio. |

**Note:** Currently only one modulation system per frequency band is supported. More work will need to be done if multiple modulation systems are possible. Contact the linux-media mailing list (https://linuxtv.org/lists.php) if you need such functionality.
Return Value

On success 0 is returned, on error -1 and the errno variable is set appropriately. The generic error codes are described at the Generic Error Codes chapter.

EINVAL The tuner or index is out of bounds or the type field is wrong.

3.2.7.18 ioctl VIDIOC_ENUMINPUT

Name

VIDIOC_ENUMINPUT - Enumerate video inputs

Synopsis

VIDIOC_ENUMINPUT

int ioctl(int fd, VIDIOC_ENUMINPUT, struct v4l2_input *argp)

Arguments

fd File descriptor returned by open().
argp Pointer to struct v4l2_input.

Description

To query the attributes of a video input applications initialize the index field of struct v4l2_input and call the ioctl VIDIOC_ENUMINPUT with a pointer to this structure. Drivers fill the rest of the structure or return an EINVAL error code when the index is out of bounds. To enumerate all inputs applications shall begin at index zero, incrementing by one until the driver returns EINVAL.

v4l2_input
### Table 162: struct v4l2_input

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>__u32 index</td>
<td>Identifies the input, set by the application.</td>
</tr>
<tr>

Return Value

On success 0 is returned, on error -1 and the errno variable is set appropriately. The generic error codes are described at the Generic Error Codes chapter.

EINVAL The struct v4l2_input index is out of bounds.

3.2.7.19 ioctl VIDIOC_ENUMOUTPUT

Name

VIDIOC_ENUMOUTPUT - Enumerate video outputs

Synopsis

VIDIOC_ENUMOUTPUT

int ioctl(int fd, VIDIOC_ENUMOUTPUT, struct v4l2_output *argp)

Arguments

fd File descriptor returned by open().
argp Pointer to struct v4l2_output.

Description

To query the attributes of a video outputs applications initialize the index field of struct v4l2_output and call the ioctl VIDIOC_ENUMOUTPUT with a pointer to this structure. Drivers fill the rest of the structure or return an EINVAL error code when the index is out of bounds. To enumerate all outputs applications shall begin at index zero, incrementing by one until the driver returns EINVAL.
### Table 166: struct v4l2_output

<table>

**EINVAL** The struct `v4l2_output` index is out of bounds.

### 3.2.7.20 ioctl VIDIOC_ENUMSTD, VIDIOC_SUBDEV_ENUMSTD

#### Name

VIDIOC_ENUMSTD - VIDIOC_SUBDEV_ENUMSTD - Enumerate supported video standards

#### Synopsis

**VIDIOC_ENUMSTD**

```c
int ioctl(int fd, VIDIOC_ENUMSTD, struct v4l2_standard *argp)
```

**VIDIOC_SUBDEV_ENUMSTD**

```c
int ioctl(int fd, VIDIOC_SUBDEV_ENUMSTD, struct v4l2_standard *argp)
```

#### Arguments

**fd** File descriptor returned by `open()`.

**argp** Pointer to struct `v4l2_standard`.
Description

To query the attributes of a video standard, especially a custom (driver defined) one, applications initialize the index field of struct v4l2_standard and call the ioctl VIDIOC_ENUMSTD, VIDIOC_SUBDEV_ENUMSTD ioctl with a pointer to this structure. Drivers fill the rest of the structure or return an EINVAL error code when the index is out of bounds. To enumerate all standards applications shall begin at index zero, incrementing by one until the driver returns EINVAL. Drivers may enumerate a different set of standards after switching the video input or output.¹

v4l2_standard

<table>
<thead>
<tr>
<th>__u32</th>
<th>index</th>
<th>Number of the video standard, set by the application.</th>
</tr>
</thead>
<tbody>
<tr>
<td>v4l2_std_id</td>
<td>id</td>
<td>The bits in this field identify the standard as one of the common standards listed in typedef v4l2_std_id, or if bits 32 to 63 are set as custom standards. Multiple bits can be set if the hardware does not distinguish between these standards, however separate indices do not indicate the opposite. The id must be unique. No other enumerated struct v4l2_standard structure, for this input or output anyway, can contain the same set of bits.</td>

### Return Value

On success 0 is returned, on error -1 and the `errno` variable is set appropriately. The generic error codes are described at the [Generic Error Codes](#) chapter.

**EINVAL** The struct `v4l2_standard` index is out of bounds.

**ENODATA** Standard video timings are not supported for this input or output.

---

2 Japan uses a standard similar to M/NTSC (V4L2_STD_NTSC_M_JP).

3 The values in brackets apply to the combination N/PAL a.k.a. Nc used in Argentina (V4L2_STD_PAL_Nc).

4 In the Federal Republic of Germany, Austria, Italy, the Netherlands, Slovakia and Switzerland a system of two sound carriers is used, the frequency of the second carrier being 242.1875 kHz above the frequency of the first sound carrier. For stereophonic sound transmissions a similar system is used in Australia.

5 New Zealand uses a sound carrier displaced 5.4996 ± 0.0005 MHz from the vision carrier.

6 In Denmark, Finland, New Zealand, Sweden and Spain a system of two sound carriers is used. In Iceland, Norway and Poland the same system is being introduced. The second carrier is 5.85 MHz above the vision carrier and is DQPSK modulated with 728 kbit/s sound and data multiplex. (NICAM system)

7 In the United Kingdom, a system of two sound carriers is used. The second sound carrier is 6.552 MHz above the vision carrier and is DQPSK modulated with a 728 kbit/s sound and data multiplex able to carry two sound channels. (NICAM system)

8 In France, a digital carrier 5.85 MHz away from the vision carrier may be used in addition to the main sound carrier. It is modulated in differentially encoded QPSK with a 728 kbit/s sound and data multiplexer capable of carrying two sound channels. (NICAM system)
3.2.7.21 ioctl VIDIOC_EXPBUF

Name

VIDIOC_EXPBUF - Export a buffer as a DMABUF file descriptor.

Synopsis

VIDIOC_EXPBUF

int ioctl(int fd, VIDIOC_EXPBUF, struct v4l2_exportbuffer *argp)

Arguments

fd  File descriptor returned by open().
argp  Pointer to struct v4l2_exportbuffer.

Description

This ioctl is an extension to the memory mapping I/O method, therefore it is available only for V4L2_MEMORY_MMAP buffers. It can be used to export a buffer as a DMABUF file at any time after buffers have been allocated with the ioctl VIDIOC_REQBUFS ioctl.

To export a buffer, applications fill struct v4l2_exportbuffer. The type field is set to the same buffer type as was previously used with struct v4l2_requestbuffers type. Applications must also set the index field. Valid index numbers range from zero to the number of buffers allocated with ioctl VIDIOC_REQBUFS (struct v4l2_requestbuffers count) minus one. For the multi-planar API, applications set the plane field to the index of the plane to be exported. Valid planes range from zero to the maximal number of valid planes for the currently active format. For the single-planar API, applications must set plane to zero. Additional flags may be posted in the flags field. Refer to a manual for open() for details. Currently only O_CLOEXEC, O_RDONLY, O_WRONLY, and O_RDWR are supported. All other fields must be set to zero. In the case of multi-planar API, every plane is exported separately using multiple ioctl VIDIOC_EXPBUF calls.

After calling ioctl VIDIOC_EXPBUF the fd field will be set by a driver. This is a DMABUF file descriptor. The application may pass it to other DMABUF-aware devices. Refer to DMABUF
importing for details about importing DMABUF files into V4L2 nodes. It is recommended to close a DMABUF file when it is no longer used to allow the associated memory to be reclaimed.

Examples

```c
int buffer_export(int v4lfd, enum v4l2_buf_type bt, int index, int *dmafd)
{
    struct v4l2_exportbuffer expbuf;

    memset(&expbuf, 0, sizeof(expbuf));
    expbuf.type = bt;
    expbuf.index = index;
    if (ioctl(v4lfd, VIDIOC_EXPBUF, &expbuf) == -1) {
        perror("VIDIOC_EXPBUF");
        return -1;
    }

    *dmafd = expbuf.fd;
    return 0;
}

int buffer_export_mp(int v4lfd, enum v4l2_buf_type bt, int index,
                      int dmafd[], int n_planes)
{
    int i;

    for (i = 0; i < n_planes; ++i) {
        struct v4l2_exportbuffer expbuf;

        memset(&expbuf, 0, sizeof(expbuf));
        expbuf.type = bt;
        expbuf.index = index;
        expbuf.plane = i;
        if (ioctl(v4lfd, VIDIOC_EXPBUF, &expbuf) == -1) {
            perror("VIDIOC_EXPBUF");
            while (i)
                close(dmafd[--i]);
            return -1;
        }
        dmafd[i] = expbuf.fd;
    }

    return 0;
}
```

Return Value

On success 0 is returned, on error -1 and the errno variable is set appropriately. The generic error codes are described at the Generic Error Codes chapter.

EINVAL A queue is not in MMAP mode or DMABUF exporting is not supported or flags or type or index or plane fields are invalid.

3.2.7.22 ioctl VIDIOC_G_AUDIO, VIDIOC_S_AUDIO

Name

VIDIOC_G_AUDIO - VIDIOC_S_AUDIO - Query or select the current audio input and its attributes

Synopsis

VIDIOC_G_AUDIO
int ioctl(int fd, VIDIOC_G_AUDIO, struct v4l2_audio *argp)

VIDIOC_S_AUDIO
int ioctl(int fd, VIDIOC_S_AUDIO, const struct v4l2_audio *argp)
Arguments

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>fd</strong></td>
<td>File descriptor returned by <code>open()</code></td>
</tr>
<tr>
<td><strong>argp</strong></td>
<td>Pointer to struct <code>v4l2_audio</code></td>
</tr>
</tbody>
</table>

Description

To query the current audio input applications zero out the reserved array of a struct `v4l2_audio` and call the `VIDIOC_G_AUDIO` ioctl with a pointer to this structure. Drivers fill the rest of the structure or return an EINVAL error code when the device has no audio inputs, or none which combine with the current video input.

Audio inputs have one writable property, the audio mode. To select the current audio input and change the audio mode, applications initialize the index and mode fields, and the reserved array of a struct `v4l2_audio` structure and call the `VIDIOC_S_AUDIO` ioctl. Drivers may switch to a different audio mode if the request cannot be satisfied. However, this is a write-only ioctl, it does not return the actual new audio mode.

\texttt{VIDIOC\_S\_AUDOUT}
\begin{verbatim}
int ioctl(int fd, VIDIOC\_S\_AUDOUT, const struct v4l2\_audioout *argp)
\end{verbatim}

Arguments

\texttt{fd} File descriptor returned by \texttt{open()}.  
\texttt{argp} Pointer to struct \texttt{v4l2\_audioout}.

Description

To query the current audio output applications zero out the reserved array of a struct \texttt{v4l2\_audioout} and call the \texttt{VIDIOC\_G\_AUDOUT} ioctl with a pointer to this structure. Drivers fill the rest of the structure or return an \texttt{EINVAL} error code when the device has no audio inputs, or none which combine with the current video output.

Audio outputs have no writable properties. Nevertheless, to select the current audio output applications can initialize the \texttt{index} field and \texttt{reserved} array (which in the future may contain writable properties) of a struct \texttt{v4l2\_audioout} structure and call the \texttt{VIDIOC\_S\_AUDOUT} ioctl. Drivers switch to the requested output or return the \texttt{EINVAL} error code when the index is out of bounds. This is a write-only ioctl, it does not return the current audio output attributes as \texttt{VIDIOC\_G\_AUDOUT} does.

\textbf{Note:} Connectors on a TV card to loop back the received audio signal to a sound card are not audio outputs in this sense.

\texttt{v4l2\_audioout}
Table 177: struct v4l2_audiout

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>index</td>
<td>Identifies the audio output, set by the driver or application.</td>
</tr>
<tr>
<td>name[32]</td>
<td>Name of the audio output, a NUL-terminated ASCII string, for example: “Line Out”. This information is intended for the user, preferably the connector label on the device itself.</td>
</tr>
<tr>
<td>capability</td>
<td>Audio capability flags, none defined yet. Drivers must set this field to zero.</td>
</tr>
<tr>
<td>mode</td>
<td>Audio mode, none defined yet. Drivers and applications (on VIDIOC_S_AUDOUT) must set this field to zero.</td>
</tr>
<tr>
<td>reserved[2]</td>
<td>Reserved for future extensions. Drivers and applications must set the array to zero.</td>
</tr>
</tbody>
</table>

Return Value

On success 0 is returned, on error -1 and the errno variable is set appropriately. The generic error codes are described at the Generic Error Codes chapter.

EINVAL No audio outputs combine with the current video output, or the number of the selected audio output is out of bounds or it does not combine.

3.2.7.24 ioctl VIDIOC_G_CROP, VIDIOC_S_CROP

Name

VIDIOC_G_CROP - VIDIOC_S_CROP - Get or set the current cropping rectangle

Synopsis

VIDIOC_G_CROP

int ioctl(int fd, VIDIOC_G_CROP, struct v4l2_crop *argp)

VIDIOC_S_CROP

int ioctl(int fd, VIDIOC_S_CROP, const struct v4l2_crop *argp)
Arguments

fd  File descriptor returned by open().
argp  Pointer to struct v4l2_crop.

Description

To query the cropping rectangle size and position applications set the type field of a struct v4l2_crop structure to the respective buffer (stream) type and call the VIDIOC_G_CROP ioctl with a pointer to this structure. The driver fills the rest of the structure or returns the EINVAL error code if cropping is not supported.

To change the cropping rectangle applications initialize the type and struct v4l2_rect substructure named c of a v4l2_crop structure and call the VIDIOC_S_CROP ioctl with a pointer to this structure.

The driver first adjusts the requested dimensions against hardware limits, i.e. the bounds given by the capture/output window, and it rounds to the closest possible values of horizontal and vertical offset, width and height. In particular the driver must round the vertical offset of the cropping rectangle to frame lines modulo two, such that the field order cannot be confused.

Second the driver adjusts the image size (the opposite rectangle of the scaling process, source or target depending on the data direction) to the closest size possible while maintaining the current horizontal and vertical scaling factor.

Finally the driver programs the hardware with the actual cropping and image parameters. VIDIOC_S_CROP is a write-only ioctl, it does not return the actual parameters. To query them applications must call VIDIOC_G_CROP and ioctl VIDIOC_G_FMT, VIDIOC_S_FMT, VIDIOC_TRY_FMT. When the parameters are unsuitable the application may modify the cropping or image parameters and repeat the cycle until satisfactory parameters have been negotiated.

When cropping is not supported then no parameters are changed and VIDIOC_S_CROP returns the EINVAL error code.

v4l2_crop

Table 178: struct v4l2_crop

<table>
<thead>
<tr>
<th>__u32 type</th>
<th>Type of the data stream, set by the application. Only these types are valid here: V4L2_BUF_TYPE_VIDEO_CAPTURE, V4L2_BUF_TYPE_VIDEO_CAPTURE_MPLANE, V4L2_BUF_TYPE_VIDEO_OUTPUT, V4L2_BUF_TYPE_VIDEO_OUTPUT_MPLANE and V4L2_BUF_TYPE_VIDEO_OVERLAY. See v4l2_buf_type and the note below.</th>
</tr>
</thead>
<tbody>
<tr>
<td>struct v4l2_rect c</td>
<td>Cropping rectangle. The same co-ordinate system as for struct v4l2_cropcap bounds is used.</td>
</tr>
</tbody>
</table>

Note: Unfortunately in the case of multiplanar buffer types (V4L2_BUF_TYPE_VIDEO_CAPTURE_MPLANE and V4L2_BUF_TYPE_VIDEO_OUTPUT_MPLANE) this API...
was messed up with regards to how the v4l2_crop type field should be filled in. Some drivers only accepted the _MPLANE buffer type while other drivers only accepted a non-multiplanar buffer type (i.e. without the _MPLANE at the end).

Starting with kernel 4.13 both variations are allowed.

**Return Value**

On success 0 is returned, on error -1 and the errno variable is set appropriately. The generic error codes are described at the *Generic Error Codes* chapter.

**ENODATA** Cropping is not supported for this input or output.

### 3.2.7.25 ioctl VIDIOC_G_CTRL, VIDIOC_S_CTRL

**Name**

VIDIOC_G_CTRL - VIDIOC_S_CTRL - Get or set the value of a control

**Synopsis**

**VIDIOC_G_CTRL**

```c
int ioctl(int fd, VIDIOC_G_CTRL, struct v4l2_control *argp)
```

**VIDIOC_S_CTRL**

```c
int ioctl(int fd, VIDIOC_S_CTRL, struct v4l2_control *argp)
```

**Arguments**

- **fd** File descriptor returned by open()
- **argp** Pointer to struct v4l2_control.

**Description**

To get the current value of a control applications initialize the id field of a struct v4l2_control and call the **VIDIOC_G_CTRL** ioctl with a pointer to this structure. To change the value of a control applications initialize the id and value fields of a struct v4l2_control and call the **VIDIOC_S_CTRL** ioctl.

When the id is invalid drivers return an EINVAL error code. When the value is out of bounds drivers can choose to take the closest valid value or return an ERANGE error code, whatever seems more appropriate. However, **VIDIOC_S_CTRL** is a write-only ioctl, it does not return the actual new value. If the value is inappropriate for the control (e.g. if it refers to an unsupported menu index of a menu control), then EINVAL error code is returned as well.

These ioctls work only with user controls. For other control classes the **VIDIOC_G_EXT_CTRLS**, **VIDIOC_S_EXT_CTRLS** or **VIDIOC_TRY_EXT_CTRLS** must be used.
v4l2_control

Table 179: struct v4l2_control

<table>
<thead>
<tr>
<th>__u32</th>
<th>id</th>
<th>Identifies the control, set by the application.</th>
</tr>
</thead>
<tbody>
<tr>
<td>__s32</td>
<td>value</td>
<td>New value or current value.</td>
</tr>
</tbody>
</table>

Return Value

On success 0 is returned, on error -1 and the errno variable is set appropriately. The generic error codes are described at the Generic Error Codes chapter.

EINVAL The struct v4l2_control id is invalid or the value is inappropriate for the given control (i.e. if a menu item is selected that is not supported by the driver according to VIDIOC_QUERYMENU).

ERANGE The struct v4l2_control value is out of bounds.

EBUSY The control is temporarily not changeable, possibly because another applications took over control of the device function this control belongs to.

EACCES Attempt to set a read-only control or to get a write-only control.

3.2.7.26 ioctl VIDIOC_G_DV_TIMINGS, VIDIOC_S_DV_TIMINGS

Name

VIDIOC_G_DV_TIMINGS - VIDIOC_S_DV_TIMINGS - VIDIOC_SUBDEV_G_DV_TIMINGS - VIDIOC_SUBDEV_S_DV_TIMINGS - Get or set DV timings for input or output

Synopsis

VIDIOC_G_DV_TIMINGS
int ioctl(int fd, VIDIOC_G_DV_TIMINGS, struct v4l2_dv_timings *argp)

VIDIOC_S_DV_TIMINGS
int ioctl(int fd, VIDIOC_S_DV_TIMINGS, struct v4l2_dv_timings *argp)

VIDIOC_SUBDEV_G_DV_TIMINGS
int ioctl(int fd, VIDIOC_SUBDEV_G_DV_TIMINGS, struct v4l2_dv_timings *argp)

VIDIOC_SUBDEV_S_DV_TIMINGS
int ioctl(int fd, VIDIOC_SUBDEV_S_DV_TIMINGS, struct v4l2_dv_timings *argp)
**Arguments**

_fd_ File descriptor returned by `open()`.

_argp_ Pointer to `struct v4l2_dv_timings`.

**Description**

To set DV timings for the input or output, applications use the `VIDIOC_S_DV_TIMINGS` ioctl and to get the current timings, applications use the `VIDIOC_G_DV_TIMINGS` ioctl. The detailed timing information is filled in using the structure `struct v4l2_dv_timings`. These ioctls take a pointer to the struct `v4l2_dv_timings` structure as argument. If the ioctl is not supported or the timing values are not correct, the driver returns `EINVAL` error code.

Calling `VIDIOC_SUBDEV_S_DV_TIMINGS` on a subdev device node that has been registered in read-only mode is not allowed. An error is returned and the `errno` variable is set to `-EPERM`.

The `linux/v4l2-dv-timings.h` header can be used to get the timings of the formats in the CEA-861-E and VESA DMT standards. If the current input or output does not support DV timings (e.g. if `ioctl VIDIOC_ENUMINPUT` does not set the `V4L2_IN_CAP_DV_TIMINGS` flag), then `ENODATA` error code is returned.

**Return Value**

On success 0 is returned, on error -1 and the `errno` variable is set appropriately. The generic error codes are described at the Generic Error Codes chapter.

- **EINVAL** This ioctl is not supported, or the `VIDIOC_S_DV_TIMINGS` parameter was unsuitable.
- **ENODATA** Digital video timings are not supported for this input or output.
- **EBUSY** The device is busy and therefore cannot change the timings.
- **EPERM** `VIDIOC_SUBDEV_S_DV_TIMINGS` has been called on a read-only subdevice.

Table 184 – continued from previous page

| V4L2_DV_FL_CAN_DETECT_REducedFPS | CEA-861 specific: only valid for video receivers, the flag is cleared by transmitters. If set, then the hardware can detect the difference between regular framerates and framerates reduced by 1000/1001. E.g.: 60 vs 59.94 Hz, 30 vs 29.97 Hz or 24 vs 23.976 Hz. |

3.2.7.27 ioctl VIDIOC_G_EDID, VIDIOC_S_EDID, VIDIOC_SUBDEV_G_EDID, VIDIOC_SUBDEV_S_EDID

Name

VIDIOC_G_EDID - VIDIOC_S_EDID - VIDIOC_SUBDEV_G_EDID - VIDIOC_SUBDEV_S_EDID - Get or set the EDID of a video receiver/transmitter

Synopsis

**VIDIOC_G_EDID**

```c
int ioctl(int fd, VIDIOC_G_EDID, struct v4l2_edid *argp)
```

**VIDIOC_S_EDID**

```c
int ioctl(int fd, VIDIOC_S_EDID, struct v4l2_edid *argp)
```

**VIDIOC_SUBDEV_G_EDID**

```c
int ioctl(int fd, VIDIOC_SUBDEV_G_EDID, struct v4l2_edid *argp)
```

**VIDIOC_SUBDEV_S_EDID**

```c
int ioctl(int fd, VIDIOC_SUBDEV_S_EDID, struct v4l2_edid *argp)
```

Arguments

- **fd** File descriptor returned by `open()`.
- **argp** Pointer to struct `v4l2_edid`.

Description

These ioctls can be used to get or set an EDID associated with an input from a receiver or an output of a transmitter device. They can be used with subdevice nodes (/dev/v4l-subdevX) or with video nodes (/dev/videoX).

When used with video nodes the pad field represents the input (for video capture devices) or output (for video output devices) index as is returned by `ioctl VIDIOC_ENUMINPUT` and `ioctl VIDIOC_ENUMOUTPUT` respectively. When used with subdevice nodes the pad field represents the input or output pad of the subdevice. If there is no EDID support for the given pad value, then the EINVAL error code will be returned.
To get the EDID data the application has to fill in the pad, start_block, blocks and edid fields, zero the reserved array and call `VIDIOC_G_EDID`. The current EDID from block start_block and of size blocks will be placed in the memory edid points to. The edid pointer must point to memory at least blocks * 128 bytes large (the size of one block is 128 bytes).

If there are fewer blocks than specified, then the driver will set blocks to the actual number of blocks. If there are no EDID blocks available at all, then the error code `ENODATA` is set.

If blocks have to be retrieved from the sink, then this call will block until they have been read.

If start_block and blocks are both set to 0 when `VIDIOC_G_EDID` is called, then the driver will set blocks to the total number of available EDID blocks and it will return 0 without copying any data. This is an easy way to discover how many EDID blocks there are.

**Note:** If there are no EDID blocks available at all, then the driver will set blocks to 0 and it returns 0.

To set the EDID blocks of a receiver the application has to fill in the pad, blocks and edid fields, set start_block to 0 and zero the reserved array. It is not possible to set part of an EDID, it is always all or nothing. Setting the EDID data is only valid for receivers as it makes no sense for a transmitter.

The driver assumes that the full EDID is passed in. If there are more EDID blocks than the hardware can handle then the EDID is not written, but instead the error code `E2BIG` is set and blocks is set to the maximum that the hardware supports. If start_block is any value other than 0 then the error code `EINVAL` is set.

To disable an EDID you set blocks to 0. Depending on the hardware this will drive the hotplug pin low and/or block the source from reading the EDID data in some way. In any case, the end result is the same: the EDID is no longer available.

Return Value

On success 0 is returned, on error -1 and the errno variable is set appropriately. The generic error codes are described at the Generic Error Codes chapter.

ENODATA The EDID data is not available.
E2BIG The EDID data you provided is more than the hardware can handle.

3.2.7.28 ioctl VIDIOC_G_ENC_INDEX

Name

VIDIOC_G_ENC_INDEX - Get meta data about a compressed video stream

Synopsis

VIDIOC_G_ENC_INDEX

int ioctl(int fd, VIDIOC_G_ENC_INDEX, struct v4l2_enc_idx *argp)

Arguments

fd File descriptor returned by open().
argp Pointer to struct v4l2_enc_idx.

Description

The VIDIOC_G_ENC_INDEX ioctl provides meta data about a compressed video stream the same or another application currently reads from the driver, which is useful for random access into the stream without decoding it.

To read the data applications must call VIDIOC_G_ENC_INDEX with a pointer to a struct v4l2_enc_idx. On success the driver fills the entry array, stores the number of elements written in the entries field, and initializes the entries_cap field.

Each element of the entry array contains meta data about one picture. A VIDIOC_G_ENC_INDEX call reads up to V4L2_ENC_IDX_ENTRIES entries from a driver buffer, which can hold up to entries_cap entries. This number can be lower or higher than V4L2_ENC_IDX_ENTRIES, but not zero. When the application fails to read the meta data in time the oldest entries will be lost. When the buffer is empty or no capturing/encoding is in progress, entries will be zero.

Currently this ioctl is only defined for MPEG-2 program streams and video elementary streams.

On success 0 is returned, on error -1 and the errno variable is set appropriately. The generic error codes are described at the Generic Error Codes chapter.

3.2.7.29 ioctl VIDIOC_G_EXT_CTRLS, VIDIOC_S_EXT_CTRLS, VIDIOC_TRY_EXT_CTRLS

Name

VIDIOC_G_EXT_CTRLS - VIDIOC_S_EXT_CTRLS - VIDIOC_TRY_EXT_CTRLS - Get or set the value of several controls, try control values

Synopsis

VIDIOC_G_EXT_CTRLS
int ioctl(int fd, VIDIOC_G_EXT_CTRLS, struct v4l2_ext_controls *argp)

VIDIOC_S_EXT_CTRLS
int ioctl(int fd, VIDIOC_S_EXT_CTRLS, struct v4l2_ext_controls *argp)

VIDIOC_TRY_EXT_CTRLS
int ioctl(int fd, VIDIOC_TRY_EXT_CTRLS, struct v4l2_ext_controls *argp)

Arguments

fd File descriptor returned by open().

argp Pointer to struct v4l2_ext_controls.

Description

These ioctls allow the caller to get or set multiple controls atomically. Control IDs are grouped into control classes (see Control classes) and all controls in the control array must belong to the same control class.

Applications must always fill in the count, which, controls and reserved fields of struct v4l2_ext_controls, and initialize the struct v4l2_ext_control array pointed to by the controls fields.

To get the current value of a set of controls applications initialize the id, size and reserved2 fields of each struct v4l2_ext_control and call the VIDIOC_G_EXT_CTRLS ioctl. String controls must also set the string field. Controls of compound types (V4L2_CTRL_FLAG_HAS_PAYLOAD is set) must set the ptr field.

If the size is too small to receive the control result (only relevant for pointer-type controls like strings), then the driver will set size to a valid value and return an ENOSPC error code. You should re-allocate the memory to this new size and try again. For the string type it is possible that the same issue occurs again if the string has grown in the meantime. It is recommended to
call `ioctl VIDI0C_QUERYCTRL, VIDI0C_QUERY_EXT_CTRL and VIDI0C_QUERYMENU` first and use maximum+1 as the new size value. It is guaranteed that that is sufficient memory.

N-dimensional arrays are set and retrieved row-by-row. You cannot set a partial array, all elements have to be set or retrieved. The total size is calculated as `elems * elem_size`. These values can be obtained by calling `VIDIOC_QUERY_EXT_CTRL`.

To change the value of a set of controls applications initialize the `id`, `size`, `reserved2` and `value/value64/string/ptr` fields of each struct `v4l2_ext_control` and call the `VIDIOC_S_EXT_CTRLS` ioctl. The controls will only be set if all control values are valid.

To check if a set of controls have correct values applications initialize the `id`, `size`, `reserved2` and `value/value64/string/ptr` fields of each struct `v4l2_ext_control` and call the `VIDIOC_TRY_EXT_CTRLS` ioctl. It is up to the driver whether wrong values are automatically adjusted to a valid value or if an error is returned.

When the `id` or which is invalid drivers return an EINVAL error code. When the value is out of bounds drivers can choose to take the closest valid value or return an ERANGE error code, whatever seems more appropriate. In the first case the new value is set in struct `v4l2_ext_control`. If the new control value is inappropriate (e.g. the given menu index is not supported by the menu control), then this will also result in an EINVAL error code error.

If `request_fd` is set to a not-yet-queued request file descriptor and which is set to `V4L2_CTRL WHICH REQUEST VAL`, then the controls are not applied immediately when calling `VIDIOC_S_EXT_CTRLS`, but instead are applied by the driver for the buffer associated with the same request. If the device does not support requests, then EACCES will be returned. If requests are supported but an invalid request file descriptor is given, then EINVAL will be returned.

An attempt to call `VIDIOC_S_EXT_CTRLS` for a request that has already been queued will result in an EBUSY error.

If `request_fd` is specified and which is set to `V4L2_CTRL WHICH REQUEST_VAL` during a call to `VIDIOC_G_EXT_CTRLS`, then it will return the values of the controls at the time of request completion. If the request is not yet completed, then this will result in an EACCES error.

The driver will only set/get these controls if all control values are correct. This prevents the situation where only some of the controls were set/get. Only low-level errors (e.g. a failed i2c command) can still cause this situation.

**v4l2_ext_control**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>

</thead>
<tbody>
<tr>
<td>__u32 id</td>
<td>Identifies the control, set by the application.</td>
</tr>
<tr>
<td>__u32 size</td>
<td>The total size in bytes of the payload of this control.</td>
</tr>
</tbody>
</table>

The `size` field is normally 0, but for pointer controls this should be set to the size of the memory that contains the payload or that will receive the payload. If `VIDIOC_G_EXT_CTRLS` finds that this value is less than is required to store the payload result, then it is set to a value large enough to store the payload result and ENOSPC is returned.

**Note:** For string controls, this `size` field should not be confused with the length of the string. This field refers to the size of the memory that contains the string. The actual length of the string may well be much smaller.

Continued on next page
struct v4l2_ctrl_mpeg2_picture * p_mpeg2_picture
    A pointer to a struct v4l2_ctrl_mpeg2_picture.
    Valid if this control is of type V4L2_CTRL_TYPE_MPEG2_PICTURE.

struct v4l2_ctrl_mpeg2_quantisation * p_mpeg2_quantisation
    A pointer to a struct v4l2_ctrl_mpeg2_quantisation.
    Valid if this control is of type V4L2_CTRL_TYPE_MPEG2_QUANTISATION.

struct v4l2_ctrl_hdr10_cll_info * p_hdr10_cll
    A pointer to a struct v4l2_ctrl_hdr10_cll_info.
    Valid if this control is of type V4L2_CTRL_TYPE_HDR10_CLL_INFO.

struct v4l2_ctrl_hdr10_mastering_display * p_hdr10_mastering
    A pointer to a struct v4l2_ctrl_hdr10_mastering_display.
    Valid if this control is of type V4L2_CTRL_TYPE_HDR10_MASTERING_DISPLAY.

void * ptr
    A pointer to a compound type which can be an N-dimensional array and/or
    a compound type (the control’s type is >= V4L2_CTRL_COMPOUND_TYPES).
    Valid if V4L2_CTRL_FLAG_HAS_PAYLOAD is set for this control.

} v4l2_ext_controls

union {
    __u32 which
    Which value of the control to get/set/try.

    V4L2_CTRL_WHICH_CUR_VAL will return the current value of the control,
    V4L2_CTRL_WHICH_DEF_VAL will return the default value of the control and
    V4L2_CTRL_WHICH_REQUEST_VAL indicates that these controls have to be retrieved from
    a request or tried/set for a request. In the latter case the request_fd field contains the
    file descriptor of the request that should be used. If the device does not support requests,
    then EACCES will be returned.

    When using V4L2_CTRL_WHICH_DEF_VAL be aware that you can only get the default value of
    the control, you cannot set or try it.

    For backwards compatibility you can also use a control class here (see Control classes).
    In that case all controls have to belong to that control class. This usage is deprecated,
    instead just use V4L2_CTRL_WHICH_CUR_VAL. There are some very old drivers that do not
    yet support V4L2_CTRL_WHICH_CUR_VAL and that require a control class here. You can
    test for such drivers by setting which to V4L2_CTRL_WHICH_CUR_VAL and calling VID-
    IOC_TRY_EXT_CTRLS with a count of 0. If that fails, then the driver does not support
    V4L2_CTRL_WHICH_CUR_VAL.

    __u32 ctrl_class
    Deprecated name kept for backwards compatibility. Use which instead.

} __u32 count
    The number of controls in the controls array. May also
    be zero.

__u32 error_idx
    Index of the failing control. Set by the driver in case of
    an error.
If the error is associated with a particular control, then \texttt{error_idx} is set to the index of that control. If the error is not related to a specific control, or the validation step failed (see below), then \texttt{error_idx} is set to count. The value is undefined if the ioctl returned 0 (success).

Before controls are read from/written to hardware a validation step takes place: this checks if all controls in the list are valid controls, if no attempt is made to write to a read-only control or read from a write-only control, and any other up-front checks that can be done without accessing the hardware. The exact validations done during this step are driver-dependent since some checks might require hardware access for some devices, thus making it impossible to do those checks up-front. However, drivers should make a best-effort to do as many up-front checks as possible.

This check is done to avoid leaving the hardware in an inconsistent state due to easy-to-avoid problems. But it leads to another problem: the application needs to know whether an error came from the validation step (meaning that the hardware was not touched) or from an error during the actual reading from/writing to hardware.

The, in hindsight quite poor, solution for that is to set \texttt{error_idx} to count if the validation failed. This has the unfortunate side-effect that it is not possible to see which control failed the validation. If the validation was successful and the error happened while accessing the hardware, then \texttt{error_idx} is less than count and only the controls up to \texttt{error_idx}-1 were read or written correctly, and the state of the remaining controls is undefined.

Since \texttt{VIDIOC_TRY_EXT_CTRLS} does not access hardware there is also no need to handle the validation step in this special way, so \texttt{error_idx} will just be set to the control that failed the validation step instead of to count. This means that if \texttt{VIDIOC_S_EXT_CTRLS} fails with \texttt{error_idx} set to count, then you can call \texttt{VIDIOC_TRY_EXT_CTRLS} to try to discover the actual control that failed the validation step. Unfortunately, there is no TRY equivalent for \texttt{VIDIOC_G_EXT_CTRLS}.

\begin{tabular}{|c|c|}
\hline
\texttt{s32} & \texttt{request_fd} \\
\hline
& File descriptor of the request to be used by this operation. Only valid if which is set to \texttt{V4L2_CTRL WHICH REQUEST VAL}. If the device does not support requests, then \texttt{EACCES} will be returned. If requests are supported but an invalid request file descriptor is given, then \texttt{EINVAL} will be returned. \\

Return Value

On success 0 is returned, on error -1 and the errno variable is set appropriately. The generic error codes are described at the Generic Error Codes chapter.

EINVAL The struct v4l2_ext_control_id is invalid, or the struct v4l2_ext_controls which is invalid, or the struct v4l2_ext_control value was inappropriate (e.g. the given menu index is not supported by the driver), or the which field was set to V4L2_CTRL WHICH REQUEST_VAL but the given request_fd was invalid or V4L2_CTRL WHICH REQUEST_VAL is not supported by the kernel. This error code is also returned by the VIDIOC_S_EXT_CTRLS and VIDIOC_TRY_EXT_CTRLS ioctls if two or more control values are in conflict.

ERANGE The struct v4l2_ext_control value is out of bounds.
**EBUSY** The control is temporarily not changeable, possibly because another applications took over control of the device function this control belongs to, or (if the which field was set to `V4L2_CTRL_WHICH_REQUEST_VAL`) the request was queued but not yet completed.

**ENOSPC** The space reserved for the control's payload is insufficient. The field size is set to a value that is enough to store the payload and this error code is returned.

**EACCES** Attempt to try or set a read-only control, or to get a write-only control, or to get a control from a request that has not yet been completed.

Or the which field was set to `V4L2_CTRL_WHICH_REQUEST_VAL` but the device does not support requests.

### 3.2.7.30 ioctl VIDIOC_G_FBUF, VIDIOC_S_FBUF

**Name**

VIDIOC_G_FBUF - VIDIOC_S_FBUF - Get or set frame buffer overlay parameters

**Synopsis**

**VIDIOC_G_FBUF**

```c
int ioctl(int fd, VIDIOC_G_FBUF, struct v4l2_framebuffer *argp)
```

**VIDIOC_S_FBUF**

```c
int ioctl(int fd, VIDIOC_S_FBUF, const struct v4l2_framebuffer *argp)
```

**Arguments**

- `fd` File descriptor returned by `open()`.
- `argp` Pointer to struct `v4l2_framebuffer`.

**Description**

Applications can use the `VIDIOC_G_FBUF` and `VIDIOC_S_FBUF` ioctl to get and set the frame buffer parameters for a Video Overlay or Video Output Overlay (OSD). The type of overlay is implied by the device type (capture or output device) and can be determined with the `ioctl VIDIOC_QUERYCAP` ioctl. One `/dev/videoN` device must not support both kinds of overlay.

The V4L2 API distinguishes destructive and non-destructive overlays. A destructive overlay copies captured video images into the video memory of a graphics card. A non-destructive overlay blends video images into a VGA signal or graphics into a video signal. Video Output Overlays are always non-destructive.

To get the current parameters applications call the `VIDIOC_G_FBUF` ioctl with a pointer to a struct `v4l2_framebuffer` structure. The driver fills all fields of the structure or returns an EINVAL error code when overlays are not supported.

To set the parameters for a Video Output Overlay, applications must initialize the flags field of a struct `v4l2_framebuffer`. Since the framebuffer is implemented on the TV card all other
parameters are determined by the driver. When an application calls `VIDIOC_S_FBUF` with a pointer to this structure, the driver prepares for the overlay and returns the framebuffer parameters as `VIDIOC_G_FBUF` does, or it returns an error code.

To set the parameters for a non-destructive Video Overlay, applications must initialize the flags field, the fmt substructure, and call `VIDIOC_S_FBUF`. Again, the driver prepares for the overlay and returns the framebuffer parameters as `VIDIOC_G_FBUF` does, or it returns an error code.

For a destructive Video Overlay applications must additionally provide a base address. Setting up a DMA to a random memory location can jeopardize the system security, its stability or even damage the hardware, therefore only the superuser can set the parameters for a destructive video overlay.

**v4l2_framebuffer**

Table 192: struct v4l2_framebuffer

<table>
<thead>
<tr>

</tr>
<tr>
<td>__u32 pixelformat</td>
<td>The pixel format of the framebuffer.</td>
</tr>
</tbody>
</table>

For non-destructive Video Overlays this field only defines a format for the struct v4l2_window chromakey field.

Continued on next page
For *destructive Video Overlays* applications must initialize this field. For *Video Output Overlays* the driver must return a valid format.

Usually this is an RGB format (for example `V4L2_PIX_FMT_RGB565`) but YUV formats (only packed YUV formats when chroma keying is used, not including `V4L2_PIX_FMT_YUYV` and `V4L2_PIX_FMT_UYVY`) and the `V4L2_PIX_FMT_PAL8` format are also permitted. The behavior of the driver when an application requests a compressed format is undefined. See *Image Formats* for information on pixel formats.

<table>
<thead>
<tr>
<th>enum v4l2_field</th>
<th>field</th>
</tr>
</thead>
<tbody>
<tr>
<td>__u32</td>
<td>bytesperline</td>
</tr>
</tbody>
</table>

Drivers and applications shall ignore this field. If applicable, the field order is selected with the `VIDIOC_S_FMT` ioctl, using the `field` field of struct `v4l2_window`.

This field is irrelevant to *non-destructive Video Overlays*.

For *destructive Video Overlays* both applications and drivers can set this field to request padding bytes at the end of each line. Drivers however may ignore the requested value, returning width times bytes-per-pixel or a larger value required by the hardware. That implies applications can just set this field to zero to get a reasonable default.

For *Video Output Overlays* the driver must return a valid value.

Video hardware may access padding bytes, therefore they must reside in accessible memory. Consider for example the case where padding bytes after the last line of an image cross a system page boundary. Capture devices may write padding bytes, the value is undefined. Output devices ignore the contents of padding bytes.

When the image format is planar the `bytesperline` value applies to the first plane and is divided by the same factor as the `width` field for the other planes. For example the Cb and Cr planes of a YUV 4:2:0 image have half as many padding bytes following each line as the Y plane. To avoid ambiguities drivers must return a `bytesperline` value rounded up to a multiple of the scale factor.

<tr>
<td>V4L2_FBUF_FLAG_OVERLAY</td>
<td>0x002</td>
<td>If this flag is set for a video capture device, then the driver will set the initial overlay size to cover the full framebuffer size, otherwise the existing overlay size (as set by <code>VIDIOC_S_FMT</code>) will be used. Only one video capture driver (bttv) supports this flag. The use of this flag for capture devices is deprecated. There is no way to detect which drivers support this flag, so the only reliable method of setting the overlay size is through <code>VIDIOC_S_FMT</code>. If this flag is set for a video output device, then the video output overlay window is relative to the top-left corner of the framebuffer and restricted to the size of the framebuffer. If it is cleared, then the video output overlay window is relative to the video output display.</td>
</tr>
<tr>
<td>V4L2_FBUF_FLAG_CHROMAKEY</td>
<td>0x004</td>
<td>Use chroma-keying. The chroma-key color is determined by the chromakey field of <code>struct v4l2_window</code> and negotiated with the <code>VIDIOC_S_FMT</code> ioctl, see <code>Video Overlay Interface</code> and <code>Video Output Overlay Interface</code>.</td>
</tr>
<tr>
<td>V4L2_FBUF_FLAG_LOCAL_ALPHA</td>
<td>0x008</td>
<td>Use the alpha channel of the framebuffer to clip or blend framebuffer pixels with video images. The blend function is: output = framebuffer pixel * alpha + video pixel * (1 - alpha). The actual alpha depth depends on the framebuffer pixel format.</td>
</tr>
<tr>
<td>V4L2_FBUF_FLAG_GLOBAL_ALPHA</td>
<td>0x010</td>
<td>Use a global alpha value to blend the framebuffer with video images. The blend function is: output = (framebuffer pixel * alpha + video pixel * (255 - alpha)) / 255. The alpha value is determined by the <code>global_alpha</code> field of <code>struct v4l2_window</code> and negotiated with the <code>VIDIOC_S_FMT</code> ioctl, see <code>Video Overlay Interface</code> and <code>Video Output Overlay Interface</code>.</td>
</tr>
</tbody>
</table>

There are no flags to enable clipping using a list of clip rectangles or a bitmap. These methods are negotiated with the `VIDIOC_S_FMT` ioctl, see `Video Overlay Interface` and `Video Output Overlay Interface`. Continued on next page
Like V4L2_FBUF_FLAG_LOCAL_ALPHA, use the alpha channel of the framebuffer to clip or blend framebuffer pixels with video images, but with an inverted alpha value. The blend function is: output = framebuffer pixel *(1 - alpha) + video pixel * alpha. The actual alpha depth depends on the framebuffer pixel format.

Use source chroma-keying. The source chroma-key color is determined by the chromakey field of struct v4l2_window and negotiated with the VIDIOC_S_FMT ioctl, see Video Overlay Interface and Video Output Overlay Interface. Both chroma-keying are mutual exclusive to each other, so same chromakey field of struct v4l2_window is being used.

Return Value

On success 0 is returned, on error -1 and the errno variable is set appropriately. The generic error codes are described at the Generic Error Codes chapter.

EPERM VIDIOC_S_FBUF can only be called by a privileged user to negotiate the parameters for a destructive overlay.

EINVAL The VIDIOC_S_FBUF parameters are unsuitable.

3.2.7.31 ioctl VIDIOC_G_FMT, VIDIOC_S_FMT, VIDIOC_TRY_FMT

Name

VIDIOC_G_FMT - VIDIOC_S_FMT - VIDIOC_TRY_FMT - Get or set the data format, try a format

Synopsis

VIDIOC_G_FMT

int ioctl(int fd, VIDIOC_G_FMT, struct v4l2_format *argp)

VIDIOC_S_FMT

int ioctl(int fd, VIDIOC_S_FMT, struct v4l2_format *argp)

VIDIOC_TRY_FMT

int ioctl(int fd, VIDIOC_TRY_FMT, struct v4l2_format *argp)
Arguments

**fd** File descriptor returned by open().

**argp** Pointer to struct v4l2_format.

Description

These ioctls are used to negotiate the format of data (typically image format) exchanged between driver and application.

To query the current parameters applications set the type field of a struct v4l2_format to the respective buffer (stream) type. For example video capture devices use V4L2_BUF_TYPE_VIDEO_CAPTURE or V4L2_BUF_TYPE_VIDEO_CAPTURE_MPLANE. When the application calls the **VIDIOC_G_FMT** ioctl with a pointer to this structure the driver fills the respective member of the fmt union. In case of video capture devices that is either the struct v4l2_pix_format pix or the struct v4l2_pix_format_mplane pix_mp member. When the requested buffer type is not supported drivers return an EINVAL error code.

To change the current format parameters applications initialize the type field and all fields of the respective fmt union member. For details see the documentation of the various devices types in *Interfaces*. Good practice is to query the current parameters first, and to modify only those parameters not suitable for the application. When the application calls the **VIDIOC_S_FMT** ioctl with a pointer to a struct v4l2_format structure the driver checks and adjusts the parameters against hardware abilities. Drivers should not return an error code unless the type field is invalid, this is a mechanism to fathom device capabilities and to approach parameters acceptable for both the application and driver. On success the driver may program the hardware, allocate resources and generally prepare for data exchange. Finally the **VIDIOC_S_FMT** ioctl returns the current format parameters as **VIDIOC_G_FMT** does. Very simple, inflexible devices may even ignore all input and always return the default parameters. However all V4L2 devices exchanging data with the application must implement the **VIDIOC_G_FMT** and **VIDIOC_S_FMT** ioctl. When the requested buffer type is not supported drivers return an EINVAL error code on a **VIDIOC_S_FMT** attempt. When I/O is already in progress or the resource is not available for other reasons drivers return the EBUSY error code.

The **VIDIOC_TRY_FMT** ioctl is equivalent to **VIDIOC_S_FMT** with one exception: it does not change driver state. It can also be called at any time, never returning EBUSY. This function is provided to negotiate parameters, to learn about hardware limitations, without disabling I/O or possibly time consuming hardware preparations. Although strongly recommended drivers are not required to implement this ioctl.

The format as returned by **VIDIOC_TRY_FMT** must be identical to what **VIDIOC_S_FMT** returns for the same input or output.

</tbody>
</table>
Return Value

On success 0 is returned, on error -1 and the errno variable is set appropriately. The generic error codes are described at the Generic Error Codes chapter.

EINVAL The struct v4l2_format type field is invalid or the requested buffer type not supported.

EBUSY The device is busy and cannot change the format. This could be because or the device is streaming or buffers are allocated or queued to the driver. Relevant for VIDIOC_S_FMT only.

3.2.7.32 ioctl VIDIOC_G_FREQUENCY, VIDIOC_S_FREQUENCY

Name

VIDIOC_G_FREQUENCY - VIDIOC_S_FREQUENCY - Get or set tuner or modulator radio frequency

Synopsis

VIDIOC_G_FREQUENCY
int ioctl(int fd, VIDIOC_G_FREQUENCY, struct v4l2_frequency *argp)

VIDIOC_S_FREQUENCY
int ioctl(int fd, VIDIOC_S_FREQUENCY, const struct v4l2_frequency *argp)

Arguments

fd File descriptor returned by open().

argp Pointer to struct v4l2_frequency.

Description

To get the current tuner or modulator radio frequency applications set the tuner field of a struct v4l2_frequency to the respective tuner or modulator number (only input devices have tuners, only output devices have modulators), zero out the reserved array and call the VIDIOC_G_FREQUENCY ioctl with a pointer to this structure. The driver stores the current frequency in the frequency field.

To change the current tuner or modulator radio frequency applications initialize the tuner, type and frequency fields, and the reserved array of a struct v4l2_frequency and call the VIDIOC_S_FREQUENCY ioctl with a pointer to this structure. When the requested frequency is not possible the driver assumes the closest possible value. However VIDIOC_S_FREQUENCY is a write-only ioctl, it does not return the actual new frequency.
Table 196: struct v4l2_frequency

| __u32 | tuner | The tuner or modulator index number. This is the same value as in the struct v4l2_input tuner field and the struct v4l2_tuner index field, or the struct v4l2_output modulator field and the struct v4l2_modulator index field. |
| __u32 | type | The tuner type. This is the same value as in the struct v4l2_tuner type field. The type must be set to V4L2_TUNER_RADIO for /dev/radioX device nodes, and to V4L2_TUNER_ANALOG_TV for all others. Set this field to V4L2_TUNER_RADIO for modulators (currently only radio modulators are supported). See v4l2_tuner_type. |
| __u32 | frequency | Tuning frequency in units of 62.5 kHz, or if the struct v4l2_tuner or struct v4l2_modulator capability flag V4L2_TUNER_CAP_LOW is set, in units of 62.5 Hz. A 1 Hz unit is used when the capability flag V4L2_TUNER_CAP_1HZ is set. |
| __u32 | reserved[8] | Reserved for future extensions. Drivers and applications must set the array to zero. |

**Return Value**

On success 0 is returned, on error -1 and the errno variable is set appropriately. The generic error codes are described at the *Generic Error Codes* chapter.

**EINVAL** The tuner index is out of bounds or the value in the type field is wrong.

**EBUSY** A hardware seek is in progress.

**3.2.7.33 ioctl VIDIOC_G_INPUT, VIDIOC_S_INPUT**

**Name**

VIDIOC_G_INPUT - VIDIOC_S_INPUT - Query or select the current video input
Synopsis

VIDIOC_G_INPUT
int ioctl(int fd, VIDIOC_G_INPUT, int *argp)

VIDIOC_S_INPUT
int ioctl(int fd, VIDIOC_S_INPUT, int *argp)

Arguments

fd  File descriptor returned by open().
argp  Pointer an integer with input index.

Description

To query the current video input applications call the VIDIOC_G_INPUT ioctl with a pointer to an integer where the driver stores the number of the input, as in the struct v4l2_input index field. This ioctl will fail only when there are no video inputs, returning EINVAL.

To select a video input applications store the number of the desired input in an integer and call the VIDIOC_S_INPUT ioctl with a pointer to this integer. Side effects are possible. For example inputs may support different video standards, so the driver may implicitly switch the current standard. Because of these possible side effects applications must select an input before querying or negotiating any other parameters.

Information about video inputs is available using the ioctl VIDIOC_ENUMINPUT ioctl.

Return Value

On success 0 is returned, on error -1 and the errno variable is set appropriately. The generic error codes are described at the Generic Error Codes chapter.

EINVAL  The number of the video input is out of bounds.

3.2.7.34 ioctl VIDIOC_G_JPEGCOMP, VIDIOC_S_JPEGCOMP

Name

VIDIOC_G_JPEGCOMP - VIDIOC_S_JPEGCOMP
Synopsis

VIDIOC_G_JPEGCOMP
int ioctl(int fd, VIDIOC_G_JPEGCOMP, v4l2_jpegcompression *argp)

VIDIOC_S_JPEGCOMP
int ioctl(int fd, VIDIOC_S_JPEGCOMP, const v4l2_jpegcompression *argp)

Arguments

fd  File descriptor returned by open().
argp  Pointer to struct v4l2_jpegcompression.

Description

These ioctls are deprecated. New drivers and applications should use JPEG class controls for image quality and JPEG markers control.

to do
Ronald Bultje elaborates:

APP is some application-specific information. The application can set it itself, and it’ll be stored in the JPEG-encoded fields (eg; interlacing information for in an AVI or so). COM is the same, but it’s comments, like ‘encoded by me’ or so.

jpeg_markers describes whether the huffman tables, quantization tables and the restart interval information (all JPEG-specific stuff) should be stored in the JPEG-encoded fields. These define how the JPEG field is encoded. If you omit them, applications assume you’ve used standard encoding. You usually do want to add them.

3.2.7.35 ioctl VIDIOC_G_MODULATOR, VIDIOC_S_MODULATOR

Name

VIDIOC_G_MODULATOR - VIDIOC_S_MODULATOR - Get or set modulator attributes

Synopsis

**VIDIOC_G_MODULATOR**

```c
int ioctl(int fd, VIDIOC_G_MODULATOR, struct v4l2_modulator *argp)
```

**VIDIOC_S_MODULATOR**

```c
int ioctl(int fd, VIDIOC_S_MODULATOR, const struct v4l2_modulator *argp)
```

Arguments

*fd*  File descriptor returned by `open()`.

*argp*  Pointer to struct `v4l2_modulator`.

Description

To query the attributes of a modulator applications initialize the index field and zero out the reserved array of a `v4l2_modulator` and call the `VIDIOC_G_MODULATOR` ioctl with a pointer to this structure. Drivers fill the rest of the structure or return an EINVAL error code when the index is out of bounds. To enumerate all modulators applications shall begin at index zero, incrementing by one until the driver returns EINVAL.

Modulators have two writable properties, an audio modulation set and the radio frequency. To change the modulated audio subprograms, applications initialize the index and `txsubchans` fields and the reserved array and call the `VIDIOC_S_MODULATOR` ioctl. Drivers may choose a different audio modulation if the request cannot be satisfied. However this is a write-only ioctl, it does not return the actual audio modulation selected.
**SDR** specific modulator types are `V4L2_TUNER_SDR` and `V4L2_TUNER_RF`. For SDR devices `txsubchans` field must be initialized to zero. The term ‘modulator’ means SDR transmitter in this context.

To change the radio frequency the `VIDIOC_S_FREQUENCY` ioctl is available.

### v4l2_modulator

Return Value

On success 0 is returned, on error -1 and the errno variable is set appropriately. The generic error codes are described at the Generic Error Codes chapter.

EINVAL The struct v4l2_modulator index is out of bounds.

3.2.7.36 ioctl VIDIOC_G_OUTPUT, VIDIOC_S_OUTPUT

Name

VIDIOC_G_OUTPUT - VIDIOC_S_OUTPUT - Query or select the current video output

Synopsis

VIDIOC_G_OUTPUT
int ioctl(int fd, VIDIOC_G_OUTPUT, int *argp)

VIDIOC_S_OUTPUT
int ioctl(int fd, VIDIOC_S_OUTPUT, int *argp)

Arguments

fd File descriptor returned by open().

argp Pointer to an integer with output index.

Description

To query the current video output applications call the VIDIOC_G_OUTPUT ioctl with a pointer to an integer where the driver stores the number of the output, as in the struct v4l2_output index field. This ioctl will fail only when there are no video outputs, returning the EINVAL error code.

To select a video output applications store the number of the desired output in an integer and call the VIDIOC_S_OUTPUT ioctl with a pointer to this integer. Side effects are possible. For example outputs may support different video standards, so the driver may implicitly switch the current standard. Because of these possible side effects applications must select an output before querying or negotiating any other parameters.

Information about video outputs is available using the ioctl VIDIOC_ENUMOUTPUT ioctl.
Return Value

On success 0 is returned, on error -1 and the errno variable is set appropriately. The generic error codes are described at the *Generic Error Codes* chapter.

**EINVAL** The number of the video output is out of bounds, or there are no video outputs at all.

### 3.2.7.37 ioctl VIDIOC_G_PARM, VIDIOC_S_PARM

**Name**

VIDIOC_G_PARM - VIDIOC_S_PARM - Get or set streaming parameters

**Synopsis**

**VIDIOC_G_PARM**

```c
int ioctl(int fd, VIDIOC_G_PARM, v4l2_streamparm *argp)
```

**VIDIOC_S_PARM**

```c
int ioctl(int fd, VIDIOC_S_PARM, v4l2_streamparm *argp)
```

**Arguments**

- **fd** File descriptor returned by `open()`.
- **argp** Pointer to struct `v4l2_streamparm`.

**Description**

Applications can request a different frame interval. The capture or output device will be reconfigured to support the requested frame interval if possible. Optionally drivers may choose to skip or repeat frames to achieve the requested frame interval.

For stateful encoders (see *Memory-to-Memory Stateful Video Encoder Interface*) this represents the frame interval that is typically embedded in the encoded video stream.

Changing the frame interval shall never change the format. Changing the format, on the other hand, may change the frame interval.

Further these ioctl's can be used to determine the number of buffers used internally by a driver in read/write mode. For implications see the section discussing the `read()` function.

To get and set the streaming parameters applications call the `VIDIOC_G_PARM` and `VIDIOC_S_PARM` ioctl, respectively. They take a pointer to a struct `v4l2_streamparm` which contains a union holding separate parameters for input and output devices.

`v4l2_streamparm`
Table 201: struct v4l2_streamparm

<table>

</tr>
</tbody>
</table>

This will configure the speed at which the video source (e.g. a sensor) generates video frames. If the speed is fixed, then the driver may choose to skip or repeat frames in order to achieve the requested frame rate.

For stateful encoders (see Memory-to-Memory Stateful Video Encoder Interface) this represents the frame interval that is typically embedded in the encoded video stream.

Applications store here the desired frame period, drivers return the actual frame period. Changing the video standard (also implicitly by switching the video input) may reset this parameter to the nominal frame period. To reset manually applications can just set this field to zero.

Drivers support this function only when they set the V4L2_CAP_TIMEPERFRAME flag in the capability field.

struct v4l2_fract timeperframe
This is the desired period between successive frames output by the driver, in seconds.

The field is intended to repeat frames on the driver side in `write()` mode (in streaming mode timestamps can be used to throttle the output), saving I/O bandwidth. For stateful encoders (see *Memory-to-Memory Stateful Video Encoder Interface*) this represents the frame interval that is typically embedded in the encoded video stream and it provides a hint to the encoder of the speed at which raw frames are queued up to the encoder.

Applications store here the desired frame period, drivers return the actual frame period. Changing the video standard (also implicitly by switching the video output) may reset this parameter to the nominal frame period. To reset manually applications can just set this field to zero.

Drivers support this function only when they set the `V4L2_CAP_TIMEPERFRAME` flag in the `capability` field.

__u32 extendedmode
Custom (driver specific) streaming parameters. When unused, applications and drivers must set this field to zero. Applications using this field should check the driver name and version, see *Querying Capabilities*.

__u32 writebuffers
Applications set this field to the desired number of buffers used internally by the driver in `write()` mode. Drivers return the actual number of buffers. When an application requests zero buffers, drivers should just return the current setting rather than the minimum or an error code. For details see *Read/Write*.

__u32 reserved[4]
Reserved for future extensions. Drivers and applications must set the array to zero.

Table 204: Streaming Parameters Capabilities

| V4L2_CAP_TIMEPERFRAME | 0x1000 | The frame period can be modified by setting the `timeperframe` field. |
Table 205: Capture Parameters Flags

<table>
<thead>
<tr>
<th>V4L2_MODE_HIGHQUALITY</th>
<th>0x0001</th>
</tr>
</thead>
</table>
| High quality imaging mode. High quality mode is intended for still imaging applications. The idea is to get the best possible image quality that the hardware can deliver. It is not defined how the driver writer may achieve that; it will depend on the hardware and the ingenuity of the driver writer. High quality mode is a different mode from the regular motion video capture modes. In high quality mode:
  • The driver may be able to capture higher resolutions than for motion capture.
  • The driver may support fewer pixel formats than motion capture (e.g., true color).
  • The driver may capture and arithmetically combine multiple successive fields or frames to remove color edge artifacts and reduce the noise in the video data.
  • The driver may capture images in slices like a scanner in order to handle larger format images than would otherwise be possible.
  • An image capture operation may be significantly slower than motion capture.
  • Moving objects in the image might have excessive motion blur.
  • Capture might only work through the read() call. |

Return Value

On success 0 is returned, on error -1 and the errno variable is set appropriately. The generic error codes are described at the *Generic Error Codes* chapter.
3.2.7.38 ioctl VIDIOC_G_PRIORITY, VIDIOC_S_PRIORITY

**Name**

VIDIOC_G_PRIORITY - VIDIOC_S_PRIORITY - Query or request the access priority associated with a file descriptor

**Synopsis**

**VIDIOC_G_PRIORITY**

```c
int ioctl(int fd, VIDIOC_G_PRIORITY, enum v4l2_priority *argp)
```

**VIDIOC_S_PRIORITY**

```c
int ioctl(int fd, VIDIOC_S_PRIORITY, const enum v4l2_priority *argp)
```

**Arguments**

- `fd` File descriptor returned by `open()`.
- `argp` Pointer to an enum `v4l2_priority` type.

**Description**

To query the current access priority applications call the `VIDIOC_G_PRIORITY` ioctl with a pointer to an enum `v4l2_priority` variable where the driver stores the current priority.

To request an access priority applications store the desired priority in an enum `v4l2_priority` variable and call `VIDIOC_S_PRIORITY` ioctl with a pointer to this variable.

**v4l2_priority**
Table 206: enum v4l2_priority

<table>
<thead>
<tr>
<th>V4L2_PRIORITY_UNSET</th>

<td>V4L2_PRIORITY_RECORD</td>
<td>3</td>
<td>Highest priority. Only one file descriptor can have this priority, it blocks any other fd from changing device properties. Usually applications which must not be interrupted, like video recording.</td>
</tr>
</tbody>
</table>

Return Value

On success 0 is returned, on error -1 and the errno variable is set appropriately. The generic error codes are described at the Generic Error Codes chapter.

EINVAL The requested priority value is invalid.

EBUSY Another application already requested higher priority.

3.2.7.39 ioctl VIDIOC_G_SELECTION, VIDIOC_S_SELECTION

Name

VIDIOC_G_SELECTION - VIDIOC_S_SELECTION - Get or set one of the selection rectangles

Synopsis

VIDIOC_G_SELECTION

int ioctl(int fd, VIDIOC_G_SELECTION, struct v4l2_selection *argp)

VIDIOC_S_SELECTION

int ioctl(int fd, VIDIOC_S_SELECTION, struct v4l2_selection *argp)
Arguments

- **fd**: File descriptor returned by `open()`.
- **argp**: Pointer to `struct v4l2_selection`.

Description

The `ioctl`s are used to query and configure selection rectangles.

To query the cropping (composing) rectangle, set `struct v4l2_selection type` field to the respective buffer type. The next step is setting the value of `struct v4l2_selection target` field to `V4L2_SEL_TGT_CROP` (`V4L2_SEL_TGT_COMPOSE`). Please refer to table `Common selection definitions` or `Cropping, composing and scaling – the SELECTION API` for additional targets. The flags and reserved fields of `struct v4l2_selection` are ignored and they must be filled with zeros. The driver fills the rest of the structure or returns EINVAL error code if incorrect buffer type or target was used. If cropping (composing) is not supported then the active rectangle is not mutable and it is always equal to the bounds rectangle. Finally, the `struct v4l2_rect` rectangle is filled with the current cropping (composing) coordinates. The coordinates are expressed in driver-dependent units. The only exception are rectangles for images in raw formats, whose coordinates are always expressed in pixels.

To change the cropping (composing) rectangle set the `struct v4l2_selection type` field to the respective buffer type. The next step is setting the value of `struct v4l2_selection target` to `V4L2_SEL_TGT_CROP` (`V4L2_SEL_TGT_COMPOSE`). Please refer to table `Common selection definitions` or `Cropping, composing and scaling – the SELECTION API` for additional targets. The `struct v4l2_rect` rectangle need to be set to the desired active area. Field `struct v4l2_selection` reserved is ignored and must be filled with zeros. The driver may adjust coordinates of the requested rectangle. An application may introduce constraints to control rounding behaviour. The `struct v4l2_selection flags` field must be set to one of the following:

- **0**: The driver can adjust the rectangle size freely and shall choose a crop/compose rectangle as close as possible to the requested one.
- **V4L2_SEL_FLAG_GE**: The driver is not allowed to shrink the rectangle. The original rectangle must lay inside the adjusted one.
- **V4L2_SEL_FLAG_LE**: The driver is not allowed to enlarge the rectangle. The adjusted rectangle must lay inside the original one.
- **V4L2_SEL_FLAG_GE | V4L2_SEL_FLAG_LE**: The driver must choose the size exactly the same as in the requested rectangle.

Please refer to `Size adjustments with constraint flags`.

The driver may have to adjust the requested dimensions against hardware limits and other parts as the pipeline, i.e. the bounds given by the capture/output window or TV display. The closest possible values of horizontal and vertical offset and sizes are chosen according to following priority:

1. Satisfy constraints from `struct v4l2_selection flags`.
2. Adjust width, height, left, and top to hardware limits and alignments.
3. Keep center of adjusted rectangle as close as possible to the original one.
4. Keep width and height as close as possible to original ones.
5. Keep horizontal and vertical offset as close as possible to original ones.

On success the struct `v4l2_rect r` field contains the adjusted rectangle. When the parameters are unsuitable the application may modify the cropping (composing) or image parameters and repeat the cycle until satisfactory parameters have been negotiated. If constraints flags have to be violated at then ERANGE is returned. The error indicates that there exist no rectangle that satisfies the constraints.

Selection targets and flags are documented in *Common selection definitions*.

![Fig. 18: Size adjustments with constraint flags.](image)

**v4l2_selection**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>__u32</code> type</td>
<td>Type of the buffer (from enum <code>v4l2_buf_type</code>).</td>

<tr>
<td><code>__u32</code> target</td>
<td>Used to select between <em>cropping and composing rectangles</em>.</td>
</tr>
<tr>
<td><code>__u32</code> flags</td>
<td>Flags controlling the selection rectangle adjustments, refer to <em>selection flags</em>.</td>
</tr>
<tr>
<td><code>struct v4l2_rect</code> r</td>
<td>The selection rectangle.</td>
</tr>
<tr>
<td><code>__u32</code> reserved[9]</td>
<td>Reserved fields for future use. Drivers and applications must zero this array.</td>
</tr>
</tbody>
</table>

**Note:** Unfortunately in the case of multiplanar buffer types...
This API was messed up with regards to how the v4l2_selection type field should be filled in. Some drivers only accepted the _MPLANE buffer type while other drivers only accepted a non-multiplanar buffer type (i.e. without the _MPLANE at the end).

Starting with kernel 4.13 both variations are allowed.

**Return Value**

On success 0 is returned, on error -1 and the errno variable is set appropriately. The generic error codes are described at the *Generic Error Codes* chapter.

- **EINVAL** Given buffer type type or the selection target target is not supported, or the flags argument is not valid.
- **ERANGE** It is not possible to adjust struct v4l2_rect r rectangle to satisfy all constraints given in the flags argument.
- **ENODATA** Selection is not supported for this input or output.
- **EBUSY** It is not possible to apply change of the selection rectangle at the moment. Usually because streaming is in progress.

**3.2.7.40 ioctl VIDIOC_G_SLICED_VBI_CAP**

**Name**

VIDIOC_G_SLICED_VBI_CAP - Query sliced VBI capabilities

**Synopsis**

```
VIDIOC_G_SLICED_VBI_CAP
int ioctl(int fd, VIDIOC_G_SLICED_VBI_CAP, struct v4l2_sliced_vbi_cap *argp)
```

**Arguments**

- **fd** File descriptor returned by `open()`.
- **argp** Pointer to struct `v4l2_sliced_vbi_cap`. 
Description

To find out which data services are supported by a sliced VBI capture or output device, applications initialize the type field of a struct v4l2_sliced_vbi_cap, clear the reserved array and call the `VIDIOC_G_SLICED_VBI_CAP` ioctl. The driver fills in the remaining fields or returns an EINVAL error code if the sliced VBI API is unsupported or type is invalid.

Note: The type field was added, and the ioctl changed from read-only to write-read, in Linux 2.6.19.

v4l2_sliced_vbi_cap

| __u16  | service_set | A set of all data services supported by the driver. Equal to the union of all elements of the service_lines array. |
| __u16  | service_lines[2][24] | Each element of this array contains a set of data services the hardware can look for or insert into a particular scan line. Data services are defined in Sliced VBI services. Array indices map to ITU-R line numbers as follows: |
| Element | 525 line systems | 625 line systems |
| service_lines[0][1] | 1 | 1 |
| service_lines[0][23] | 23 | 23 |
| service_lines[1][1] | 264 | 314 |
| service_lines[1][23] | 286 | 336 |

The number of VBI lines the hardware can capture or output per frame, or the number of services it can identify on a given line may be limited. For example on PAL line 16 the hardware may be able to look for a VPS or Teletext signal, but not both at the same time. Applications can learn about these limits using the `VIDIOC_S_FMT` ioctl as described in Sliced VBI Data Interface.

Drivers must set service_lines[0][0] and service_lines[1][0] to zero.

| __u32  | type | Type of the data stream, see v4l2_buf_type. Should be V4L2_BUF_TYPE_SLICED_VBI_CAPTURE or V4L2_BUF_TYPE_SLICED_VBI_OUTPUT. |
| __u32  | reserved[3] | This array is reserved for future extensions. Applications and drivers must set it to zero. |

1 See also Figure 4.2. ITU-R 525 line numbering (M/NTSC and M/PAL) and Figure 4.3. ITU-R 625 line numbering.

EINVAL The value in the type field is wrong.

3.2.7.41 ioctl VIDIOC_G_STD, VIDIOC_S_STD, VIDIOC_SUBDEV_G_STD, VIDIOC_SUBDEV_S_STD

Name

VIDIOC_G_STD - VIDIOC_S_STD - VIDIOC_SUBDEV_G_STD - VIDIOC_SUBDEV_S_STD - Query or select the video standard of the current input

Synopsis

VIDIOC_G_STD

int ioctl(int fd, VIDIOC_G_STD, v4l2_std_id *argp)

VIDIOC_S_STD

int ioctl(int fd, VIDIOC_S_STD, const v4l2_std_id *argp)

VIDIOC_SUBDEV_G_STD

int ioctl(int fd, VIDIOC_SUBDEV_G_STD, v4l2_std_id *argp)

VIDIOC_SUBDEV_S_STD

1186 Chapter 3. Linux Media Infrastructure userspace API
int ioctl(int fd, VIDIOC_SUBDEV_S_STD, const v4l2_std_id *argp)

**Arguments**

*fd*  File descriptor returned by open().

*argp*  Pointer to v4l2_std_id.

**Description**

To query and select the current video standard applications use the `VIDIOC_G_STD` and `VIDIOC_S_STD` ioctls which take a pointer to a `v4l2_std_id` type as argument. `VIDIOC_G_STD` can return a single flag or a set of flags as in struct `v4l2_standard` field *id*. The flags must be unambiguous such that they appear in only one enumerated struct `v4l2_standard` structure.

`VIDIOC_S_STD` accepts one or more flags, being a write-only ioctl it does not return the actual new standard as `VIDIOC_G_STD` does. When no flags are given or the current input does not support the requested standard the driver returns an EINVAL error code. When the standard set is ambiguous drivers may return EINVAL or choose any of the requested standards. If the current input or output does not support standard video timings (e.g. if `ioctl VIDIOC_ENUMINPUT` does not set the `V4L2_IN_CAP_STD` flag), then ENODATA error code is returned.

Calling VIDIOC_SUBDEV_S_STD on a subdev device node that has been registered in read-only mode is not allowed. An error is returned and the errno variable is set to -EPERM.

**Return Value**

On success 0 is returned, on error -1 and the errno variable is set appropriately. The generic error codes are described at the *Generic Error Codes* chapter.

- EINVAL  The `VIDIOC_S_STD` parameter was unsuitable.
- ENODATA  Standard video timings are not supported for this input or output.
- EPERM  VIDIOC_SUBDEV_S_STD has been called on a read-only subdevice.

**3.2.7.42 ioctl VIDIOC_G_TUNER, VIDIOC_S_TUNER**

**Name**

VIDIOC_G_TUNER - VIDIOC_S_TUNER - Get or set tuner attributes
**Synopsis**

VIDIOC_G_TUNER

```c
int ioctl(int fd, VIDIOC_G_TUNER, struct v4l2_tuner *argp)
```

VIDIOC_S_TUNER

```c
int ioctl(int fd, VIDIOC_S_TUNER, const struct v4l2_tuner *argp)
```

**Arguments**

- `fd` File descriptor returned by `open()`.
- `argp` Pointer to `struct v4l2_tuner`.

**Description**

To query the attributes of a tuner applications initialize the `index` field and zero out the reserved array of a `struct v4l2_tuner` and call the `VIDIOC_G_TUNER` ioctl with a pointer to this structure. Drivers fill the rest of the structure or return an EINVAL error code when the index is out of bounds. To enumerate all tuners applications shall begin at index zero, incrementing by one until the driver returns EINVAL.

Tuners have two writable properties, the audio mode and the radio frequency. To change the audio mode, applications initialize the `index`, `audmode` and `reserved` fields and call the `VIDIOC_S_TUNER` ioctl. This will *not* change the current tuner, which is determined by the current video input. Drivers may choose a different audio mode if the requested mode is invalid or unsupported. Since this is a write-only ioctl, it does not return the actually selected audio mode.

**SDR** specific tuner types are `V4L2_TUNER_SDR` and `V4L2_TUNER_RF`. For SDR devices `audmode` field must be initialized to zero. The term ‘tuner’ means SDR receiver in this context.

To change the radio frequency the `VIDIOC_S_FREQUENCY` ioctl is available.

**v4l2_tuner**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>__u32</td>
<td><code>index</code> Identifies the tuner, set by the application.</td>
</tr>
<tr>
<td>__u8</td>
<td><code>name[32]</code> Name of the tuner, a NUL-terminated ASCII string. This information is intended for the user.</td>
</tr>
<tr>
<td>__u32</td>
<td><code>type</code> Type of the tuner, see <code>v4l2_tuner_type</code>.</td>
</tr>
</tbody>
</table>

Table 210: `struct v4l2_tuner`

Continued on next page
The lowest tunable frequency in units of 62.5 kHz, or if the capability flag V4L2_TUNER_CAP_LOW is set, in units of 62.5 Hz, or if the capability flag V4L2_TUNER_CAP_1HZ is set, in units of 1 Hz. If multiple frequency bands are supported, then range low is the lowest frequency of all the frequency bands.

The highest tunable frequency in units of 62.5 kHz, or if the capability flag V4L2_TUNER_CAP_LOW is set, in units of 62.5 Hz, or if the capability flag V4L2_TUNER_CAP_1HZ is set, in units of 1 Hz. If multiple frequency bands are supported, then range high is the highest frequency of all the frequency bands.

Some tuners or audio decoders can determine the received audio subprograms by analyzing audio carriers, pilot tones or other indicators. To pass this information drivers set flags defined in Tuner Audio Reception Flags in this field. For example:

<table>
<thead>
<tr>
<th>V4L2_TUNER_SUB_MONO</th>
<th>receiving mono audio</th>
</tr>
</thead>
<tbody>
<tr>
<td>STEREO</td>
<td>SAP</td>
</tr>
<tr>
<td>MONO</td>
<td>STEREO</td>
</tr>
<tr>
<td>LANG1</td>
<td>LANG2</td>
</tr>
<tr>
<td>MONO</td>
<td>STEREO</td>
</tr>
</tbody>
</table>

When the V4L2_TUNER_CAP_STEREO, LANG1, LANG2 or SAP flag is cleared in the capability field, the corresponding V4L2_TUNER_SUB flag must not be set here. This field is valid only if this is the tuner of the current video input, or when the structure refers to a radio tuner.

The selected audio mode, see Tuner Audio Modes for valid values. The audio mode does not affect audio subprogram detection, and like a User Controls it does not automatically change unless the requested mode is invalid or unsupported. See Tuner Audio Matrix for possible results when the selected and received audio programs do not match. Currently this is the only field of struct struct v4l2_tuner applications can change.

The signal strength if known. Ranging from 0 to 65535. Higher values indicate a better signal.

Automatic frequency control. When theafc value is negative, the frequency is too low, when positive too high.
Table 210 – continued from previous page

| __u32 | reserved[4] | Reserved for future extensions. Drivers and applications must set the array to zero. |

Return Value

On success 0 is returned, on error -1 and the errno variable is set appropriately. The generic error codes are described at the Generic Error Codes chapter.

EINVAL The struct v4l2_tuner index is out of bounds.

3.2.7.43 ioctl VIDIOC_LOG_STATUS

Name

VIDIOC_LOG_STATUS - Log driver status information

Synopsis

VIDIOC_LOG_STATUS

int ioctl(int fd, VIDIOC_LOG_STATUS)

Arguments

fd File descriptor returned by open().

¹ This mode has been added in Linux 2.6.17 and may not be supported by older drivers.
² Playback of both languages in MODE_STEREO is deprecated. In the future drivers should produce only the primary language in this mode. Applications should request MODE_LANG1_LANG2 to record both languages or a stereo signal.
Description

As the video/audio devices become more complicated it becomes harder to debug problems. When this ioctl is called the driver will output the current device status to the kernel log. This is particular useful when dealing with problems like no sound, no video and incorrectly tuned channels. Also many modern devices autodetect video and audio standards and this ioctl will report what the device thinks what the standard is. Mismatches may give an indication where the problem is.

This ioctl is optional and not all drivers support it. It was introduced in Linux 2.6.15.

Return Value

On success 0 is returned, on error -1 and the errno variable is set appropriately. The generic error codes are described at the Generic Error Codes chapter.

3.2.7.44 ioctl VIDIOC_OVERLAY

Name

VIDIOC_OVERLAY - Start or stop video overlay

Synopsis

VIDIOC_OVERLAY

int ioctl(int fd, VIDIOC_OVERLAY, const int *argp)

Arguments

fd  File descriptor returned by open().
argp  Pointer to an integer.

Description

This ioctl is part of the video overlay I/O method. Applications call ioctl VIDIOC_OVERLAY to start or stop the overlay. It takes a pointer to an integer which must be set to zero by the application to stop overlay, to one to start.

Drivers do not support ioctl VIDIOC_STREAMON, VIDIOC_STREAMOFF or VIDIOC_STREAMOFF with V4L2_BUF_TYPE_VIDEO_OVERLAY.
Return Value

On success 0 is returned, on error -1 and the errno variable is set appropriately. The generic error codes are described at the Generic Error Codes chapter.

EINVAL The overlay parameters have not been set up. See Video Overlay Interface for the necessary steps.

3.2.7.45 ioctl VIDIOC_PREPARE_BUF

Name

VIDIOC_PREPARE_BUF - Prepare a buffer for I/O

Synopsis

VIDIOC_PREPARE_BUF

int ioctl(int fd, VIDIOC_PREPARE_BUF, struct v4l2_buffer *argp)

Arguments

fd File descriptor returned by open().

argp Pointer to struct v4l2_buffer.

Description

Applications can optionally call the ioctl VIDIOC_PREPARE_BUF ioctl to pass ownership of the buffer to the driver before actually enqueuing it, using the VIDIOC_QBUF ioctl, and to prepare it for future I/O. Such preparations may include cache invalidation or cleaning. Performing them in advance saves time during the actual I/O.

The struct v4l2_buffer structure is specified in Buffers.

Return Value

On success 0 is returned, on error -1 and the errno variable is set appropriately. The generic error codes are described at the Generic Error Codes chapter.

EBUSY File I/O is in progress.

EINVAL The buffer type is not supported, or the index is out of bounds, or no buffers have been allocated yet, or the userpattr or length are invalid.
3.2.7.46 ioctl VIDIOC_QBUF, VIDIOC_DQBUF

**Name**

VIDIOC_QBUF - VIDIOC_DQBUF - Exchange a buffer with the driver

**Synopsis**

VIDIOC_QBUF

```c
int ioctl(int fd, VIDIOC_QBUF, struct v4l2_buffer *argp)
```

VIDIOC_DQBUF

```c
int ioctl(int fd, VIDIOC_DQBUF, struct v4l2_buffer *argp)
```

**Arguments**

fd  File descriptor returned by `open()`.
argp  Pointer to struct `v4l2_buffer`.

**Description**

Applications call the VIDIOC_QBUF ioctl to enqueue an empty (capturing) or filled (output) buffer in the driver’s incoming queue. The semantics depend on the selected I/O method.

To enqueue a buffer applications set the type field of a struct `v4l2_buffer` to the same buffer type as was previously used with struct `v4l2_format` type and struct `v4l2_requestbuffers` type. Applications must also set the index field. Valid index numbers range from zero to the number of buffers allocated with `ioctl VIDIOC_REQBUFS` (struct `v4l2_requestbuffers count`) minus one. The contents of the struct `v4l2_buffer` returned by a `ioctl VIDIOC_QUERYBUF` ioctl will do as well. When the buffer is intended for output (type is V4L2_BUF_TYPE_VIDEO_OUTPUT, V4L2_BUF_TYPE_VIDEO_OUTPUT_MPLANE, or V4L2_BUF_TYPE_VBI_OUTPUT) applications must also initialize the bytesused, field and timestamp fields, see **Buffers** for details. Applications must also set flags to 0. The reserved2 and reserved fields must be set to 0. When using the **multi-planar API**, the m.planes field must contain a userspace pointer to a filled-in array of struct `v4l2_plane` and the length field must be set to the number of elements in that array.

To enqueue a **memory mapped** buffer applications set the memory field to V4L2_MEMORY_MMAP. When VIDIOC_QBUF is called with a pointer to this structure the driver sets the V4L2_BUF_FLAG_MAPPED and V4L2_BUF_FLAG_QUEUED flags and clears the V4L2_BUF_FLAG_DONE flag in the flags field, or it returns an EINVAL error code.

To enqueue a **user pointer** buffer applications set the memory field to V4L2_MEMORY_USERPTR, the m.userptr field to the address of the buffer and length to its size. When the multi-planar API is used, m.userptr and length members of the passed array of struct `v4l2_plane` have to be used instead. When VIDIOC_QBUF is called with a pointer to this structure the driver sets the V4L2_BUF_FLAG_QUEUED flag and clears the V4L2_BUF_FLAG_MAPPED and V4L2_BUF_FLAG_DONE flags in the flags field, or it returns an error code. This ioctl locks the memory pages of the buffer in physical memory, they cannot be swapped out to disk. Buffers remain locked until
dequeued, until the `VIDIOC_STREAMOFF` or `ioctl VIDIOC_REQBUFS` ioctl is called, or until

the device is closed.

To enqueue a `DMABUF` buffer applications set the memory field to `V4L2_MEMORY_DMABUF` and the m.fd field to a file descriptor associated with a DMABUF buffer. When the multi-planar API is used the m.fd fields of the passed array of struct `v4l2_plane` have to be used instead. When

`VIDIOC_QBUF` is called with a pointer to this structure the driver sets the `V4L2_BUF_FLAG_QUEUED` flag and clears the `V4L2_BUF_FLAG_MAPPED` and `V4L2_BUF_FLAG_DONE` flags in the flags field, or it returns an error code. This ioctl locks the buffer. Locking a buffer means passing it to a driver for a hardware access (usually DMA). If an application accesses (reads/writes) a locked buffer then the result is undefined. Buffers remain locked until dequeued, until the

`VIDIOC_STREAMOFF` or `ioctl VIDIOC_REQBUFS` ioctl is called, or until the device is closed.

The request_fd field can be used with the `VIDIOC_QBUF` ioctl to specify the file descriptor of a request, if requests are in use. Setting it means that the buffer will not be passed to the driver until the request itself is queued. Also, the driver will apply any settings associated with the request for this buffer. This field will be ignored unless the `V4L2_BUF_FLAG_REQUEST_FD` flag is set. If the device does not support requests, then EBADR will be returned. If requests are supported but an invalid request file descriptor is given, then EINVAL will be returned.

**Caution:** It is not allowed to mix queuing requests with queuing buffers directly. EBUSY will be returned if the first buffer was queued directly and then the application tries to queue a request, or vice versa. After closing the file descriptor, calling `VIDIOC_STREAMOFF` or calling `ioctl VIDIOC_REQBUFS` the check for this will be reset.

For memory-to-memory devices you can specify the request_fd only for output buffers, not for capture buffers. Attempting to specify this for a capture buffer will result in an EBADR error.

Applications call the `VIDIOC_DQBUF` ioctl to dequeue a filled (capturing) or displayed (output) buffer from the driver’s outgoing queue. They just set the type, memory and reserved fields of a struct `v4l2_buffer` as above, when `VIDIOC_DQBUF` is called with a pointer to this structure the driver fills the remaining fields or returns an error code. The driver may also set `V4L2_BUF_FLAG_ERROR` in the flags field. It indicates a non-critical (recoverable) streaming error. In such case the application may continue as normal, but should be aware that data in the dequeued buffer might be corrupted. When using the multi-planar API, the planes array must be passed in as well.

If the application sets the memory field to `V4L2_MEMORY_DMABUF` to dequeue a `DMABUF` buffer, the driver fills the m.fd field with a file descriptor numerically the same as the one given to `VIDIOC_QBUF` when the buffer was enqueued. No new file descriptor is created at dequeue time and the value is only for the application convenience. When the multi-planar API is used the m.fd fields of the passed array of struct `v4l2_plane` are filled instead.

By default `VIDIOC_DQBUF` blocks when no buffer is in the outgoing queue. When the `O_NONBLOCK` flag was given to the `open()` function, `VIDIOC_DQBUF` returns immediately with an EAGAIN error code when no buffer is available.

The struct `v4l2_buffer` structure is specified in *Buffers*. 

---

**Chapter 3. Linux Media Infrastructure userspace API**
Return Value

On success 0 is returned, on error -1 and the errno variable is set appropriately. The generic error codes are described at the Generic Error Codes chapter.

**EAGAIN** Non-blocking I/O has been selected using O_NONBLOCK and no buffer was in the outgoing queue.

**EINVAL** The buffer type is not supported, or the index is out of bounds, or no buffers have been allocated yet, or the userptr or length are invalid, or the V4L2_BUF_FLAG_REQUEST_FD flag was set but the given request_fd was invalid, or m.fd was an invalid DMABUF file descriptor.

**EIO** VIDIOC_DQBUF failed due to an internal error. Can also indicate temporary problems like signal loss.

**Note:** The driver might dequeue an (empty) buffer despite returning an error, or even stop capturing. Reusing such buffer may be unsafe though and its details (e.g. index) may not be returned either. It is recommended that drivers indicate recoverable errors by setting the V4L2_BUF_FLAG_ERROR and returning 0 instead. In that case the application should be able to safely reuse the buffer and continue streaming.

**EPIPE** VIDIOC_DQBUF returns this on an empty capture queue for mem2mem codecs if a buffer with the V4L2_BUF_FLAG_LAST was already dequeued and no new buffers are expected to become available.

**EBADR** The V4L2_BUF_FLAG_REQUEST_FD flag was set but the device does not support requests for the given buffer type, or the V4L2_BUF_FLAG_REQUEST_FD flag was not set but the device requires that the buffer is part of a request.

**EBUSY** The first buffer was queued via a request, but the application now tries to queue it directly, or vice versa (it is not permitted to mix the two APIs).

### 3.2.7.47 ioctl VIDIOC_QUERYBUF

**Name**

VIDIOC_QUERYBUF - Query the status of a buffer

**Synopsis**

```c
int ioctl(int fd, VIDIOC_QUERYBUF, struct v4l2_buffer *argp)
```
Arguments

**fd** File descriptor returned by `open()`.

**argp** Pointer to struct `v4l2_buffer`.

Description

This ioctl is part of the **streaming** I/O method. It can be used to query the status of a buffer at any time after buffers have been allocated with the `ioctl VIDIOC_REQBUFS` ioctl.

Applications set the *type* field of a struct `v4l2_buffer` to the same buffer type as was previously used with struct `v4l2_format` type and struct `v4l2_requestbuffers` type, and the *index* field. Valid index numbers range from zero to the number of buffers allocated with `ioctl VIDIOC_REQBUFS` (struct `v4l2_requestbuffers count`) minus one. The reserved and reserved2 fields must be set to 0. When using the **multi-planar API**, the `m.planes` field must contain a userspace pointer to an array of struct `v4l2_plane` and the *length* field has to be set to the number of elements in that array. After calling `ioctl VIDIOC_QUERYBUF` with a pointer to this structure drivers return an error code or fill the rest of the structure.

In the *flags* field the `V4L2_BUF_FLAG_MAPPED`, `V4L2_BUF_FLAG_PREPARED`, `V4L2_BUF_FLAG_QUEUED` and `V4L2_BUF_FLAG_DONE` flags will be valid. The *memory* field will be set to the current I/O method. For the single-planar API, the *m.offset* contains the offset of the buffer from the start of the device memory, the *length* field its size. For the multi-planar API, fields `m.mem_offset` and `length` in the `m.planes` array elements will be used instead and the *length* field of struct `v4l2_buffer` is set to the number of filled-in array elements. The driver may or may not set the remaining fields and flags, they are meaningless in this context.

The struct `v4l2_buffer` structure is specified in *Buffers*.

Return Value

On success 0 is returned, on error -1 and the `errno` variable is set appropriately. The generic error codes are described at the **Generic Error Codes** chapter.

**EINVAL** The buffer type is not supported, or the index is out of bounds.

3.2.7.48 `ioctl VIDIOC_QUERYCAP`

Name

`VIDIOC_QUERYCAP` - Query device capabilities
Synopsis

**VIDIOC_QUERYCAP**

```c
int ioctl(int fd, VIDIOC_QUERYCAP, struct v4l2_capability *argp)
```

Arguments

- **fd** File descriptor returned by `open()`.
- **argp** Pointer to `struct v4l2_capability`.

Description

All V4L2 devices support the `VIDIOC_QUERYCAP` ioctl. It is used to identify kernel devices compatible with this specification and to obtain information about driver and hardware capabilities. The ioctl takes a pointer to a `struct v4l2_capability` which is filled by the driver. When the driver is not compatible with this specification the ioctl returns an `EINVAL` error code.

**v4l2_capability**

```c
struct v4l2_capability
```

<table>
<thead>
<tr>
<th>Type</th>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>__u8</td>
<td>driver[16]</td>
<td>Name of the driver, a unique NUL-terminated ASCII string. For example: “bttv”. Driver specific applications can use this information to verify the driver identity. It is also useful to work around known bugs, or to identify drivers in error reports. Storing strings in fixed sized arrays is bad practice but unavoidable here. Drivers and applications should take precautions to never read or write beyond the end of the array and to make sure the strings are properly NUL-terminated.</td>
</tr>
<tr>
<td>__u8</td>
<td>card[32]</td>
<td>Name of the device, a NUL-terminated UTF-8 string. For example: “Yoyodyne TV/FM”. One driver may support different brands or models of video hardware. This information is intended for users, for example in a menu of available devices. Since multiple TV cards of the same brand may be installed which are supported by the same driver, this name should be combined with the character device file name (e. g. <code>/dev/video2</code>) or the bus_info string to avoid ambiguities.</td>
</tr>
<tr>
<td>__u8</td>
<td>bus_info[32]</td>
<td>Location of the device in the system, a NUL-terminated ASCII string. For example: “PCI:0000:05:06.0”. This information is intended for users, to distinguish multiple identical devices. If no such information is available the field must simply count the devices controlled by the driver (“platform:vivid-000”). The bus_info must start with “PCI:” for PCI boards, “PCle:” for PCI Express boards, “usb-” for USB devices, “I2C:” for i2c devices, “ISA:” for ISA devices, “par-port” for parallel port devices and “platform:” for platform devices.</td>
</tr>
</tbody>
</table>

Continued on next page
Table 216 – continued from previous page

__u32 version
Version number of the driver.
Starting with kernel 3.1, the version reported is provided by the V4L2 subsystem following the kernel numbering scheme. However, it may not always return the same version as the kernel if, for example, a stable or distribution-modified kernel uses the V4L2 stack from a newer kernel.
The version number is formatted using the KERNEL_VERSION() macro. For example if the media stack corresponds to the V4L2 version shipped with Kernel 4.14, it would be equivalent to:

```c
#define KERNEL_VERSION(a,b,c) (((a) << 16) + ((b) << 8) + (c))
__u32 version = KERNEL_VERSION(4, 14, 0);
printf ("Version: %u.%u.%u\n",
(version >> 16) & 0xFF, (version >> 8) & 0xFF, version & 0xFF);
```

__u32 capabilities
Available capabilities of the physical device as a whole, see Device Capabilities Flags. The same physical device can export multiple devices in /dev (e.g. /dev/videoX, /dev/vbiY and /dev/radioZ). The capabilities field should contain a union of all capabilities available around the several V4L2 devices exported to userspace. For all those devices the capabilities field returns the same set of capabilities. This allows applications to open just one of the devices (typically the video device) and discover whether video, vbi and/or radio are also supported.

__u32 device_caps
Device capabilities of the opened device, see Device Capabilities Flags. Should contain the available capabilities of that specific device node. So, for example, device_caps of a radio device will only contain radio related capabilities and no video or vbi capabilities. This field is only set if the capabilities field contains the V4L2_CAP_DEVICE_CAPS capability. Only the capabilities field can have the V4L2_CAP_DEVICE_CAPS capability, device_caps will never set V4L2_CAP_DEVICE_CAPS.

__u32 reserved[3]
Reserved for future extensions. Drivers must set this array to zero.

</tr>
</tbody>
</table>

1 The struct v4l2_framebuffer lacks an enum v4l2_buf_type field, therefore the type of overlay is implied by the driver capabilities.
Return Value

On success 0 is returned, on error -1 and the errno variable is set appropriately. The generic error codes are described at the *Generic Error Codes* chapter.

### 3.2.7.49 ioctls

VIDIOC_QUERYCTRL, VIDIOC_QUERY_EXT_CTRL and VIDIOC_QUERYMENU

**Name**

VIDIOC_QUERYCTRL - VIDIOC_QUERY_EXT_CTRL - VIDIOC_QUERYMENU - Enumerate controls and menu control items

**Synopsis**

```c
int ioctl(int fd, int VIDIOC_QUERYCTRL, struct v4l2_queryctrl *argp)
```

VIDIOC_QUERY_EXT_CTRL

```c
int ioctl(int fd, VIDIOC_QUERY_EXT_CTRL, struct v4l2_query_ext_ctrl *argp)
```

VIDIOC_QUERYMENU

```c
int ioctl(int fd, VIDIOC_QUERYMENU, struct v4l2_querymenu *argp)
```

**Arguments**

**fd** File descriptor returned by `open()`.

**argp** Pointer to struct `v4l2_queryctrl`, `v4l2_query_ext_ctrl` or `v4l2_querymenu` (depending on the ioctl).

**Description**

To query the attributes of a control applications set the id field of a struct `v4l2_queryctrl` and call the VIDIOC_QUERYCTRL ioctl with a pointer to this structure. The driver fills the rest of the structure or returns an EINVAL error code when the id is invalid.

It is possible to enumerate controls by calling VIDIOC_QUERYCTRL with successive id values starting from `V4L2_CID_BASE` up to and exclusive `V4L2_CID_LASTP1`. Drivers may return EINVAL if a control in this range is not supported. Further applications can enumerate private controls, which are not defined in this specification, by starting at `V4L2_CID_PRIVATE_BASE` and incrementing id until the driver returns EINVAL.

In both cases, when the driver sets the `V4L2_CTRL_FLAG_DISABLED` flag in the flags field this control is permanently disabled and should be ignored by the application.\(^1\)

---

\(^1\) `V4L2_CTRL_FLAG_DISABLED` was intended for two purposes: Drivers can skip predefined controls not supported by the hardware (although returning EINVAL would do as well), or disable predefined and private controls after
When the application ORs id with V4L2_CTRL_FLAG_NEXT_CTRL the driver returns the next supported non-compound control, or EINVAL if there is none. In addition, the V4L2_CTRL_FLAG_NEXT_COMPOUND flag can be specified to enumerate all compound controls (i.e. controls with type ≥ V4L2_CTRL_COMPOUND_TYPES and/or array control, in other words controls that contain more than one value). Specify both V4L2_CTRL_FLAG_NEXT_CTRL and V4L2_CTRL_FLAG_NEXT_COMPOUND in order to enumerate all controls, compound or not. Drivers which do not support these flags yet always return EINVAL.

The VIDI OC_QUERY_EXT_CTRL ioctl was introduced in order to better support controls that can use compound types, and to expose additional control information that cannot be returned in struct v4l2_queryctrl since that structure is full.

VIDIOC_QUERY_EXT_CTRL is used in the same way as VIDI OC_QUERYCTRL, except that the reserved array must be zeroed as well.

Additional information is required for menu controls: the names of the menu items. To query them applications set the id and index fields of struct v4l2_querymenu and call the VIDI OC_QUERYMENU ioctl with a pointer to this structure. The driver fills the rest of the structure or returns an EINVAL error code when the id or index is invalid. Menu items are enumerated by calling VIDI OC_QUERYMENU with successive index values from struct v4l2_queryctrl minimum to maximum, inclusive.

Note: It is possible for VIDI OC_QUERYMENU to return an EINVAL error code for some indices between minimum and maximum. In that case that particular menu item is not supported by this driver. Also note that the minimum value is not necessarily 0.

See also the examples in User Controls.

### Table 222: Control Flags

<table>
<thead>
<tr>
<th>Flag</th>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>V4L2_CTRL_FLAG_DISABLED</td>
<td>0x0001</td>
<td>This control is permanently disabled and should be ignored by the application. Any attempt to change the control will result in an EINVAL error code.</td>
</tr>
<tr>
<td>V4L2_CTRL_FLAG_GRABBED</td>
<td>0x0002</td>
<td>This control is temporarily unchangeable, for example because another application took over control of the respective resource. Such controls may be displayed specially in a user interface. Attempts to change the control may result in an EBUSY error code.</td>
</tr>
<tr>
<td>V4L2_CTRL_FLAG_READ_ONLY</td>
<td>0x0004</td>
<td>This control is permanently readable only. Any attempt to change the control will result in an EINVAL error code.</td>
</tr>
<tr>
<td>V4L2_CTRL_FLAG_UPDATE</td>
<td>0x0008</td>
<td>A hint that changing this control may affect the value of other controls within the same control class. Applications should update their user interface accordingly.</td>
</tr>
<tr>
<td>V4L2_CTRL_FLAG_INACTIVE</td>
<td>0x0010</td>
<td>This control is not applicable to the current configuration and should be displayed accordingly in a user interface. For example the flag may be set on a MPEG audio level 2 bitrate control when MPEG audio encoding level 1 was selected with another control.</td>
</tr>
<tr>
<td>V4L2_CTRL_FLAG_SLIDER</td>
<td>0x0020</td>
<td>A hint that this control is best represented as a slider-like element in a user interface.</td>
</tr>
<tr>
<td>Control Name</td>
<td>Value (Hex)</td>
<td>Description</td>
</tr>
<tr>
<td>--------------</td>
<td>-------------</td>
<td>-------------</td>
</tr>
</tbody>
</table>
| V4L2_CTRL_FLAG_WRITE_ONLY | 0x0040 | This control is permanently writable only. Any attempt to read the control will result in an EACCES error code.
| | | This flag is typically present for relative controls or action controls where writing a value will cause the device to carry out a given action (e.g., motor control) but no meaningful value can be returned. |
| V4L2_CTRL_FLAG_VOLATILE | 0x0080 | This control is volatile, which means that the value of the control changes continuously. A typical example would be the current gain value if the device is in auto-gain mode. In such a case the hardware calculates the gain value based on the lighting conditions which can change over time. |
| | | **Note:** Setting a new value for a volatile control will be ignored unless `V4L2_CTRL_FLAG_EXECUTE_ON_WRITE` is also set. Setting a new value for a volatile control will never trigger a `V4L2_EVENT_CTRL_CH_VALUE` event. |
| V4L2_CTRL_FLAG_HAS_PAYLOAD | 0x0100 | This control has a pointer type, so its value has to be accessed using one of the pointer fields of the `struct v4l2_ext_control`. This flag is set for controls that are an array, string, or have a compound type. In all cases you have to set a pointer to memory containing the payload of the control. |
| V4L2_CTRL_FLAG_EXECUTE_ON_WRITE | 0x0200 | The value provided to the control will be propagated to the driver even if it remains constant. This is required when the control represents an action on the hardware. For example: clearing an error flag or triggering the flash. All the controls of the type `V4L2_CTRL_TYPE_BUTTON` have this flag set. |
| V4L2_CTRL_FLAG_MODIFY_LAYOUT | 0x0400 | Changing this control value may modify the layout of the buffer (for video devices) or the media bus format (for sub-devices). A typical example would be the `V4L2_CID_ROTATE` control. Note that typically controls with this flag will also set the `V4L2_CTRL_FLAG_GRABBED` flag when buffers are allocated or streaming is in progress since most drivers do not support changing the format in that case. |
Return Value

On success 0 is returned, on error -1 and the errno variable is set appropriately. The generic error codes are described at the Generic Error Codes chapter.

EINVAL The struct v4l2_queryctrl id is invalid. The struct v4l2_querymenu id is invalid or index is out of range (less than minimum or greater than maximum) or this particular menu item is not supported by the driver.

EACCES An attempt was made to read a write-only control.

3.2.7.50 ioctl VIDIOC_QUERY_DV_TIMINGS

Name

VIDIOC_QUERY_DV_TIMINGS - VIDIOC_SUBDEV_QUERY_DV_TIMINGS - Sense the DV preset received by the current input

Synopsis

VIDIOC_QUERY_DV_TIMINGS
int ioctl(int fd, VIDIOC_QUERY_DV_TIMINGS, struct v4l2_dv_timings *argp)

VIDIOC_SUBDEV_QUERY_DV_TIMINGS
int ioctl(int fd, VIDIOC_SUBDEV_QUERY_DV_TIMINGS, struct v4l2_dv_timings *argp)

Arguments

fd File descriptor returned by open().
argp Pointer to struct v4l2_dv_timings.

Description

The hardware may be able to detect the current DV timings automatically, similar to sensing the video standard. To do so, applications call ioctl VIDIOC_QUERY_DV_TIMINGS with a pointer to a struct v4l2_dv_timings. Once the hardware detects the timings, it will fill in the timings structure.

Note: Drivers shall not switch timings automatically if new timings are detected. Instead, drivers should send the V4L2_EVENT_SOURCE_CHANGE event (if they support this) and expect that userspace will take action by calling ioctl VIDIOC_QUERY_DV_TIMINGS. The reason is that new timings usually mean different buffer sizes as well, and you cannot change buffer sizes on the fly. In general, applications that receive the Source Change event will have to call ioctl VIDIOC_QUERY_DV_TIMINGS, and if the detected timings are valid they will have to stop streaming, set the new timings, allocate new buffers and start streaming again.
If the timings could not be detected because there was no signal, then ENOLINK is returned. If a signal was detected, but it was unstable and the receiver could not lock to the signal, then ENOLCK is returned. If the receiver could lock to the signal, but the format is unsupported (e.g. because the pixelclock is out of range of the hardware capabilities), then the driver fills in whatever timings it could find and returns ERANGE. In that case the application can call ioctl VIDIOC_DV_TIMINGS_CAP, VIDIOC_SUBDEV_DV_TIMINGS_CAP to compare the found timings with the hardware’s capabilities in order to give more precise feedback to the user.

Return Value

On success 0 is returned, on error -1 and the errno variable is set appropriately. The generic error codes are described at the Generic Error Codes chapter.

ENODATA Digital video timings are not supported for this input or output.
ENOLINK No timings could be detected because no signal was found.
ENOLCK The signal was unstable and the hardware could not lock on to it.
ERANGE Timings were found, but they are out of range of the hardware capabilities.

3.2.7.51 ioctl VIDIOC_QUERYSTD, VIDIOC_SUBDEV_QUERYSTD

Name

VIDIOC_QUERYSTD - VIDIOC_SUBDEV_QUERYSTD - Sense the video standard received by the current input

Synopsis

VIDIOC_QUERYSTD
int ioctl(int fd, VIDIOC_QUERYSTD, v4l2_std_id *argp)

VIDIOC_SUBDEV_QUERYSTD
int ioctl(int fd, VIDIOC_SUBDEV_QUERYSTD, v4l2_std_id *argp)

Arguments

fd File descriptor returned by open().
argp Pointer to v4l2_std_id.
Description

The hardware may be able to detect the current video standard automatically. To do so, applications call `ioctl VIDIOC_QUERYSTD, VIDIOC_SUBDEV_QUERYSTD` with a pointer to a `v4l2_std_id` type. The driver stores here a set of candidates, this can be a single flag or a set of supported standards if for example the hardware can only distinguish between 50 and 60 Hz systems.

If no signal was detected, then the driver will return V4L2_STD_UNKNOWN. When detection is not possible or fails, the set must contain all standards supported by the current video input or output.

Note: Drivers shall *not* switch the video standard automatically if a new video standard is detected. Instead, drivers should send the V4L2_EVENT_SOURCE_CHANGE event (if they support this) and expect that userspace will take action by calling `ioctl VIDIOC_QUERYSTD, VIDIOC_SUBDEV_QUERYSTD`. The reason is that a new video standard can mean different buffer sizes as well, and you cannot change buffer sizes on the fly. In general, applications that receive the Source Change event will have to call `ioctl VIDIOC_QUERYSTD, VIDIOC_SUBDEV_QUERYSTD`, and if the detected video standard is valid they will have to stop streaming, set the new standard, allocate new buffers and start streaming again.

Return Value

On success 0 is returned, on error -1 and the `errno` variable is set appropriately. The generic error codes are described at the *Generic Error Codes* chapter.

**ENODATA** Standard video timings are not supported for this input or output.

### 3.2.7.52 ioctl VIDIOC_REQBUFS

**Name**

VIDIOC_REQBUFS - Initiate Memory Mapping, User Pointer I/O or DMA buffer I/O

**Synopsis**

**VIDIOC_REQBUFS**

```c
int ioctl(int fd, VIDIOC_REQBUFS, struct v4l2_requestbuffers *argp)
```
Arguments

fd  File descriptor returned by open().
argp  Pointer to struct v4l2_requestbuffers.

Description

This ioctl is used to initiate memory mapped, user pointer or DMABUF based I/O. Memory mapped buffers are located in device memory and must be allocated with this ioctl before they can be mapped into the application’s address space. User buffers are allocated by applications themselves, and this ioctl is merely used to switch the driver into user pointer I/O mode and to setup some internal structures. Similarly, DMABUF buffers are allocated by applications through a device driver, and this ioctl only configures the driver into DMABUF I/O mode without performing any direct allocation.

To allocate device buffers applications initialize all fields of the struct v4l2_requestbuffers structure. They set the type field to the respective stream or buffer type, the count field to the desired number of buffers, memory must be set to the requested I/O method and the reserved array must be zeroed. When the ioctl is called with a pointer to this structure the driver will attempt to allocate the requested number of buffers and it stores the actual number allocated in the count field. It can be smaller than the number requested, even zero, when the driver runs out of free memory. A larger number is also possible when the driver requires more buffers to function correctly. For example video output requires at least two buffers, one displayed and one filled by the application.

When the I/O method is not supported the ioctl returns an EINVAL error code.

Applications can call ioctl VIDIOC_REQBUFS again to change the number of buffers. Note that if any buffers are still mapped or exported via DMABUF, then ioctl VIDIOC_REQBUFS can only succeed if the V4L2_BUF_CAP_SUPPORTS_ORPHANED_BUFS capability is set. Otherwise ioctl VIDIOC_REQBUFS will return the EBUSY error code. If V4L2_BUF_CAP_SUPPORTS_ORPHANED_BUFS is set, then these buffers are orphaned and will be freed when they are unmapped or when the exported DMABUF fds are closed. A count value of zero frees or orphans all buffers, after aborting or finishing any DMA in progress, an implicit VIDIOC_STREAMOFF.

v4l2_requestbuffers
Table 223: struct v4l2_requestbuffers

| __u32 | count         | The number of buffers requested or granted. |
|__u32  | type          | Type of the stream or buffers, this is the same as the struct v4l2_format type field. See v4l2_buf_type for valid values. |
|__u32  | memory        | Applications set this field to V4L2_MEMORY_MMAP, V4L2_MEMORY_DMABUF or V4L2_MEMORY_USERPTR. See v4l2_memory. |
|__u32  | capabilities  | Set by the driver. If 0, then the driver doesn’t support capabilities. In that case all you know is that the driver is guaranteed to support V4L2_MEMORY_MMAP and might support other v4l2_memory types. It will not support any other capabilities. If you want to query the capabilities with a minimum of side-effects, then this can be called with count set to 0, memory set to V4L2_MEMORY_MMAP and type set to the buffer type. This will free any previously allocated buffers, so this is typically something that will be done at the start of the application. |
|__u32  | reserved[1]   | A place holder for future extensions. Drivers and applications must set the array to zero. |

Table 224: V4L2 Buffer Capabilities Flags

| V4L2_BUF_CAP_SUPPORTS_MMAP       | 0x00000001 | This buffer type supports the V4L2_MEMORY_MMAP streaming mode. |
| V4L2_BUF_CAP_SUPPORTS_USERPTR   | 0x00000002 | This buffer type supports the V4L2_MEMORY_USERPTR streaming mode. |
| V4L2_BUF_CAP_SUPPORTS_DMABUF    | 0x00000004 | This buffer type supports the V4L2_MEMORY_DMABUF streaming mode. |
| V4L2_BUF_CAP_SUPPORTS_REQUESTS  | 0x00000008 | This buffer type supports requests. |
| V4L2_BUF_CAP_SUPPORTS_ORPHANED_BUFS | 0x00000010 | The kernel allows calling ioctl VIDIOC_REQBUFS while buffers are still mapped or exported via DMABUF. These orphaned buffers will be freed when they are unmapped or when the exported DMABUF fds are closed. |
| V4L2_BUF_CAP_SUPPORTS_M2M_HOLD_CAPTURE_BUF | 0x00000020 | Only valid for stateless decoders. If set, then userspace can set the V4L2_BUF_FLAG_M2M_HOLD_CAPTURE_BUF flag to hold off on returning the capture buffer until the OUTPUT timestamp changes. |

Continued on next page
Return Value

On success 0 is returned, on error -1 and the errno variable is set appropriately. The generic error codes are described at the Generic Error Codes chapter.

EINVAL  The buffer type (type field) or the requested I/O method (memory) is not supported.

3.2.7.53 ioctl VIDIOC_S_HW_FREQ_SEEK

Name

VIDIOC_S_HW_FREQ_SEEK - Perform a hardware frequency seek

Synopsis

VIDIOC_S_HW_FREQ_SEEK

int ioctl(int fd, VIDIOC_S_HW_FREQ_SEEK, struct v4l2_hw_freq_seek *argp)

Arguments

fd  File descriptor returned by open().

argp  Pointer to struct v4l2_hw_freq_seek.

Description

Start a hardware frequency seek from the current frequency. To do this applications initialize the tuner, type, seek_upward, wrap_around, spacing, rangelow and rangehigh fields, and zero out the reserved array of a struct v4l2_hw_freq_seek and call the VIDIOC_S_HW_FREQ_SEEK ioctl with a pointer to this structure.

The rangelow and rangehigh fields can be set to a non-zero value to tell the driver to search a specific band. If the struct v4l2_tuner capability field has the V4L2_TUNER_CAP_HWSEEK_PROG_LIM flag set, these values must fall within one of the bands returned by ioctl VIDIOC_ENUM_FREQ_BANDS. If the V4L2_TUNER_CAP_HWSEEK_PROG_LIM flag is not set, then these values must exactly match those of one of the bands returned by ioctl VIDIOC_ENUM_FREQ_BANDS. If the current frequency of the tuner does not fall within the selected band it will be clamped to fit in the band before the seek is started.

If an error is returned, then the original frequency will be restored.
This ioctl is supported if the V4L2_CAP_HW_FREQSEEK capability is set.

If this ioctl is called from a non-blocking filehandle, then EAGAIN error code is returned and no seek takes place.

<td>rangelow</td>
<td>If non-zero, the lowest tunable frequency of the band to search in units of 62.5 kHz, or if the struct v4l2_tuner capability field has the V4L2_TUNER_CAP_LOW flag set, in units of 62.5 Hz.</td>
</tr>
<tr>
<td>__u32</td>
<td>rangehigh</td>
<td>If non-zero, the highest tunable frequency of the band to search in units of 62.5 kHz, or if the struct v4l2_tuner capability field has the V4L2_TUNER_CAP_LOW flag set, in units of 62.5 Hz.</td>
</tr>
</tbody>
</table>
Return Value

On success 0 is returned, on error -1 and the errno variable is set appropriately. The generic error codes are described at the *Generic Error Codes* chapter.

EINVAL  The tuner index is out of bounds, the wrap_around value is not supported or one of the values in the type, rangelow or rangehigh fields is wrong.

EAGAIN  Attempted to call VIDIOC_S_HW_FREQSEEK with the filehandle in non-blocking mode.

ENODATA  The hardware seek found no channels.

EBUSY  Another hardware seek is already in progress.

### 3.2.7.54 ioctl VIDIOC_STREAMON, VIDIOC_STREAMOFF

**Name**

VIDIOC_STREAMON - VIDIOC_STREAMOFF - Start or stop streaming I/O

**Synopsis**

**VIDIOC_STREAMON**

```c
int ioctl(int fd, VIDIOC_STREAMON, const int *argp)
```

**VIDIOC_STREAMOFF**

```c
int ioctl(int fd, VIDIOC_STREAMOFF, const int *argp)
```

**Arguments**

- **fd**  File descriptor returned by open().
- **argp**  Pointer to an integer.

**Description**

The VIDIOC_STREAMON and VIDIOC_STREAMOFF ioctl start and stop the capture or output process during streaming (*memory mapping*, *user pointer* or *DMABUF*) I/O.

Capture hardware is disabled and no input buffers are filled (if there are any empty buffers in the incoming queue) until VIDIOC_STREAMON has been called. Output hardware is disabled and no video signal is produced until VIDIOC_STREAMON has been called. The ioctl will succeed when at least one output buffer is in the incoming queue.

Memory-to-memory devices will not start until VIDIOC_STREAMON has been called for both the capture and output stream types.

If VIDIOC_STREAMON fails then any already queued buffers will remain queued.

The VIDIOC_STREAMOFF ioctl, apart of aborting or finishing any DMA in progress, unlocks any user pointer buffers locked in physical memory, and it removes all buffers from the incoming and
outgoing queues. That means all images captured but not dequeued yet will be lost, likewise all images enqueued for output but not transmitted yet. I/O returns to the same state as after calling `ioctl VIDIOC_REQBUFS` and can be restarted accordingly.

If buffers have been queued with `ioctl VIDIOC_QBUF, VIDIOC_DQBUF` and VIDIOC_STREAMOFF is called without ever having called VIDIOC_STREAMON, then those queued buffers will also be removed from the incoming queue and all are returned to the same state as after calling `ioctl VIDIOC_REQBUFS` and can be restarted accordingly.

Both ioctl's take a pointer to an integer, the desired buffer or stream type. This is the same as struct `v4l2_requestbuffers` type.

If VIDIOC_STREAMON is called when streaming is already in progress, or if VIDIOC_STREAMOFF is called when streaming is already stopped, then 0 is returned. Nothing happens in the case of VIDIOC_STREAMON, but VIDIOC_STREAMOFF will return queued buffers to their starting state as mentioned above.

---

**Note:** Applications can be preempted for unknown periods right before or after the VIDIOC_STREAMON or VIDIOC_STREAMOFF calls, there is no notion of starting or stopping “now”. Buffer timestamps can be used to synchronize with other events.

---

**Return Value**

On success 0 is returned, on error -1 and the `errno` variable is set appropriately. The generic error codes are described at the *Generic Error Codes* chapter.

**EINVAL** The buffer type is not supported, or no buffers have been allocated (memory mapping) or enqueued (output) yet.

**EPIPE** The driver implements *pad-level format configuration* and the pipeline configuration is invalid.

**ENOLINK** The driver implements Media Controller interface and the pipeline link configuration is invalid.
3.2.7.55 ioctl VIDIOC_SUBDEV_ENUM_FRAME_INTERVAL

Name

VIDIOC_SUBDEV_ENUM_FRAME_INTERVAL - Enumerate frame intervals

Synopsis

VIDIOC_SUBDEV_ENUM_FRAME_INTERVAL

int ioctl(int fd, VIDIOC_SUBDEV_ENUM_FRAME_INTERVAL, struct v4l2_subdev_frame_interval_enum * argp)

Arguments

fd  File descriptor returned by open().

argp  Pointer to struct v4l2_subdev_frame_interval_enum.

Description

This ioctl lets applications enumerate available frame intervals on a given sub-device pad. Frame intervals only makes sense for sub-devices that can control the frame period on their own. This includes, for instance, image sensors and TV tuners.

For the common use case of image sensors, the frame intervals available on the sub-device output pad depend on the frame format and size on the same pad. Applications must thus specify the desired format and size when enumerating frame intervals.

To enumerate frame intervals applications initialize the index, pad, which, code, width and height fields of struct v4l2_subdev_frame_interval_enum and call the ioctl VIDIOC_SUBDEV_ENUM_FRAME_INTERVAL ioctl with a pointer to this structure. Drivers fill the rest of the structure or return an EINVAL error code if one of the input fields is invalid. All frame intervals are enumerable by beginning at index zero and incrementing by one until EINVAL is returned.

Available frame intervals may depend on the current 'try' formats at other pads of the sub-device, as well as on the current active links. See ioctl VIDIOC_SUBDEV_G_FMT, VIDIOC_SUBDEV_S_FMT for more information about the try formats.

Sub-devices that support the frame interval enumeration ioctl should implemented it on a single pad only. Its behaviour when supported on multiple pads of the same sub-device is not defined.

<td>Reserved for future extensions. Applications and drivers must set the array to zero.</td>
</tr>
</tbody>
</table>

Return Value

On success 0 is returned, on error -1 and the errno variable is set appropriately. The generic error codes are described at the Generic Error Codes chapter.

EINVAL The struct v4l2_subdev_frame_interval_enum pad references a non-existing pad, one of the code, width or height fields are invalid for the given pad or the index field is out of bounds.

3.2.7.56 ioctl VIDIOC_SUBDEV_ENUM_FRAME_SIZE

Name

VIDIOC_SUBDEV_ENUM_FRAME_SIZE - Enumerate media bus frame sizes

Synopsis

VIDIOC_SUBDEV_ENUM_FRAME_SIZE

int ioctl(int fd, VIDIOC_SUBDEV_ENUM_FRAME_SIZE, struct v4l2_subdev_frame_size_enum * argp)

Arguments

fd  File descriptor returned by open().
argp Pointer to struct v4l2_subdev_frame_size_enum.
Description

This ioctl allows applications to enumerate all frame sizes supported by a sub-device on the given pad for the given media bus format. Supported formats can be retrieved with the `ioctl VIDIOC_SUBDEV_ENUM_MBUS_CODE` ioctl.

To enumerate frame sizes applications initialize the `pad`, `code` and `index` fields of the `struct v4l2_subdev_mbus_code_enum` and call the `ioctl VIDIOC_SUBDEV_ENUM_FRAME_SIZE` ioctl with a pointer to the structure. Drivers fill the minimum and maximum frame sizes or return an EINVAL error code if one of the input parameters is invalid.

Sub-devices that only support discrete frame sizes (such as most sensors) will return one or more frame sizes with identical minimum and maximum values.

Not all possible sizes in given [minimum, maximum] ranges need to be supported. For instance, a scaler that uses a fixed-point scaling ratio might not be able to produce every frame size between the minimum and maximum values. Applications must use the `VIDIOC_SUBDEV_S_FMT` ioctl to try the sub-device for an exact supported frame size.

Available frame sizes may depend on the current 'try' formats at other pads of the sub-device, as well as on the current active links and the current values of V4L2 controls. See `ioctl VIDIOC_SUBDEV_G_FMT, VIDIOC_SUBDEV_S_FMT` for more information about try formats.

**EINVAL** The `struct v4l2_subdev_frame_size_enum` `pad` references a non-existing pad, the `code` is invalid for the given pad or the `index` field is out of bounds.
3.2.7.57 ioctl VIDIOC_SUBDEV_ENUM_MBUS_CODE

Name

VIDIOC_SUBDEV_ENUM_MBUS_CODE - Enumerate media bus formats

Synopsis

VIDIOC_SUBDEV_ENUM_MBUS_CODE

int ioctl(int fd, VIDIOC_SUBDEV_ENUM_MBUS_CODE, struct v4l2_subdev_mbus_code_enum * argp)

Arguments

fd  File descriptor returned by open().

argp  Pointer to struct v4l2_subdev_mbus_code_enum.

Description

To enumerate media bus formats available at a given sub-device pad applications initialize the pad, which and index fields of struct v4l2_subdev_mbus_code_enum and call the ioctl VIDIOC_SUBDEV_ENUM_MBUS_CODE ioctl with a pointer to this structure. Drivers fill the rest of the structure or return an EINVAL error code if either the pad or index are invalid. All media bus formats are enumerable by beginning at index zero and incrementing by one until EINVAL is returned.

Available media bus formats may depend on the current ‘try’ formats at other pads of the sub-device, as well as on the current active links. See ioctl VIDIOC_SUBDEV_G_FMT, VIDIOC_SUBDEV_S_FMT for more information about the try formats.

Return Value

On success 0 is returned, on error -1 and the errno variable is set appropriately. The generic error codes are described at the Generic Error Codes chapter.

EINVAL  The struct v4l2_subdev_mbus_code_enum pad references a non-existing pad, or the index field is out of bounds.

3.2.7.58  ioctl VIDIOC_SUBDEV_G_CROP, VIDIOC_SUBDEV_S_CROP

Name

VIDIOC_SUBDEV_G_CROP - VIDIOC_SUBDEV_S_CROP - Get or set the crop rectangle on a subdev pad

Synopsis

VIDIOC_SUBDEV_G_CROP

int ioctl(int fd, VIDIOC_SUBDEV_G_CROP, struct v4l2_subdev_crop *argp)

VIDIOC_SUBDEV_S_CROP

int ioctl(int fd, VIDIOC_SUBDEV_S_CROP, const struct v4l2_subdev_crop *argp)

Arguments

fd  File descriptor returned by open().

argp  Pointer to struct v4l2_subdev_crop.

Description

Note:  This is an Obsolete API Elements interface and may be removed in the future. It is superseded by the selection API.

To retrieve the current crop rectangle applications set the pad field of a struct v4l2_subdev_crop to the desired pad number as reported by the media API and the which field to V4L2_SUBDEV_FORMAT_ACTIVE. They then call the VIDIOC_SUBDEV_G_CROP ioctl with a pointer to this structure. The driver fills the members of the rect field or returns EINVAL error code if the input arguments are invalid, or if cropping is not supported on the given pad.

To change the current crop rectangle applications set both the pad and which fields and all members of the rect field. They then call the VIDIOC_SUBDEV_S_CROP ioctl with a pointer to this structure. The driver verifies the requested crop rectangle, adjusts it based on the hardware capabilities and configures the device. Upon return the struct v4l2_subdev_crop contains the current format as would be returned by a VIDIOC_SUBDEV_G_CROP call.
Applications can query the device capabilities by setting the `which` to `V4L2_SUBDEV_FORMAT_TRY`. When set, ‘try’ crop rectangles are not applied to the device by the driver, but are mangled exactly as active crop rectangles and stored in the sub-device file handle. Two applications querying the same sub-device would thus not interact with each other.

If the subdev device node has been registered in read-only mode, calls to `VIDIOC_SUBDEV_S_CROP` are only valid if the `which` field is set to `V4L2_SUBDEV_FORMAT_TRY`, otherwise an error is returned and the `errno` variable is set to `-EPERM`.

Drivers must not return an error solely because the requested crop rectangle doesn’t match the device capabilities. They must instead modify the rectangle to match what the hardware can provide. The modified format should be as close as possible to the original request.

`v4l2_subdev_crop`

Table 230: `struct v4l2_subdev_crop`

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>__u32 pad</code></td>
<td>Pad number as reported by the media framework.</td>

<td>Crop rectangle boundaries, in pixels.</td>
</tr>
<tr>
<td><code>__u32 reserved[8]</code></td>
<td>Reserved for future extensions. Applications and drivers must set the array to zero.</td>
</tr>
</tbody>
</table>

Return Value

On success 0 is returned, on error -1 and the `errno` variable is set appropriately. The generic error codes are described at the `Generic Error Codes` chapter.

- **EBUSY** The crop rectangle can’t be changed because the pad is currently busy. This can be caused, for instance, by an active video stream on the pad. The ioctl must not be retried without performing another action to fix the problem first. Only returned by `VIDIOC_SUBDEV_S_CROP`.

- **EINVAL** The struct `v4l2_subdev_crop` pad references a non-existing pad, the `which` field references a non-existing format, or cropping is not supported on the given subdev pad.

- **EPERM** The `VIDIOC_SUBDEV_S_CROP` ioctl has been called on a read-only subdevice and the `which` field is set to `V4L2_SUBDEV_FORMAT_ACTIVE`.

3.2.7.59 ioctl `VIDIOC_SUBDEV_G_FMT, VIDIOC_SUBDEV_S_FMT`

Name

`VIDIOC_SUBDEV_G_FMT - VIDIOC_SUBDEV_S_FMT` - Get or set the data format on a subdev pad.
Synopsis

VIDIOC_SUBDEV_G_FMT
int ioctl(int fd, VIDIOC_SUBDEV_G_FMT, struct v4l2_subdev_format *argp)

VIDIOC_SUBDEV_S_FMT
int ioctl(int fd, VIDIOC_SUBDEV_S_FMT, struct v4l2_subdev_format *argp)

Arguments

fd  File descriptor returned by open().
argp  Pointer to struct v4l2_subdev_format.

Description

These ioctls are used to negotiate the frame format at specific subdev pads in the image pipeline. To retrieve the current format applications set the pad field of a struct v4l2_subdev_format to the desired pad number as reported by the media API and the which field to V4L2_SUBDEV_FORMAT_ACTIVE. When they call the VIDIOC_SUBDEV_G_FMT ioctl with a pointer to this structure the driver fills the members of the format field.

To change the current format applications set both the pad and which fields and all members of the format field. When they call the VIDIOC_SUBDEV_S_FMT ioctl with a pointer to this structure the driver verifies the requested format, adjusts it based on the hardware capabilities and configures the device. Upon return the struct v4l2_subdev_format contains the current format as would be returned by a VIDIOC_SUBDEV_G_FMT call.

Applications can query the device capabilities by setting the which to V4L2_SUBDEV_FORMAT_TRY. When set, 'try' formats are not applied to the device by the driver, but are changed exactly as active formats and stored in the sub-device file handle. Two applications querying the same sub-device would thus not interact with each other.

For instance, to try a format at the output pad of a sub-device, applications would first set the try format at the sub-device input with the VIDIOC_SUBDEV_S_FMT ioctl. They would then either retrieve the default format at the output pad with the VIDIOC_SUBDEV_G_FMT ioctl, or set the desired output pad format with the VIDIOC_SUBDEV_S_FMT ioctl and check the returned value.

Try formats do not depend on active formats, but can depend on the current links configuration or sub-device controls value. For instance, a low-pass noise filter might crop pixels at the frame boundaries, modifying its output frame size.

If the subdev device node has been registered in read-only mode, calls to VIDIOC_SUBDEV_S_FMT are only valid if the which field is set to V4L2_SUBDEV_FORMAT_TRY, otherwise an error is returned and the errno variable is set to -EPERM.

Drivers must not return an error solely because the requested format doesn’t match the device capabilities. They must instead modify the format to match what the hardware can provide. The modified format should be as close as possible to the original request.

<td>1</td>
<td>Active formats, applied to the hardware.</td>
</tr>
</tbody>
</table>

### Return Value

On success 0 is returned, on error -1 and the `errno` variable is set appropriately. The generic error codes are described at the [Generic Error Codes](#) chapter.

**EBUSY** The format can’t be changed because the pad is currently busy. This can be caused, for instance, by an active video stream on the pad. The ioctl must not be retried without performing another action to fix the problem first. Only returned by `VIDIOC_SUBDEV_S_FMT`.

**EINVAL** The struct `v4l2_subdev_format` pad references a non-existing pad, or the `which` field references a non-existing format.

**EPERM** The `VIDIOC_SUBDEV_S_FMT` ioctl has been called on a read-only subdevice and the `which` field is set to V4L2_SUBDEV_FORMAT_ACTIVE.

On success 0 is returned, on error -1 and the `errno` variable is set appropriately. The generic error codes are described at the [Generic Error Codes](#) chapter.

### 3.2.7.60 ioctl VIDIOC_SUBDEV_G_FRAME_INTERVAL, VIDIOC_SUBDEV_S_FRAME_INTERVAL

#### Name

`VIDIOC_SUBDEV_G_FRAME_INTERVAL` - `VIDIOC_SUBDEV_S_FRAME_INTERVAL` - Get or set the frame interval on a subdev pad
Synopsis

VIDIOC_SUBDEV_G_FRAME_INTERVAL

```c
int ioctl(int fd, VIDIOC_SUBDEV_G_FRAME_INTERVAL, struct v4l2_subdev_frame_interval *argp)
```

VIDIOC_SUBDEV_S_FRAME_INTERVAL

```c
int ioctl(int fd, VIDIOC_SUBDEV_S_FRAME_INTERVAL, struct v4l2_subdev_frame_interval *argp)
```

Arguments

- **fd** File descriptor returned by open().
- **argp** Pointer to struct v4l2_subdev_frame_interval.

Description

These ioctls are used to get and set the frame interval at specific subdev pads in the image pipeline. The frame interval only makes sense for sub-devices that can control the frame period on their own. This includes, for instance, image sensors and TV tuners. Sub-devices that don’t support frame intervals must not implement these ioctls.

To retrieve the current frame interval applications set the pad field of a struct v4l2_subdev_frame_interval to the desired pad number as reported by the media controller API. When they call the VIDIOC_SUBDEV_G_FRAME_INTERVAL ioctl with a pointer to this structure the driver fills the members of the interval field.

To change the current frame interval applications set both the pad field and all members of the interval field. When they call the VIDIOC_SUBDEV_S_FRAME_INTERVAL ioctl with a pointer to this structure the driver verifies the requested interval, adjusts it based on the hardware capabilities and configures the device. Upon return the struct v4l2_subdev_frame_interval contains the current frame interval as would be returned by a VIDIOC_SUBDEV_G_FRAME_INTERVAL call.

Calling VIDIOC_SUBDEV_S_FRAME_INTERVAL on a subdev device node that has been registered in read-only mode is not allowed. An error is returned and the errno variable is set to -EPERM.

Drivers must not return an error solely because the requested interval doesn’t match the device capabilities. They must instead modify the interval to match what the hardware can provide. The modified interval should be as close as possible to the original request.

Changing the frame interval shall never change the format. Changing the format, on the other hand, may change the frame interval.

Sub-devices that support the frame interval ioctls should implement them on a single pad only. Their behaviour when supported on multiple pads of the same sub-device is not defined.

### v4l2_subdev_frame_interval

**3.2. Part I - Video for Linux API**
Table 233: struct v4l2_subdev_frame_interval

<table>
<thead>
<tr>
<th>__u32</th>
<th>pad</th>
<th>Pad number as reported by the media controller API.</th>
</tr>
</thead>
<tbody>
<tr>
<td>struct v4l2_fраст</td>
<td>interval</td>
<td>Period, in seconds, between consecutive video frames.</td>
</tr>
<tr>
<td>__u32</td>
<td>reserved[9]</td>
<td>Reserved for future extensions. Applications and drivers must set the array to zero.</td>
</tr>
</tbody>
</table>

Return Value

On success 0 is returned, on error -1 and the errno variable is set appropriately. The generic error codes are described at the *Generic Error Codes* chapter.

**EBUSY** The frame interval can't be changed because the pad is currently busy. This can be caused, for instance, by an active video stream on the pad. The ioctl must not be retried without performing another action to fix the problem first. Only returned by VIDIOC_SUBDEV_S_FRAME_INTERVAL

**EINVAL** The struct v4l2_subdev_frame_interval pad references a non-existing pad, or the pad doesn't support frame intervals.

**EPERM** The VIDIOC_SUBDEV_S_FRAME_INTERVAL ioctl has been called on a read-only subdevice.

3.2.7.61 ioctl VIDIOC_SUBDEV_G_SELECTION, VIDIOC_SUBDEV_S_SELECTION

Name

VIDIOC_SUBDEV_G_SELECTION - VIDIOC_SUBDEV_S_SELECTION - Get or set selection rectangles on a subdev pad

Synopsis

**VIDIOC_SUBDEV_G_SELECTION**

int ioctl(int fd, VIDIOC_SUBDEV_G_SELECTION, struct v4l2_subdev_selection *argp)

**VIDIOC_SUBDEV_S_SELECTION**

int ioctl(int fd, VIDIOC_SUBDEV_S_SELECTION, struct v4l2_subdev_selection *argp)
Linux Media Documentation

Arguments

- **fd**  File descriptor returned by open().
- **argp**  Pointer to struct v4l2_subdev_selection.

Description

The selections are used to configure various image processing functionality performed by the subdevs which affect the image size. This currently includes cropping, scaling and composition. The selection API replaces the old subdev crop API. All the function of the crop API, and more, are supported by the selections API.

See Sub-device Interface for more information on how each selection target affects the image processing pipeline inside the subdevice.

If the subdev device node has been registered in read-only mode, calls to VIDIOC_SUBDEV_S_SELECTION are only valid if the **which** field is set to V4L2_SUBDEV_FORMAT_TRY, otherwise an error is returned and the errno variable is set to -EPERM.

Types of selection targets

There are two types of selection targets: actual and bounds. The actual targets are the targets which configure the hardware. The BOUNDS target will return a rectangle that contain all possible actual rectangles.

Discovering supported features

To discover which targets are supported, the user can perform VIDIOC_SUBDEV_G_SELECTION on them. Any unsupported target will return EINVAL.

Selection targets and flags are documented in Common selection definitions.

Table 234: struct v4l2_subdev_selection

<td></td>
</tr>
<tr>
<td>__u32 reserved[8]</td>
<td>Reserved for future extensions. Applications and drivers must set the array to zero.</td>
<td></td>
</tr>
</tbody>
</table>
Return Value

On success 0 is returned, on error -1 and the errno variable is set appropriately. The generic error codes are described at the *Generic Error Codes* chapter.

**EBUSY**  The selection rectangle can't be changed because the pad is currently busy. This can be caused, for instance, by an active video stream on the pad. The ioctl must not be retried without performing another action to fix the problem first. Only returned by VIDIOC_SUBDEV_S_SELECTION

**EINVAL**  The struct v4l2_subdev_selection pad references a non-existing pad, the which field references a non-existing format, or the selection target is not supported on the given subdev pad.

**EPERM**  The VIDIOC_SUBDEV_S_SELECTION ioctl has been called on a read-only subdevice and the which field is set to V4L2_SUBDEV_FORMAT_ACTIVE.

### 3.2.7.62 ioctl VIDIOC_SUBDEV_QUERYCAP

**Name**

VIDIOC_SUBDEV_QUERYCAP - Query sub-device capabilities

**Synopsis**

```c
VIDIOC_SUBDEV_QUERYCAP
int ioctl(int fd, VIDIOC_SUBDEV_QUERYCAP, struct v4l2_subdev_capability *argp)
```

**Arguments**

- **fd**  File descriptor returned by open().
- **argp**  Pointer to struct v4l2_subdev_capability.

**Description**

All V4L2 sub-devices support the VIDIOC_SUBDEV_QUERYCAP ioctl. It is used to identify kernel devices compatible with this specification and to obtain information about driver and hardware capabilities. The ioctl takes a pointer to a struct v4l2_subdev_capability which is filled by the driver. When the driver is not compatible with this specification the ioctl returns ENOTTY error code.

**v4l2_subdev_capability**
Table 235: struct v4l2_subdev_capability

| __u32 version | Version number of the driver. The version reported is provided by the V4L2 subsystem following the kernel numbering scheme. However, it may not always return the same version as the kernel if, for example, a stable or distribution-modified kernel uses the V4L2 stack from a newer kernel. The version number is formatted using the KERNEL_VERSION() macro: |
| __u32 capabilities | Sub-device capabilities of the opened device, see Sub-Device Capabilities Flags. |
| __u32 reserved[14] | Reserved for future extensions. Set to 0 by the V4L2 core. |

```c
#define KERNEL_VERSION(a,b,c) (((a) << 16) + ((b) << 8) + (c))
__u32 version = KERNEL_VERSION(0, 8, 1);
printf ("Version: %u.%u.%u\n",
    (version >> 16) & 0xFF, (version >> 8) & 0xFF, version & 0xFF);
```

Table 236: Sub-Device Capabilities Flags

<table>
<thead>
<tr>
<th>V4L2_SUBDEV_CAP_RO_SUBDEV</th>
<th>The sub-device device node is registered in read-only mode. Access to the sub-device ioctls that modify the device state is restricted. Refer to each individual sub-device ioctl documentation for a description of which restrictions apply to a read-only sub-device.</th>
</tr>
</thead>
<tbody>
<tr>
<td>0x00000001</td>
<td></td>
</tr>
</tbody>
</table>

Return Value

On success 0 is returned, on error -1 and the errno variable is set appropriately. The generic error codes are described at the Generic Error Codes chapter.

ENOTTY The device node is not a V4L2 sub-device.

3.2.7.63 ioctl VIDIOC_SUBSCRIBE_EVENT, VIDIOC_UNSUBSCRIBE_EVENT

Name

VIDIOC_SUBSCRIBE_EVENT - VIDIOC_UNSUBSCRIBE_EVENT - Subscribe or unsubscribe event
Synopsis

**VIDIOC_SUBSCRIBE_EVENT**

```c
int ioctl(int fd, VIDIOC_SUBSCRIBE_EVENT, struct v4l2_event_subscription *argp)
```

**VIDIOC_UNSUBSCRIBE_EVENT**

```c
int ioctl(int fd, VIDIOC_UNSUBSCRIBE_EVENT, struct v4l2_event_subscription *argp)
```

**Arguments**

- **fd** File descriptor returned by `open()`.
- **argp** Pointer to struct `v4l2_event_subscription`.

**Description**

Subscribe or unsubscribe V4L2 event. Subscribed events are dequeued by using the `ioctl VIDIOC_DQEVENT` ioctl.

**v4l2_event_subscription**

Table 237: struct `v4l2_event_subscription`

<table>
<thead>

<td>When this event is subscribed an initial event will be sent containing the current status. This only makes sense for events that are triggered by a status change such as V4L2_EVENT_CTRL. Other events will ignore this flag.</td>
</tr>
<tr>
<td>V4L2_EVENT_SUB_FL_ALLOW_FEEDBACK</td>
<td>0x0002</td>
<td>If set, then events directly caused by an ioctl will also be sent to the filehandle that called that ioctl. For example, changing a control using VIDIOC_S_CTRL will cause a V4L2_EVENT_CTRL to be sent back to that same filehandle. Normally such events are suppressed to prevent feedback loops where an application changes a control to a one value and then another, and then receives an event telling it that that control has changed to the first value. Since it can’t tell whether that event was caused by another application or by the VIDIOC_S_CTRL call it is hard to decide whether to set the control to the value in the event, or ignore it. Think carefully when you set this flag so you won’t get into situations like that.</td>
</tr>
</tbody>
</table>

Return Value

On success 0 is returned, on error -1 and the errno variable is set appropriately. The generic error codes are described at the Generic Error Codes chapter.

3.2.7.64 V4L2 mmap()

Name

v4l2-mmap - Map device memory into application address space
# Synopsis

```c
#include <unistd.h>
#include <sys/mman.h>

void *mmap(void *start, size_t length, int prot, int flags, int fd, off_t offset)
```

## Arguments

- **start** Map the buffer to this address in the application’s address space. When the MAP_FIXED flag is specified, `start` must be a multiple of the pagesize and `mmap` will fail when the specified address cannot be used. Use of this option is discouraged; applications should just specify a NULL pointer here.

- **length** Length of the memory area to map. This must be the same value as returned by the driver in the struct `v4l2_buffer length` field for the single-planar API, and the same value as returned by the driver in the struct `v4l2_plane length` field for the multi-planar API.

- **prot** The `prot` argument describes the desired memory protection. Regardless of the device type and the direction of data exchange it should be set to PROT_READ | PROT_WRITE, permitting read and write access to image buffers. Drivers should support at least this combination of flags.

### Note:

1. The Linux videobuf kernel module, which is used by some drivers supports only PROT_READ | PROT_WRITE. When the driver does not support the desired protection, the `mmap()` function fails.

2. Device memory accesses (e.g. the memory on a graphics card with video capturing hardware) may incur a performance penalty compared to main memory accesses, or reads may be significantly slower than writes or vice versa. Other I/O methods may be more efficient in such case.

- **flags** The `flags` parameter specifies the type of the mapped object, mapping options and whether modifications made to the mapped copy of the page are private to the process or are to be shared with other references.

  - MAP_FIXED requests that the driver selects no other address than the one specified. If the specified address cannot be used, `mmap()` will fail. If MAP_FIXED is specified, `start` must be a multiple of the pagesize. Use of this option is discouraged.

  One of the MAP_SHARED or MAP_PRIVATE flags must be set. MAP_SHARED allows applications to share the mapped memory with other (e.g. child-) processes.

### Note: The Linux videobuf module which is used by some drivers supports only MAP_SHARED. MAP_PRIVATE requests copy-on-write semantics. V4L2 applications should not set the MAP_PRIVATE, MAP_DENYWRITE, MAP_EXECUTABLE or MAP_ANON flags.

- **fd** File descriptor returned by `open()`.
offset  Offset of the buffer in device memory. This must be the same value as returned by the
driver in the struct v4l2_buffer m union offset field for the single-planar API, and the
same value as returned by the driver in the struct v4l2_plane m union mem_offset field
for the multi-planar API.

Description

The mmap() function asks to map length bytes starting at offset in the memory of the device
specified by fd into the application address space, preferably at address start. This latter
address is a hint only, and is usually specified as 0.

Suitable length and offset parameters are queried with the ioctl VIDIOC_QUERYBUF ioctl.
Buffers must be allocated with the ioctl VIDIOC_REQBUFS ioctl before they can be queried.

To unmap buffers the munmap() function is used.

Return Value

On success mmap() returns a pointer to the mapped buffer. On error MAP_FAILED (-1) is returned,
and the errno variable is set appropriately. Possible error codes are:

EBADF  fd is not a valid file descriptor.
EACCES  fd is not open for reading and writing.
EINVAL  The start or length or offset are not suitable. (E. g. they are too large, or not
aligned on a PAGESIZE boundary.)

    The flags or prot value is not supported.

    No buffers have been allocated with the ioctl VIDIOC_REQBUFS ioctl.
ENOMEM  Not enough physical or virtual memory was available to complete the request.

3.2.7.65 V4L2 munmap()

Name

v4l2-munmap - Unmap device memory

Synopsis

```
#include <unistd.h>
#include <sys/mman.h>

int munmap(void *start, size_t length)
```
**Arguments**

**start** Address of the mapped buffer as returned by the `mmap()` function.

**length** Length of the mapped buffer. This must be the same value as given to `mmap()` and returned by the driver in the struct `v4l2_buffer length` field for the single-planar API and in the struct `v4l2_plane length` field for the multi-planar API.

**Description**

Unmaps a previously with the `mmap()` function mapped buffer and frees it, if possible.

**Return Value**

On success `munmap()` returns 0, on failure -1 and the `errno` variable is set appropriately:

- **EINVAL** The `start` or `length` is incorrect, or no buffers have been mapped yet.

### 3.2.7.66 V4L2 open()

**Name**

v4l2-open - Open a V4L2 device

**Synopsis**

```c
#include <fcntl.h>

int open(const char *device_name, int flags)
```

**Arguments**

**device_name** Device to be opened.

**flags** Open flags. Access mode must be `O_RDWR`. This is just a technicality, input devices still support only reading and output devices only writing.

When the `O_NONBLOCK` flag is given, the `read()` function and the `VIDIOC_DQBUF` ioctl will return the `EAGAIN` error code when no data is available or no buffer is in the driver outgoing queue, otherwise these functions block until data becomes available. All V4L2 drivers exchanging data with applications must support the `O_NONBLOCK` flag.

Other flags have no effect.
**Description**

To open a V4L2 device applications call `open()` with the desired device name. This function has no side effects; all data format parameters, current input or output, control values or other properties remain unchanged. At the first `open()` call after loading the driver they will be reset to default values, drivers are never in an undefined state.

**Return Value**

On success `open()` returns the new file descriptor. On error -1 is returned, and the `errno` variable is set appropriately. Possible error codes are:

- **EACCES** The caller has no permission to access the device.
- **EBUSY** The driver does not support multiple opens and the device is already in use.
- **ENXIO** No device corresponding to this device special file exists.
- **ENOMEM** Not enough kernel memory was available to complete the request.
- **EMFILE** The process already has the maximum number of files open.
- **ENFILE** The limit on the total number of files open on the system has been reached.

**3.2.7.67 V4L2 poll()**

**Name**

v4l2-poll - Wait for some event on a file descriptor

**Synopsis**

```c
#include <sys/poll.h>

int poll(struct pollfd *ufds, unsigned int nfds, int timeout)
```

**Arguments**

**Description**

With the `poll()` function applications can suspend execution until the driver has captured data or is ready to accept data for output.

When streaming I/O has been negotiated this function waits until a buffer has been filled by the capture device and can be dequeued with the `VIDIOC_DQBUF` ioctl. For output devices this function waits until the device is ready to accept a new buffer to be queued up with the `VIDIOC_QBUF` ioctl for display. When buffers are already in the outgoing queue of the driver (capture) or the incoming queue isn’t full (display) the function returns immediately.

On success `poll()` returns the number of file descriptors that have been selected (that is, file descriptors for which the `revents` field of the respective `struct pollfd` structure is non-zero).
Capture devices set the POLLIN and POLLRDNORM flags in the revents field, output devices the POLLOUT and POLLWRNORM flags. When the function timed out it returns a value of zero, on failure it returns -1 and the errno variable is set appropriately. When the application did not call VIDIOC_STREAMON the poll() function succeeds, but sets the POLLERR flag in the revents field. When the application has called VIDIOC_STREAMON for a capture device but hasn’t yet called VIDIOC_QBUF, the poll() function succeeds and sets the POLLERR flag in the revents field. For output devices this same situation will cause poll() to succeed as well, but it sets the POLLOUT and POLLWRNORM flags in the revents field.

If an event occurred (see ioctl VIDIOC_DQEVENT) then POLLPRI will be set in the revents field and poll() will return.

When use of the read() function has been negotiated and the driver does not capture yet, the poll() function starts capturing. When that fails it returns a POLLERR as above. Otherwise it waits until data has been captured and can be read. When the driver captures continuously (as opposed to, for example, still images) the function may return immediately.

When use of the write() function has been negotiated and the driver does not stream yet, the poll() function starts streaming. When that fails it returns a POLLERR as above. Otherwise it waits until the driver is ready for a non-blocking write() call.

If the caller is only interested in events (just POLLPRI is set in the events field), then poll() will not start streaming if the driver does not stream yet. This makes it possible to just poll for events and not for buffers.

All drivers implementing the read() or write() function or streaming I/O must also support the poll() function.

For more details see the poll() manual page.

**Return Value**

On success, poll() returns the number structures which have non-zero revents fields, or zero if the call timed out. On error -1 is returned, and the errno variable is set appropriately:

- **EBADF** One or more of the ufds members specify an invalid file descriptor.
- **EBUSY** The driver does not support multiple read or write streams and the device is already in use.
- **EFAULT** ufds references an inaccessible memory area.
- **EINTR** The call was interrupted by a signal.
- **EINVAL** The nfds value exceeds the RLIMIT_NOFILE value. Use getrlimit() to obtain this value.
3.2.7.68 V4L2 read()

Name

v4l2-read - Read from a V4L2 device

Synopsis

```c
#include <unistd.h>

ssize_t read(int fd, void *buf, size_t count)
```

Arguments

- **fd**: File descriptor returned by `open()`.
- **buf**: Buffer to be filled.
- **count**: Max number of bytes to read.

Description

The `read()` function attempts to read up to `count` bytes from file descriptor `fd` into the buffer starting at `buf`. The layout of the data in the buffer is discussed in the respective device interface section, see `##`. If `count` is zero, `read()` returns zero and has no other results. If `count` is greater than `SSIZE_MAX`, the result is unspecified. Regardless of the `count` value each `read()` call will provide at most one frame (two fields) worth of data.

By default `read()` blocks until data becomes available. When the `O_NONBLOCK` flag was given to the `open()` function it returns immediately with an `EAGAIN` error code when no data is available. The `select()` or `poll()` functions can always be used to suspend execution until data becomes available. All drivers supporting the `read()` function must also support `select()` and `poll()`.

Drivers can implement read functionality in different ways, using a single or multiple buffers and discarding the oldest or newest frames once the internal buffers are filled.

`read()` never returns a “snapshot” of a buffer being filled. Using a single buffer the driver will stop capturing when the application starts reading the buffer until the read is finished. Thus only the period of the vertical blanking interval is available for reading, or the capture rate must fall below the nominal frame rate of the video standard.

The behavior of `read()` when called during the active picture period or the vertical blanking separating the top and bottom field depends on the discarding policy. A driver discarding the oldest frames keeps capturing into an internal buffer, continuously overwriting the previously, not read frame, and returns the frame being received at the time of the `read()` call as soon as it is complete.

A driver discarding the newest frames stops capturing until the next `read()` call. The frame being received at `read()` time is discarded, returning the following frame instead. Again this implies a reduction of the capture rate to one half or less of the nominal frame rate. An example of this model is the video read mode of the btvtv driver, initiating a DMA to user memory when `read()` is called and returning when the DMA finished.
In the multiple buffer model drivers maintain a ring of internal buffers, automatically advancing
to the next free buffer. This allows continuous capturing when the application can empty the
buffers fast enough. Again, the behavior when the driver runs out of free buffers depends on
the discarding policy.

Applications can get and set the number of buffers used internally by the driver with the VID-
IOC_G_PARM and VIDIOC_S_PARM ioctls. They are optional, however. The discarding policy
is not reported and cannot be changed. For minimum requirements see Interfaces.

Return Value

On success, the number of bytes read is returned. It is not an error if this number is smaller
than the number of bytes requested, or the amount of data required for one frame. This may
happen for example because read() was interrupted by a signal. On error, -1 is returned, and
the errno variable is set appropriately. In this case the next read will start at the beginning of
a new frame. Possible error codes are:

EAGAIN Non-blocking I/O has been selected using O_NONBLOCK and no data was immedia-
tely available for reading.

EBADF fd is not a valid file descriptor or is not open for reading, or the process already has
the maximum number of files open.

EBUSY The driver does not support multiple read streams and the device is already in use.

EFAULT buf references an inaccessible memory area.

EINTR The call was interrupted by a signal before any data was read.

EIO I/O error. This indicates some hardware problem or a failure to communicate with a remote
device (USB camera etc.).

EINVAL The read() function is not supported by this driver, not on this device, or generally
not on this type of device.

3.2.7.69 V4L2 select()

Name

v4l2-select - Synchronous I/O multiplexing

Synopsis

```c
#include <sys/time.h>
#include <sys/types.h>
#include <unistd.h>

int select(int nfds, fd_set *readfds, fd_set *writefds, fd_set *exceptfds, struct
timeval *timeout)
```
Arguments

**nfds**  The highest-numbered file descriptor in any of the three sets, plus 1.

**readfds**  File descriptions to be watched if a read() call won’t block.

**writefds**  File descriptions to be watched if a write() won’t block.

**exceptfds**  File descriptions to be watched for V4L2 events.

**timeout**  Maximum time to wait.

Description

With the `select()` function applications can suspend execution until the driver has captured data or is ready to accept data for output.

When streaming I/O has been negotiated this function waits until a buffer has been filled or displayed and can be dequeued with the **VIDIOC_DQBUF** ioctl. When buffers are already in the outgoing queue of the driver the function returns immediately.

On success `select()` returns the total number of bits set in `fd_set`. When the function timed out it returns a value of zero. On failure it returns -1 and the `errno` variable is set appropriately. When the application did not call `ioctl VIDIOC_QBUF, VIDIOC_DQBUF` or `ioctl VIDIOC_STREAMON, VIDIOC_STREAMOFF` yet the `select()` function succeeds, setting the bit of the file descriptor in `readfds` or `writefds`, but subsequent `VIDIOC_DQBUF` calls will fail.\(^1\)

When use of the `read()` function has been negotiated and the driver does not capture yet, the `select()` function starts capturing. When that fails, `select()` returns successful and a subsequent `read()` call, which also attempts to start capturing, will return an appropriate error code. When the driver captures continuously (as opposed to, for example, still images) and data is already available the `select()` function returns immediately.

When use of the `write()` function has been negotiated the `select()` function just waits until the driver is ready for a non-blocking `write()` call.

All drivers implementing the `read()` or `write()` function or streaming I/O must also support the `select()` function.

For more details see the `select()` manual page.

Return Value

On success, `select()` returns the number of descriptors contained in the three returned descriptor sets, which will be zero if the timeout expired. On error -1 is returned, and the `errno` variable is set appropriately; the sets and timeout are undefined. Possible error codes are:

- **EBADF** One or more of the file descriptor sets specified a file descriptor that is not open.
- **EBUSY**  The driver does not support multiple read or write streams and the device is already in use.
- **EFAULT**  The `readfds`, `writefds`, `exceptfds` or `timeout` pointer references an inaccessible memory area.

---

\(^1\) The Linux kernel implements `select()` like the `poll()` function, but `select()` cannot return a `POLLERR`. 

3.2. Part I - Video for Linux API 1245

**EINTR** The call was interrupted by a signal.

**EINVAL** The {nfds} argument is less than zero or greater than {FD_SETSIZE}.

### 3.2.7.70 V4L2 write()

**Name**

v4l2-write - Write to a V4L2 device

**Synopsis**

```c
#include <unistd.h>

ssize_t write(int fd, void *buf, size_t count)
```

**Arguments**

- **fd** File descriptor returned by open().
- **buf** Buffer with data to be written
- **count** Number of bytes at the buffer

**Description**

write() writes up to count bytes to the device referenced by the file descriptor {fd} from the buffer starting at {buf}. When the hardware outputs are not active yet, this function enables them. When count is zero, write() returns 0 without any other effect.

When the application does not provide more data in time, the previous video frame, raw VBI image, sliced VPS or WSS data is displayed again. Sliced Teletext or Closed Caption data is not repeated, the driver inserts a blank line instead.

**Return Value**

On success, the number of bytes written are returned. Zero indicates nothing was written. On error, -1 is returned, and the {errno} variable is set appropriately. In this case the next write will start at the beginning of a new frame. Possible error codes are:

- **EAGAIN** Non-blocking I/O has been selected using the {O_NONBLOCK} flag and no buffer space was available to write the data immediately.
- **EBADF** {fd} is not a valid file descriptor or is not open for writing.
- **EBUSY** The driver does not support multiple write streams and the device is already in use.
- **EFAULT** {buf} references an inaccessible memory area.
- **EINTR** The call was interrupted by a signal before any data was written.
- **EIO** I/O error. This indicates some hardware problem.
EINVAL The write() function is not supported by this driver, not on this device, or generally not on this type of device.

3.2.8 Common definitions for V4L2 and V4L2 subdev interfaces

3.2.8.1 Common selection definitions

While the V4L2 selection API and V4L2 subdev selection APIs are very similar, there’s one fundamental difference between the two. On sub-device API, the selection rectangle refers to the media bus format, and is bound to a sub-device’s pad. On the V4L2 interface the selection rectangles refer to the in-memory pixel format.

This section defines the common definitions of the selection interfaces on the two APIs.

Selection targets

The precise meaning of the selection targets may be dependent on which of the two interfaces they are used.

Table 239: Selection target definitions

<table>
<thead>
<tr>
<th>Target name</th>
<th>Id</th>
<th>Definition</th>
<th>Valid for V4L2</th>
<th>Valid for V4L2 sub-dev</th>
</tr>
</thead>
<tbody>
<tr>
<td>V4L2_SEL_TGT_CROP</td>
<td>0x0000</td>
<td>Crop rectangle. Defines the cropped area.</td>
<td>Yes</td>
<td>Yes</td>
</tr>
<tr>
<td>V4L2_SEL_TGT_CROP_DEFAULT</td>
<td>0x0001</td>
<td>Suggested cropping rectangle that covers the “whole picture”. This includes only active pixels and excludes other non-active pixels such as black pixels.</td>
<td>Yes</td>
<td>Yes</td>
</tr>
<tr>
<td>V4L2_SEL_TGT_CROP_BOUNDS</td>
<td>0x0002</td>
<td>Bounds of the crop rectangle. All valid crop rectangles fit inside the crop bounds rectangle.</td>
<td>Yes</td>
<td>Yes</td>
</tr>
<tr>
<td>V4L2_SEL_TGT_NATIVE_SIZE</td>
<td>0x0003</td>
<td>The native size of the device, e.g. a sensor’s pixel array. left and top fields are zero for this target.</td>
<td>Yes</td>
<td>Yes</td>
</tr>
<tr>
<td>V4L2_SEL_TGT_COMPOSE</td>
<td>0x0100</td>
<td>Cookpe rectangle. Used to configure scaling and composition.</td>
<td>Yes</td>
<td>Yes</td>
</tr>
<tr>
<td>V4L2_SEL_TGT_COMPOSE_DEFAULT</td>
<td>0x0101</td>
<td>Suggested composition rectangle that covers the “whole picture”.</td>
<td>Yes</td>
<td>No</td>
</tr>
<tr>
<td>V4L2_SEL_TGT_COMPOSE_BOUNDS</td>
<td>0x0102</td>
<td>Bounds of the compose rectangle. All valid compose rectangles fit inside the compose bounds rectangle.</td>
<td>Yes</td>

/** struct v4l2_bt_timings - BT.656/BT.1120 timing data */
* @width: total width of the active video in pixels
* @height: total height of the active video in lines
* @interlaced: Interlaced or progressive
* @polarities: Positive or negative polarities
* @pixelclock: Pixel clock in HZ. Ex. 74.25MHz->74250000
* @hfrontporch: Horizontal front porch in pixels
* @hsync: Horizontal Sync length in pixels
* @hbackporch: Horizontal back porch in pixels
* @vfrontporch: Vertical front porch in lines
* @vsync: Vertical Sync length in lines
* @vbackporch: Vertical back porch in lines
* @il_vfrontporch: Vertical front porch for the even field
* @il_vsasync: Vertical Sync length for the even field
* @il_vbackporch: Vertical back porch for the even field
* @standards: Standards the timing belongs to
* @flags: Flags
* @picture_aspect: The picture aspect ratio (hor/vert).
* @cea861_vic: VIC code as per the CEA-861 standard.
* @hdmi_vic: VIC code as per the HDMI standard.
* @reserved: Reserved fields, must be zeroed.
*
* A note regarding vertical interlaced timings: height refers to the total
* height of the active video frame (= two fields). The blanking timings refer
* to the blanking of each field. So the height of the total frame is
* calculated as follows:
*
* \[
* \text{tot} \_ \text{height} = \text{height} + \text{vfrontporch} + \text{vsync} + \text{vbackporch} + \\
* \quad \text{il} \_ \text{vfrontporch} + \text{il} \_ \text{vsync} + \text{il} \_ \text{vbackporch}
* \]
*
* The active height of each field is height / 2.
*/

3.2.11 Video Grabber example using libv4l

This program demonstrates how to grab V4L2 images in ppm format by using libv4l handlers. The advantage is that this grabber can potentially work with any V4L2 driver.

Authors, in alphabetical order:

- **Ailus, Sakari** <sakari.ailus@iki.fi>
  - Subdev selections API.

- **Carvalho Chehab, Mauro** <mchehab+samsung@kernel.org>
  - Documented libv4l, designed and added v4l2grab example, Remote Controller chapter.

- **Dirks, Bill**
  - Original author of the V4L2 API and documentation.

- **Figa, Tomasz** <tfiga@chromium.org>
  - Documented the memory-to-memory decoder interface.
  - Documented the memory-to-memory encoder interface.

- **H Schimek, Michael** <mschimek@gmx.at>
  - Original author of the V4L2 API and documentation.

- **Karicheri, Muralidharan** <m-karicheri2@ti.com>
  - Documented the Digital Video timings API.

- **Osciak, Pawel** <posciak@chromium.org>
  - Documented the memory-to-memory decoder interface.
  - Documented the memory-to-memory encoder interface.

- **Osciak, Pawel** <pawel@osciak.com>
  - Designed and documented the multi-planar API.

- **Palosaari, Antti** <crope@iki.fi>
  - SDR API.

- **Ribalda, Ricardo**
  - Introduce HSV formats and other minor changes.

- **Rubli, Martin**
  - Designed and documented the VIDIJC_ENUM_FRAMESIZES and VIDIIOC_ENUM_FRAMEINTERVALS ioctls.

- **Walls, Andy** <awalls@md.metrocast.net>
  - Documented the fielded V4L2_MPEG_STREAM_VBI_FMT_IVTV MPEG stream embedded, sliced VBI data format in this specification.

- **Verkuil, Hans** <hverkuil@xs4all.nl>
  - Designed and documented the VIDIIOC_LOG_STATUS ioctl, the extended control ioctls, major parts of the sliced VBI API, the MPEG encoder and decoder APIs and the DV Timings API.
### 3.2.14 Revision History

**Revision 4.10** / 2016-07-15 (rr)

Introduce HSV formats.

**Revision 4.5** / 2015-10-29 (rr)

Extend `VIDIOC_G_EXT_CTRLS`.
Replace `ctrl_class` with a new union with `ctrl_class` and `which`.
Which is used to select the current value of the control or the default value.

**Revision 4.4** / 2015-05-26 (ap)

Renamed `V4L2_TUNER_ADC` to `V4L2_TUNER_SDR`. Added `V4L2_CID_RF_TUNER_RF_GAIN`
control. Added transmitter support for Software Defined Radio (SDR) Interface.

**Revision 4.1** / 2015-02-13 (mcc)

Fix documentation for media controller device nodes and add support for DVB device nodes.
Add support for Tuner sub-device.

**Revision 3.19** / 2014-12-05 (hv)

Rewrote Colorspace chapter, added new enum `v4l2_ycbcr_encoding` and enum `v4l2_quantization`
fields to struct `v4l2_pix_format`, struct `v4l2_pix_format_mplane` and struct `v4l2_mbus_framefmt`.

**Revision 3.17** / 2014-08-04 (lp, hv)

Extended struct `v4l2_pix_format`. Added format flags. Added compound control types and
`VIDIOC_QUERY_EXT_CTRLS`.

**Revision 3.15** / 2014-02-03 (hv, ap)

Update several sections of “Common API Elements”: “Opening and Closing Devices” “Querying
Capabilities”, “Application Priority”, “Video Inputs and Outputs”, “Audio Inputs and Outputs”
“Tuners and Modulators”, “Video Standards” and “Digital Video (DV) Timings”. Added SDR API.

**Revision 3.14** / 2013-11-25 (rr)

Set width and height as unsigned on `v4l2_rect`.

**Revision 3.11** / 2013-05-26 (hv)

Remove obsolete `VIDIOC_DBG_G_CHIP_IDENT` ioctl.

**Revision 3.10** / 2013-03-25 (hv)

Remove obsolete and unused `DV_PRESET` ioctls: `VIDIOC_G_DV_PRESET`, `VIDIOC_S_DV_PRESET`,
`VIDIOC_QUERY_DV_PRESET` and `VIDIOC_ENUM_DV_PRESET`. Remove the related `v4l2_input/output`
Added timestamp types to v4l2_buffer. Added V4L2_EVENT_CTRL_CH_RANGE control event changes flag.

**revision 3.6 / 2012-07-02 (hv)**

Added VIDIOC_ENUM_FREQ_BANDS.

**revision 3.5 / 2012-05-07 (sa, sn, hv)**

**revision 3.4 / 2012-01-25 (sn)**

Added JPEG compression control class.

**revision 3.3 / 2012-01-11 (hv)**

Added device_caps field to struct v4l2_capabilities.

**revision 3.2 / 2011-08-26 (hv)**

Added V4L2_CTRL_FLAG_VOLATILE.

**revision 3.1 / 2011-06-27 (mcc, po, hv)**

Documented that VIDIOC_QUERYCAP now returns a per-subsystem version instead of a per-driver one. Standardize an error code for invalid ioctl. Added V4L2_CTRL_TYPE_BITMASK.

**revision 2.6.39 / 2011-03-01 (mcc, po)**

Removed VIDIOC_*_OLD from videodev2.h header and update it to reflect latest changes. Added the multi-planar API.

**revision 2.6.37 / 2010-08-06 (hv)**

Removed obsolete vtx (videotext) API.

**revision 2.6.33 / 2009-12-03 (mk)**

Added documentation for the Digital Video timings API.

**revision 2.6.32 / 2009-08-31 (mcc)**

Now, revisions will match the kernel version where the V4L2 API changes will be used by the Linux Kernel. Also added Remote Controller chapter.

**revision 0.29 / 2009-08-26 (ev)**

Added documentation for string controls and for FM Transmitter controls.

**revision 0.28 / 2009-08-26 (gl)**

Added V4L2_CID_BAND_STOP_FILTER documentation.
Added libv4l and Remote Controller documentation; added v4l2grab and keytable application examples.

Finalized the RDS capture API. Added modulator and RDS encoder capabilities. Added support for string controls.

Added pixel formats VYUY, NV16 and NV61, and changed the debug ioctls VIDIOC_DBG_G/S REGISTER and VIDIOC_DBG_G CHIP_IDENT. Added camera controls V4L2_CID_ZOOM_ABSOLUTE, V4L2_CID_ZOOM_RELATIVE, V4L2_CID_ZOOM_CONTINUOUS and V4L2_CID_PRIVACY.

Added pixel formats Y16 and SBGGR16, new controls and a camera controls class. Removed VIDIOC_G/S_MPEGCOMP.

Fixed a typo in VIDIOC_DBG_G/S REGISTER. Clarified the byte order of packed pixel formats.

Added the Video Output Overlay interface, new MPEG controls, V4L2_FIELD_INTERLACED_TB and V4L2_FIELD_INTERLACED_BT, VIDIOC_DBG_G/S REGISTER, VIDIOC_(TRY_)ENCODER_CMD, VIDIOC_G_CHIP_IDENT, VIDIOC_G_ENC_INDEX, new pixel formats. Clarifications in the cropping chapter, about RGB pixel formats, the mmap(), poll(), select(), read() and write() functions. Typographical fixes.

Fixed a link in the VIDIOC_G_EXT_CTRLS section.

Clarified the purpose of the audioset field in struct v4l2_input and v4l2_output.

Documented V4L2_PIX_FMT_RGB444.

Added the description of extended controls by Hans Verkuil. Linked V4L2_PIX_FMT_MPEG to V4L2_CID_MPEG_STREAM_TYPE.

Corrected V4L2_PIX_FMT_HM12 description.

VIDIOC_ENUM_FRAMESIZES and VIDIOC_ENUM_FRAMEINTERVALS are now part of the API.
Cleaned up the bibliography, added BT.653 and BT.1119. `capture.c/start_captureing()` for user pointer I/O did not initialize the buffer index. Documented the V4L MPEG and MJPEG VID_TYPES and V4L2_PIX_FMT_SBGGR8. Updated the list of reserved pixel formats. See the history chapter for API changes.

**revision** 0.14 / 2006-09-14 (mr)

Added VIDIOC_ENUM_FRAMESIZES and VIDIOC_ENUM_FRAMEINTERVALS proposal for frame format enumeration of digital devices.

**revision** 0.13 / 2006-04-07 (mhs)

Corrected the description of struct v4l2_window clips. New V4L2_STD_ and V4L2_TUNER_MODE_LANG1_LANG2 defines.

**revision** 0.12 / 2006-02-03 (mhs)

Corrected the description of struct v4l2_captureparm and v4l2_outputparm.

**revision** 0.11 / 2006-01-27 (mhs)

Improved the description of struct v4l2_tuner.

**revision** 0.10 / 2006-01-10 (mhs)

VIDIOC_G_INPUT and VIDIOC_S_PARM clarifications.

**revision** 0.9 / 2005-11-27 (mhs)

Improved the 525 line numbering diagram. Hans Verkuil and I rewrote the sliced VBI section. He also contributed a VIDIOC_LOG_STATUS page. Fixed VIDIOC_S_STD call in the video standard selection example. Various updates.

**revision** 0.8 / 2004-10-04 (mhs)

Somehow a piece of junk slipped into the capture example, removed.

**revision** 0.7 / 2004-09-19 (mhs)

Fixed video standard selection, control enumeration, downscaling and aspect example. Added read and user pointer i/o to video capture example.

**revision** 0.6 / 2004-08-01 (mhs)

v4l2_buffer changes, added video capture example, various corrections.

**revision** 0.5 / 2003-11-05 (mhs)

Pixel format erratum.

**revision** 0.4 / 2003-09-17 (mhs)

Corrected source and Makefile to generate a PDF. SGML fixes. Added latest API changes. Closed gaps in the history chapter.

**revision** 0.3 / 2003-02-05 (mhs)

Another draft, more corrections.

**revision** 0.2 / 2003-01-15 (mhs)

Second draft, with corrections pointed out by Gerd Knorr:

**revision** 0.1 / 2002-12-01 (mhs)
First draft, based on documentation by Bill Dirks and discussions on the V4L mailing list.

3.3 Part II - Digital TV API

**Note:** This API is also known as Linux **DVB API**.

It was originally written to support the European digital TV standard (DVB), and later extended to support all digital TV standards.

In order to avoid confusion, within this document, it was opted to refer to it, and to associated hardware as **Digital TV**.

The word **DVB** is reserved to be used for:

- the Digital TV API version (e.g. DVB API version 3 or DVB API version 5);
- digital TV data types (enums, structs, defines, etc);
- digital TV device nodes (/dev/dvb/...);
- the European DVB standard.

**Version 5.10**

3.3.1 Introduction

3.3.1.1 What you need to know

The reader of this document is required to have some knowledge in the area of digital video broadcasting (Digital TV) and should be familiar with part I of the MPEG2 specification ISO/IEC 13818 (aka ITU-T H.222), i.e you should know what a program/transport stream (PS/TS) is and what is meant by a packetized elementary stream (PES) or an I-frame.

Various Digital TV standards documents are available for download at:

- American standards (ATSC): [https://www.atsc.org/standards/](https://www.atsc.org/standards/)

It is also necessary to know how to access Linux devices and how to use ioctl calls. This also includes the knowledge of C or C++. 

3.3.1.2 History

The first API for Digital TV cards we used at Convergence in late 1999 was an extension of the Video4Linux API which was primarily developed for frame grabber cards. As such it was not really well suited to be used for Digital TV cards and their new features like recording MPEG streams and filtering several section and PES data streams at the same time.

In early 2000, Convergence was approached by Nokia with a proposal for a new standard Linux Digital TV API. As a commitment to the development of terminals based on open standards, Nokia and Convergence made it available to all Linux developers and published it on https://linuxtv.org in September 2000. With the Linux driver for the Siemens/Hauppauge DVB PCI card, Convergence provided a first implementation of the Linux Digital TV API. Convergence was the maintainer of the Linux Digital TV API in the early days.

Now, the API is maintained by the LinuxTV community (i.e. you, the reader of this document). The Linux Digital TV API is constantly reviewed and improved together with the improvements at the subsystem’s core at the Kernel.

3.3.1.3 Overview

![Components of a Digital TV card/STB](image)

A Digital TV card or set-top-box (STB) usually consists of the following main hardware components:

**Frontend consisting of tuner and digital TV demodulator** Here the raw signal reaches the digital TV hardware from a satellite dish or antenna or directly from cable. The frontend down-converts and demodulates this signal into an MPEG transport stream (TS). In case of a satellite frontend, this includes a facility for satellite equipment control (SEC), which allows control of LNB polarization, multi feed switches or dish rotors.
Conditional Access (CA) hardware like CI adapters and smartcard slots

The complete TS is passed through the CA hardware. Programs to which the user has access (controlled by the smart card) are decoded in real time and re-inserted into the TS.

Note: Not every digital TV hardware provides conditional access hardware.

Demultiplexer which filters the incoming Digital TV MPEG-TS stream

The demultiplexer splits the TS into its components like audio and video streams. Besides usually several of such audio and video streams it also contains data streams with information about the programs offered in this or other streams of the same provider.

Audio and video decoder

The main targets of the demultiplexer are audio and video decoders. After decoding, they pass on the uncompressed audio and video to the computer screen or to a TV set.

Note: Modern hardware usually doesn’t have a separate decoder hardware, as such functionality can be provided by the main CPU, by the graphics adapter of the system or by a signal processing hardware embedded on a Systems on a Chip (SoC) integrated circuit.

It may also not be needed for certain usages (e.g. for data-only uses like “internet over satellite”).

Components of a Digital TV card/STB shows a crude schematic of the control and data flow between those components.

3.3.1.4 Linux Digital TV Devices

The Linux Digital TV API lets you control these hardware components through currently six Unix-style character devices for video, audio, frontend, demux, CA and IP-over-DVB networking. The video and audio devices control the MPEG2 decoder hardware, the frontend device the tuner and the Digital TV demodulator. The demux device gives you control over the PES and section filters of the hardware. If the hardware does not support filtering these filters can be implemented in software. Finally, the CA device controls all the conditional access capabilities of the hardware. It can depend on the individual security requirements of the platform, if and how many of the CA functions are made available to the application through this device.

All devices can be found in the /dev tree under /dev/dvb. The individual devices are called:

- /dev/dvb/adapterN/audioM,
- /dev/dvb/adapterN/videoM,
- /dev/dvb/adapterN/frontendM,
- /dev/dvb/adapterN/netM,
- /dev/dvb/adapterN/demuxM,
- /dev/dvb/adapterN/dvrM,
- /dev/dvb/adapterN/caM,
where N enumerates the Digital TV cards in a system starting from 0, and M enumerates the devices of each type within each adapter, starting from 0, too. We will omit the "/dev/dvb/adapterN/" in the further discussion of these devices.

More details about the data structures and function calls of all the devices are described in the following chapters.

### 3.3.1.5 API include files

For each of the Digital TV devices a corresponding include file exists. The Digital TV API include files should be included in application sources with a partial path like:

```c
#include <linux/dvb/ca.h>
#include <linux/dvb/dmx.h>
#include <linux/dvb/frontend.h>
#include <linux/dvb/net.h>
```

To enable applications to support different API version, an additional include file `linux/dvb/version.h` exists, which defines the constant `DVB_API_VERSION`. This document describes `DVB_API_VERSION 5.10`.

### 3.3.2 Digital TV Frontend API

The Digital TV frontend API was designed to support three groups of delivery systems: Terrestrial, cable and Satellite. Currently, the following delivery systems are supported:

- Terrestrial systems: DVB-T, DVB-T2, ATSC, ATSC M/H, ISDB-T, DVB-H, DTMB, CM MM
- Cable systems: DVB-C Annex A/C, ClearQAM (DVB-C Annex B)
- Satellite systems: DVB-S, DVB-S2, DVB Turbo, ISDB-S, DSS

The Digital TV frontend controls several sub-devices including:

- Tuner
- Digital TV demodulator
- Low noise amplifier (LNA)
- Satellite Equipment Control (SEC)

The frontend can be accessed through `/dev/dvb/adapterN/frontend`. Data types and ioctl definitions can be accessed by including `linux/dvb/frontend.h` in your application.

**Note:** Transmission via the internet (DVB-IP) and MMT (MPEG Media Transport) is not yet handled by this API but a future extension is possible.

---

1 On Satellite systems, the API support for the Satellite Equipment Control (SEC) allows to power control and to send/receive signals to control the antenna subsystem, selecting the polarization and choosing the Intermediate Frequency IF) of the Low Noise Block Converter Feed Horn (LNBf). It supports the DiSEqC and V-SEC protocols. The DiSEqC (digital SEC) specification is available at [Eutelsat](https://www.eutelsat.com).
3.3.2.1 Querying frontend information

Usually, the first thing to do when the frontend is opened is to check the frontend capabilities. This is done using `ioctl FE_GET_INFO`. This ioctl will enumerate the Digital TV API version and other characteristics about the frontend, and can be opened either in read only or read/write mode.

3.3.2.2 Querying frontend status and statistics

Once `FE_SET_PROPERTY` is called, the frontend will run a kernel thread that will periodically check for the tuner lock status and provide statistics about the quality of the signal.

The information about the frontend tuner locking status can be queried using `ioctl FE_READ_STATUS`.

Signal statistics are provided via `ioctl FE_SET_PROPERTY, FE_GET_PROPERTY`.

---

**Note:** Most statistics require the demodulator to be fully locked (e.g. with FE_HAS_LOCK bit set). See *Frontend statistics indicators* for more details.

3.3.2.3 Property types

Tuning into a Digital TV physical channel and starting decoding it requires changing a set of parameters, in order to control the tuner, the demodulator, the Linear Low-noise Amplifier (LNA) and to set the antenna subsystem via Satellite Equipment Control - SEC (on satellite systems). The actual parameters are specific to each particular digital TV standards, and may change as the digital TV specs evolves.

In the past (up to DVB API version 3 - DVBv3), the strategy used was to have a union with the parameters needed to tune for DVB-S, DVB-C, DVB-T and ATSC delivery systems grouped there. The problem is that, as the second generation standards appeared, the size of such union was not big enough to group the structs that would be required for those new standards. Also, extending it would break userspace.

So, the legacy union/struct based approach was deprecated, in favor of a properties set approach. On such approach, `FE_GET_PROPERTY` and `FE_SET_PROPERTY` are used to setup the frontend and read its status.

The actual action is determined by a set of `dtv_property cmd/data` pairs. With one single ioctl, is possible to get/set up to 64 properties.

This section describes the new and recommended way to set the frontend, with supports all digital TV delivery systems.

---

**Note:**

1. On Linux DVB API version 3, setting a frontend was done via struct `dvb_frontend_parameters`.
2. Don’t use DVB API version 3 calls on hardware with supports newer standards. Such API provides no support or a very limited support to new standards and/or new hardware.

3.3. Part II - Digital TV API
3. Nowadays, most frontends support multiple delivery systems. Only with DVB API version 5 calls it is possible to switch between the multiple delivery systems supported by a frontend.

4. DVB API version 5 is also called S2API, as the first new standard added to it was DVB-S2.

**Example:** in order to set the hardware to tune into a DVB-C channel at 651 kHz, modulated with 256-QAM, FEC 3/4 and symbol rate of 5.217 Mbauds, those properties should be sent to `FE_SET_PROPERTY` ioctl:

```
DTV_DELIVERY_SYSTEM = SYS_DVBC_ANNEX_A
DTV_FREQUENCY = 651000000
DTV_MODULATION = QAM_256
DTV_INVERSION = INVERSION_AUTO
DTV_SYMBOL_RATE = 5217000
DTV_INNER_FEC = FEC_3_4
DTV_TUNE
```

The code that would do the above is show in **Example: Setting digital TV frontend properties**.

Listing 1: Example: Setting digital TV frontend properties

```c
#include <stdio.h>
#include <fcntl.h>
#include <sys/ioctl.h>
#include <linux/dvb/frontend.h>

static struct dtv_property props[] = {
    { .cmd = DTV_DELIVERY_SYSTEM, .u.data = SYS_DVBC_ANNEX_A },
    { .cmd = DTV_FREQUENCY, .u.data = 651000000 },
    { .cmd = DTV_MODULATION, .u.data = QAM_256 },
    { .cmd = DTV_INVERSION, .u.data = INVERSION_AUTO },
    { .cmd = DTV_SYMBOL_RATE, .u.data = 5217000 },
    { .cmd = DTV_INNER_FEC, .u.data = FEC_3_4 },
    { .cmd = DTV_TUNE }
};

static struct dtv_properties dtv_prop = {
    .num = 6, .props = props
};

int main(void)
{
    int fd = open("/dev/dvb/adapter0/frontend0", O_RDWR);

    if (!fd) {
        perror ("open");
        return -1;
    }

    if (ioctl(fd, FE_SET_PROPERTY, &dtv_prop) == -1) {
        perror("ioctl");
        return -1;
    }
}
```
printf("Frontend set\n");
return 0;
}

Attention: While it is possible to directly call the Kernel code like the above example, it is strongly recommended to use libdvbv5, as it provides abstraction to work with the supported digital TV standards and provides methods for usual operations like program scanning and to read/write channel descriptor files.

Digital TV property parameters

There are several different Digital TV parameters that can be used by FE_SET_PROPERTY and FE_GET_PROPERTY ioctls. This section describes each of them. Please notice, however, that only a subset of them are needed to setup a frontend.

DTV_UNDEFINED

Used internally. A GET/SET operation for it won’t change or return anything.

DTV_TUNE

Interpret the cache of data, build either a traditional frontend tunerequest so we can pass validation in the FE_SET_FRONTEND ioctl.

DTV_CLEAR

Reset a cache of data specific to the frontend here. This does not effect hardware.

DTV_FREQUENCY

Frequency of the digital TV transponder/channel.

Note:

1. For satellite delivery systems, the frequency is in kHz.
2. For cable and terrestrial delivery systems, the frequency is in Hz.
3. On most delivery systems, the frequency is the center frequency of the transponder/channel. The exception is for ISDB-T, where the main carrier has a 1/7 offset from the center.
4. For ISDB-T, the channels are usually transmitted with an offset of about 143kHz. E.g. a valid frequency could be 474,143 kHz. The stepping is bound to the bandwidth of the channel which is typically 6MHz.
5. In ISDB-Tsb, the channel consists of only one or three segments the frequency step is 429kHz, 3*429 respectively.

**DTV_MODULATION**

Specifies the frontend modulation type for delivery systems that supports more multiple modulations.

The modulation can be one of the types defined by enum `fe_modulation`.

Most of the digital TV standards offers more than one possible modulation type.

The table below presents a summary of the types of modulation types supported by each delivery system, as currently defined by specs.

<table>
<thead>
<tr>
<th>Standard</th>
<th>Modulation types</th>
</tr>
</thead>
<tbody>
<tr>
<td>ATSC (version 1)</td>
<td>8-VSB and 16-VSB.</td>
</tr>
<tr>
<td>DMTB</td>
<td>4-QAM, 16-QAM, 32-QAM, 64-QAM and 4-QAM-NR.</td>
</tr>
<tr>
<td>DVB-C Annex A/C</td>
<td>16-QAM, 32-QAM, 64-QAM and 256-QAM.</td>
</tr>
<tr>
<td>DVB-C Annex B</td>
<td>64-QAM.</td>
</tr>
<tr>
<td>DVB-T</td>
<td>QPSK, 16-QAM and 64-QAM.</td>
</tr>
<tr>
<td>DVB-T2</td>
<td>QPSK, 16-QAM, 64-QAM and 256-QAM.</td>
</tr>
<tr>
<td>DVB-S</td>
<td>No need to set. It supports only QPSK.</td>
</tr>
<tr>
<td>DVB-S2</td>
<td>QPSK, 8-PSK, 16-APSK and 32-APSK.</td>
</tr>
<tr>
<td>ISDB-T</td>
<td>QPSK, DQPSK, 16-QAM and 64-QAM.</td>
</tr>
<tr>
<td>ISDB-S</td>
<td>8-PSK, QPSK and BPSK.</td>
</tr>
</tbody>
</table>

**Note:** Please notice that some of the above modulation types may not be defined currently at the Kernel. The reason is simple: no driver needed such definition yet.

**DTV_BANDWIDTH_HZ**

Bandwidth for the channel, in HZ.

Should be set only for terrestrial delivery systems.

Possible values: 1712000, 5000000, 6000000, 7000000, 8000000, 10000000.

<table>
<thead>
<tr>
<th>Terrestrial Standard</th>
<th>Possible values for bandwidth</th>
</tr>
</thead>
<tbody>
<tr>
<td>ATSC (version 1)</td>
<td>No need to set. It is always 6MHz.</td>
</tr>
<tr>
<td>DMTB</td>
<td>No need to set. It is always 8MHz.</td>
</tr>
<tr>
<td>DVB-T</td>
<td>6MHz, 7MHz and 8MHz.</td>
</tr>
<tr>
<td>DVB-T2</td>
<td>1.172 MHz, 5MHz, 6MHz, 7MHz, 8MHz and 10MHz</td>
</tr>
<tr>
<td>ISDB-T</td>
<td>5MHz, 6MHz, 7MHz and 8MHz, although most places use 6MHz.</td>
</tr>
</tbody>
</table>

**Note:**
1. For ISDB-Tsb, the bandwidth can vary depending on the number of connected segments. It can be easily derived from other parameters (DTV_ISDBT_SB_SEGMENT_IDX, DTV_ISDBT_SB_SEGMENT_COUNT).

2. On Satellite and Cable delivery systems, the bandwidth depends on the symbol rate. So, the Kernel will silently ignore any setting DTV_BANDWIDTH_HZ. I will however fill it back with a bandwidth estimation. Such bandwidth estimation takes into account the symbol rate set with DTV_SYMBOL_RATE, and the rolloff factor, with is fixed for DVB-C and DVB-S. For DVB-S2, the rolloff should also be set via DTV_ROLLOFF.

**DTV_INVERSION**

Specifies if the frontend should do spectral inversion or not. The acceptable values are defined by fe_spectral_inversion.

**DTV_DISEQC_MASTER**

Currently not implemented.

**DTV_SYMBOL_RATE**

Used on cable and satellite delivery systems. Digital TV symbol rate, in bauds (symbols/second).

**DTV_INNER_FEC**

Used on cable and satellite delivery systems. The acceptable values are defined by fe_code_rate.

**DTV_VOLTAGE**

Used on satellite delivery systems. The voltage is usually used with non-DiSEqC capable LNBs to switch the polarization (horizontal/vertical). When using DiSEqC equipment this voltage has to be switched consistently to the DiSEqC commands as described in the DiSEqC spec. The acceptable values are defined by fe_sec_voltage.
**DTV_TONE**

Currently not used.

**DTV_PILOT**

Used on DVB-S2.
Sets DVB-S2 pilot.
The acceptable values are defined by fe_pilot.

**DTV_ROLLOFF**

Used on DVB-S2.
Sets DVB-S2 rolloff.
The acceptable values are defined by fe_rolloff.

**DTV_DISEQC_SLAVE_REPLY**

Currently not implemented.

**DTV_FE_CAPABILITY_COUNT**

Currently not implemented.

**DTV_FE_CAPABILITY**

Currently not implemented.

**DTV_DELIVERY_SYSTEM**

Specifies the type of the delivery system.
The acceptable values are defined by fe_delivery_system.

**DTV_ISDBT_PARTIAL_RECEPTION**

Used only on ISDB.

If `DTV_ISDBT_SOUND_BROADCASTING` is ‘0’ this bit-field represents whether the channel is in partial reception mode or not.

If ‘1’ `DTV_ISDBT_LAYERA_*` values are assigned to the center segment and `DTV_ISDBT_LAYERA_SEGMENT_COUNT` has to be ‘1’.
If in addition `DTV_ISDBT_SOUND_BROADCASTING` is ‘1’ `DTV_ISDBT_PARTIAL_RECEPTION` represents whether this ISDB-Tsb channel is consisting of one segment and layer or three segments and two layers.

Possible values: 0, 1, -1 (AUTO)

**DTV_ISDBT_SOUND_BROADCASTING**

Used only on ISDB.

This field represents whether the other `DTV_ISDBT_*`-parameters are referring to an ISDB-T and an ISDB-Tsb channel. (See also `DTV_ISDBT_PARTIAL_RECEPTION`).

Possible values: 0, 1, -1 (AUTO)

**DTV_ISDBT_SB_SUBCHANNEL_ID**

Used only on ISDB.

This field only applies if `DTV_ISDBT_SOUND_BROADCASTING` is ‘1’.

(Note of the author: This might not be the correct description of the SUBCHANNEL-ID in all details, but it is my understanding of the technical background needed to program a device)

An ISDB-Tsb channel (1 or 3 segments) can be broadcasted alone or in a set of connected ISDB-Tsb channels. In this set of channels every channel can be received independently. The number of connected ISDB-Tsb segment can vary, e.g. depending on the frequency spectrum bandwidth available.

Example: Assume 8 ISDB-Tsb connected segments are broadcasted. The broadcaster has several possibilities to put those channels in the air: Assuming a normal 13-segment ISDB-T spectrum he can align the 8 segments from position 1-8 to 5-13 or anything in between.

The underlying layer of segments are subchannels: each segment is consisting of several subchannels with a predefined IDs. A sub-channel is used to help the demodulator to synchronize on the channel.

An ISDB-T channel is always centered over all sub-channels. As for the example above, in ISDB-Tsb it is no longer as simple as that.

The `DTV_ISDBT_SB_SUBCHANNEL_ID` parameter is used to give the sub-channel ID of the segment to be demodulated.

Possible values: 0 .. 41, -1 (AUTO)
DTV_ISDBT_SB_SEGMENT_IDX

Used only on ISDB.
This field only applies if DTV_ISDBT_SOUND_BROADCASTING is ‘1’.

DTV_ISDBT_SB_SEGMENT_IDX gives the index of the segment to be demodulated for an ISDB-Tsb channel where several of them are transmitted in the connected manner.

Possible values: 0 .. DTV_ISDBT_SB_SEGMENT_COUNT - 1

Note: This value cannot be determined by an automatic channel search.

DTV_ISDBT_SB_SEGMENT_COUNT

Used only on ISDB.
This field only applies if DTV_ISDBT_SOUND_BROADCASTING is ‘1’.

DTV_ISDBT_SB_SEGMENT_COUNT gives the total count of connected ISDB-Tsb channels.

Possible values: 1 .. 13

Note: This value cannot be determined by an automatic channel search.

DTV-ISDBT-LAYER[A-C] parameters

Used only on ISDB.

ISDB-T channels can be coded hierarchically. As opposed to DVB-T in ISDB-T hierarchical layers can be decoded simultaneously. For that reason a ISDB-T demodulator has 3 Viterbi and 3 Reed-Solomon decoders.

ISDB-T has 3 hierarchical layers which each can use a part of the available segments. The total number of segments over all layers has to 13 in ISDB-T.

There are 3 parameter sets, for Layers A, B and C.

DTV_ISDBT_LAYER_ENABLED

Used only on ISDB.

Hierarchical reception in ISDB-T is achieved by enabling or disabling layers in the decoding process. Setting all bits of DTV_ISDBT_LAYER_ENABLED to ‘1’ forces all layers (if applicable) to be demodulated. This is the default.

If the channel is in the partial reception mode (DTV_ISDBT_PARTIAL_RECEPTION = 1) the central segment can be decoded independently of the other 12 segments. In that mode layer A has to have a SEGMENT_COUNT of 1.

In ISDB-Tsb only layer A is used, it can be 1 or 3 in ISDB-Tsb according to DTV_ISDBT_PARTIAL_RECEPTION. SEGMENT_COUNT must be filled accordingly.

Only the values of the first 3 bits are used. Other bits will be silently ignored:

DTV_ISDBT_LAYER_ENABLED bit 0: layer A enabled
DTV_ISDBT_LAYER_ENABLED bit 1: layer B enabled
DTV_ISDBT_LAYER_ENABLED bit 2: layer C enabled
DTV_ISDBT_LAYER_ENABLED bits 3-31: unused

DTV_ISDBT_LAYER[A-C]_FEC

Used only on ISDB.

The Forward Error Correction mechanism used by a given ISDB Layer, as defined by fe_code_rate.

Possible values are: FEC_AUTO, FEC_1_2, FEC_2_3, FEC_3_4, FEC_5_6, FEC_7_8

DTV_ISDBT_LAYER[A-C]_MODULATION

Used only on ISDB.

The modulation used by a given ISDB Layer, as defined by fe_modulation.

Possible values are: QAM_AUTO, QPSK, QAM_16, QAM_64, DQPSK

Note:

1. If layer C is DQPSK, then layer B has to be DQPSK.
2. If layer B is DQPSK and DTV_ISDBT_PARTIAL_RECEPTION = 0, then layer has to be DQPSK.

DTV_ISDBT_LAYER[A-C]_SEGMENT_COUNT

Used only on ISDB.

Possible values: 0, 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, -1 (AUTO)

Note: Truth table for DTV_ISDBT_SOUND_BROADCASTING and DTV_ISDBT_PARTIAL_RECEPTION and LAYER[A-C]_SEGMENT_COUNT

3.3. Part II - Digital TV API
**DTV_ISDBT_LAYER[A-C]_TIME_INTERLEAVING**

Used only on ISDB.

Valid values: 0, 1, 2, 4, -1 (AUTO)

when DTV_ISDBT_SOUND_BROADCASTING is active, value 8 is also valid.

Note: The real time interleaving length depends on the mode (fft-size). The values here are referring to what can be found in the TMCC-structure, as shown in the table below.

**DTV_ATSCMH_FIC_VER**

Used only on ATSC-MH.

Version number of the FIC (Fast Information Channel) signaling data.

FIC is used for relaying information to allow rapid service acquisition by the receiver.

Possible values: 0, 1, 2, 3, ..., 30, 31

**DTV_ATSCMH_PARADE_ID**

Used only on ATSC-MH.

Parade identification number

A parade is a collection of up to eight MH groups, conveying one or two ensembles.

Possible values: 0, 1, 2, 3, ..., 126, 127

**DTV_ATSCMH_NOG**

Used only on ATSC-MH.

Number of MH groups per MH subframe for a designated parade.

Possible values: 1, 2, 3, 4, 5, 6, 7, 8
**DTV_ATSCMH_TNOG**

Used only on ATSC-MH.
Total number of MH groups including all MH groups belonging to all MH parades in one MH subframe.
Possible values: 0, 1, 2, 3, ..., 30, 31

**DTV_ATSCMH_SGN**

Used only on ATSC-MH.
Start group number.
Possible values: 0, 1, 2, 3, ..., 14, 15

**DTV_ATSCMH_PRC**

Used only on ATSC-MH.
Parade repetition cycle.
Possible values: 1, 2, 3, 4, 5, 6, 7, 8

**DTV_ATSCMH_RS_FRAME_MODE**

Used only on ATSC-MH.
Reed Solomon (RS) frame mode.
The acceptable values are defined by atscmh_rs_frame_mode.

**DTV_ATSCMH_RS_FRAME_ENSEMBLE**

Used only on ATSC-MH.
Reed Solomon(RS) frame ensemble.
The acceptable values are defined by atscmh_rs_frame_ensemble.

**DTV_ATSCMH_RS_CODE_MODE_PRI**

Used only on ATSC-MH.
Reed Solomon (RS) code mode (primary).
The acceptable values are defined by atscmh_rs_code_mode.
DTV_ATSCMH_RS_CODE_MODE_SEC

Used only on ATSC-MH.
Reed Solomon (RS) code mode (secondary).
The acceptable values are defined by atscmh_rs_code_mode.

DTV_ATSCMH_SCCC_BLOCK_MODE

Used only on ATSC-MH.
Series Concatenated Convolutional Code Block Mode.
The acceptable values are defined by atscmh_sccc_block_mode.

DTV_ATSCMH_SCCC_CODE_MODE_A

Used only on ATSC-MH.
Series Concatenated Convolutional Code Rate.
The acceptable values are defined by atscmh_sccc_code_mode.

DTV_ATSCMH_SCCC_CODE_MODE_B

Used only on ATSC-MH.
Series Concatenated Convolutional Code Rate.
Possible values are the same as documented on enum atscmh_sccc_code_mode.

DTV_ATSCMH_SCCC_CODE_MODE_C

Used only on ATSC-MH.
Series Concatenated Convolutional Code Rate.
Possible values are the same as documented on enum atscmh_sccc_code_mode.

DTV_ATSCMH_SCCC_CODE_MODE_D

Used only on ATSC-MH.
Series Concatenated Convolutional Code Rate.
Possible values are the same as documented on enum atscmh_sccc_code_mode.
**DTV_API_VERSION**

Returns the major/minor version of the Digital TV API

**DTV_CODE_RATE_HP**

Used on terrestrial transmissions.
The acceptable values are defined by `fe_transmit_mode`.

**DTV_CODE_RATE_LP**

Used on terrestrial transmissions.
The acceptable values are defined by `fe_transmit_mode`.

**DTV_GUARD_INTERVAL**

The acceptable values are defined by `fe_guard_interval`.

---

**Note:**

1. If `DTV_GUARD_INTERVAL` is set the `GUARD_INTERVAL_AUTO` the hardware will try to find the correct guard interval (if capable) and will use TMCC to fill in the missing parameters.

2. Intervals `GUARD_INTERVAL_1_128`, `GUARD_INTERVAL_19_128` and `GUARD_INTERVAL_19_256` are used only for DVB-T2 at present.

3. Intervals `GUARD_INTERVAL_PN420`, `GUARD_INTERVAL_PN595` and `GUARD_INTERVAL_PN945` are used only for DMTB at the present. On such standard, only those intervals and `GUARD_INTERVAL_AUTO` are valid.

---

**DTV_TRANSMISSION_MODE**

Used only on OFTM-based standards, e. g. DVB-T/T2, ISDB-T, DTMB.

Specifies the FFT size (with corresponds to the approximate number of carriers) used by the standard.

The acceptable values are defined by `fe_transmit_mode`.

---

**Note:**

1. ISDB-T supports three carrier/symbol-size: 8K, 4K, 2K. It is called `mode` on such standard, and are numbered from 1 to 3:
2. If `DTV_TRANSMISSION_MODE` is set the `TRANSMISSION_MODE_AUTO` the hardware will try to find the correct FFT-size (if capable) and will use TMCC to fill in the missing parameters.

3. DVB-T specifies 2K and 8K as valid sizes.

4. DVB-T2 specifies 1K, 2K, 4K, 8K, 16K and 32K.

5. DTMB specifies C1 and C3780.

### DTV_HIERARCHY

Used only on DVB-T and DVB-T2.

Frontend hierarchy.

The acceptable values are defined by `fe_hierarchy`.

### DTV_STREAM_ID

Used on DVB-S2, DVB-T2 and ISDB-S.

DVB-S2, DVB-T2 and ISDB-S support the transmission of several streams on a single transport stream. This property enables the digital TV driver to handle substream filtering, when supported by the hardware. By default, substream filtering is disabled.

For DVB-S2 and DVB-T2, the valid substream id range is from 0 to 255.

For ISDB, the valid substream id range is from 1 to 65535.

To disable it, you should use the special macro `NO_STREAM_ID_FILTER`.

Note: any value outside the id range also disables filtering.

### DTV_DVBT2_PLP_ID_LEGACY

Obsolete, replaced with `DTV_STREAM_ID`. 

![Table](image)
**DTV_ENUM_DELSYS**

A Multi standard frontend needs to advertise the delivery systems provided. Applications need to enumerate the provided delivery systems, before using any other operation with the frontend. Prior to it’s introduction, FE_GET_INFO was used to determine a frontend type. A frontend which provides more than a single delivery system, FE_GET_INFO doesn’t help much. Applications which intends to use a multistandard frontend must enumerate the delivery systems associated with it, rather than trying to use FE_GET_INFO. In the case of a legacy frontend, the result is just the same as with FE_GET_INFO, but in a more structured format

The acceptable values are defined by `fe_delivery_system`.

**DTV_INTERLEAVING**

Time interleaving to be used.

The acceptable values are defined by `fe_interleaving`.

**DTV_LNA**

Low-noise amplifier.

Hardware might offer controllable LNA which can be set manually using that parameter. Usually LNA could be found only from terrestrial devices if at all.

Possible values: 0, 1, LNA_AUTO

0, LNA off

1, LNA on

use the special macro LNA_AUTO to set LNA auto

**DTV_SCRAMBLING_SEQUENCE_INDEX**

Used on DVB-S2.

This 18 bit field, when present, carries the index of the DVB-S2 physical layer scrambling sequence as defined in clause 5.5.4 of EN 302 307. There is no explicit signalling method to convey scrambling sequence index to the receiver. If S2 satellite delivery system descriptor is available it can be used to read the scrambling sequence index (EN 300 468 table 41).

By default, gold scrambling sequence index 0 is used.

The valid scrambling sequence index range is from 0 to 262142.
**Frontend statistics indicators**

The values are returned via `dtv_property.stat`. If the property is supported, `dtv_property.stat.len` is bigger than zero.

For most delivery systems, `dtv_property.stat.len` will be 1 if the stats is supported, and the properties will return a single value for each parameter.

It should be noted, however, that new OFDM delivery systems like ISDB can use different modulation types for each group of carriers. On such standards, up to 3 groups of statistics can be provided, and `dtv_property.stat.len` is updated to reflect the “global” metrics, plus one metric per each carrier group (called “layer” on ISDB).

So, in order to be consistent with other delivery systems, the first value at `dtv_property.stat.dtv_stats` array refers to the global metric. The other elements of the array represent each layer, starting from layer A (index 1), layer B (index 2) and so on.

The number of filled elements are stored at `dtv_property.stat.len`.

Each element of the `dtv_property.stat.dtv_stats` array consists on two elements:

- **svalue** or **uvalue**, where svalue is for signed values of the measure (dB measures) and uvalue is for unsigned values (counters, relative scale)
- **scale** - Scale for the value. It can be:
  - **FE_SCALE_NOT_AVAILABLE** - The parameter is supported by the frontend, but it was not possible to collect it (could be a transitory or permanent condition)
  - **FE_SCALE_DECIBEL** - parameter is a signed value, measured in 1/1000 dB
  - **FE_SCALE_RELATIVE** - parameter is a unsigned value, where 0 means 0% and 65535 means 100%
  - **FE_SCALE_COUNTER** - parameter is a unsigned value that counts the occurrence of an event, like bit error, block error, or lapsed time.

**DTV_STAT_SIGNAL_STRENGTH**

Indicates the signal strength level at the analog part of the tuner or of the demod.

Possible scales for this metric are:

- **FE_SCALE_NOT_AVAILABLE** - it failed to measure it, or the measurement was not complete yet.
- **FE_SCALE_DECIBEL** - signal strength is in 0.001 dBm units, power measured in miliwatts. This value is generally negative.
- **FE_SCALE_RELATIVE** - The frontend provides a 0% to 100% measurement for power (actually, 0 to 65535).
**DTV_STAT_CNR**

Indicates the Signal to Noise ratio for the main carrier.

Possible scales for this metric are:

- **FE_SCALE_NOT_AVAILABLE** - it failed to measure it, or the measurement was not complete yet.
- **FE_SCALE_DECIBEL** - Signal/Noise ratio is in 0.001 dB units.
- **FE_SCALE_RELATIVE** - The frontend provides a 0% to 100% measurement for Signal/Noise (actually, 0 to 65535).

**DTV_STAT_PRE_ERROR_BIT_COUNT**

Measures the number of bit errors before the forward error correction (FEC) on the inner coding block (before Viterbi, LDPC or other inner code).

This measure is taken during the same interval as **DTV_STAT_PRE_TOTAL_BIT_COUNT**.

In order to get the BER (Bit Error Rate) measurement, it should be divided by **DTV_STAT_PRE_TOTAL_BIT_COUNT**.

This measurement is monotonically increased, as the frontend gets more bit count measurements. The frontend may reset it when a channel/transponder is tuned.

Possible scales for this metric are:

- **FE_SCALE_NOT_AVAILABLE** - it failed to measure it, or the measurement was not complete yet.
- **FE_SCALE_COUNTER** - Number of error bits counted before the inner coding.

**DTV_STAT_PRE_TOTAL_BIT_COUNT**

Measures the amount of bits received before the inner code block, during the same period as **DTV_STAT_PRE_ERROR_BIT_COUNT** measurement was taken.

It should be noted that this measurement can be smaller than the total amount of bits on the transport stream, as the frontend may need to manually restart the measurement, losing some data between each measurement interval.

This measurement is monotonically increased, as the frontend gets more bit count measurements. The frontend may reset it when a channel/transponder is tuned.

Possible scales for this metric are:

- **FE_SCALE_NOT_AVAILABLE** - it failed to measure it, or the measurement was not complete yet.
- **FE_SCALE_COUNTER** - Number of bits counted while measuring **DTV_STAT_PRE_ERROR_BIT_COUNT**.
**DTV_STAT_POST_ERROR_BIT_COUNT**

Measures the number of bit errors after the forward error correction (FEC) done by inner code block (after Viterbi, LDPC or other inner code).

This measure is taken during the same interval as **DTV_STAT_POST_TOTAL_BIT_COUNT**.

In order to get the BER (Bit Error Rate) measurement, it should be divided by **DTV_STAT_POST_TOTAL_BIT_COUNT**.

This measurement is monotonically increased, as the frontend gets more bit count measurements. The frontend may reset it when a channel/transponder is tuned.

Possible scales for this metric are:
- **FE_SCALE_NOT_AVAILABLE** - it failed to measure it, or the measurement was not complete yet.
- **FE_SCALE_COUNTER** - Number of error bits counted after the inner coding.

**DTV_STAT_POST_TOTAL_BIT_COUNT**

Measures the amount of bits received after the inner coding, during the same period as **DTV_STAT_POST_ERROR_BIT_COUNT** measurement was taken.

It should be noted that this measurement can be smaller than the total amount of bits on the transport stream, as the frontend may need to manually restart the measurement, losing some data between each measurement interval.

This measurement is monotonically increased, as the frontend gets more bit count measurements. The frontend may reset it when a channel/transponder is tuned.

Possible scales for this metric are:
- **FE_SCALE_NOT_AVAILABLE** - it failed to measure it, or the measurement was not complete yet.
- **FE_SCALE_COUNTER** - Number of bits counted while measuring **DTV_STAT_POST_ERROR_BIT_COUNT**.

**DTV_STAT_ERROR_BLOCK_COUNT**

Measures the number of block errors after the outer forward error correction coding (after Reed-Solomon or other outer code).

This measurement is monotonically increased, as the frontend gets more bit count measurements. The frontend may reset it when a channel/transponder is tuned.

Possible scales for this metric are:
- **FE_SCALE_NOT_AVAILABLE** - it failed to measure it, or the measurement was not complete yet.
- **FE_SCALE_COUNTER** - Number of error blocks counted after the outer coding.
**DTV-STAT_TOTAL_BLOCK_COUNT**

Measures the total number of blocks received during the same period as `DTV_STAT_ERROR_BLOCK_COUNT` measurement was taken.

It can be used to calculate the PER indicator, by dividing `DTV_STAT_ERROR_BLOCK_COUNT` by `DTV-STAT_TOTAL_BLOCK_COUNT`.

Possible scales for this metric are:

- **FE_SCALE_NOT_AVAILABLE** - it failed to measure it, or the measurement was not complete yet.
- **FE_SCALE_COUNTER** - Number of blocks counted while measuring `DTV_STAT_ERROR_BLOCK_COUNT`.

**Properties used on terrestrial delivery systems**

**DVB-T delivery system**

The following parameters are valid for DVB-T:

- `DTV_API_VERSION`
- `DTV_DELIVERY_SYSTEM`
- `DTV_TUNE`
- `DTV_CLEAR`
- `DTV_FREQUENCY`
- `DTV_MODULATION`
- `DTV_BANDWIDTH_HZ`
- `DTV_INVERSION`
- `DTV_CODE_RATE_HP`
- `DTV_CODE_RATE_LP`
- `DTV_GUARD_INTERVAL`
- `DTV_TRANSMISSION_MODE`
- `DTV_HIERARCHY`
- `DTV_LNA`

In addition, the **DTV QoS statistics** are also valid.
DVB-T2 delivery system

DVB-T2 support is currently in the early stages of development, so expect that this section may grow and become more detailed with time.

The following parameters are valid for DVB-T:

- DTV_API_VERSION
- DTV_DELIVERY_SYSTEM
- DTV_TUNE
- DTV_CLEAR
- DTV_FREQUENCY
- DTV_MODULATION
- DTV_BANDWIDTH_HZ
- DTV_INVERSION
- DTV_CODE_RATE_HP
- DTV_CODE_RATE_LP
- DTV_GUARD_INTERVAL
- DTV_TRANSMISSION_MODE
- DTV_HIERARCHY
- DTV_STREAM_ID
- DTV_LNA

In addition, the DTV QoS statistics are also valid.

ISDB-T delivery system

This ISDB-T/ISDB-Tsb API extension should reflect all information needed to tune any ISDB-T/ISDB-Tsb hardware. Of course it is possible that some very sophisticated devices won’t need certain parameters to tune.

The information given here should help application writers to know how to handle ISDB-T and ISDB-Tsb hardware using the Linux Digital TV API.

The details given here about ISDB-T and ISDB-Tsb are just enough to basically show the dependencies between the needed parameter values, but surely some information is left out. For more detailed information see the following documents:

ARIB STD-B31 - “Transmission System for Digital Terrestrial Television Broadcasting” and
ARIB TR-B14 - “Operational Guidelines for Digital Terrestrial Television Broadcasting”.

In order to understand the ISDB specific parameters, one has to have some knowledge the channel structure in ISDB-T and ISDB-Tsb. I.e. it has to be known to the reader that an ISDB-T channel consists of 13 segments, that it can have up to 3 layer sharing those segments, and things like that.

The following parameters are valid for ISDB-T:
• `DTV_API_VERSION`
• `DTV_DELIVERY_SYSTEM`
• `DTV_TUNE`
• `DTV_CLEAR`
• `DTV_FREQUENCY`
• `DTV_BANDWIDTH_HZ`
• `DTV_INVERSION`
• `DTV_GUARD_INTERVAL`
• `DTV_TRANSMISSION_MODE`
• `DTV_ISDBT_LAYER_ENABLED`
• `DTV_ISDBT_PARTIAL_RECEPTION`
• `DTV_ISDBT_SOUND_BROADCASTING`
• `DTV_ISDBT_SB_SUBCHANNEL_ID`
• `DTV_ISDBT_SB_SEGMENTIDX`
• `DTV_ISDBT_SB_SEGMENT_COUNT`
• `DTV_ISDBT_LAYERA_FEC`
• `DTV_ISDBT_LAYERA_MODULATION`
• `DTV_ISDBT_LAYERA_SEGMENT_COUNT`
• `DTV_ISDBT_LAYERA_TIME_INTERLEAVING`
• `DTV_ISDBT_LAYERB_FEC`
• `DTV_ISDBT_LAYERB_MODULATION`
• `DTV_ISDBT_LAYERB_SEGMENT_COUNT`
• `DTV_ISDBT_LAYERB_TIME_INTERLEAVING`
• `DTV_ISDBT_LAYERC_FEC`
• `DTV_ISDBT_LAYERC_MODULATION`
• `DTV_ISDBT_LAYERC_SEGMENT_COUNT`
• `DTV_ISDBT_LAYERC_TIME_INTERLEAVING`

In addition, the `DTV QoS statistics` are also valid.
ATSC delivery system

The following parameters are valid for ATSC:

- `DTV_API_VERSION`
- `DTV_DELIVERY_SYSTEM`
- `DTV_TUNE`
- `DTV_CLEAR`
- `DTV_FREQUENCY`
- `DTV_MODULATION`
- `DTV_BANDWIDTH_HZ`

In addition, the `DTV QoS statistics` are also valid.

ATSC-MH delivery system

The following parameters are valid for ATSC-MH:

- `DTV_API_VERSION`
- `DTV_DELIVERY_SYSTEM`
- `DTV_TUNE`
- `DTV_CLEAR`
- `DTV_FREQUENCY`
- `DTV_BANDWIDTH_HZ`
- `DTV_ATSCMH_FIC_VER`
- `DTV_ATSCMH_PARADE_ID`
- `DTV_ATSCMH_NOG`
- `DTV_ATSCMH_TNOG`
- `DTV_ATSCMH_SGN`
- `DTV_ATSCMH_PRC`
- `DTV_ATSCMH_RS_FRAME_MODE`
- `DTV_ATSCMH_RS_FRAME_ENSEMBLE`
- `DTV_ATSCMH_RS_CODE_MODE_PRI`
- `DTV_ATSCMH_RS_CODE_MODE_SEC`
- `DTV_ATSCMH_SCCC_BLOCK_MODE`
- `DTV_ATSCMH_SCCC_CODE_MODE_A`
- `DTV_ATSCMH_SCCC_CODE_MODE_B`
- `DTV_ATSCMH_SCCC_CODE_MODE_C`
• `DTV_ATSCMH_SCCC_CODE_MODE_D`

In addition, the `DTV QoS statistics` are also valid.

**DTMB delivery system**

The following parameters are valid for DTMB:

• `DTV_API_VERSION`
• `DTV_DELIVERY_SYSTEM`
• `DTV_TUNE`
• `DTV_CLEAR`
• `DTV_FREQUENCY`
• `DTV_MODULATION`
• `DTV_BANDWIDTH_HZ`
• `DTV_INVERSION`
• `DTV_INNER_FEC`
• `DTV_GUARD_INTERVAL`
• `DTV_TRANSMISSION_MODE`
• `DTV_INTERLEAVING`
• `DTV_LNA`

In addition, the `DTV QoS statistics` are also valid.

**Properties used on cable delivery systems**

**DVB-C delivery system**

The DVB-C Annex-A is the widely used cable standard. Transmission uses QAM modulation.

The DVB-C Annex-C is optimized for 6MHz, and is used in Japan. It supports a subset of the Annex A modulation types, and a roll-off of 0.13, instead of 0.15.

The following parameters are valid for DVB-C Annex A/C:

• `DTV_API_VERSION`
• `DTV_DELIVERY_SYSTEM`
• `DTV_TUNE`
• `DTV_CLEAR`
• `DTV_FREQUENCY`
• `DTV_MODULATION`
• `DTV_INVERSION`
• `DTV_SYMBOL_RATE`
In addition, the DTV QoS statistics are also valid.

**DVB-C Annex B delivery system**

The DVB-C Annex-B is only used on a few Countries like the United States. The following parameters are valid for DVB-C Annex B:

- `DTV_API_VERSION`
- `DTV_DELIVERY_SYSTEM`
- `DTV_TUNE`
- `DTV_CLEAR`
- `DTV_FREQUENCY`
- `DTV_MODULATION`
- `DTV_INVERSION`
- `DTV_LNA`

In addition, the DTV QoS statistics are also valid.

**Properties used on satellite delivery systems**

**DVB-S delivery system**

The following parameters are valid for DVB-S:

- `DTV_API_VERSION`
- `DTV_DELIVERY_SYSTEM`
- `DTV_TUNE`
- `DTV_CLEAR`
- `DTV_FREQUENCY`
- `DTV_INVERSION`
- `DTV_SYMBOL_RATE`
- `DTV_INNER_FEC`
- `DTV_VOLTAGE`
- `DTV_TONE`

In addition, the DTV QoS statistics are also valid.

Future implementations might add those two missing parameters:

- `DTV_DISEQC_MASTER`
• `DTV_DISEQC_SLAVE_REPLY`

**DVB-S2 delivery system**

In addition to all parameters valid for DVB-S, DVB-S2 supports the following parameters:
- `DTV_MODULATION`
- `DTV_PILOT`
- `DTV_ROLLOFF`
- `DTV_STREAM_ID`
- `DTV_SCRAMBLING_SEQUENCE_INDEX`

In addition, the **DTV QoS statistics** are also valid.

**Turbo code delivery system**

In addition to all parameters valid for DVB-S, turbo code supports the following parameters:
- `DTV_MODULATION`

**ISDB-S delivery system**

The following parameters are valid for ISDB-S:
- `DTV_API_VERSION`
- `DTV_DELIVERY_SYSTEM`
- `DTV_TUNE`
- `DTV_CLEAR`
- `DTV_FREQUENCY`
- `DTV_INVERSION`
- `DTV_SYMBOL_RATE`
- `DTV_INNER_FEC`
- `DTV_VOLTAGE`
- `DTV_STREAM_ID`
Frontend uAPI data types

enum fe_caps
    Frontend capabilities

Constants

FE_IS_STUPID  There’s something wrong at the frontend, and it can’t report its capabilities.

FE_CAN_INVERSION_AUTO  Can auto-detect frequency spectral band inversion

FE_CAN_FEC_1_2  Supports FEC 1/2
FE_CAN_FEC_2_3  Supports FEC 2/3
FE_CAN_FEC_3_4  Supports FEC 3/4
FE_CAN_FEC_4_5  Supports FEC 4/5
FE_CAN_FEC_5_6  Supports FEC 5/6
FE_CAN_FEC_6_7  Supports FEC 6/7
FE_CAN_FEC_7_8  Supports FEC 7/8
FE_CAN_FEC_8_9  Supports FEC 8/9

FE_CAN_FEC_AUTO  Can auto-detect FEC

FE_CAN_QPSK  Supports QPSK modulation
FE_CAN_QAM_16  Supports 16-QAM modulation
FE_CAN_QAM_32  Supports 32-QAM modulation
FE_CAN_QAM_64  Supports 64-QAM modulation
FE_CAN_QAM_128  Supports 128-QAM modulation
FE_CAN_QAM_256  Supports 256-QAM modulation

FE_CAN_QAM_AUTO  Can auto-detect QAM modulation

FE_CAN_TRANSMISSION_MODE_AUTO  Can auto-detect transmission mode

FE_CAN_BANDWIDTH_AUTO  Can auto-detect bandwidth

FE_CAN_GUARD_INTERVAL_AUTO  Can auto-detect guard interval

FE_CAN_HIERARCHY_AUTO  Can auto-detect hierarchy

FE_CAN_8VSB  Supports 8-VSB modulation
FE_CAN_16VSB  Supports 16-VSB modulation

FE_HAS_EXTENDED_CAPS  Unused

FE_CAN_MULTISTREAM  Supports multistream filtering

FE_CAN_TURBO_FEC  Supports “turbo FEC” modulation

FE_CAN_2G_MODULATION  Supports “2nd generation” modulation, e. g. DVB-S2, DVB-T2, DVB-C2

FE_NEEDS_BENDING  Unused
**FE_CAN_RECOVER** Can recover from a cable unplug automatically

**FE_CAN_MUTE_TS** Can stop spurious TS data output

```c
struct dvb_frontend_info
    Frontend properties and capabilities

Definition
```

```c
struct dvb_frontend_info {
    char name[128];
    enum fe_type type;
    __u32 frequency_min;
    __u32 frequency_max;
    __u32 frequency_stepsize;
    __u32 frequency_tolerance;
    __u32 symbol_rate_min;
    __u32 symbol_rate_max;
    __u32 symbol_rate_tolerance;
    __u32 notifier_delay;
    enum fe_caps caps;
};
```

**Members**

name Name of the frontend

type **DEPRECATED.** Should not be used on modern programs, as a frontend may have more than one type. In order to get the support types of a given frontend, use DTV_ENUM_DELSYS instead.

frequency_min Minimal frequency supported by the frontend.

frequency_max Minimal frequency supported by the frontend.

frequency_stepsize All frequencies are multiple of this value.

frequency_tolerance Frequency tolerance.

symbol_rate_min Minimal symbol rate, in bauds (for Cable/Satellite systems).

symbol_rate_max Maximal symbol rate, in bauds (for Cable/Satellite systems).

symbol_rate_tolerance Maximal symbol rate tolerance, in ppm (for Cable/Satellite systems).

notifier_delay **DEPRECATED.** Not used by any driver.

caps Capabilities supported by the frontend, as specified in enum fe_caps.

**Description**

```c
struct dvb_diseqc_master_cmd
    DiSEqC master command
```

**Definition**

```c
struct dvb_diseqc_master_cmd {
    __u8 msg[6];
    __u8 msg_len;
};
```
Members

msg

DiSEqC message to be sent. It contains a 3 bytes header with: framing + address + command, and an optional argument of up to 3 bytes of data.

msg_len

Length of the DiSEqC message. Valid values are 3 to 6.

Description

Check out the DiSEqC bus spec available on http://www.eutelsat.org/ for the possible messages that can be used.

struct dvb_diseqc_slave_reply

DiSEqC received data

Definition

```
struct dvb_diseqc_slave_reply {
    __u8 msg[4];
    __u8 msg_len;
    int timeout;
};
```

Members

msg

DiSEqC message buffer to store a message received via DiSEqC. It contains one byte header with: framing and an optional argument of up to 3 bytes of data.

msg_len

Length of the DiSEqC message. Valid values are 0 to 4, where 0 means no message.

timeout

Return from ioctl after timeout ms with errorcode when no message was received.

Description

Check out the DiSEqC bus spec available on http://www.eutelsat.org/ for the possible messages that can be used.

enum fe_sec_voltage

DC Voltage used to feed the LNBf

Constants

SEC_VOLTAGE_13 Output 13V to the LNBf

SEC_VOLTAGE_18 Output 18V to the LNBf

SEC_VOLTAGE_OFF Don’t feed the LNBf with a DC voltage

enum fe_sec_tone_mode

Type of tone to be send to the LNBf.

Constants

SEC_TONE_ON Sends a 22kHz tone burst to the antenna.
SEC_TONE_OFF Don’t send a 22kHz tone to the antenna (except if the FE_DISEQC_* ioctls are called).

enum fe_sec_mini_cmd
    Type of mini burst to be sent

Constants
SEC_MINI_A Sends a mini-DiSEqC 22kHz ‘0’ Tone Burst to select satellite-A
SEC_MINI_B Sends a mini-DiSEqC 22kHz ‘1’ Data Burst to select satellite-B

enum fe_status
    Enumerates the possible frontend status.

Constants
FE_NONE The frontend doesn’t have any kind of lock. That’s the initial frontend status
FE_HAS_SIGNAL Has found something above the noise level.
FE_HAS_CARRIER Has found a signal.
FE_HAS_VITERBI FEC inner coding (Viterbi, LDPC or other inner code). is stable.
FE_HAS_SYNC Synchronization bytes was found.
FE_HAS_LOCK Digital TV were locked and everything is working.
FE_TIMEDOUT Fo lock within the last about 2 seconds.
FE_REINIT Frontend was reinitialized, application is recommended to reset DiSEqC, tone and parameters.

enum fe_spectral_inversion
    Type of inversion band

Constants
INVERSION_OFF Don’t do spectral band inversion.
INVERSION_ON Do spectral band inversion.
INVERSION_AUTO Autodetect spectral band inversion.

Description
This parameter indicates if spectral inversion should be presumed or not. In the automatic setting (INVERSION_AUTO) the hardware will try to figure out the correct setting by itself. If the hardware doesn’t support, the dvb_frontend will try to lock at the carrier first with inversion off. If it fails, it will try to enable inversion.

enum fe_code_rate
    Type of Forward Error Correction (FEC)

Constants
FEC_NONE No Forward Error Correction Code
FEC_1_2 Forward Error Correction Code 1/2
FEC_2_3 Forward Error Correction Code 2/3
FEC_3_4 Forward Error Correction Code 3/4
**Description**

Please note that not all FEC types are supported by a given standard.

```c
enum fe_modulation
    Type of modulation/constellation
```

**Constants**

- QPSK  QPSK modulation
- QAM_16 16-QAM modulation
- QAM_32 32-QAM modulation
- QAM_64 64-QAM modulation
- QAM_128 128-QAM modulation
- QAM_256 256-QAM modulation
- QAM_AUTO Autodetect QAM modulation
- VSB_8  8-VSB modulation
- VSB_16 16-VSB modulation
- PSK_8  8-PSK modulation
- APSK_16 16-APSK modulation
- APSK_32 32-APSK modulation
- DQPSK  DQPSK modulation
- QAM_4_NR 4-QAM-NR modulation

**Description**

Please note that not all modulations are supported by a given standard.

```c
enum fe_transmit_mode
    Transmission mode
```

**Constants**

- TRANSMISSION_MODE_2K
    Transmission mode 2K
TRANSMISSION_MODE_8K
    Transmission mode 8K

TRANSMISSION_MODE_AUTO
    Autodetect transmission mode. The hardware will try to find the correct FFT-size (if capable) to fill in the missing parameters.

TRANSMISSION_MODE_4K
    Transmission mode 4K

TRANSMISSION_MODE_1K
    Transmission mode 1K

TRANSMISSION_MODE_16K
    Transmission mode 16K

TRANSMISSION_MODE_32K
    Transmission mode 32K

TRANSMISSION_MODE_C1
    Single Carrier (C=1) transmission mode (DTMB only)

TRANSMISSION_MODE_C3780
    Multi Carrier (C=3780) transmission mode (DTMB only)

**Description**

Please note that not all transmission modes are supported by a given standard.

```c
enum fe_guard_interval
    Guard interval

Constants

GUARD_INTERVAL_1_32  Guard interval 1/32
GUARD_INTERVAL_1_16  Guard interval 1/16
GUARD_INTERVAL_1_8   Guard interval 1/8
GUARD_INTERVAL_1_4   Guard interval 1/4
GUARD_INTERVAL_AUTO  Autodetect the guard interval
GUARD_INTERVAL_1_128 Guard interval 1/128
GUARD_INTERVAL_19_128 Guard interval 19/128
GUARD_INTERVAL_19_256 Guard interval 19/256
GUARD_INTERVAL_PN420 PN length 420 (1/4)
GUARD_INTERVAL_PN595 PN length 595 (1/6)
GUARD_INTERVAL_PN945 PN length 945 (1/9)
```

**Description**

Please note that not all guard intervals are supported by a given standard.
enum fe_hierarchy
   Hierarchy

Constants
HIERARCHY_NONE No hierarchy
HIERARCHY_1 Hierarchy 1
HIERARCHY_2 Hierarchy 2
HIERARCHY_4 Hierarchy 4
HIERARCHY_AUTO Autodetect hierarchy (if supported)

Description
Please note that not all hierarchy types are supported by a given standard.

enum fe_interleaving
   Interleaving

Constants
INTERLEAVING_NONE No interleaving.
INTERLEAVING_AUTO Auto-detect interleaving.
INTERLEAVING_240 Interleaving of 240 symbols.
INTERLEAVING_720 Interleaving of 720 symbols.

Description
Please note that, currently, only DTMB uses it.

enum fe_pilot
   Type of pilot tone

Constants
PILOT_ON Pilot tones enabled
PILOT_OFF Pilot tones disabled
PILOT_AUTO Autodetect pilot tones

enum fe_rolloff
   Rolloff factor

Constants
ROLLOFF_35 Rolloff factor: α=35%
ROLLOFF_20 Rolloff factor: α=20%
ROLLOFF_25 Rolloff factor: α=25%
ROLLOFF_AUTO Auto-detect the rolloff factor.

Description

enum fe_delivery_system
   Type of the delivery system
Constants

SYS_UNDEFINED
Undefined standard. Generally, indicates an error

SYS_DVBC_ANNEX_A
Cable TV: DVB-C following ITU-T J.83 Annex A spec

SYS_DVBC_ANNEX_B
Cable TV: DVB-C following ITU-T J.83 Annex B spec (ClearQAM)

SYS_DVBT
Terrestrial TV: DVB-T

SYS_DSS
Satellite TV: DSS (not fully supported)

SYS_DVBS
Satellite TV: DVB-S

SYS_DVBS2
Satellite TV: DVB-S2

SYS_DVBM

SYS_DVBT2
Terrestrial TV: DVB-T2

SYS_TURBO

Satellite TV: DVB-S Turbo

SYS_DVBC ANNEX C

Cable TV: DVB-C following ITU-T J.83 Annex C spec

eighbor enum atscmh_sccc_block_mode

Type of Series Concatenated Convolutional Code Block Mode.

**Constants**

**ATSCMH SCCC BLK SEP**

Separate SCCC: the SCCC outer code mode shall be set independently for each Group Region (A, B, C, D)

**ATSCMH SCCC BLK COMB**

Combined SCCC: all four Regions shall have the same SCCC outer code mode.

**ATSCMH SCCC BLK RES**

Reserved. Shouldn’t be used.

neighbor enum atscmh_sccc_code_mode

Type of Series Concatenated Convolutional Code Rate.

**Constants**

**ATSCMH SCCC CODE HLF**

The outer code rate of a SCCC Block is 1/2 rate.

**ATSCMH SCCC CODE QTR**

The outer code rate of a SCCC Block is 1/4 rate.

**ATSCMH SCCC CODE RES**

Reserved. Should not be used.

neighbor enum atscmh_rs_frame_ensemble

Reed Solomon (RS) frame ensemble.

**Constants**

**ATSCMH RSFRAME ENS PRI** Primary Ensemble.

**ATSCMH RSFRAME ENS SEC** Secondary Ensemble.

neighbor enum atscmh_rs_frame_mode

Reed Solomon (RS) frame mode.

**Constants**

**ATSCMH RSFRAME PRI ONLY**

Single Frame: There is only a primary RS Frame for all Group Regions.

**ATSCMH RSFRAME PRI SEC**
Dual Frame: There are two separate RS Frames: Primary RS Frame for Group Region A and B and Secondary RS Frame for Group Region C and D.

ATSCMH_RSFRAME_RES
Reserved. Shouldn’t be used.

enum atscmh_rs_code_mode

Constants
ATSCMH_RSCODE_211_187 Reed Solomon code (211,187).
ATSCMH_RSCODE_223_187 Reed Solomon code (223,187).
ATSCMH_RSCODE_235_187 Reed Solomon code (235,187).
ATSCMH_RSCODE_RES Reserved. Shouldn’t be used.

enum fecap_scale_params
scale types for the quality parameters.

Constants
FE_SCALE_NOT_AVAILABLE That QoS measure is not available. That could indicate a temporary or a permanent condition.
FE_SCALE_DECIBEL The scale is measured in 0.001 dB steps, typically used on signal measures.
FE_SCALE_RELATIVE The scale is a relative percentual measure, ranging from 0 (0%) to 0xffff (100%).
FE_SCALE_COUNTER The scale counts the occurrence of an event, like bit error, block error, lapsed time.

struct dtv_stats
Used for reading a DTV status property

Definition

```c
struct dtv_stats {
    __u8 scale;
    union {
        __u64 uvalue;
        __s64 svalue;
    };
};
```

Members
scale
Filled with enum fecap_scale_params - the scale in usage for that parameter

{anonymous} unnamed_union

uvalue
unsigned integer value of the measure, used when scale is either FE_SCALE_RELATIVE or FE_SCALE_COUNTER.

svalue
integer value of the measure, for FE_SCALE_DECIBEL, used for dB measures. The unit is 0.001 dB.

**Description**

For most delivery systems, this will return a single value for each parameter.

It should be noticed, however, that new OFDM delivery systems like ISDB can use different modulation types for each group of carriers. On such standards, up to 8 groups of statistics can be provided, one for each carrier group (called “layer” on ISDB).

In order to be consistent with other delivery systems, the first value refers to the entire set of carriers (“global”).

`scale` should use the value FE_SCALE_NOT_AVAILABLE when the value for the entire group of carriers or from one specific layer is not provided by the hardware.

`len` should be filled with the latest filled status + 1.

In other words, for ISDB, those values should be filled like:

```c
u.st.stat.svalue[0] = global statistics;
u.st.stat.scale[0] = FE_SCALE_DECIBEL;
u.st.stat.value[1] = layer A statistics;
u.st.stat.scale[1] = FE_SCALE_NOT_AVAILABLE (if not available);
u.st.stat.scale[2] = FE_SCALE_DECIBEL;
u.st.stat.svalue[3] = layer C statistics;
u.st.stat.scale[3] = FE_SCALE_DECIBEL;
u.st.len = 4;
```

**struct dtv_fe_stats**

store Digital TV frontend statistics

**Definition**

```c
struct dtv_fe_stats {
    __u8 len;
    struct dtv_stats stat[MAX_DTV_STATS];
};
```

**Members**

- `len` length of the statistics - if zero, stats is disabled.
- `stat` array with digital TV statistics.

**Description**

On most standards, `len` can either be 0 or 1. However, for ISDB, each layer is modulated in separate. So, each layer may have its own set of statistics. If so, stat[0] carries on a global value for the property. Indexes 1 to 3 means layer A to B.

**struct dtv_property**

store one of frontend command and its value

**Definition**

```c
struct dtv_property {
    __u32 cmd;
    __u32 reserved[3];
};
```
union {
    __u32 data;
    struct dtv_fe_stats st;
    struct {
        __u8 data[32];
        __u32 len;
        __u32 reserved1[3];
        void *reserved2;
    } buffer;
} u;
int result;
}

Members

**cmd** Digital TV command.

**reserved** Not used.

**u** Union with the values for the command.

**u.data** A unsigned 32 bits integer with command value.

**u.st** a struct dtv_fe_stats array of statistics.

**u.buffer** Struct to store bigger properties. Currently unused.

**u.buffer.data** an unsigned 32-bits array.

**u.buffer.len** number of elements of the buffer.

**u.buffer.reserved1** Reserved.

**u.buffer.reserved2** Reserved.

**result** Currently unused.

struct **dtv_properties**

    a set of command/value pairs.

Definition

struct dtv_properties {
    __u32 num;
    struct dtv_property *props;
};

Members

**num** amount of commands stored at the struct.

**props** a pointer to struct dtv_property.
3.3.2.4 Frontend Function Calls

Digital TV frontend open()

Name

fe-open - Open a frontend device

Synopsis

```c
#include <fcntl.h>

int open(const char *device_name, int flags)
```

Arguments

device_name Device to be opened.

flags Open flags. Access can either be `O_RDWR` or `O_RDONLY`.

- Multiple opens are allowed with `O_RDONLY`. In this mode, only query and read ioctls are allowed.
- Only one open is allowed in `O_RDWR`. In this mode, all ioctls are allowed.
- When the `O_NONBLOCK` flag is given, the system calls may return `EAGAIN` error code when no data is available or when the device driver is temporarily busy.
- Other flags have no effect.

Description

This system call opens a named frontend device `/dev/dvb/adapter?/frontend?` for subsequent use. Usually the first thing to do after a successful open is to find out the frontend type with `ioctl FE_GET_INFO`.

The device can be opened in read-only mode, which only allows monitoring of device status and statistics, or read/write mode, which allows any kind of use (e.g. performing tuning operations.)

In a system with multiple front-ends, it is usually the case that multiple devices cannot be open in read/write mode simultaneously. As long as a front-end device is opened in read/write mode, other open() calls in read/write mode will either fail or block, depending on whether non-blocking or blocking mode was specified. A front-end device opened in blocking mode can later be put into non-blocking mode (and vice versa) using the `F_SETFL` command of the `fcntl` system call. This is a standard system call, documented in the Linux manual page for `fcntl`. When an open() call has succeeded, the device will be ready for use in the specified mode. This implies that the corresponding hardware is powered up, and that other front-ends may have been powered down to make that possible.
Return Value

On success open() returns the new file descriptor. On error, -1 is returned, and the errno variable is set appropriately.

Possible error codes are:

- **ENOMEM** The caller has no permission to access the device.
- **EBUSY** The device driver is already in use.
- **EMFILE** The process already has the maximum number of files open.
- **ENFILE** The limit on the total number of files open on the system has been reached.

The generic error codes are described at the *Generic Error Codes* chapter.

Digital TV frontend close()

Name

fe-close - Close a frontend device

Synopsis

```c
#include <unistd.h>

int close(int fd)
```

Arguments

- **fd** File descriptor returned by open().

Description

This system call closes a previously opened front-end device. After closing a front-end device, its corresponding hardware might be powered down automatically.
Return Value

On success 0 is returned.
On error -1 is returned, and the *errno* variable is set appropriately.
Generic error codes are described at the *Generic Error Codes* chapter.

**ioctl FE_GET_INFO**

**Name**

FE_GET_INFO - Query Digital TV frontend capabilities and returns information about the frontend. This call only requires read-only access to the device.

**Synopsis**

```c
FE_GET_INFO
int ioctl(int fd, FE_GET_INFO, struct dvb_frontend_info *argp)
```

**Arguments**

*fd* File descriptor returned by `open()`.

*argp* pointer to `struct dvb_frontend_info`

**Description**

All Digital TV frontend devices support the `ioctl FE_GET_INFO` ioctl. It is used to identify kernel devices compatible with this specification and to obtain information about driver and hardware capabilities. The ioctl takes a pointer to `dvb_frontend_info` which is filled by the driver. When the driver is not compatible with this specification the ioctl returns an error.

**frontend capabilities**

Capabilities describe what a frontend can do. Some capabilities are supported only on some specific frontend types.

The frontend capabilities are described at `fe_caps`. 

1374 Chapter 3. Linux Media Infrastructure userspace API
Return Value

On success 0 is returned.
On error -1 is returned, and the errno variable is set appropriately.
Generic error codes are described at the Generic Error Codes chapter.

ioctl FE_READ_STATUS

Name

FE_READ_STATUS - Returns status information about the front-end. This call only requires read-only access to the device.

Synopsis

FE_READ_STATUS

int ioctl(int fd, FE_READ_STATUS, unsigned int *status)

Arguments

fd  File descriptor returned by open().
status  pointer to a bitmask integer filled with the values defined by enum fe_status.

Description

All Digital TV frontend devices support the FE_READ_STATUS ioctl. It is used to check about the locking status of the frontend after being tuned. The ioctl takes a pointer to an integer where the status will be written.

Note:  The size of status is actually sizeof(enum fe_status), with varies according with the architecture. This needs to be fixed in the future.

int fe_status

The fe_status parameter is used to indicate the current state and/or state changes of the frontend hardware. It is produced using the enum fe_status values on a bitmask.
Return Value

On success 0 is returned.
On error -1 is returned, and the errno variable is set appropriately.
Generic error codes are described at the *Generic Error Codes* chapter.

**ioctl FE_SET_PROPERTY, FE_GET_PROPERTY**

**Name**

FE_SET_PROPERTY - FE_GET_PROPERTY - FE_SET_PROPERTY sets one or more frontend properties. - FE_GET_PROPERTY returns one or more frontend properties.

**Synopsis**

**FE_GET_PROPERTY**

```c
int ioctl(int fd, FE_GET_PROPERTY, struct dtv_properties *argp)
```

**FE_SET_PROPERTY**

```c
int ioctl(int fd, FE_SET_PROPERTY, struct dtv_properties *argp)
```

**Arguments**

fd  File descriptor returned by `open()`.

argp  Pointer to `struct dtv_properties`.

**Description**

All Digital TV frontend devices support the `FE_SET_PROPERTY` and `FE_GET_PROPERTY` ioctls. The supported properties and statistics depends on the delivery system and on the device:

- **FE_SET_PROPERTY:**
  - This ioctl is used to set one or more frontend properties.
  - This is the basic command to request the frontend to tune into some frequency and to start decoding the digital TV signal.
  - This call requires read/write access to the device.

**Note:** At return, the values aren’t updated to reflect the actual parameters used. If the actual parameters are needed, an explicit call to `FE_GET_PROPERTY` is needed.

- **FE_GET_PROPERTY:**
  - This ioctl is used to get properties and statistics from the frontend.
- No properties are changed, and statistics aren’t reset.
- This call only requires read-only access to the device.

**Return Value**

On success 0 is returned.
On error -1 is returned, and the `errno` variable is set appropriately.
Generic error codes are described at the *Generic Error Codes* chapter.

### ioctl FE_DISEQC_RESET_OVERLOAD

**Name**

FE_DISEQC_RESET_OVERLOAD - Restores the power to the antenna subsystem, if it was powered off due to power overload.

**Synopsis**

`FE_DISEQC_RESET_OVERLOAD`

```c
int ioctl(int fd, FE_DISEQC_RESET_OVERLOAD, NULL)
```

**Arguments**

- **fd** File descriptor returned by `open()`.

**Description**

If the bus has been automatically powered off due to power overload, this ioctl call restores the power to the bus. The call requires read/write access to the device. This call has no effect if the device is manually powered off. Not all Digital TV adapters support this ioctl.

**Return Value**

On success 0 is returned.
On error -1 is returned, and the `errno` variable is set appropriately.
Generic error codes are described at the *Generic Error Codes* chapter.

---

3.3. Part II - Digital TV API 1377
ioctl FE_DISEQC_SEND_MASTER_CMD

Name

FE_DISEQC_SEND_MASTER_CMD - Sends a DiSEqC command

Synopsis

FE_DISEQC_SEND_MASTER_CMD

int ioctl(int fd, FE_DISEQC_SEND_MASTER_CMD, struct dvb_diseqc_master_cmd *argp)

Arguments

fd  File descriptor returned by open().
argp  pointer to struct dvb_diseqc_master_cmd

Description

Sends the DiSEqC command pointed by dvb_diseqc_master_cmd to the antenna subsystem.

Return Value

On success 0 is returned.
On error -1 is returned, and the errno variable is set appropriately.
Generic error codes are described at the Generic Error Codes chapter.

ioctl FE_DISEQC_RECV_SLAVE_REPLY

Name

FE_DISEQC_RECV_SLAVE_REPLY - Receives reply from a DiSEqC 2.0 command

Synopsis

FE_DISEQC_RECV_SLAVE_REPLY

int ioctl(int fd, FE_DISEQC_RECV_SLAVE_REPLY, struct dvb_diseqc_slave_reply *argp)
Arguments

fd  File descriptor returned by open().
argp  pointer to struct dvb_diseqc_slave_reply.

Description

Receives reply from a DiSEqC 2.0 command.
The received message is stored at the buffer pointed by argp.

Return Value

On success 0 is returned.
On error -1 is returned, and the errno variable is set appropriately.
Generic error codes are described at the Generic Error Codes chapter.

ioctl FE_DISEQC_SEND_BURST

Name

FE_DISEQC_SEND_BURST - Sends a 22KHz tone burst for 2x1 mini DiSEqC satellite selection.

Synopsis

FE_DISEQC_SEND_BURST
int ioctl(int fd, FE_DISEQC_SEND_BURST, enum fe_sec_mini_cmd tone)

Arguments

fd  File descriptor returned by open().
tone  An integer enumerated value described at fe_sec_mini_cmd.

Description

This ioctl is used to set the generation of a 22kHz tone burst for mini DiSEqC satellite selection for 2x1 switches. This call requires read/write permissions.
It provides support for what's specified at Digital Satellite Equipment Control (DiSEqC) - Simple "ToneBurst" Detection Circuit specification.
Return Value

On success 0 is returned.
On error -1 is returned, and the errno variable is set appropriately.
Generic error codes are described at the Generic Error Codes chapter.

ioctl FE_SET_TONE

Name

FE_SET_TONE - Sets/resets the generation of the continuous 22kHz tone.

Synopsis

FE_SET_TONE

int ioctl(int fd, FE_SET_TONE, enum fe_sec_tone_mode tone)

Arguments

fd File descriptor returned by open().
tone an integer enumerated value described at fe_sec_tone_mode

Description

This ioctl is used to set the generation of the continuous 22kHz tone. This call requires read/write permissions.
Usually, satellite antenna subsystems require that the digital TV device to send a 22kHz tone in order to select between high/low band on some dual-band LNBf. It is also used to send signals to DiSEqC equipment, but this is done using the DiSEqC ioctls.

Attention: If more than one device is connected to the same antenna, setting a tone may interfere on other devices, as they may lose the capability of selecting the band. So, it is recommended that applications would change to SEC_TONE_OFF when the device is not used.
**Return Value**

On success 0 is returned.

On error -1 is returned, and the `errno` variable is set appropriately.

Generic error codes are described at the *Generic Error Codes* chapter.

**ioctl FE_SET_VOLTAGE**

**Name**

FE_SET_VOLTAGE - Allow setting the DC level sent to the antenna subsystem.

**Synopsis**

```c
FE_SET_VOLTAGE
int ioctl(int fd, FE_SET_VOLTAGE, enum fe_sec_voltage voltage)
```

**Arguments**

- `fd` File descriptor returned by `open()`.
- `voltage` an integer enumerated value described at `fe_sec_voltage`

**Description**

This ioctl allows to set the DC voltage level sent through the antenna cable to 13V, 18V or off.

Usually, a satellite antenna subsystems require that the digital TV device to send a DC voltage to feed power to the LNBf. Depending on the LNBf type, the polarization or the intermediate frequency (IF) of the LNBf can controlled by the voltage level. Other devices (for example, the ones that implement DISEqC and multipoint LNBf’s don’t need to control the voltage level, provided that either 13V or 18V is sent to power up the LNBf.

**Attention:** if more than one device is connected to the same antenna, setting a voltage level may interfere on other devices, as they may lose the capability of setting polarization or IF. So, on those cases, setting the voltage to SEC_VOLTAGE_OFF while the device is not is used is recommended.
Return Value

On success 0 is returned.
On error -1 is returned, and the errno variable is set appropriately.

Generic error codes are described at the *Generic Error Codes* chapter.

**ioctl FE_ENABLE_HIGH_LNB_VOLTAGE**

**Name**

FE_ENABLE_HIGH_LNB_VOLTAGE - Select output DC level between normal LNBf voltages or higher LNBf - voltages.

**Synopsis**

```
FE_ENABLE_HIGH_LNB_VOLTAGE
int ioctl(int fd, FE_ENABLE_HIGH_LNB_VOLTAGE, unsigned int high)
```

**Arguments**

- **fd** File descriptor returned by `open()`.
- **high** Valid flags:
  - 0 - normal 13V and 18V.
  - >0 - enables slightly higher voltages instead of 13/18V, in order to compensate for long antenna cables.

**Description**

Select output DC level between normal LNBf voltages or higher LNBf voltages between 0 (normal) or a value greater than 0 for higher voltages.

**Return Value**

On success 0 is returned.
On error -1 is returned, and the errno variable is set appropriately.

Generic error codes are described at the *Generic Error Codes* chapter.
ioctl FD_SET_FRONTEND_TUNE_MODE

Name

FD_SET_FRONTEND_TUNE_MODE - Allow setting tuner mode flags to the frontend.

Synopsis

FD_SET_FRONTEND_TUNE_MODE

int ioctl(int fd, FD_SET_FRONTEND_TUNE_MODE, unsigned int flags)

Arguments

fd  File descriptor returned by open().

flags  Valid flags:

• 0 - normal tune mode

• FD_TUNE_MODE_ONESHOT - When set, this flag will disable any zigzagging or other "normal" tuning behaviour. Additionally, there will be no automatic monitoring of the lock status, and hence no frontend events will be generated. If a frontend device is closed, this flag will be automatically turned off when the device is reopened read-write.

Description

Allow setting tuner mode flags to the frontend, between 0 (normal) or FD_TUNE_MODE_ONESHOT mode

Return Value

On success 0 is returned.

On error -1 is returned, and the errno variable is set appropriately.

Generic error codes are described at the Generic Error Codes chapter.

3.3.3 Digital TV Demux Device

The Digital TV demux device controls the MPEG-TS filters for the digital TV. If the driver and hardware supports, those filters are implemented at the hardware. Otherwise, the Kernel provides a software emulation.

It can be accessed through /dev/adapter?/demux?. Data types and ioctl definitions can be accessed by including linux/dvb/dmx.h in your application.
3.3.3.1 Demux Data Types

enum dmx_output
    Output for the demux.

Constants
DMX_OUT_DECODER
    Streaming directly to decoder.

DMX_OUT_TAP
    Output going to a memory buffer (to be retrieved via the read command). Delivers
    the stream output to the demux device on which the ioctl is called.

DMX_OUT_TS_TAP
    Output multiplexed into a new TS (to be retrieved by reading from the logical DVR
    device). Routes output to the logical DVR device /dev/dvb/adapter?/dvr?, which
    delivers a TS multiplexed from all filters for which DMX_OUT_TS_TAP was specified.

DMX_OUT_TSDEMUX_TAP
    Like DMX_OUT_TS_TAP but retrieved from the DMX device.

enum dmx_input
    Input from the demux.

Constants
DMX_IN_FRONTEND Input from a front-end device.

DMX_IN_DVR Input from the logical DVR device.

enum dmx_ts_pes
    type of the PES filter.

Constants
DMX_PES_AUDIO0 first audio PID. Also referred as DMX_PES_AUDIO.

DMX_PES_VIDEO0 first video PID. Also referred as DMX_PES_VIDEO.

DMX_PES_TELETEXT0 first teletext PID. Also referred as DMX_PES_TELETEXT.

DMX_PES_SUBTITLE0 first subtitle PID. Also referred as DMX_PES_SUBTITLE.

DMX_PES_PCR0 first Program Clock Reference PID. Also referred as DMX_PES_PCR.

DMX_PES_AUDIO1 second audio PID.

DMX_PES_VIDEO1 second video PID.

DMX_PES_TELETEXT1 second teletext PID.

DMX_PES_SUBTITLE1 second subtitle PID.

DMX_PES_PCR1 second Program Clock Reference PID.

DMX_PES_AUDIO2 third audio PID.

DMX_PES_VIDEO2 third video PID.

DMX_PES_TELETEXT2 third teletext PID.
**DMX_PES_SUBTITLE2** third subtitle PID.

**DMX_PES_PCR2** third Program Clock Reference PID.

**DMX_PES_AUDIO3** fourth audio PID.

**DMX_PES_VIDEO3** fourth video PID.

**DMX_PES_TELETEXT3** fourth teletext PID.

**DMX_PES_SUBTITLE3** fourth subtitle PID.

**DMX_PES_PCR3** fourth Program Clock Reference PID.

**DMX_PES_OTHER** any other PID.

The `dmx_filter` structure specifies a section header filter.

**Definition**

```c
struct dmx_filter {
    __u8 filter[DMX_FILTER_SIZE];
    __u8 mask[DMX_FILTER_SIZE];
    __u8 mode[DMX_FILTER_SIZE];
};
```

**Members**

- **filter** bit array with bits to be matched at the section header.
- **mask** bits that are valid at the filter bit array.
- **mode** mode of match: if bit is zero, it will match if equal (positive match); if bit is one, it will match if the bit is negated.

**Note**

All arrays in this struct have a size of DMX_FILTER_SIZE (16 bytes).

The `dmx_sct_filter_params` structure specifies a section filter.

**Definition**

```c
struct dmx_sct_filter_params {
    __u16 pid;
    struct dmx_filter filter;
    __u32 timeout;
    __u32 flags;
#define DMX_CHECK_CRC 1;
#define DMX_ONESHOT 2;
#define DMX_IMMEDIATE_START 4;
};
```

**Members**

- **pid** PID to be filtered.
- **filter** section header filter, as defined by `struct dmx_filter`.
- **timeout** maximum time to filter, in milliseconds.
flags extra flags for the section filter.

Description
Carries the configuration for a MPEG-TS section filter.

The flags can be:

- `DMX_CHECK_CRC` - only deliver sections where the CRC check succeeded;
- `DMX_ONESHOT` - disable the section filter after one section has been delivered;
- `DMX_IMMEDIATE_START` - Start filter immediately without requiring a `DMX_START`.

struct `dmx_pes_filter_params`  
Specifies Packetized Elementary Stream (PES) filter parameters.

Definition
```
struct dmx_pes_filter_params {
    __u16 pid;
    enum dmx_input input;
    enum dmx_output output;
    enum dmx_ts_pes pes_type;
    __u32 flags;
};
```

Members

pid PID to be filtered.

input Demux input, as specified by `enum dmx_input`.

output Demux output, as specified by `enum dmx_output`.

pes_type Type of the pes filter, as specified by `enum dmx_pes_type`.

flags Demux PES flags.

struct `dmx_stc`  
Stores System Time Counter (STC) information.

Definition
```
struct dmx_stc {
    unsigned int num;
    unsigned int base;
    __u64 stc;
};
```

Members

num input data: number of the STC, from 0 to N.

base output: divisor for STC to get 90 kHz clock.

stc output: stc in base * 90 kHz units.

enum `dmx_buffer_flags`  
DMX memory-mapped buffer flags

Constants

`DMX_BUFFER_FLAG_HAD_CRC32_DISCARD`
Indicates that the Kernel discarded one or more frames due to wrong CRC32 checksum.

DMX_BUFFER_FLAG_TEI
Indicates that the Kernel has detected a Transport Error indicator (TEI) on a filtered pid.

DMX_BUFFER_PKT_COUNTER_MISMATCH
Indicates that the Kernel has detected a packet counter mismatch on a filtered pid.

DMX_BUFFER_FLAG_DISCONTINUITY_DETECTED
Indicates that the Kernel has detected one or more frame discontinuity.

DMX_BUFFER_FLAG_DISCONTINUITY_INDICATOR
Received at least one packet with a frame discontinuity indicator.

struct dmx_buffer
dmx_buffer info

Definition

```c
struct dmx_buffer {
    __u32 index;
    __u32 bytesused;
    __u32 offset;
    __u32 length;
    __u32 flags;
    __u32 count;
};
```

Members

index  id number of the buffer

bytesused  number of bytes occupied by data in the buffer (payload);

offset  for buffers with memory == DMX_MEMORY_MMAP; offset from the start of the device memory for this plane, (or a “cookie” that should be passed to mmap() as offset)

length  size in bytes of the buffer

flags  bit array of buffer flags as defined by enum dmx_buffer_flags. Filled only at DMX_DQBUF.

count  monotonic counter for filled buffers. Helps to identify data stream loses. Filled only at DMX_DQBUF.

Description

Contains data exchanged by application and driver using one of the streaming I/O methods.

Please notice that, for DMX_QBUF, only index should be filled. On DMX_DQBUF calls, all fields will be filled by the Kernel.

struct dmx_requestbuffers
request dmx buffer information

Definition
struct dmx_requestbuffers {
    __u32 count;
    __u32 size;
};

Members

count  number of requested buffers,
size  size in bytes of the requested buffer

Description

Contains data used for requesting a dmx buffer. All reserved fields must be set to zero.

struct dmx_exportbuffer
    export of dmx buffer as DMABUF file descriptor

Definition

struct dmx_exportbuffer {
    __u32 index;
    __u32 flags;
    __s32 fd;
};

Members

index  id number of the buffer
flags  flags for newly created file, currently only O_CLOEXEC is supported, refer to manual of open syscall for more details
fd  file descriptor associated with DMABUF (set by driver)

Description

Contains data used for exporting a dmx buffer as DMABUF file descriptor. The buffer is identified by a ‘cookie’ returned by DMX_QUERYBUF (identical to the cookie used to mmap() the buffer to userspace). All reserved fields must be set to zero. The field reserved0 is expected to become a structure ‘type’ allowing an alternative layout of the structure content. Therefore this field should not be used for any other extensions.

3.3.3.2 Demux Function Calls

Digital TV demux open()

Name

Digital TV demux open()
Synopsis

int open(const char *deviceName, int flags)

Arguments

name Name of specific Digital TV demux device.

flags A bit-wise OR of the following flags:

<table>
<thead>
<tr>
<th>Flags</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>O_RDONLY</td>
<td>read-only access</td>
</tr>
<tr>
<td>O_RDWR</td>
<td>read/write access</td>
</tr>
<tr>
<td>O_NONBLOCK</td>
<td>open in non-blocking mode (blocking mode is the default)</td>
</tr>
</tbody>
</table>

Description

This system call, used with a device name of /dev/dvb/adapter?/demux?, allocates a new filter and returns a handle which can be used for subsequent control of that filter. This call has to be made for each filter to be used, i.e. every returned file descriptor is a reference to a single filter. /dev/dvb/adapter?/dvr? is a logical device to be used for retrieving Transport Streams for digital video recording. When reading from this device a transport stream containing the packets from all PES filters set in the corresponding demux device (/dev/dvb/adapter?/demux?) having the output set to DMX_OUT_TS_TAP. A recorded Transport Stream is replayed by writing to this device.

The significance of blocking or non-blocking mode is described in the documentation for functions where there is a difference. It does not affect the semantics of the open() call itself. A device opened in blocking mode can later be put into non-blocking mode (and vice versa) using the F_SETFL command of the fcntl system call.

Return Value

On success 0 is returned.

On error -1 is returned, and the errno variable is set appropriately.

<table>
<thead>
<tr>
<th>Error Code</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>EMFILE</td>
<td>“Too many open files”, i.e. no more filters available.</td>
</tr>
</tbody>
</table>

The generic error codes are described at the *Generic Error Codes* chapter.
**Digital TV demux close()**

**Name**

Digital TV demux close()

**Synopsis**

```c
int close(int fd)
```

**Arguments**

- `fd` File descriptor returned by a previous call to `open()`.

**Description**

This system call deactivates and deallocates a filter that was previously allocated via the `open()` call.

**Return Value**

On success 0 is returned.

On error, -1 is returned and the `errno` variable is set appropriately.

The generic error codes are described at the *Generic Error Codes* chapter.

**Digital TV demux read()**

**Name**

Digital TV demux read()

**Synopsis**

```c
size_t read(int fd, void *buf, size_t count)
```
### Arguments

**fd**  
File descriptor returned by a previous call to `open()`.  
**buf** Buffer to be filled  
**count** Max number of bytes to read

### Description

This system call returns filtered data, which might be section or Packetized Elementary Stream (PES) data. The filtered data is transferred from the driver's internal circular buffer to `buf`. The maximum amount of data to be transferred is implied by `count`.

**Note:** if a section filter created with `DMX_CHECK_CRC` flag set, data that fails on CRC check will be silently ignored.

### Return Value

On success 0 is returned.

On error -1 is returned, and the `errno` variable is set appropriately.

<table>
<thead>
<tr>
<th>Error Code</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>EWOULDBLOCK</td>
<td>No data to return and 0_NONBLOCK was specified.</td>
</tr>
<tr>
<td>EOVERFLOW</td>
<td>The filtered data was not read from the buffer in due time, resulting in non-</td>
</tr>
<tr>
<td></td>
<td>read data being lost. The buffer is flushed.</td>
</tr>
<tr>
<td>ETIMEDOUT</td>
<td>The section was not loaded within the stated timeout period. See <code>ioctl</code></td>
</tr>
<tr>

<td><code>DMX_SET_FILTER</code> for how to set a timeout.</td>
</tr>
<tr>
<td>EFAULT</td>
<td>The driver failed to write to the callers buffer due to an invalid *buf pointer.</td>
</tr>
</tbody>
</table>

The generic error codes are described at the *Generic Error Codes* chapter.

### Digital TV demux write()

#### Name

Digital TV demux write()
Synopsis

ssize_t write(int fd, const void *buf, size_t count)

Arguments

fd  File descriptor returned by a previous call to open().
buf Buffer with data to be written
count Number of bytes at the buffer

Description

This system call is only provided by the logical device /dev/dvb/adapter?/dvr?, associated with the physical demux device that provides the actual DVR functionality. It is used for replay of a digitally recorded Transport Stream. Matching filters have to be defined in the corresponding physical demux device, /dev/dvb/adapter?/demux?. The amount of data to be transferred is implied by count.

Return Value

On success 0 is returned.
On error -1 is returned, and the errno variable is set appropriately.

| EWOULDBLOCK | No data was written. This might happen if O_NONBLOCK was specified and there is no more buffer space available (if O_NONBLOCK is not specified the function will block until buffer space is available). |
| EBUSY        | This error code indicates that there are conflicting requests. The corresponding demux device is setup to receive data from the front-end. Make sure that these filters are stopped and that the filters with input set to DMX_IN_DVR are started. |

The generic error codes are described at the Generic Error Codes chapter.

Digital TV mmap()

Name

dmx-mmap - Map device memory into application address space

Warning: this API is still experimental
Synopsis

```c
#include <unistd.h>
#include <sys/mman.h>

void *mmap(void *start, size_t length, int prot, int flags, int fd, off_t offset)
```

Arguments

**start**  Map the buffer to this address in the application’s address space. When the MAP_FIXED flag is specified, start must be a multiple of the pagesize and `mmap` will fail when the specified address cannot be used. Use of this option is discouraged; applications should just specify a NULL pointer here.

**length**  Length of the memory area to map. This must be a multiple of the DVB packet length (188, on most drivers).

**prot**  The prot argument describes the desired memory protection. Regardless of the device type and the direction of data exchange it should be set to PROT_READ | PROT_WRITE, permitting read and write access to image buffers. Drivers should support at least this combination of flags.

**flags**  The flags parameter specifies the type of the mapped object, mapping options and whether modifications made to the mapped copy of the page are private to the process or are to be shared with other references.

- **MAP_FIXED** requests that the driver selects no other address than the one specified. If the specified address cannot be used, `mmap()` will fail. If MAP_FIXED is specified, start must be a multiple of the pagesize. Use of this option is discouraged.

- One of the MAP_SHARED or MAP_PRIVATE flags must be set. MAP_SHARED allows applications to share the mapped memory with other (e.g. child-) processes.

**fd**  File descriptor returned by `open()`.

**offset**  Offset of the buffer in device memory, as returned by `ioctl DMX_QUERYBUF` ioctl.

Description

The `mmap()` function asks to map `length` bytes starting at `offset` in the memory of the device specified by `fd` into the application address space, preferably at address `start`. This latter address is a hint only, and is usually specified as 0.

Suitable length and offset parameters are queried with the `ioctl DMX_QUERYBUF` ioctl. Buffers must be allocated with the `ioctl DMX_REQBUFS` ioctl before they can be queried.

To unmap buffers the `munmap()` function is used.
Return Value

On success `mmap()` returns a pointer to the mapped buffer. On error `MAP_FAILED` (-1) is returned, and the `errno` variable is set appropriately. Possible error codes are:

**EBADF** fd is not a valid file descriptor.

**EACCES** fd is not open for reading and writing.

**EINVAL** The start or length or offset are not suitable. (E. g. they are too large, or not aligned on a PAGESIZE boundary.)

The flags or prot value is not supported.

No buffers have been allocated with the `ioctl DMX_REQBUFS` ioctl.

**ENOMEM** Not enough physical or virtual memory was available to complete the request.

DVB munmap()

Name
dmx-munmap - Unmap device memory

**Warning:** This API is still experimental.

Synopsis

```c
#include <unistd.h>
#include <sys/mman.h>

int munmap(void *start, size_t length)
```

Arguments

**start** Address of the mapped buffer as returned by the `mmap()` function.

**length** Length of the mapped buffer. This must be the same value as given to `mmap()`.

Description

Unmaps a previously with the `mmap()` function mapped buffer and frees it, if possible.
Return Value

On success `munmap()` returns 0, on failure -1 and the `errno` variable is set appropriately:

**EINVAL** The start or length is incorrect, or no buffers have been mapped yet.

Name

DMX_START

Synopsis

DMX_START

```c
int ioctl(int fd, DMX_START)
```

Arguments

**fd** File descriptor returned by `open()`.

Description

This ioctl call is used to start the actual filtering operation defined via the ioctl calls `DMX_SET_FILTER` or `DMX_SET_PES_FILTER`.

Return Value

On success 0 is returned.

On error -1 is returned, and the `errno` variable is set appropriately.

<table>
<thead>
<tr>
<th>Error</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>EINVAL</td>
<td>Invalid argument, i.e. no filtering parameters provided via the <code>DMX_SET_FILTER</code> or <code>DMX_SET_PES_FILTER</code> ioctls.</td>
</tr>
<tr>
<td>EBUSY</td>
<td>This error code indicates that there are conflicting requests. There are active filters filtering data from another input source. Make sure that these filters are stopped before starting this filter.</td>
</tr>
</tbody>
</table>

The generic error codes are described at the **Generic Error Codes** chapter.
DMX_STOP

Name

DMX_STOP

Synopsis

DMX_STOP

int ioctl(int fd, DMX_STOP)

Arguments

fd  File descriptor returned by open().

Description

This ioctl call is used to stop the actual filtering operation defined via the ioctl calls DMX_SET_FILTER or DMX_SET_PES_FILTER and started via the DMX_START command.

Return Value

On success 0 is returned.

On error -1 is returned, and the errno variable is set appropriately.

The generic error codes are described at the Generic Error Codes chapter.

DMX_SET_FILTER

Name

DMX_SET_FILTER

Synopsis

DMX_SET_FILTER

int ioctl(int fd, DMX_SET_FILTER, struct dmx_sct_filter_params *params)
Arguments

**fd**  File descriptor returned by open().

**params**  
Pointer to structure containing filter parameters.

Description

This ioctl call sets up a filter according to the filter and mask parameters provided. A timeout may be defined stating number of seconds to wait for a section to be loaded. A value of 0 means that no timeout should be applied. Finally there is a flag field where it is possible to state whether a section should be CRC-checked, whether the filter should be a “one-shot” filter, i.e. if the filtering operation should be stopped after the first section is received, and whether the filtering operation should be started immediately (without waiting for a `DMX_START` ioctl call). If a filter was previously set-up, this filter will be canceled, and the receive buffer will be flushed.

Return Value

On success 0 is returned.

On error -1 is returned, and the **errno** variable is set appropriately.

The generic error codes are described at the *Generic Error Codes* chapter.

**DMX_SET_PES_FILTER**

Name

**DMX_SET_PES_FILTER**

Synopsis

```c
int ioctl(int fd, DMX_SET_PES_FILTER, struct dmx_pes_filter_params *params)
```

Arguments

**fd**  File descriptor returned by open().

**params**  Pointer to structure containing filter parameters.
**Description**

This ioctl call sets up a PES filter according to the parameters provided. By a PES filter is meant a filter that is based just on the packet identifier (PID), i.e. no PES header or payload filtering capability is supported.

**Return Value**

On success 0 is returned.

On error -1 is returned, and the `errno` variable is set appropriately.

| EBUSY | This error code indicates that there are conflicting requests. There are active filters filtering data from another input source. Make sure that these filters are stopped before starting this filter. |

The generic error codes are described at the *Generic Error Codes* chapter.

**DMX_SET_BUFFER_SIZE**

**Name**

DMX_SET_BUFFER_SIZE

**Synopsis**

```c
DMX_SET_BUFFER_SIZE
int ioctl(int fd, DMX_SET_BUFFER_SIZE, unsigned long size)
```

**Arguments**

- **fd** File descriptor returned by `open()`.
- **size** Unsigned long size

**Description**

This ioctl call is used to set the size of the circular buffer used for filtered data. The default size is two maximum sized sections, i.e. if this function is not called a buffer size of \(2 \times 4096\) bytes will be used.
**Return Value**

On success 0 is returned.
On error -1 is returned, and the `errno` variable is set appropriately.
The generic error codes are described at the *Generic Error Codes* chapter.

---

**DMX_GET_STC**

**Name**

DMX_GET_STC

**Synopsis**

```c
int ioctl(int fd, DMX_GET_STC, struct dmx_stc *stc)
```

**Arguments**

- **fd** File descriptor returned by `open()`.
- **stc** Pointer to `dmx_stc` where the stc data is to be stored.

**Description**

This ioctl call returns the current value of the system time counter (which is driven by a PES filter of type `DMX_PES_PCR`). Some hardware supports more than one STC, so you must specify which one by setting the `num` field of `stc` before the ioctl (range 0...n). The result is returned in form of a ratio with a 64 bit numerator and a 32 bit denominator, so the real 90kHz STC value is `stc->stc / stc->base`.

**Return Value**

On success 0 is returned.
On error -1 is returned, and the `errno` variable is set appropriately.

<table>
<thead>
<tr>
<th>Error Code</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>EINVAL</td>
<td>Invalid stc number.</td>
</tr>
</tbody>
</table>

The generic error codes are described at the *Generic Error Codes* chapter.
**DMX_GET_PES_PIDS**

**Name**

DMX_GET_PES_PIDS

**Synopsis**

```c
int ioctl(fd, DMX_GET_PES_PIDS, __u16 pids[5])
```

**Arguments**

- `fd` File descriptor returned by open().
- `pids` Array used to store 5 Program IDs.

**Description**

This ioctl allows to query a DVB device to return the first PID used by audio, video, textext, subtitle and PCR programs on a given service. They’re stored as:

<table>
<thead>
<tr>
<th>PID element</th>
<th>position</th>
<th>content</th>
</tr>
</thead>
<tbody>
<tr>
<td>pids[DMX_PES_AUDIO]</td>
<td>0</td>
<td>first audio PID</td>
</tr>
<tr>
<td>pids[DMX_PES_VIDEO]</td>
<td>1</td>
<td>first video PID</td>
</tr>
<tr>
<td>pids[DMX_PES_TELETEXT]</td>
<td>2</td>
<td>first teletext PID</td>
</tr>
<tr>
<td>pids[DMX_PES_SUBTITLE]</td>
<td>3</td>
<td>first subtitle PID</td>
</tr>
<tr>
<td>pids[DMX_PES_PCR]</td>
<td>4</td>
<td>first Program Clock Reference PID</td>
</tr>
</tbody>
</table>

**Note:** A value equal to 0xffffffff means that the PID was not filled by the Kernel.

**Return Value**

On success 0 is returned.

On error -1 is returned, and the `errno` variable is set appropriately.

The generic error codes are described at the *Generic Error Codes* chapter.
**DMX_ADD_PID**

**Name**

DMX_ADD_PID

**Synopsis**

```c
int ioctl(fd, DMX_ADD_PID, __u16 *pid)
```

**Arguments**

- `fd` File descriptor returned by `open()`.
- `pid` PID number to be filtered.

**Description**

This ioctl call allows to add multiple PIDs to a transport stream filter previously set up with `DMX_SET_PES_FILTER` and output equal to `DMX_OUT_TSDEMUX_TAP`.

**Return Value**

On success 0 is returned.
On error -1 is returned, and the `errno` variable is set appropriately.
Generic error codes are described at the `Generic Error Codes` chapter.

**DMX_REMOVE_PID**

**Name**

DMX_REMOVE_PID

**Synopsis**

```c
int ioctl(fd, DMX_REMOVE_PID, __u16 *pid)
```
Arguments

**fd**  File descriptor returned by open().

**pid**  PID of the PES filter to be removed.

Description

This ioctl call allows to remove a PID when multiple PIDs are set on a transport stream filter, e.g. a filter previously set up with output equal to `DMX_OUT_TSDEMUX_TAP`, created via either `DMX_SET_PES_FILTER` or `DMX_ADD_PID`.

Return Value

On success 0 is returned.

On error, -1 is returned, and the `errno` variable is set appropriately.

The generic error codes are described at the `Generic Error Codes` chapter.

**ioctl DMX_REQBUFS**

Name

DMX_REQBUFS - Initiate Memory Mapping and/or DMA buffer I/O

**Warning:** this API is still experimental

Synopsis

**DMX_REQBUFS**

```c
int ioctl(int fd, DMX_REQBUFS, struct dmx_requestbuffers *argp)
```

Arguments

**fd**  File descriptor returned by open().

**argp**  Pointer to struct `dmx_requestbuffers`. 
**Description**

This ioctl is used to initiate a memory mapped or DMABUF based demux I/O.

Memory mapped buffers are located in device memory and must be allocated with this ioctl before they can be mapped into the application’s address space. User buffers are allocated by applications themselves, and this ioctl is merely used to switch the driver into user pointer I/O mode and to setup some internal structures. Similarly, DMABUF buffers are allocated by applications through a device driver, and this ioctl only configures the driver into DMABUF I/O mode without performing any direct allocation.

To allocate device buffers applications initialize all fields of the struct `dmx_requestbuffers` structure. They set the `count` field to the desired number of buffers, and `size` to the size of each buffer.

When the ioctl is called with a pointer to this structure, the driver will attempt to allocate the requested number of buffers and it stores the actual number allocated in the `count` field. The `count` can be smaller than the number requested, even zero, when the driver runs out of free memory. A larger number is also possible when the driver requires more buffers to function correctly. The actual allocated buffer size can is returned at `size`, and can be smaller than what’s requested.

When this I/O method is not supported, the ioctl returns an EOPNOTSUPP error code.

Applications can call `ioctl DMX_REQBUFS` again to change the number of buffers, however this cannot succeed when any buffers are still mapped. A `count` value of zero frees all buffers, after aborting or finishing any DMA in progress.

**Return Value**

On success 0 is returned, on error -1 and the `errno` variable is set appropriately. The generic error codes are described at the `Generic Error Codes` chapter.

**EOPNOTSUPP** The the requested I/O method is not supported.

**ioctl DMX_QUERYBUF**

**Name**

DMX_QUERYBUF - Query the status of a buffer

**Warning:** this API is still experimental
Synopsis

DMX_QUERYBUF

int ioctl(int fd, DMX_QUERYBUF, struct dvb_buffer *argp)

Arguments

fd File descriptor returned by open().
argp Pointer to struct dvb_buffer.

Description

This ioctl is part of the mmap streaming I/O method. It can be used to query the status of a buffer at any time after buffers have been allocated with the ioctl DMX_REQBUFS ioctl. Applications set the index field. Valid index numbers range from zero to the number of buffers allocated with ioctl DMX_REQBUFS (struct dvb_requestbuffers count) minus one. After calling ioctl DMX_QUERYBUF with a pointer to this structure, drivers return an error code or fill the rest of the structure.

On success, the offset will contain the offset of the buffer from the start of the device memory, the length field its size, and the bytesused the number of bytes occupied by data in the buffer (payload).

Return Value

On success 0 is returned, the offset will contain the offset of the buffer from the start of the device memory, the length field its size, and the bytesused the number of bytes occupied by data in the buffer (payload).

On error it returns -1 and the errno variable is set appropriately. The generic error codes are described at the Generic Error Codes chapter.

EINVAL The index is out of bounds.

ioctl DMX_EXPBUF

Name

DMX_EXPBUF - Export a buffer as a DMABUF file descriptor.

Warning: this API is still experimental
Synopsis

DMX_EXPBUF

int ioctl(int fd, DMX_EXPBUF, struct dmx_exportbuffer *argp)

Arguments

fd  File descriptor returned by open().

argp  Pointer to struct dmx_exportbuffer.

Description

This ioctl is an extension to the memory mapping I/O method. It can be used to export a buffer as a DMABUF file at any time after buffers have been allocated with the ioctl DMX_REQBUFS ioctl.

To export a buffer, applications fill struct dmx_exportbuffer. Applications must set the index field. Valid index numbers range from zero to the number of buffers allocated with ioctl DMX_REQBUFS (struct dmx_requestbuffers count) minus one. Additional flags may be posted in the flags field. Refer to a manual for open() for details. Currently only O_CLOEXEC, O_RDONLY, O_WRONLY, and O_RDWR are supported. All other fields must be set to zero. In the case of multi-planar API, every plane is exported separately using multiple ioctl DMX_EXPBUF calls.

After calling ioctl DMX_EXPBUF the fd field will be set by a driver, on success. This is a DMABUF file descriptor. The application may pass it to other DMABUF-aware devices. It is recommended to close a DMABUF file when it is no longer used to allow the associated memory to be reclaimed.

Examples

```c
int buffer_export(int v4lfd, enum dmx_buf_type bt, int index, int *dmafd)
{
    struct dmx_exportbuffer expbuf;

    memset(&expbuf, 0, sizeof(expbuf));
    expbuf.type = bt;
    expbuf.index = index;
    if (ioctl(v4lfd, DMX_EXPBUF, &expbuf) == -1) {
        perror("DMX_EXPBUF");
        return -1;
    }

    *dmafd = expbuf.fd;

    return 0;
}
```
Return Value

On success 0 is returned, on error -1 and the errno variable is set appropriately. The generic error codes are described at the Generic Error Codes chapter.

EINVAL A queue is not in MMAP mode or DMABUF exporting is not supported or flags or index fields are invalid.

ioctl DMX_QBUF, DMX_DQBUF

Name

DMX_QBUF - DMX_DQBUF - Exchange a buffer with the driver

Warning: this API is still experimental

Synopsis

DMX_QBUF
int ioctl(int fd, DMX_QBUF, struct dmx_buffer *argp)

DMX_DQBUF
int ioctl(int fd, DMX_DQBUF, struct dmx_buffer *argp)

Arguments

fd  File descriptor returned by open().

argp  Pointer to struct dmx_buffer.

Description

Applications call the DMX_QBUF ioctl to enqueue an empty (capturing) or filled (output) buffer in the driver’s incoming queue. The semantics depend on the selected I/O method.

To enqueue a buffer applications set the index field. Valid index numbers range from zero to the number of buffers allocated with ioctl DMX_REQBUFS (struct dmx_requestbuffers count) minus one. The contents of the struct dmx_buffer returned by a ioctl DMX_QUERYBUF ioctl will do as well.

When DMX_QBUF is called with a pointer to this structure, it locks the memory pages of the buffer in physical memory, so they cannot be swapped out to disk. Buffers remain locked until dequeued, until the device is closed.

Applications call the DMX_DQBUF ioctl to dequeue a filled (capturing) buffer from the driver’s outgoing queue. They just set the index field with the buffer ID to be queued. When DMX_DQBUF is called with a pointer to struct dmx_buffer, the driver fills the remaining fields or returns an error code.
By default DMX_DQBUF blocks when no buffer is in the outgoing queue. When the O_NONBLOCK flag was given to the open() function, DMX_DQBUF returns immediately with an EAGAIN error code when no buffer is available.

The struct dmx_buffer structure is specified in Buffers.

Return Value

On success 0 is returned, on error -1 and the errno variable is set appropriately. The generic error codes are described at the Generic Error Codes chapter.

EAGAIN Non-blocking I/O has been selected using O_NONBLOCK and no buffer was in the outgoing queue.

EINVAL The index is out of bounds, or no buffers have been allocated yet.

EIO DMX_DQBUF failed due to an internal error. Can also indicate temporary problems like signal loss or CRC errors.

3.3.4 Digital TV CA Device

The Digital TV CA device controls the conditional access hardware. It can be accessed through /dev/dvb/adapter/~/ca?. Data types and ioctl definitions can be accessed by including linux/dvb/ca.h in your application.

Note: There are three ioctls at this API that aren’t documented: CA_GET_MSG, CA_SEND_MSG and CA_SET_DESCR. Documentation for them are welcome.

3.3.4.1 CA Data Types

struct ca_slot_info

CA slot interface types and info.

Definition

```
struct ca_slot_info {
    int num;
    int type;
    #define CA_CI 1;
    #define CA_CI_LINK 2;
    #define CA_CI_PHYS 4;
    #define CA_DESCR 8;
    #define CA_SC 128;
    unsigned int flags;
    #define CA_CI_MODULE_PRESENT 1;
    #define CA_CI_MODULE_READY 2;
};
```

Members

num slot number.

type slot type.
flags flags applicable to the slot.

Description
This struct stores the CA slot information.

**type** can be:
- CA_CI - CI high level interface;
- CA_CI_LINK - CI link layer level interface;
- CA_CI_PHYS - CI physical layer level interface;
- CA_DESCR - built-in descrambler;
- CA_SC - simple smart card interface.

**flags** can be:
- CA_CI_MODULE_PRESENT - module (or card) inserted;
- CA_CI_MODULE_READY - module is ready for usage.

**struct ca_descr_info**

des scrambler types and info.

Definition

```
struct ca_descr_info {
    unsigned int num;
    unsigned int type;
    #define CA_ECD 1;
    #define CA_NDS 2;
    #define CA_DSS 4;
};
```

Members

**num** number of available descramblers (keys).

**type** type of supported scrambling system.

Description
Identifies the number of descramblers and their type.

**type** can be:
- CA_ECD - European Common Descrambler (ECD) hardware;
- CA_NDS - Videoguard (NDS) hardware;
- CA_DSS - Distributed Sample Scrambling (DSS) hardware.

**struct ca_caps**

CA slot interface capabilities.

Definition

```
struct ca_caps {
    unsigned int slot_num;
    unsigned int slot_type;
    unsigned int descr_num;
};
```
Members

slot_num total number of CA card and module slots.

slot_type bitmap with all supported types as defined at struct ca_slot_info (e.g. CA_CI, CA_CI_LINK, etc).

descr_num total number of descrambler slots (keys)

descr_type bitmap with all supported types as defined at struct ca_descr_info (e.g. CA_ECD, CA_NDS, etc).

struct ca_msg
  a message to/from a CI-CAM

Definition

```
struct ca_msg {
    unsigned int index;
    unsigned int type;
    unsigned int length;
    unsigned char msg[256];
};
```

Members

index unused
type unused

length length of the message

msg message

Description

This struct carries a message to be send/received from a CI CA module.

struct ca_descr
  CA descrambler control words info

Definition

```
struct ca_descr {
    unsigned int index;
    unsigned int parity;
    unsigned char cw[8];
};
```

Members

index CA Desembrller slot

parity control words parity, where 0 means even and 1 means odd
cw CA Desembrller control words
3.3.4.2 CA Function Calls

Digital TV CA open()

Name

Digital TV CA open()

Synopsis

int open(const char *name, int flags)

Arguments

name Name of specific Digital TV CA device.
flags A bit-wise OR of the following flags:

<table>
<thead>
<tr>
<th>Flags</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>O_RDONLY</td>
<td>read-only access</td>
</tr>
<tr>
<td>O_RDWR</td>
<td>read/write access</td>
</tr>
<tr>
<td>O_NONBLOCK</td>
<td>open in non-blocking mode (blocking mode is the default)</td>
</tr>
</tbody>
</table>

Description

This system call opens a named ca device (e.g. /dev/dvb/adapter?/ca?) for subsequent use. When an open() call has succeeded, the device will be ready for use. The significance of blocking or non-blocking mode is described in the documentation for functions where there is a difference. It does not affect the semantics of the open() call itself. A device opened in blocking mode can later be put into non-blocking mode (and vice versa) using the F_SETFL command of thefcntl system call. This is a standard system call, documented in the Linux manual page forfcntl. Only one user can open the CA Device in O_RDWR mode. All other attempts to open the device in this mode will fail, and an error code will be returned.

Return Value

On success 0 is returned.

On error -1 is returned, and the errno variable is set appropriately.

Generic error codes are described at the Generic Error Codes chapter.
Digital TV CA close()

Name

Digital TV CA close()

Synopsis

int close(int fd)

Arguments

fd  File descriptor returned by a previous call to open().

Description

This system call closes a previously opened CA device.

Return Value

On success 0 is returned.
On error -1 is returned, and the errno variable is set appropriately.
Generic error codes are described at the Generic Error Codes chapter.

CA_RESET

Name

CA_RESET

Synopsis

CA_RESET

int ioctl(fd, CA_RESET)
Arguments

`fd` File descriptor returned by a previous call to `open()`.

Description

Puts the Conditional Access hardware on its initial state. It should be called before start using the CA hardware.

Return Value

On success 0 is returned.
On error -1 is returned, and the `errno` variable is set appropriately.
Generic error codes are described at the `Generic Error Codes` chapter.

CA_GET_CAP

Name

CA_GET_CAP

Synopsis

CA_GET_CAP

```c
int ioctl(fd, CA_GET_CAP, struct ca_caps *caps)
```

Arguments

`fd` File descriptor returned by a previous call to `open()`.
`caps` Pointer to struct `ca_caps`.

Description

Queries the Kernel for information about the available CA and descrambler slots, and their types.
Return Value

On success 0 is returned and ca_caps is filled.
On error, -1 is returned and the errno variable is set appropriately.
The generic error codes are described at the Generic Error Codes chapter.

CA_GET_SLOT_INFO

Name

CA_GET_SLOT_INFO

Synopsis

CA_GET_SLOT_INFO

int ioctl(fd, CA_GET_SLOT_INFO, struct ca_slot_info *info)

Arguments

fd  File descriptor returned by a previous call to open().
info  Pointer to struct ca_slot_info.

Description

Returns information about a CA slot identified by ca_slot_info.slot_num.

Return Value

On success 0 is returned, and ca_slot_info is filled.
On error -1 is returned, and the errno variable is set appropriately.

| ENODEV | the slot is not available. |

The generic error codes are described at the Generic Error Codes chapter.
CA_GET_DESCR_INFO

Name

CA_GET_DESCR_INFO

Synopsis

CA_GET_DESCR_INFO

int ioctl(fd, CA_GET_DESCR_INFO, struct ca_descr_info *desc)

Arguments

fd  File descriptor returned by a previous call to open().

desc  Pointer to struct ca_descr_info.

Description

Returns information about all descrambler slots.

Return Value

On success 0 is returned, and ca_descr_info is filled.

On error -1 is returned, and the errno variable is set appropriately. The generic error codes are described at the Generic Error Codes chapter.

CA_GET_MSG

Name

CA_GET_MSG

Synopsis

CA_GET_MSG

int ioctl(fd, CA_GET_MSG, struct ca_msg *msg)
Arguments

fd  File descriptor returned by a previous call to open().
msg  Pointer to struct ca_msg.

Description

Receives a message via a CI CA module.

Note:  Please notice that, on most drivers, this is done by reading from the /dev/adapter?/ca? device node.

Return Value

On success 0 is returned.
On error -1 is returned, and the errno variable is set appropriately.
Generic error codes are described at the Generic Error Codes chapter.

CA_SEND_MSG

Name

CA_SEND_MSG

Synopsis

CA_SEND_MSG
int ioctl(fd, CA_SEND_MSG, struct ca_msg *msg)

Arguments

fd  File descriptor returned by a previous call to open().
msg  Pointer to struct ca_msg.
Description

Sends a message via a CI CA module.

**Note:** Please notice that, on most drivers, this is done by writing to the /dev/adapter?/ca? device node.

Return Value

On success 0 is returned.
On error -1 is returned, and the **errno** variable is set appropriately.
Generic error codes are described at the *Generic Error Codes* chapter.

---

**CA_SET_DESCR**

**Name**

CA_SET_DESCR

**Synopsis**

CA_SET_DESCR

int ioctl(fd, CA_SET_DESCR, struct ca_descr *desc)

**Arguments**

*fd* File descriptor returned by a previous call to open().
*msg* Pointer to struct ca_descr.

**Description**

CA_SET_DESCR is used for feeding descrambler CA slots with descrambling keys (referred as control words).
Return Value

On success 0 is returned.
On error -1 is returned, and the errno variable is set appropriately.
Generic error codes are described at the Generic Error Codes chapter.

3.3.4.3 The High level CI API

Note: This documentation is outdated.

This document describes the high level CI API as in accordance to the Linux DVB API.

With the High Level CI approach any new card with almost any random architecture can be implemented with this style, the definitions inside the switch statement can be easily adapted for any card, thereby eliminating the need for any additional ioctls.

The disadvantage is that the driver/hardware has to manage the rest. For the application programmer it would be as simple as sending/receiving an array to/from the CI ioctls as defined in the Linux DVB API. No changes have been made in the API to accommodate this feature.

Why the need for another CI interface?

This is one of the most commonly asked question. Well a nice question. Strictly speaking this is not a new interface.

The CI interface is defined in the DVB API in ca.h as:

```c
typedef struct ca_slot_info {
    int num;  /* slot number */
    int type;  /* CA interface this slot supports */
#define CA_CI 1  /* CI high level interface */
#define CA_CI_LINK 2  /* CI link layer level interface */
#define CA_CI_PHYS 4  /* CI physical layer level interface */
#define CA_DESCR 8  /* built-in descrambler */
#define CA_SC 128  /* simple smart card interface */
    unsigned int flags;
#define CA_CI_MODULE_PRESENT 1  /* module (or card) inserted */
#define CA_CI_MODULE_READY 2
} ca_slot_info_t;
```

This CI interface follows the CI high level interface, which is not implemented by most applications. Hence this area is revisited.

This CI interface is quite different in the case that it tries to accommodate all other CI based devices, that fall into the other categories.

This means that this CI interface handles the EN50221 style tags in the Application layer only and no session management is taken care of by the application. The driver/hardware will take care of all that.
This interface is purely an EN50221 interface exchanging APDU’s. This means that no session management, link layer or a transport layer do exist in this case in the application to driver communication. It is as simple as that. The driver/hardware has to take care of that.

With this High Level CI interface, the interface can be defined with the regular ioctls.

All these ioctls are also valid for the High level CI interface

```
#define CA_RESET _IO('o', 128) #define CA_GET_CAP _IOR('o', 129, ca_caps_t) #define CA_GET_SLOT_INFO _IOR('o', 130, ca_slot_info_t) #define CA_GET_DESCR_INFO _IOR('o', 131, ca_descr_info_t)#define CA_GET_MSG _IOR('o',132,ca_msg_t) #define CA_SEND_MSG _IOW('o',133,ca_msg_t)#define CA_SET_DESCR _IOW('o',134,ca_descr_t)
```

On querying the device, the device yields information thus:

```
CA_GET_SLOT_INFO
---------------------
Command = [info]
APP: Number=[1]
APP: Type=[1]
APP: flags=[1]
APP: CI High level interface
APP: CA/CI Module Present

CA_GET_CAP
---------------------
Command = [caps]
APP: Slots=[1]
APP: Type=[1]
APP: Descrambler keys=[16]
APP: Type=[1]

CA_SEND_MSG
---------------------
Descriptors(Program Level)=[ 09 06 04 05 50 ff f1]
Found CA descriptor @ program level

(20) ES type=[2] ES pid=[201] ES length =0 (0x0)
(25) ES type=[4] ES pid=[301] ES length =0 (0x0)
ca_message length is 25 (0x19) bytes
EN50221 CA MSG=[ 9f 80 32 19 03 01 2d d1 f0 08 01 09 06 04 05 50 ff f1 02 e0 c9 00, _00 04 e1 2d 00 00]
```

Not all ioctl’s are implemented in the driver from the API, the other features of the hardware that cannot be implemented by the API are achieved using the CA_GET_MSG and CA_SEND_MSG ioctls. An EN50221 style wrapper is used to exchange the data to maintain compatibility with other hardware.

```
/* a message to/from a CI-CAM */
typedef struct ca_msg {
    unsigned int index;
    unsigned int type;
    unsigned int length;
    unsigned char msg[256];
} ca_msg_t;
```

The flow of data can be described thus,
The High Level CI interface uses the EN50221 DVB standard, following a standard ensures futureproofness.

### 3.3.5 Digital TV Network API

The Digital TV net device controls the mapping of data packages that are part of a transport stream to be mapped into a virtual network interface, visible through the standard Linux network protocol stack.

Currently, two encapsulations are supported:

- **Multi Protocol Encapsulation (MPE)**
- **Ultra Lightweight Encapsulation (ULE)**

In order to create the Linux virtual network interfaces, an application needs to tell to the Kernel what are the PIDs and the encapsulation types that are present on the transport stream. This is done through `/dev/dvb/adapter?/net?` device node. The data will be available via virtual `dvb?_?` network interfaces, and will be controlled/routed via the standard ip tools (like `ip`, `route`, `netstat`, `ifconfig`, etc).

Data types and ioctl definitions are defined via `linux/dvb/net.h` header.
### 3.3.5.1 Digital TV net Function Calls

#### Net Data Types

```c
struct dvb_net_if
    describes a DVB network interface
```

#### Definition

```c
struct dvb_net_if {
    __u16 pid;
    __u16 if_num;
    __u8 feedtype;
#define DVB_NET_FEEDTYPE_MPE 0 
#define DVB_NET_FEEDTYPE_ULE 1 
};
```

#### Members

- **pid**  
  Packet ID (PID) of the MPEG-TS that contains data

- **if_num**  
  number of the Digital TV interface.

- **feedtype**  
  Encapsulation type of the feed.

#### Description

A MPEG-TS stream may contain packet IDs with IP packages on it. This struct describes it, and the type of encoding.

**feedtype** can be:

- `DVB_NET_FEEDTYPE_MPE` for MPE encoding
- `DVB_NET_FEEDTYPE_ULE` for ULE encoding.

#### ioctl NET_ADD_IF

#### Name

NET_ADD_IF - Creates a new network interface for a given Packet ID.

#### Synopsis

```c
int ioctl(int fd, NET_ADD_IF, struct dvb_net_if *net_if)
```
Arguments

fd  File descriptor returned by open().
net_if  pointer to struct dvb_net_if

Description

The NET_ADD_IF ioctl system call selects the Packet ID (PID) that contains a TCP/IP traffic, the type of encapsulation to be used (MPE or ULE) and the interface number for the new interface to be created. When the system call successfully returns, a new virtual network interface is created.

The struct dvb_net_if::ifnum field will be filled with the number of the created interface.

Return Value

On success 0 is returned, and ca_slot_info is filled.
On error -1 is returned, and the errno variable is set appropriately.

The generic error codes are described at the Generic Error Codes chapter.

ioctl NET_REMOVE_IF

Name

NET_REMOVE_IF - Removes a network interface.

Synopsis

NET_REMOVE_IF
int ioctl(int fd, NET_REMOVE_IF, int ifnum)

Arguments

fd  File descriptor returned by open().
net_if  number of the interface to be removed
Description

The NET_REMOVE_IF ioctl deletes an interface previously created via NET_ADD_IF.

Return Value

On success 0 is returned, and ca_slot_info is filled.
On error -1 is returned, and the errno variable is set appropriately.
The generic error codes are described at the Generic Error Codes chapter.

ioctl NET_GET_IF

Name

NET_GET_IF - Read the configuration data of an interface created via - NET_ADD_IF.

Synopsis

NET_GET_IF

int ioctl(int fd, NET_GET_IF, struct dvb_net_if *net_if)

Arguments

fd  File descriptor returned by open().
net_if  pointer to struct dvb_net_if

Description

The NET_GET_IF ioctl uses the interface number given by the struct dvb_net_if::ifnum field and fills the content of struct dvb_net_if with the packet ID and encapsulation type used on such interface. If the interface was not created yet with NET_ADD_IF, it will return -1 and fill the errno with EINVAL error code.

Return Value

On success 0 is returned, and ca_slot_info is filled.
On error -1 is returned, and the errno variable is set appropriately.
The generic error codes are described at the Generic Error Codes chapter.
3.3.6 Digital TV Deprecated APIs

The APIs described here should not be used on new drivers or applications. The DVBv3 frontend API has issues with new delivery systems, including DVB-S2, DVB-T2, ISDB, etc.

**Attention:** The APIs described here doesn’t necessarily reflect the current code implementation, as this section of the document was written for DVB version 1, while the code reflects DVB version 3 implementation.

3.3.6.1 Digital TV Frontend legacy API (a. k. a. DVBv3)

The usage of this API is deprecated, as it doesn’t support all digital TV standards, doesn’t provide good statistics measurements and provides incomplete information. This is kept only to support legacy applications.

Frontend Legacy Data Types

Frontend type

For historical reasons, frontend types are named by the type of modulation used in transmission. The frontend types are given by `fe_type_t` type, defined as:

**fe_type**

<table>
<thead>
<tr>
<th>fe_type</th>
<th>Description</th>
<th>DTV_DELIVERY_SYSTEM equivalent type</th>
</tr>
</thead>
<tbody>
<tr>
<td>FE_QPSK</td>
<td>For DVB-S standard</td>
<td>SYS_DVBS</td>
</tr>
<tr>
<td>FE_QAM</td>
<td>For DVB-C annex A standard</td>
<td>SYS_DVBC_ANNEX_A</td>
</tr>
<tr>
<td>FE_OFDM</td>
<td>For DVB-T standard</td>
<td>SYS_DVBT</td>
</tr>
<tr>
<td>FE_ATSC</td>
<td>For ATSC standard (terrestrial) or for DVB-C Annex B (cable) used in US.</td>
<td>SYS_ATSC (terrestrial) or SYS_DVBC_ANNEX_B (cable)</td>
</tr>
</tbody>
</table>

Newer formats like DVB-S2, ISDB-T, ISDB-S and DVB-T2 are not described at the above, as they’re supported via the new `FE_GET_PROPERTY/FE_GET_SET_PROPERTY` ioctl’s, using the `DTV_DELIVERY_SYSTEM` parameter.
In the old days, struct `dvb_frontend_info` used to contain `fe_type_t` field to indicate the delivery systems, filled with either `FE_QPSK`, `FE_QAM`, `FE_OFDM` or `FE_ATSC`. While this is still filled to keep backward compatibility, the usage of this field is deprecated, as it can report just one delivery system, but some devices support multiple delivery systems. Please use `DTV_ENUM_DELSYS` instead.

On devices that support multiple delivery systems, struct `dvb_frontend_info::fe_type_t` is filled with the currently standard, as selected by the last call to `FE_SET_PROPERTY` using the `DTV_DELIVERY_SYSTEM` property.

**Frontend bandwidth**

### fe_bandwidth

<table>
<thead>
<tr>
<th>ID</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>BANDWIDTH_AUTO</td>
<td>Autodetect bandwidth (if supported)</td>
</tr>
<tr>
<td>BANDWIDTH_1_712_MHZ</td>
<td>1.712 MHz</td>
</tr>
<tr>
<td>BANDWIDTH_5_MHZ</td>
<td>5 MHz</td>
</tr>
<tr>
<td>BANDWIDTH_6_MHZ</td>
<td>6 MHz</td>
</tr>
<tr>
<td>BANDWIDTH_7_MHZ</td>
<td>7 MHz</td>
</tr>
<tr>
<td>BANDWIDTH_8_MHZ</td>
<td>8 MHz</td>
</tr>
<tr>
<td>BANDWIDTH_10_MHZ</td>
<td>10 MHz</td>
</tr>
</tbody>
</table>

**dvb_frontend_parameters**

### frontend parameters

The kind of parameters passed to the frontend device for tuning depend on the kind of hardware you are using.

The struct `dvb_frontend_parameters` uses a union with specific per-system parameters. However, as newer delivery systems required more data, the structure size weren’t enough to fit, and just extending its size would break the existing applications. So, those parameters were replaced by the usage of `FE_GET_PROPERTY/FE_SET_PROPERTY` ioctl’s. The new API is flexible enough to add new parameters to existing delivery systems, and to add newer delivery systems.

So, newer applications should use `FE_GET_PROPERTY/FE_SET_PROPERTY` instead, in order to be able to support the newer System Delivery like DVB-S2, DVB-T2, DVB-C2, ISDB, etc.

All kinds of parameters are combined as a union in the `dvb_frontend_parameters` structure:

```c
struct dvb_frontend_parameters {
    uint32_t frequency; /* (absolute) frequency in Hz for QAM/OFDM */
    /* intermediate frequency in kHz for QPSK */
    fe_spectral_inversion_t inversion;
    union {
```
In the case of QPSK frontends the `frequency` field specifies the intermediate frequency, i.e. the offset which is effectively added to the local oscillator frequency (LOF) of the LNB. The intermediate frequency has to be specified in units of kHz. For QAM and OFDM frontends the frequency specifies the absolute frequency and is given in Hz.

**QPSK parameters**

For satellite QPSK frontends you have to use the `dvb_qpsk_parameters` structure:

```c
struct dvb_qpsk_parameters {
    uint32_t symbol_rate; /* symbol rate in Symbols per second */
    fe_code_rate_t fec_inner; /* forward error correction (see above) */
};
```

**QAM parameters**

For cable QAM frontend you use the `dvb_qam_parameters` structure:

```c
struct dvb_qam_parameters {
    uint32_t symbol_rate; /* symbol rate in Symbols per second */
    fe_code_rate_t fec_inner; /* forward error correction (see above) */
    fe_modulation_t modulation; /* modulation type (see above) */
};
```

**VSB parameters**

ATSC frontends are supported by the `dvb_vsb_parameters` structure:

```c
struct dvb_vsb_parameters {
    fe_modulation_t modulation; /* modulation type (see above) */
};
```

**OFDM parameters**

```c
struct dvb_ofdm_parameters {
    fe_modulation_t modulation; /* modulation type (see above) */
};
```
**OFDM parameters**

DVB-T frontends are supported by the `dvb_ofdm_parameters` structure:

```c
struct dvb_ofdm_parameters {
    fe_bandwidth_t bandwidth;
    fe_code_rate_t code_rate_HP; /* high priority stream code rate */
    fe_code_rate_t code_rate_LP; /* low priority stream code rate */
    fe_modulation_t constellation; /* modulation type (see above) */
    fe_transmit_mode_t transmission_mode;
    fe_guard_interval_t guard_interval;
    fe_hierarchy_t hierarchy_information;
};
```

dvb_frontend_event

**frontend events**

```c
struct dvb_frontend_event {
    fe_status_t status;
    struct dvb_frontend_parameters parameters;
};
```

**Frontend Legacy Function Calls**

Those functions are defined at DVB version 3. The support is kept in the kernel due to compatibility issues only. Their usage is strongly not recommended

**FE_READ_BER**

**Name**

FE_READ_BER

**Attention:** This ioctl is deprecated.

**Synopsis**

**FE_READ_BER**

```c
int ioctl(int fd, FE_READ_BER, uint32_t *ber)
```
**Arguments**

fd  File descriptor returned by open().
ber  The bit error rate is stored into *ber.

**Description**

This ioctl call returns the bit error rate for the signal currently received/demodulated by the front-end. For this command, read-only access to the device is sufficient.

**Return Value**

On success 0 is returned.
On error -1 is returned, and the errno variable is set appropriately.
Generic error codes are described at the *Generic Error Codes* chapter.

**FE_READ_SNR**

**Name**

FE_READ_SNR

Attention: This ioctl is deprecated.

**Synopsis**

FE_READ_SNR

int ioctl(int fd, FE_READ_SNR, int16_t *snr)

**Arguments**

fd  File descriptor returned by open().

snr  The signal-to-noise ratio is stored into *snr.
Description

This ioctl call returns the signal-to-noise ratio for the signal currently received by the front-end. For this command, read-only access to the device is sufficient.

Return Value

On success 0 is returned.
On error -1 is returned, and the \texttt{errno} variable is set appropriately.
Generic error codes are described at the \textit{Generic Error Codes} chapter.

\textbf{FE\_READ\_SIGNAL\_STRENGTH}  

Name

FE\_READ\_SIGNAL\_STRENGTH

\textbf{Attention:} This ioctl is deprecated.

Synopsis

\textbf{FE\_READ\_SIGNAL\_STRENGTH}  

\texttt{int ioctl(int fd, FE\_READ\_SIGNAL\_STRENGTH, uint16\_t *strength)}

Arguments

\texttt{fd} File descriptor returned by \texttt{open()}.  
\texttt{strength} The signal strength value is stored into \(*strength\).

Description

This ioctl call returns the signal strength value for the signal currently received by the front-end. For this command, read-only access to the device is sufficient.
**Return Value**

On success 0 is returned.

On error -1 is returned, and the **errno** variable is set appropriately.

Generic error codes are described at the *Generic Error Codes* chapter.

---

**FE_READ_UNCORRECTED_BLOCKS**

**Name**

FE_READ_UNCORRECTED_BLOCKS

**Attention:** This ioctl is deprecated.

---

**Synopsis**

**FE_READ_UNCORRECTED_BLOCKS**

```c
int ioctl(int fd, FE_READ_UNCORRECTED_BLOCKS, uint32_t *ublocks)
```

**Arguments**

- **fd** File descriptor returned by `open()`.
- **ublocks** The total number of uncorrected blocks seen by the driver so far.

**Description**

This ioctl call returns the number of uncorrected blocks detected by the device driver during its lifetime. For meaningful measurements, the increment in block count during a specific time interval should be calculated. For this command, read-only access to the device is sufficient.

**Return Value**

On success 0 is returned.

On error -1 is returned, and the **errno** variable is set appropriately.

Generic error codes are described at the *Generic Error Codes* chapter.
FE_SET_FRONTEND

Attention: This ioctl is deprecated.

Name

FE_SET_FRONTEND

Synopsis

FE_SET_FRONTEND

int ioctl(int fd, FE_SET_FRONTEND, struct dvb_frontend_parameters *p)

Arguments

fd  File descriptor returned by open().
p  Points to parameters for tuning operation.

Description

This ioctl call starts a tuning operation using specified parameters. The result of this call will be successful if the parameters were valid and the tuning could be initiated. The result of the tuning operation in itself, however, will arrive asynchronously as an event (see documentation for FE_GET_EVENT and FrontendEvent.) If a new FE_SET_FRONTEND operation is initiated before the previous one was completed, the previous operation will be aborted in favor of the new one. This command requires read/write access to the device.

Return Value

On success 0 is returned.
On error -1 is returned, and the errno variable is set appropriately.

EINVAL         Maximum supported symbol rate reached.

Generic error codes are described at the Generic Error Codes chapter.
**FE_GET_FRONTEND**

**Name**

FE_GET_FRONTEND

**Attention:** This ioctl is deprecated.

**Synopsis**

```c
int ioctl(int fd, FE_GET_FRONTEND, struct dvb_frontend_parameters *p)
```

**Arguments**

fd  File descriptor returned by open().

p  Points to parameters for tuning operation.

**Description**

This ioctl call queries the currently effective frontend parameters. For this command, read-only access to the device is sufficient.

**Return Value**

On success 0 is returned.

On error -1 is returned, and the `errno` variable is set appropriately.

| EINVAL | Maximum supported symbol rate reached. |

Generic error codes are described at the *Generic Error Codes* chapter.

**FE_GET_EVENT**

**Name**

FE_GET_EVENT

**Attention:** This ioctl is deprecated.
Synopsis

**FE_GET_EVENT**

```c
int ioctl(int fd, FE_GET_EVENT, struct dvb_frontend_event *ev)
```

**Arguments**

- **fd** File descriptor returned by `open()`.
- **ev** Points to the location where the event, if any, is to be stored.

**Description**

This ioctl call returns a frontend event if available. If an event is not available, the behavior depends on whether the device is in blocking or non-blocking mode. In the latter case, the call fails immediately with `errno` set to `EWOULDBLOCK`. In the former case, the call blocks until an event becomes available.

**Return Value**

On success 0 is returned.

On error -1 is returned, and the `errno` variable is set appropriately.

- `EWOULDBLOCK` | There is no event pending, and the device is in non-blocking mode.
- `EOVERFLOW` | Overflow in event queue - one or more events were lost.

Generic error codes are described at the *Generic Error Codes* chapter.

**FE_DISHNETWORK_SEND_LEGACY_CMD**

**Name**

`FE_DISHNETWORK_SEND_LEGACY_CMD`

**Synopsis**

```c
int ioctl(int fd, FE_DISHNETWORK_SEND_LEGACY_CMD, unsigned long cmd)
```
Arguments

**fd** File descriptor returned by open().

**cmd** Sends the specified raw cmd to the dish via DISEqC.

Description

**Warning:** This is a very obscure legacy command, used only at stv0299 driver. Should not be used on newer drivers.

It provides a non-standard method for selecting DiseqC voltage on the frontend, for Dish Network legacy switches.

As support for this ioctl were added in 2004, this means that such dishes were already legacy in 2004.

Return Value

On success 0 is returned.

On error -1 is returned, and the **errno** variable is set appropriately.

Generic error codes are described at the *Generic Error Codes* chapter.

3.3.7 Examples

In the past, we used to have a set of examples here. However, those examples got out of date and doesn’t even compile nowadays.

Also, nowadays, the best is to use the libdvbv5 DVB API nowadays, with is fully documented. Please refer to the libdvbv5 for updated/recommended examples.

@INVERSION_OFF: Don't do spectral band inversion.
@INVERSION_ON: Do spectral band inversion.
@INVERSION_AUTO: Autodetect spectral band inversion.

This parameter indicates if spectral inversion should be presumed or not. In the automatic setting (``INVERSION_AUTO``) the hardware will try to figure out the correct setting by itself. If the hardware doesn't support, the %dvb_frontend will try to lock at the carrier first with inversion off. If it fails, it will try to enable inversion.

```c
enum fe_spectral_inversion {
    INVERSION_OFF,
    INVERSION_ON,
    INVERSION_AUTO
};
```

```
/**

/**
 * struct dtv_stats - Used for reading a DTV status property
 *
 * @scale:
 * Filled with enum fecap_scale_params - the scale in usage
 * for that parameter
 *
 * @svalue:
 * integer value of the measure, for %FE_SCALE_DECIBEL,
 * used for dB measures. The unit is 0.001 dB.
 *
 * @uvalue:
 * unsigned integer value of the measure, used when @scale is
 * either %FE_SCALE_RELATIVE or %FE_SCALE_COUNTER.
 *
 * For most delivery systems, this will return a single value for each
It should be noticed, however, that new OFDM delivery systems like ISDB can use different modulation types for each group of carriers. On such standards, up to 8 groups of statistics can be provided, one for each carrier group (called "layer" on ISDB).

In order to be consistent with other delivery systems, the first value refers to the entire set of carriers ("global").

@scale should use the value %FE_SCALE_NOT_AVAILABLE when the value for the entire group of carriers or from one specific layer is not provided by the hardware.

@len should be filled with the latest filled status + 1.

In other words, for ISDB, those values should be filled like:

```c
  u.st.stat.svalue[0] = global statistics;
  u.st.stat.scale[0] = FE_SCALE_DECIBEL;
  u.st.stat.value[1] = layer A statistics;
  u.st.stat.scale[1] = FE_SCALE_NOT_AVAILABLE (if not available);
  u.st.stat.scale[2] = FE_SCALE_DECIBEL;
  u.st.stat.svalue[3] = layer C statistics;
  u.st.stat.scale[3] = FE_SCALE_DECIBEL;
  u.st.len = 4;
```

```c
struct dtv_stats {
    __u8 scale; /* enum fecap_scale_params type */
    union {
        __u64 uvalue; /* for counters and relative scales */
        __s64 svalue; /* for 0.001 dB measures */
    }
} __attribute__((packed));
```

#define MAX_DTV_STATS 4

/**
 * struct dtv_fe_stats - store Digital TV frontend statistics
 *
 * @len: length of the statistics - if zero, stats is disabled.
 * @stat: array with digital TV statistics.
 *
 * On most standards, @len can either be 0 or 1. However, for ISDB, each
 * layer is modulated in separate. So, each layer may have its own set
 * of statistics. If so, stat[0] carries on a global value for the property.
 * Indexes 1 to 3 means layer A to B.

3.3.9 Revision and Copyright

Authors:

- J. K. Metzler, Ralph <rjkm@metzlerbros.de>
  - Original author of the Digital TV API documentation.
- O. C. Metzler, Marcus <rjkm@metzlerbros.de>
  - Original author of the Digital TV API documentation.
- Carvalho Chehab, Mauro <mchehab+samsung@kernel.org>
3.3.10 Revision History

**revision 2.2.0** / 2017-09-01 (*mcc*)
Most gaps between the uAPI document and the Kernel implementation got fixed for the non-legacy API.

**revision 2.1.0** / 2015-05-29 (*mcc*)
DocBook improvements and cleanups, in order to document the system calls on a more standard way and provide more description about the current Digital TV API.

**revision 2.0.4** / 2011-05-06 (*mcc*)
Add more information about DVBv5 API, better describing the frontend GET/SET props ioctl’s.

**revision 2.0.3** / 2010-07-03 (*mcc*)
Add some frontend capabilities flags, present on kernel, but missing at the specs.

**revision 2.0.2** / 2009-10-25 (*mcc*)
documents FE_SET_FRONTEND_TUNE_MODE and FE_DISHETWORK_SEND_LEGACY_CMD ioctl’s.

**revision 2.0.1** / 2009-09-16 (*mcc*)
Added ISDB-T test originally written by Patrick Boettcher

**revision 2.0.0** / 2009-09-06 (*mcc*)
Conversion from LaTex to DocBook XML. The contents is the same as the original LaTex version.

**revision 1.0.0** / 2003-07-24 (*rjkm*)
Initial revision on LaTEX.

3.4 Part III - Remote Controller API

3.4.1 Introduction

Currently, most analog and digital devices have an Infrared input for remote controllers. Each manufacturer has their own type of control. It is not rare for the same manufacturer to ship different types of controls, depending on the device.

A Remote Controller interface is mapped as a normal evdev/input interface, just like a keyboard or a mouse. So, it uses all ioctl’s already defined for any other input devices.

However, remote controllers are more flexible than a normal input device, as the IR receiver (and/or transmitter) can be used in conjunction with a wide variety of different IR remotes.

In order to allow flexibility, the Remote Controller subsystem allows controlling the RC-specific attributes via *the sysfs class nodes*. 

3.4. Part III - Remote Controller API 1465
3.4.2 Remote Controller’s sysfs nodes

As defined at Documentation/ABI/testing/sysfs-class-rc, those are the sysfs nodes that control the Remote Controllers:

3.4.2.1 /sys/class/rc/

The /sys/class/rc/ class sub-directory belongs to the Remote Controller core and provides a sysfs interface for configuring infrared remote controller receivers.

3.4.2.2 /sys/class/rc/rcN/

A /sys/class/rc/rcN directory is created for each remote control receiver device where N is the number of the receiver.

3.4.2.3 /sys/class/rc/rcN/protocols

Reading this file returns a list of available protocols, something like:

| rc5  | [rc6] nec jvc  | [sony] |

Enabled protocols are shown in [] brackets.
Writing “+proto” will add a protocol to the list of enabled protocols.
Writing “-proto” will remove a protocol from the list of enabled protocols.
Writing “proto” will enable only “proto”.
Writing “none” will disable all protocols.
Write fails with EINVAL if an invalid protocol combination or unknown protocol name is used.

3.4.2.4 /sys/class/rc/rcN/filter

Sets the scancode filter expected value.
Use in combination with /sys/class/rc/rcN/filter_mask to set the expected value of the bits set in the filter mask. If the hardware supports it then scancodes which do not match the filter will be ignored. Otherwise the write will fail with an error.
This value may be reset to 0 if the current protocol is altered.
3.4.2.5 /sys/class/rc/rcN/filter_mask

Sets the scancode filter mask of bits to compare. Use in combination with /sys/class/rc/rcN/filter to set the bits of the scancode which should be compared against the expected value. A value of 0 disables the filter to allow all valid scancodes to be processed.

If the hardware supports it then scancodes which do not match the filter will be ignored. Otherwise the write will fail with an error.

This value may be reset to 0 if the current protocol is altered.

3.4.2.6 /sys/class/rc/rcN/wakeup_protocols

Reading this file returns a list of available protocols to use for the wakeup filter, something like:

```
rc-5  nec  nec-x  rc-6-0  rc-6-6a-24  [rc-6-6a-32]  rc-6-mce
```

Note that protocol variants are listed, so nec, sony, rc-5, rc-6 have their different bit length encodings listed if available.

Note that all protocol variants are listed.

The enabled wakeup protocol is shown in [ ] brackets.

Only one protocol can be selected at a time.

Writing “proto” will use “proto” for wakeup events.

Writing “none” will disable wakeup.

Write fails with EINVAL if an invalid protocol combination or unknown protocol name is used, or if wakeup is not supported by the hardware.

3.4.2.7 /sys/class/rc/rcN/wakeup_filter

Sets the scancode wakeup filter expected value. Use in combination with /sys/class/rc/rcN/wakeup_filter_mask to set the expected value of the bits set in the wakeup filter mask to trigger a system wake event.

If the hardware supports it and wakeup_filter_mask is not 0 then scancodes which match the filter will wake the system from e.g. suspend to RAM or power off. Otherwise the write will fail with an error.

This value may be reset to 0 if the wakeup protocol is altered.

3.4.2.8 /sys/class/rc/rcN/wakeup_filter_mask

Sets the scancode wakeup filter mask of bits to compare. Use in combination with /sys/class/rc/rcN/wakeup_filter to set the bits of the scancode which should be compared against the expected value to trigger a system wake event.

If the hardware supports it and wakeup_filter_mask is not 0 then scancodes which match the filter will wake the system from e.g. suspend to RAM or power off. Otherwise the write will fail with an error.

This value may be reset to 0 if the wakeup protocol is altered.
3.4.3 Remote Controller Protocols and Scancodes

IR is encoded as a series of pulses and spaces, using a protocol. These protocols can encode e.g. an address (which device should respond) and a command: what it should do. The values for these are not always consistent across different devices for a given protocol.

Therefore out the output of the IR decoder is a scancode; a single u32 value. Using keymap tables this can be mapped to linux key codes.

Other things can be encoded too. Some IR protocols encode a toggle bit; this is to distinguish whether the same button is being held down, or has been released and pressed again. If has been released and pressed again, the toggle bit will invert from one IR message to the next.

Some remotes have a pointer-type device which can used to control the mouse; some air conditioning systems can have their target temperature target set in IR.

The following are the protocols the kernel knows about and also lists how scan codes are encoded for each protocol.

3.4.3.1 rc-5 (RC_PROTO_RC5)

This IR protocol uses manchester encoding to encode 14 bits. There is a detailed description here https://www.sbprojects.net/knowledge/ir/rc5.php.

The scancode encoding is not consistent with the lirc daemon (lircd) rc5 protocol, or the manchester BPF decoder.

<table>
<thead>
<tr>
<th>rc-5 bit</th>
<th>scancode bit</th>
<th>description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>none</td>
<td>Start bit, always set</td>
</tr>
<tr>
<td>1</td>
<td>6 (inverted)</td>
<td>2nd start bit in rc5, re-used as 6th command bit</td>
</tr>
<tr>
<td>1</td>
<td>none</td>
<td>Toggle bit</td>
</tr>
<tr>
<td>5</td>
<td>8 to 13</td>
<td>Address</td>
</tr>
<tr>
<td>6</td>
<td>0 to 5</td>
<td>Command</td>
</tr>
</tbody>
</table>

There is a variant of rc5 called either rc5x or extended rc5 where there the second stop bit is the 6th command bit, but inverted. This is done so it the scan codes and encoding is compatible with existing schemes. This bit is stored in bit 6 of the scancode, inverted. This is done to keep it compatible with plain rc-5 where there are two start bits.

3.4.3.2 rc-5-sz (RC_PROTO_RC5_SZ)

This is much like rc-5 but one bit longer. The scancode is encoded differently.

<table>
<thead>
<tr>
<th>rc-5-sz bits</th>
<th>scancode bit</th>
<th>description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>none</td>
<td>Start bit, always set</td>
</tr>
<tr>
<td>1</td>
<td>T3</td>
<td>Address</td>
</tr>
<tr>
<td>1</td>
<td>none</td>
<td>Toggle bit</td>
</tr>
<tr>
<td>6</td>
<td>6 to 11</td>
<td>Address</td>
</tr>
<tr>
<td>6</td>
<td>0 to 5</td>
<td>Command</td>
</tr>
</tbody>
</table>
### 3.4.3.3 rc-5x-20 (RC_PROTO_RC5X_20)

This rc-5 extended to encoded 20 bits. The is a 3555 microseconds space after the 8th bit.

<table>
<thead>
<tr>
<th>rc-5-sz bits</th>
<th>scancode bit</th>
<th>description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>none</td>
<td>Start bit, always set</td>
</tr>
<tr>
<td>1</td>
<td>14</td>
<td>Address bit</td>
</tr>
<tr>
<td>1</td>
<td>none</td>
<td>Toggle bit</td>
</tr>
<tr>
<td>5</td>
<td>16 to 20</td>
<td>Address</td>
</tr>
<tr>
<td>6</td>
<td>8 to 13</td>
<td>Address</td>
</tr>
<tr>
<td>6</td>
<td>0 to 5</td>
<td>Command</td>
</tr>
</tbody>
</table>

### 3.4.3.4 jvc (RC_PROTO_JVC)

The jvc protocol is much like nec, without the inverted values. It is described here https://www.sbprojects.net/knowledge/ir/jvc.php.

The scancode is a 16 bits value, where the address is the lower 8 bits and the command the higher 8 bits; this is reversed from IR order.

### 3.4.3.5 sony-12 (RC_PROTO_SONY12)

The sony protocol is a pulse-width encoding. There are three variants, which just differ in number of bits and scancode encoding.

<table>
<thead>
<tr>
<th>sony-12 bits</th>
<th>scancode bit</th>
<th>description</th>
</tr>
</thead>
<tbody>
<tr>
<td>5</td>
<td>16 to 20</td>
<td>device</td>
</tr>
<tr>
<td>7</td>
<td>0 to 6</td>
<td>function</td>
</tr>
</tbody>
</table>

### 3.4.3.6 sony-15 (RC_PROTO_SONY15)

The sony protocol is a pulse-width encoding. There are three variants, which just differ in number of bits and scancode encoding.

<table>
<thead>
<tr>
<th>sony-12 bits</th>
<th>scancode bit</th>
<th>description</th>
</tr>
</thead>
<tbody>
<tr>
<td>8</td>
<td>16 to 23</td>
<td>device</td>
</tr>
<tr>
<td>7</td>
<td>0 to 6</td>
<td>function</td>
</tr>
</tbody>
</table>
### 3.4.3.7 sony-20 (RC_PROTO_SONY20)

The sony protocol is a pulse-width encoding. There are three variants, which just differ in number of bits and scancode encoding.

<table>
<thead>
<tr>
<th>sony-20 bits</th>
<th>scancode bit</th>
<th>description</th>
</tr>
</thead>
<tbody>
<tr>
<td>5</td>
<td>16 to 20</td>
<td>device</td>
</tr>
<tr>
<td>7</td>
<td>0 to 7</td>
<td>device</td>
</tr>
<tr>
<td>8</td>
<td>8 to 15</td>
<td>extended bits</td>
</tr>
</tbody>
</table>

### 3.4.3.8 nec (RC_PROTO_NEC)

The nec protocol encodes an 8 bit address and an 8 bit command. It is described here [https://www.sbprojects.net/knowledge/ir/nec.php](https://www.sbprojects.net/knowledge/ir/nec.php). Note that the protocol sends least significant bit first.

As a check, the nec protocol sends the address and command twice; the second time it is inverted. This is done for verification.

A plain nec IR message has 16 bits; the high 8 bits are the address and the low 8 bits are the command.

### 3.4.3.9 nec-x (RC_PROTO_NECX)

Extended nec has a 16 bit address and a 8 bit command. This is encoded as a 24 bit value as you would expect, with the lower 8 bits the command and the upper 16 bits the address.

### 3.4.3.10 nec-32 (RC_PROTO_NEC32)

nec-32 does not send an inverted address or an inverted command; the entire message, all 32 bits, are used.

For this to be decoded correctly, the second 8 bits must not be the inverted value of the first, and also the last 8 bits must not be the inverted value of the third 8 bit value.

The scancode has a somewhat unusual encoding.

<table>
<thead>
<tr>
<th>nec-32 bits</th>
<th>scancode bit</th>
</tr>
</thead>
<tbody>
<tr>
<td>First 8 bits</td>
<td>16 to 23</td>
</tr>
<tr>
<td>Second 8 bits</td>
<td>24 to 31</td>
</tr>
<tr>
<td>Third 8 bits</td>
<td>0 to 7</td>
</tr>
<tr>
<td>Fourth 8 bits</td>
<td>8 to 15</td>
</tr>
</tbody>
</table>
3.4.3.11 sanyo (RC_PROTO_SANYO)

The sanyo protocol is like the nec protocol, but with 13 bits address rather than 8 bits. Both the address and the command are followed by their inverted versions, but these are not present in the scan codes.

Bis 8 to 20 of the scan code is the 13 bits address, and the lower 8 bits are the command.

3.4.3.12 mcir2-kbd (RC_PROTO_MCIR2_KBD)

This protocol is generated by the Microsoft MCE keyboard for keyboard events. Refer to the ir-mce_kbd-decoder.c to see how it is encoded.

3.4.3.13 mcir2-mse (RC_PROTO_MCIR2_MSE)

This protocol is generated by the Microsoft MCE keyboard for pointer events. Refer to the ir-mce_kbd-decoder.c to see how it is encoded.

3.4.3.14 rc-6-0 (RC_PROTO_RC6_0)

This is the rc-6 in mode 0. rc-6 is described here https://www.sbprojects.net/knowledge/ir/rc6.php. The scan code is the exact 16 bits as in the protocol. There is also a toggle bit.

3.4.3.15 rc-6-6a-20 (RC_PROTO_RC6_6A_20)

This is the rc-6 in mode 6a, 20 bits. rc-6 is described here https://www.sbprojects.net/knowledge/ir/rc6.php. The scan code is the exact 20 bits as in the protocol. There is also a toggle bit.

3.4.3.16 rc-6-6a-24 (RC_PROTO_RC6_6A_24)

This is the rc-6 in mode 6a, 24 bits. rc-6 is described here https://www.sbprojects.net/knowledge/ir/rc6.php. The scan code is the exact 24 bits as in the protocol. There is also a toggle bit.

3.4.3.17 rc-6-6a-32 (RC_PROTO_RC6_6A_32)

This is the rc-6 in mode 6a, 32 bits. rc-6 is described here https://www.sbprojects.net/knowledge/ir/rc6.php. The upper 16 bits are the vendor, and the lower 16 bits are the vendor-specific bits. This protocol is for the non-Microsoft MCE variant (vendor != 0x800f).
3.4.3.18 rc-6-mce (RC_PROTO_RC6_MCE)

This is the rc-6 in mode 6a, 32 bits. The upper 16 bits are the vendor, and the lower 16 bits are the vendor-specific bits. This protocol is for the Microsoft MCE variant (vendor = 0x800f). The toggle bit in the protocol itself is ignored, and the 16th bit should be takes as the toggle bit.

3.4.3.19 sharp (RC_PROTO_SHARP)

This is a protocol used by Sharp VCRs, is described here https://www.sbprojects.net/knowledge/ir/sharp.php. There is a very long (40ms) space between the normal and inverted values, and some IR receivers cannot decode this.

There is a 5 bit address and a 8 bit command. In the scancode the address is in bits 8 to 12, and the command in bits 0 to 7.

3.4.3.20 xmp (RC_PROTO_XMP)

This protocol has several versions and only version 1 is supported. Refer to the decoder (ir-xmp-decoder.c) to see how it is encoded.

3.4.3.21 cec (RC_PROTO_CEC)

This is not an IR protocol, this is a protocol over CEC. The CEC infrastructure uses rc-core for handling CEC commands, so that they can easily be remapped.

3.4.3.22 imon (RC_PROTO_IMON)

This protocol is used by Antec Veris/SoundGraph iMON remotes.

The protocol describes both button presses and pointer movements. The protocol encodes 31 bits, and the scancode is simply the 31 bits with the top bit always 0.

3.4.3.23 rc-mm-12 (RC_PROTO_RCMM12)

The rc-mm protocol is described here https://www.sbprojects.net/knowledge/ir/rcmm.php. The scancode is simply the 12 bits.

3.4.3.24 rc-mm-24 (RC_PROTO_RCMM24)

The rc-mm protocol is described here https://www.sbprojects.net/knowledge/ir/rcmm.php. The scancode is simply the 24 bits.
3.4.3.25 rc-mm-32 (RC_PROTO_RCM32)

The rc-mm protocol is described here https://www.sbprojects.net/knowledge/ir/rcmm.php. The
scan code is simply the 32 bits.

3.4.3.26 xbox-dvd (RC_PROTO_XBOX_DVD)

This protocol is used by XBox DVD Remote, which was made for the original XBox. There is no
in-kernel decoder or encoder for this protocol. The usb device decodes the protocol. There is
a BPF decoder available in v4l-utils.

3.4.4 Remote controller tables

Unfortunately, for several years, there was no effort to create uniform IR keycodes for different
devices. This caused the same IR keyname to be mapped completely differently on different IR
devices. This resulted that the same IR keyname to be mapped completely different on different
IR’s. Due to that, V4L2 API now specifies a standard for mapping Media keys on IR.

This standard should be used by both V4L/DVB drivers and userspace applications

The modules register the remote as keyboard within the linux input layer. This means that the
IR key strokes will look like normal keyboard key strokes (if CONFIG_INPUT_KEYBOARD is
enabled). Using the event devices (CONFIG_INPUT_EVDEV) it is possible for applications to
access the remote via /dev/input/event devices.

**Navigation keys**

| KEY_ESC        | Cancel current operation             | CANCEL / BACK                                 |
| KEY_HELP       | Open a Help window                   | HELP                                          |
| KEY_HOMEPAGE   | Navigate to Home page                | HOME                                          |
| KEY_INFO       | Open On Screen Display               | DISPLAY INFORMATION / OSD                     |
| KEY_WWW        | Open the default browser             | WEB                                           |
| KEY_UP         | Up key                               | UP                                            |
| KEY_DOWN       | Down key                             | DOWN                                          |
| KEY_LEFT       | Left key                             | LEFT                                          |
| KEY_RIGHT      | Right key                            | RIGHT                                         |

**Miscellaneous keys**

| KEY_DOT        | Return a dot                         | .                                             |
| KEY_FN         | Select a function                    | FUNCTION                                      |

It should be noted that, sometimes, there some fundamental missing keys at some cheaper IR’s. Due to that, it is recommended to:

Table 253: Notes

| On simpler IR’s, without separate channel keys, you need to map UP as KEY_CHANNELUP |
| On simpler IR’s, without separate channel keys, you need to map DOWN as KEY_CHANNELDOWN |
| On simpler IR’s, without separate volume keys, you need to map LEFT as KEY_VOLUMEDOWN |
| On simpler IR’s, without separate volume keys, you need to map RIGHT as KEY_VOLUMEUP |

### 3.4.5 Changing default Remote Controller mappings

The event interface provides two ioctls to be used against the /dev/input/event device, to allow changing the default keymapping.

This program demonstrates how to replace the keymap tables.

#### 3.4.5.1 file: uapi/v4l/keytable.c

```c

# 3.4.6 LIRC Device Interface

## 3.4.6.1 Introduction

LIRC stands for Linux Infrared Remote Control. The LIRC device interface is a bi-directional interface for transporting raw IR and decoded scancodes data between userspace and kernelspace. Fundamentally, it is just a chardev (/dev/lircX, for X = 0, 1, 2, ….), with a number of standard struct file_operations defined on it. With respect to transporting raw IR and decoded scancodes to and fro, the essential fops are read, write and ioctl.

It is also possible to attach a BPF program to a LIRC device for decoding raw IR into scancodes.

Example dmesg output upon a driver registering w/LIRC:

```
$ dmesg |grep lirc_dev
rc rc0: lirc_dev: driver mceusb registered at minor = 0, raw IR receiver, raw IR transmitter
```

What you should see for a chardev:

```
$ ls -l /dev/lirc*
crw-rw---- 1 root root 248, 0 Jul 2 22:20 /dev/lirc0
```

Note that the package `v4l-utils` contains tools for working with LIRC devices:

- **ir-ctl**: can receive raw IR and transmit IR, as well as query LIRC device features.
- **ir-keytable**: can load keymaps; allows you to set IR kernel protocols; load BPF IR decoders and test IR decoding. Some BPF IR decoders are also provided.

## 3.4.6.2 LIRC modes

LIRC supports some modes of receiving and sending IR codes, as shown on the following table.

**LIRC_MODE_SCANCODE**

This mode is for both sending and receiving IR.

For transmitting (aka sending), create a struct lirc_scancode with the desired scancode set in the scancode member, rc_proto set to the IR protocol, and all other members set to 0. Write this struct to the lirc device.

For receiving, you read struct lirc_scancode from the LIRC device. The scancode field is set to the received scancode and the IR protocol is set in rc_proto. If the scancode maps to a valid key code, this is set in the keycode field, else it is set to KEY_RESERVED.

The flags can have LIRC_SCANCODE_FLAG_TOGGLE set if the toggle bit is set in protocols that support it (e.g. rc-5 and rc-6), or LIRC_SCANCODE_FLAG_REPEAT for when a repeat is received for protocols that support it (e.g. nec).

In the Sanyo and NEC protocol, if you hold a button on remote, rather than repeating the entire scancode, the remote sends a shorter message with no scancode, which just means button is held, a “repeat”. When this is received, the LIRC_SCANCODE_FLAG_REPEAT is set and the scancode and keycode is repeated.

With nec, there is no way to distinguish “button hold” from “repeatedly pressing the same button”. The rc-5 and rc-6 protocols have a toggle bit. When a button
is released and pressed again, the toggle bit is inverted. If the toggle bit is set, the \texttt{LIRC_SCANCODE_FLAG_TOGGLE} is set.

The \texttt{timestamp} field is filled with the time nanoseconds (in \texttt{CLOCK_MONOTONIC}) when the scancode was decoded.

\textbf{LIRC_MODE_MODE2}

The driver returns a sequence of pulse and space codes to userspace, as a series of u32 values.

This mode is used only for IR receive.

The upper 8 bits determine the packet type, and the lower 24 bits the payload. Use \texttt{LIRC_VALUE()} macro to get the payload, and the macro \texttt{LIRC_MODE2()} will give you the type, which is one of:

\begin{enumerate}
  \item \texttt{LIRC_MODE2_PULSE}
    \begin{itemize}
      \item Signifies the presence of IR in microseconds.
    \end{itemize}
  \item \texttt{LIRC_MODE2_SPACE}
    \begin{itemize}
      \item Signifies absence of IR in microseconds.
    \end{itemize}
  \item \texttt{LIRC_MODE2_FREQUENCY}
    \begin{itemize}
      \item If measurement of the carrier frequency was enabled with \texttt{ioctl LIRC_SET_MEASURE_CARRIER_MODE} then this packet gives you the carrier frequency in Hertz.
    \end{itemize}
  \item \texttt{LIRC_MODE2_TIMEOUT}
    \begin{itemize}
      \item If timeout reports are enabled with \texttt{ioctl LIRC_SET_REC_TIMEOUT_REPORTS}, when the timeout set with \texttt{ioctl LIRC_GET_REC_TIMEOUT} and \texttt{LIRC_SET_REC_TIMEOUT} expires due to no IR being detected, this packet will be sent, with the number of microseconds with no IR.
    \end{itemize}
\end{enumerate}

\texttt{LIRC_MODE_PULSE}

In pulse mode, a sequence of pulse/space integer values are written to the lirc device using \texttt{LIRC write()}.

The values are alternating pulse and space lengths, in microseconds. The first and last entry must be a pulse, so there must be an odd number of entries.

This mode is used only for IR send.

\subsection*{3.4.6.3 Data types used by \texttt{LIRC_MODE_SCANCODE}}

\begin{verbatim}
struct lirc_scancode
  decoded scancode with protocol for use with LIRC_MODE_SCANCODE

Definition

struct lirc_scancode {
  __u64 timestamp;
  __u16 flags;
  __u16 rc_proto;
  __u32 keycode;
}
\end{verbatim}
Members

timestamp Timestamp in nanoseconds using CLOCK_MONOTONIC when IR was decoded.

flags should be 0 for transmit. When receiving scan codes, LIRC_SCANCODE_FLAG_TOGGLE or LIRC_SCANCODE_FLAG_REPEAT can be set depending on the protocol

rc_proto see enum rc_proto

 keycode the translated keycode. Set to 0 for transmit.

scancode the scan code received or to be sent

enum rc_proto
  the Remote Controller protocol

Constants

RC_PROTO_UNKNOWN Protocol not known
RC_PROTO_OTHER Protocol known but proprietary
RC_PROTO_RC5 Philips RC5 protocol
RC_PROTO_RC5X_20 Philips RC5x 20 bit protocol
RC_PROTO_RC5_SZ StreamZap variant of RC5
RC_PROTO_JVC JVC protocol
RC_PROTO_SONY12 Sony 12 bit protocol
RC_PROTO_SONY15 Sony 15 bit protocol
RC_PROTO_SONY20 Sony 20 bit protocol
RC_PROTO_NEC NEC protocol
RC_PROTO_NECX Extended NEC protocol
RC_PROTO_NEC32 NEC 32 bit protocol
RC_PROTO_SANYO Sanyo protocol
RC_PROTO_MCIR2_KBD RC6-ish MCE keyboard
RC_PROTO_MCIR2_MSE RC6-ish MCE mouse
RC_PROTO_RC6_0 Philips RC6-0-16 protocol
RC_PROTO_RC6_6A_20 Philips RC6-6A-20 protocol
RC_PROTO_RC6_6A_24 Philips RC6-6A-24 protocol
RC_PROTO_RC6_6A_32 Philips RC6-6A-32 protocol
RC_PROTO_RC6_MCE MCE (Philips RC6-6A-32 subtype) protocol
RC_PROTO_SHARP Sharp protocol
RC_PROTO_XMP XMP protocol
RC_PROTO_CEC CEC protocol
**3.4.6.4 BPF based IR decoder**

The kernel has support for decoding the most common IR protocols, but there are many protocols which are not supported. To support these, it is possible to load an BPF program which does the decoding. This can only be done on LIRC devices which support reading raw IR.

First, using the `bpf(2)` syscall with the BPF_LOAD_PROG argument, program must be loaded of type BPF_PROG_TYPE_LIRC_MODE2. Once attached to the LIRC device, this program will be called for each pulse, space or timeout event on the LIRC device. The context for the BPF program is a pointer to an unsigned int, which is a LIRC_MODE_MODE2 value. When the program has decoded the scancode, it can be submitted using the BPF functions `bpf_rc_keydown()` or `bpf_rc_repeat()`. Mouse or pointer movements can be reported using `bpf_rc_pointer_rel()`.

Once you have the file descriptor for the BPF_PROG_TYPE_LIRC_MODE2 BPF program, it can be attached to the LIRC device using the `bpf(2)` syscall. The target must be the file descriptor for the LIRC device, and the attach type must be BPF_LIRC_MODE2. No more than 64 BPF programs can be attached to a single LIRC device at a time.

**3.4.6.5 LIRC Function Reference**

**LIRC read()**

**Name**

lirc-read - Read from a LIRC device

**Synopsis**

```c
#include <unistd.h>

ssize_t read(int fd, void *buf, size_t count)
```

**Example**

Read data from a LIRC device.
Arguments

**fd** File descriptor returned by `open()`.

**buf** Buffer to be filled

**count** Max number of bytes to read

Description

`read()` attempts to read up to `count` bytes from file descriptor `fd` into the buffer starting at `buf`. If `count` is zero, `read()` returns zero and has no other results. If `count` is greater than `SSIZE_MAX`, the result is unspecified.

The exact format of the data depends on what `LIRC modes` a driver uses. Use `ioctl LIRC_GET_FEATURES` to get the supported mode, and use `ioctl LIRC_GET_REC_MODE` and `LIRC_SET_REC_MODE` set the current active mode.

The mode `LIRC_MODE_MODE2` is for raw IR, in which packets containing an unsigned int value describing an IR signal are read from the chardev.

Alternatively, `LIRC_MODE_SCANCODE` can be available, in this mode scancodes which are either decoded by software decoders, or by hardware decoders. The `rc_proto` member is set to the `IR protocol` used for transmission, and `scancode` to the decoded scancode, and the `keycode` set to the keycode or `KEY_RESERVED`.

Return Value

On success, the number of bytes read is returned. It is not an error if this number is smaller than the number of bytes requested, or the amount of data required for one frame. On error, -1 is returned, and the `errno` variable is set appropriately.

**LIRC write()**

Name

lirc-write - Write to a LIRC device

Synopsis

```c
#include <unistd.h>

ssize_t write(int fd, void *buf, size_t count)
```

1484 Chapter 3. Linux Media Infrastructure userspace API
Arguments

fd  File descriptor returned by open().
buf  Buffer with data to be written
count  Number of bytes at the buffer

Description

write() writes up to count bytes to the device referenced by the file descriptor fd from the buffer starting at buf.

The exact format of the data depends on what mode a driver is in, use ioctl LIRC_GET_FEATURES to get the supported modes and use ioctls LIRC_GET_SEND_MODE and LIRC_SET_SEND_MODE set the mode.

When in LIRC_MODE_PULSE mode, the data written to the chardev is a pulse/space sequence of integer values. Pulses and spaces are only marked implicitly by their position. The data must start and end with a pulse, therefore, the data must always include an uneven number of samples. The write function blocks until the data has been transmitted by the hardware. If more data is provided than the hardware can send, the driver returns EINVAL.

When in LIRC_MODE_SCANCODE mode, one struct lirc_scancode must be written to the chardev at a time, else EINVAL is returned. Set the desired scancode in the scancode member, and the IR protocol in the rc_proto member. All other members must be set to 0, else EINVAL is returned. If there is no protocol encoder for the protocol or the scancode is not valid for the specified protocol, EINVAL is returned. The write function blocks until the scancode is transmitted by the hardware.

Return Value

On success, the number of bytes written is returned. It is not an error if this number is smaller than the number of bytes requested, or the amount of data required for one frame. On error, -1 is returned, and the errno variable is set appropriately. The generic error codes are described at the Generic Error Codes chapter.

ioctl LIRC_GET_FEATURES

Name

LIRC_GET_FEATURES - Get the underlying hardware device’s features
Synopsis

LIRC_GET_FEATURES

int ioctl(int fd, LIRC_GET_FEATURES, __u32 *features)

Arguments

fd File descriptor returned by open().

features Bitmask with the LIRC features.

Description

Get the underlying hardware device’s features. If a driver does not announce support of certain features, calling of the corresponding ioctls is undefined.

LIRC features

LIRC_CAN_REC_RAW

Unused. Kept just to avoid breaking uAPI.

LIRC_CAN_REC_PULSE

Unused. Kept just to avoid breaking uAPI. LIRC_MODE_PULSE can only be used for transmitting.

LIRC_CAN_REC_MODE2

This is raw IR driver for receiving. This means that LIRC_MODE_MODE2 is used. This also implies that LIRC_MODE_SCANCODE is also supported, as long as the kernel is recent enough. Use the ioctls LIRC_GET_REC_MODE and LIRC_SET_REC_MODE to switch modes.

LIRC_CAN_REC_LIRCCODE

Unused. Kept just to avoid breaking uAPI.

LIRC_CAN_REC_SCANCODE

This is a scancode driver for receiving. This means that LIRC_MODE_SCANCODE is used.

LIRC_CAN_SET_SEND_CARRIER

The driver supports changing the modulation frequency via ioctl LIRC_SET_SEND_CARRIER.

LIRC_CAN_SET_SEND_DUTY_CYCLE

The driver supports changing the duty cycle using ioctl LIRC_SET_SEND_DUTY_CYCLE.

LIRC_CAN_SET_TRANSMITTER_MASK
The driver supports changing the active transmitter(s) using \texttt{ioctl LIRC\_SET\_TRANSMITTER\_MASK}.

\textbf{LIRC\_CAN\_SET\_REC\_CARRIER}

The driver supports setting the receive carrier frequency using \texttt{ioctl LIRC\_SET\_REC\_CARRIER}.

\textbf{LIRC\_CAN\_SET\_REC\_DUTY\_CYCLE\_RANGE}

Unused. Kept just to avoid breaking uAPI.

\textbf{LIRC\_CAN\_SET\_REC\_CARRIER\_RANGE}

The driver supports \texttt{ioctl LIRC\_SET\_REC\_CARRIER\_RANGE}.

\textbf{LIRC\_CAN\_GET\_REC\_RESOLUTION}

The driver supports \texttt{ioctl LIRC\_GET\_REC\_RESOLUTION}.

\textbf{LIRC\_CAN\_SET\_REC\_TIMEOUT}

The driver supports \texttt{ioctl LIRC\_SET\_REC\_TIMEOUT}.

\textbf{LIRC\_CAN\_SET\_REC\_FILTER}

Unused. Kept just to avoid breaking uAPI.

\textbf{LIRC\_CAN\_MEASURE\_CARRIER}

The driver supports measuring of the modulation frequency using \texttt{ioctl LIRC\_SET\_MEASURE\_CARRIER\_MODE}.

\textbf{LIRC\_CAN\_USE\_WIDEBAND\_RECEIVER}

The driver supports learning mode using \texttt{ioctl LIRC\_SET\_WIDEBAND\_RECEIVER}.

\textbf{LIRC\_CAN\_NOTIFY\_DECODE}

Unused. Kept just to avoid breaking uAPI.

\textbf{LIRC\_CAN\_SEND\_RAW}

Unused. Kept just to avoid breaking uAPI.

\textbf{LIRC\_CAN\_SEND\_PULSE}

The driver supports sending (also called as IR blasting or IR TX) using \texttt{LIRC\_MODE\_PULSE}. This implies that \texttt{LIRC\_MODE\_SCANCODE} is also supported for transmit, as long as the kernel is recent enough. Use the \texttt{ioctl LIRC\_GET\_SEND\_MODE and LIRC\_SET\_SEND\_MODE} to switch modes.

\textbf{LIRC\_CAN\_SEND\_MODE2}

Unused. Kept just to avoid breaking uAPI. \texttt{LIRC\_MODE\_MODE2} can only be used for receiving.

\textbf{LIRC\_CAN\_SEND\_LIRCCODE}

Unused. Kept just to avoid breaking uAPI.
Return Value

On success 0 is returned, on error -1 and the errno variable is set appropriately. The generic error codes are described at the *Generic Error Codes* chapter.

**ioctl** **LIRC_GET_SEND_MODE** and **LIRC_SET_SEND_MODE**

Name

**LIRC_GET_SEND_MODE/LIRC_SET_SEND_MODE** - Get/set current transmit mode.

Synopsis

**LIRC_GET_SEND_MODE**

```c
int ioctl(int fd, LIRC_GET_SEND_MODE, __u32 *mode)
```

**LIRC_SET_SEND_MODE**

```c
int ioctl(int fd, LIRC_SET_SEND_MODE, __u32 *mode)
```

Arguments

*fd* File descriptor returned by open().

*mode* The mode used for transmitting.

Description

Get/set current transmit mode.

Only **LIRC_MODE_PULSE** and **LIRC_MODE_SCANCODE** are supported by for IR send, depending on the driver. Use **ioctl LIRC_GET_FEATURES** to find out which modes the driver supports.

Return Value

<table>
<thead>
<tr>
<th>Error Code</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ENODEV</td>
<td>Device not available.</td>
</tr>
<tr>
<td>ENOTTY</td>
<td>Device does not support transmitting.</td>
</tr>
<tr>
<td>EINVAL</td>
<td>Invalid mode or invalid mode for this device.</td>
</tr>
</tbody>
</table>
ioctls LIRC_GET_REC_MODE and LIRC_SET_REC_MODE

Name

LIRC_GET_REC_MODE/LIRC_SET_REC_MODE - Get/set current receive mode.

Synopsis

LIRC_GET_REC_MODE
int ioctl(int fd, LIRC_GET_REC_MODE, __u32 *mode)

LIRC_SET_REC_MODE
int ioctl(int fd, LIRC_SET_REC_MODE, __u32 *mode)

Arguments

fd File descriptor returned by open().
mode Mode used for receive.

Description

Get and set the current receive mode. Only LIRC_MODE_MODE2 and LIRC_MODE_SCANCODE are supported. Use ioctl LIRC_GET_FEATURES to find out which modes the driver supports.

Return Value

<table>
<thead>
<tr>
<th>ENODEV</th>
<th>Device not available.</th>
</tr>
</thead>
<tbody>
<tr>
<td>ENOTTY</td>
<td>Device does not support receiving.</td>
</tr>
<tr>
<td>EINVAL</td>
<td>Invalid mode or invalid mode for this device.</td>
</tr>
</tbody>
</table>

ioctl LIRC_GET_REC_RESOLUTION

Name

LIRC_GET_REC_RESOLUTION - Obtain the value of receive resolution, in microseconds.
Synopsis

LIRC_GET_REC_RESOLUTION

```c
int ioctl(int fd, LIRC_GET_REC_RESOLUTION, __u32 *microseconds)
```

Arguments

- **fd** File descriptor returned by open().
- **microseconds** Resolution, in microseconds.

Description

Some receivers have maximum resolution which is defined by internal sample rate or data format limitations. E.g. it’s common that signals can only be reported in 50 microsecond steps. This ioctl returns the integer value with such resolution, with can be used by userspace applications like lircd to automatically adjust the tolerance value.

Return Value

On success 0 is returned, on error -1 and the **errno** variable is set appropriately. The generic error codes are described at the *Generic Error Codes* chapter.

ioctl LIRC_SET_SEND_DUTY_CYCLE

Name

LIRC_SET_SEND_DUTY_CYCLE - Set the duty cycle of the carrier signal for IR transmit.

Synopsis

LIRC_SET_SEND_DUTY_CYCLE

```c
int ioctl(int fd, LIRC_SET_SEND_DUTY_CYCLE, __u32 *duty_cycle)
```

Arguments

- **fd** File descriptor returned by open().
- **duty_cycle** Duty cicle, describing the pulse width in percent (from 1 to 99) of the total cycle. Values 0 and 100 are reserved.
Description

Get/set the duty cycle of the carrier signal for IR transmit.

Currently, no special meaning is defined for 0 or 100, but this could be used to switch off carrier generation in the future, so these values should be reserved.

Return Value

On success 0 is returned, on error -1 and the errno variable is set appropriately. The generic error codes are described at the Generic Error Codes chapter.

ioctls LIRC_GET_MIN_TIMEOUT and LIRC_GET_MAX_TIMEOUT

Name

LIRC_GET_MIN_TIMEOUT/LIRC_GET_MAX_TIMEOUT - Obtain the possible timeout range for IR receive.

Synopsis

LIRC_GET_MIN_TIMEOUT

int ioctl(int fd, LIRC_GET_MIN_TIMEOUT, __u32 *timeout)

LIRC_GET_MAX_TIMEOUT

int ioctl(int fd, LIRC_GET_MAX_TIMEOUT, __u32 *timeout)

Arguments

fd File descriptor returned by open().

timeout Timeout, in microseconds.

Description

Some devices have internal timers that can be used to detect when there’s no IR activity for a long time. This can help lircd in detecting that a IR signal is finished and can speed up the decoding process. Returns an integer value with the minimum/maximum timeout that can be set.

Note: Some devices have a fixed timeout, in that case both ioctls will return the same value even though the timeout cannot be changed via ioctl LIRC_GET_REC_TIMEOUT and LIRC_SET_REC_TIMEOUT.
Return Value

On success 0 is returned, on error -1 and the errno variable is set appropriately. The generic error codes are described at the Generic Error Codes chapter.

ioctl LIRC_GET_REC_TIMEOUT and LIRC_SET_REC_TIMEOUT

Name

LIRC_GET_REC_TIMEOUT/LIRC_SET_REC_TIMEOUT - Get/set the integer value for IR inactivity timeout.

Synopsis

LIRC_GET_REC_TIMEOUT
int ioctl(int fd, LIRC_GET_REC_TIMEOUT, __u32 *timeout)

LIRC_SET_REC_TIMEOUT
int ioctl(int fd, LIRC_SET_REC_TIMEOUT, __u32 *timeout)

Arguments

df  File descriptor returned by open().
timeout  Timeout, in microseconds.

Description

Get and set the integer value for IR inactivity timeout.

If supported by the hardware, setting it to 0 disables all hardware timeouts and data should be reported as soon as possible. If the exact value cannot be set, then the next possible value greater than the given value should be set.

Note:  The range of supported timeout is given by ioctls LIRC_GET_MIN_TIMEOUT and LIRC_GET_MAX_TIMEOUT.
Return Value

On success 0 is returned, on error -1 and the \texttt{errno} variable is set appropriately. The generic error codes are described at the \textit{Generic Error Codes} chapter.

\textbf{ioctl LIRC\_SET\_REC\_CARRIER}

\textbf{Name}

LIRC\_SET\_REC\_CARRIER - Set carrier used to modulate IR receive.

\textbf{Synopsis}

LIRC\_SET\_REC\_CARRIER

\texttt{int ioctl(int fd, LIRC\_SET\_REC\_CARRIER, \_u32 \*frequency)}

\textbf{Arguments}

\texttt{fd} File descriptor returned by \texttt{open()}.  
\texttt{frequency} Frequency of the carrier that modulates PWM data, in Hz.

\textbf{Description}

Set receive carrier used to modulate IR PWM pulses and spaces.

\textbf{Note:} If called together with \texttt{ioctl LIRC\_SET\_REC\_CARRIER\_RANGE}, this ioctl sets the upper bound frequency that will be recognized by the device.

\textbf{Return Value}

On success 0 is returned, on error -1 and the \texttt{errno} variable is set appropriately. The generic error codes are described at the \textit{Generic Error Codes} chapter.

\textbf{ioctl LIRC\_SET\_REC\_CARRIER\_RANGE}

\textbf{Name}

LIRC\_SET\_REC\_CARRIER\_RANGE - Set lower bound of the carrier used to modulate IR receive.
**Synopsis**

**LIRC_SET_REC_CARRIER_RANGE**

```c
int ioctl(int fd, LIRC_SET_REC_CARRIER_RANGE, __u32 *frequency)
```

**Arguments**

- **fd** File descriptor returned by `open()`.
- **frequency** Frequency of the carrier that modulates PWM data, in Hz.

**Description**

This ioctl sets the upper range of carrier frequency that will be recognized by the IR receiver.

**Note:** To set a range use `LIRC_SET_REC_CARRIER_RANGE` with the lower bound first and later call `LIRC_SET_REC_CARRIER` with the upper bound.

**Return Value**

On success 0 is returned, on error -1 and the `errno` variable is set appropriately. The generic error codes are described at the *Generic Error Codes* chapter.

**ioctl LIRC_SET_SEND_CARRIER**

**Name**

LIRC_SET_SEND_CARRIER - Set send carrier used to modulate IR TX.

**Synopsis**

**LIRC_SET_SEND_CARRIER**

```c
int ioctl(int fd, LIRC_SET_SEND_CARRIER, __u32 *frequency)
```

**Arguments**

- **fd** File descriptor returned by `open()`.
- **frequency** Frequency of the carrier to be modulated, in Hz.
Description

Set send carrier used to modulate IR PWM pulses and spaces.

Return Value

On success 0 is returned, on error -1 and the errno variable is set appropriately. The generic error codes are described at the Generic Error Codes chapter.

ioctl LIRC_SET_TRANSMITTER_MASK

Name

LIRC_SET_TRANSMITTER_MASK - Enables send codes on a given set of transmitters

Synopsis

LIRC_SET_TRANSMITTER_MASK

int ioctl(int fd, LIRC_SET_TRANSMITTER_MASK, __u32 *mask)

Arguments

fd  File descriptor returned by open().

mask  Mask with channels to enable tx. Channel 0 is the least significant bit.

Description

Some IR TX devices have multiple output channels, in such case, LIRC_CAN_SET_TRANSMITTER_MASK is returned via ioctl LIRC_GET_FEATURES and this ioctl sets what channels will send IR codes.

This ioctl enables the given set of transmitters. The first transmitter is encoded by the least significant bit and so on.

When an invalid bit mask is given, i.e. a bit is set, even though the device does not have so many transitters, then this ioctl returns the number of available transitters and does nothing otherwise.
Return Value

On success 0 is returned, on error -1 and the errno variable is set appropriately. The generic error codes are described at the Generic Error Codes chapter.

ioctl LIRC_SET_REC_TIMEOUT_REPORTS

Name

LIRC_SET_REC_TIMEOUT_REPORTS - enable or disable timeout reports for IR receive

Synopsis

LIRC_SET_REC_TIMEOUT_REPORTS

int ioctl(int fd, LIRC_SET_REC_TIMEOUT_REPORTS, __u32 *enable)

Arguments

fd  File descriptor returned by open().

enable  enable = 1 means enable timeout report, enable = 0 means disable timeout reports.

Description

Enable or disable timeout reports for IR receive. By default, timeout reports should be turned off.

Note:  This ioctl is only valid for LIRC_MODE_MODE2.

Return Value

On success 0 is returned, on error -1 and the errno variable is set appropriately. The generic error codes are described at the Generic Error Codes chapter.

ioctl LIRC_SET_MEASURE_CARRIER_MODE

Name

LIRC_SET_MEASURE_CARRIER_MODE - enable or disable measure mode
Synopsis

_LIRC_SET_MEASURE_CARRIER_MODE_

int ioctl(int fd, LIRC_SET_MEASURE_CARRIER_MODE, __u32 *enable)

Arguments

(fd File descriptor returned by open().
(enable enable = 1 means enable measure mode, enable = 0 means disable measure mode.

Description

Enable or disable measure mode. If enabled, from the next key press on, the driver will send LIRC_MODE2_FREQUENCY packets. By default this should be turned off.

Return Value

On success 0 is returned, on error -1 and the errno variable is set appropriately. The generic error codes are described at the *Generic Error Codes* chapter.

_ioctl LIRC_SET_WIDEBAND_RECEIVER

Name

LIRC_SET_WIDEBAND_RECEIVER - enable wide band receiver.

Synopsis

_LIRC_SET_WIDEBAND_RECEIVER_

int ioctl(int fd, LIRC_SET_WIDEBAND_RECEIVER, __u32 *enable)

Arguments

(fd File descriptor returned by open().
(enable enable = 1 means enable wideband receiver, enable = 0 means disable wideband receiver.
Description

Some receivers are equipped with special wide band receiver which is intended to be used to learn output of existing remote. This ioctl allows enabling or disabling it.

This might be useful of receivers that have otherwise narrow band receiver that prevents them to be used with some remotes. Wide band receiver might also be more precise. On the other hand its disadvantage it usually reduced range of reception.

Note: Wide band receiver might be implicitly enabled if you enable carrier reports. In that case it will be disabled as soon as you disable carrier reports. Trying to disable wide band receiver while carrier reports are active will do nothing.

Return Value

On success 0 is returned, on error -1 and the errno variable is set appropriately. The generic error codes are described at the Generic Error Codes chapter.

**revision** 3.15 / 2014-02-06 (*mcc*)
Added the interface description and the RC sysfs class description.

**revision** 1.0 / 2009-09-06 (*mcc*)
Initial revision

### 3.5 Part IV - Media Controller API

#### 3.5.1 Introduction

Media devices increasingly handle multiple related functions. Many USB cameras include microphones, video capture hardware can also output video, or SoC camera interfaces also perform memory-to-memory operations similar to video codecs.

Independent functions, even when implemented in the same hardware, can be modelled as separate devices. A USB camera with a microphone will be presented to userspace applications as V4L2 and ALSA capture devices. The devices’ relationships (when using a webcam, end-users shouldn’t have to manually select the associated USB microphone), while not made available directly to applications by the drivers, can usually be retrieved from sysfs.

With more and more advanced SoC devices being introduced, the current approach will not scale. Device topologies are getting increasingly complex and can’t always be represented by a tree structure. Hardware blocks are shared between different functions, creating dependencies between seemingly unrelated devices.

Kernel abstraction APIs such as V4L2 and ALSA provide means for applications to access hardware parameters. As newer hardware expose an increasingly high number of those parameters, drivers need to guess what applications really require based on limited information, thereby implementing policies that belong to userspace.

The media controller API aims at solving those problems.
3.5.2 Media device model

Discovering a device internal topology, and configuring it at runtime, is one of the goals of the media controller API. To achieve this, hardware devices and Linux Kernel interfaces are modelled as graph objects on an oriented graph. The object types that constitute the graph are:

- **An entity** is a basic media hardware or software building block. It can correspond to a large variety of logical blocks such as physical hardware devices (CMOS sensor for instance), logical hardware devices (a building block in a System-on-Chip image processing pipeline), DMA channels or physical connectors.

- **An interface** is a graph representation of a Linux Kernel userspace API interface, like a device node or a sysfs file that controls one or more entities in the graph.

- **A pad** is a data connection endpoint through which an entity can interact with other entities. Data (not restricted to video) produced by an entity flows from the entity’s output to one or more entity inputs. Pads should not be confused with physical pins at chip boundaries.

- **A data link** is a point-to-point oriented connection between two pads, either on the same entity or on different entities. Data flows from a source pad to a sink pad.

- **An interface link** is a point-to-point bidirectional control connection between a Linux Kernel interface and an entity.

3.5.3 Types and flags used to represent the media graph elements

<tr>
<td>MEDIA_ENT_F_PROC_VIDEO_COMPOSER</td>
<td>Video composer (blender). An entity capable of video composing must have at least two sink pads and one source pad, and composes input video frames onto output video frames. Composition can be performed using alpha blending, color keying, raster operations (ROP), stitching or any other means.</td>
</tr>
</tbody>
</table>

Continued on next page
### Table 254 – continued from previous page

| **MEDIA_ENT_F_PROC_VIDEO_PIXEL_FORMATTER** | **Video pixel formatter.** An entity capable of pixel formatting must have at least one sink pad and one source pad. Read pixel formaters read pixels from memory and perform a subset of unpacking, cropping, color keying, alpha multiplication and pixel encoding conversion. Write pixel formaters perform a subset of dithering, pixel encoding conversion and packing and write pixels to memory. |
| **MEDIA_ENT_F_PROC_VIDEO_PIXEL_ENCOD_CONV** | **Video pixel encoding converter.** An entity capable of pixel encoding conversion must have at least one sink pad and one source pad, and convert the encoding of pixels received on its sink pad(s) to a different encoding output on its source pad(s). Pixel encoding conversion includes but isn’t limited to RGB to/from HSV, RGB to/from YUV and CFA (Bayer) to RGB conversions. |
| **MEDIA_ENT_F_PROC_VIDEO_LUT** | **Video look-up table.** An entity capable of video lookup table processing must have one sink pad and one source pad. It uses the values of the pixels received on its sink pad to look up entries in internal tables and output them on its source pad. The lookup processing can be performed on all components separately or combine them for multi-dimensional table lookups. |
| **MEDIA_ENT_F_PROC_VIDEO_SCALER** | **Video scaler.** An entity capable of video scaling must have at least one sink pad and one source pad, and scale the video frame(s) received on its sink pad(s) to a different resolution output on its source pad(s). The range of supported scaling ratios is entity-specific and can differ between the horizontal and vertical directions (in particular scaling can be supported in one direction only). Binning and sub-sampling (occasionally also referred to as skipping) are considered as scaling. |
| **MEDIA_ENT_F_PROC_VIDEO_STATISTICS** | **Video statistics computation (histogram, 3A, etc.).** An entity capable of statistics computation must have one sink pad and one source pad. It computes statistics over the frames received on its sink pad and outputs the statistics data on its source pad. |
| **MEDIA_ENT_F_PROC_VIDEO_ENCODER** | **Video (MPEG, HEVC, VPx, etc.) encoder.** An entity capable of compressing video frames. Must have one sink pad and at least one source pad. Continued on next page |
Table 254 – continued from previous page

| MEDIA_ENT_F_PROC_VIDEO_DECODER | Video (MPEG, HEVC, VPx, etc.) decoder. An entity capable of decompressing a compressed video stream into uncompressed video frames. Must have one sink pad and at least one source pad. |
| MEDIA_ENT_F_PROC_VIDEO_ISP | An Image Signal Processor (ISP) device. ISPs generally are one of a kind devices that have their specific control interfaces using a combination of custom V4L2 controls and IOCTLs, and parameters supplied in a metadata buffer. |
| MEDIA_ENT_F_VID_MUX | Video multiplexer. An entity capable of multiplexing must have at least two sink pads and one source pad, and must pass the video frame(s) received from the active sink pad to the source pad. |
| MEDIA_ENT_F_VID_IF_BRIDGE | Video interface bridge. A video interface bridge entity must have at least one sink pad and at least one source pad. It receives video frames on its sink pad from an input video bus of one type (HDMI, eDP, MIPI CSI-2, etc.), and outputs them on its source pad to an output video bus of another type (eDP, MIPI CSI-2, parallel, etc.). |
| MEDIA_ENT_F_DV_DECODER | Digital video decoder. The basic function of the video decoder is to accept digital video from a wide variety of sources and output it in some digital video standard, with appropriate timing signals. |
| MEDIA_ENT_F_DV_ENCODER | Digital video encoder. The basic function of the video encoder is to accept digital video from some digital video standard with appropriate timing signals (usually a parallel video bus with sync signals) and output this to a digital video output connector such as HDMI or DisplayPort. |

Table 255: Media entity flags

| MEDIA_ENT_FL_DEFAULT | Default entity for its type. Used to discover the default audio, VBI and video devices, the default camera sensor, etc. |
| MEDIA_ENT_FL_CONNECTOR | The entity represents a connector. |

<td>This is a bitmask that defines the type of the link. Currently, two types of links are supported: MEDIA_LNK_FL_DATA_LINK if the link is between two pads, MEDIA_LNK_FL_INTERFACE_LINK if the link is between an interface and an entity</td>
</tr>
</tbody>
</table>

3.5.4 Request API

The Request API has been designed to allow V4L2 to deal with requirements of modern devices (stateless codecs, complex camera pipelines, ...) and APIs (Android Codec v2). One such requirement is the ability for devices belonging to the same pipeline to reconfigure and collaborate closely on a per-frame basis. Another is support of stateless codecs, which require controls to be applied to specific frames (aka ‘per-frame controls’) in order to be used efficiently.

While the initial use-case was V4L2, it can be extended to other subsystems as well, as long as they use the media controller.

Supporting these features without the Request API is not always possible and if it is, it is terribly inefficient: user-space would have to flush all activity on the media pipeline, reconfigure it for the next frame, queue the buffers to be processed with that configuration, and wait until they are all available for dequeuing before considering the next frame. This defeats the purpose of having buffer queues since in practice only one buffer would be queued at a time.

The Request API allows a specific configuration of the pipeline (media controller topology + configuration for each media entity) to be associated with specific buffers. This allows user-space to schedule several tasks (“requests”) with different configurations in advance, knowing that the configuration will be applied when needed to get the expected result. Configuration values at the time of request completion are also available for reading.
3.5.4.1 General Usage

The Request API extends the Media Controller API and cooperates with subsystem-specific APIs to support request usage. At the Media Controller level, requests are allocated from the supporting Media Controller device node. Their life cycle is then managed through the request file descriptors in an opaque way. Configuration data, buffer handles and processing results stored in requests are accessed through subsystem-specific APIs extended for request support, such as V4L2 APIs that take an explicit request_fd parameter.

3.5.4.2 Request Allocation

User-space allocates requests using ioctl MEDIA_IOC_REQUEST_ALLOC for the media device node. This returns a file descriptor representing the request. Typically, several such requests will be allocated.

3.5.4.3 Request Preparation

Standard V4L2 ioctls can then receive a request file descriptor to express the fact that the ioctl is part of said request, and is not to be applied immediately. See ioctl MEDIA_IOC_REQUEST_ALLOC for a list of ioctls that support this. Configurations set with a request_fd parameter are stored instead of being immediately applied, and buffers queued to a request do not enter the regular buffer queue until the request itself is queued.

3.5.4.4 Request Submission

Once the configuration and buffers of the request are specified, it can be queued by calling ioctl MEDIA_REQUEST_IOC_QUEUE on the request file descriptor. A request must contain at least one buffer, otherwise ENOENT is returned. A queued request cannot be modified anymore.

**Caution:** For *memory-to-memory devices* you can use requests only for output buffers, not for capture buffers. Attempting to add a capture buffer to a request will result in an EBADR error.

If the request contains configurations for multiple entities, individual drivers may synchronize so the requested pipeline’s topology is applied before the buffers are processed. Media controller drivers do a best effort implementation since perfect atomicity may not be possible due to hardware limitations.

**Caution:** It is not allowed to mix queuing requests with directly queuing buffers: whichever method is used first locks this in place until VIDIOC_STREAMOFF is called or the device is closed. Attempts to directly queue a buffer when earlier a buffer was queued via a request or vice versa will result in an EBUSY error.

Controls can still be set without a request and are applied immediately, regardless of whether a request is in use or not.
Caution: Setting the same control through a request and also directly can lead to undefined behavior!

User-space can poll() a request file descriptor in order to wait until the request completes. A request is considered complete once all its associated buffers are available for dequeuing and all the associated controls have been updated with the values at the time of completion. Note that user-space does not need to wait for the request to complete to dequeue its buffers: buffers that are available halfway through a request can be dequeued independently of the request’s state.

A completed request contains the state of the device after the request was executed. User-space can query that state by calling ioctl VIDIOC_G_EXT_CTRLS with the request file descriptor. Calling ioctl VIDIOC_G_EXT_CTRLS for a request that has been queued but not yet completed will return EBUSY since the control values might be changed at any time by the driver while the request is in flight.

3.5.4.5 Recycling and Destruction

Finally, a completed request can either be discarded or be reused. Calling close() on a request file descriptor will make that file descriptor unusable and the request will be freed once it is no longer in use by the kernel. That is, if the request is queued and then the file descriptor is closed, then it won’t be freed until the driver completed the request.

The ioctl MEDIA_REQUEST_IOC_REINIT will clear a request’s state and make it available again. No state is retained by this operation: the request is as if it had just been allocated.

3.5.4.6 Example for a Codec Device

For use-cases such as codecs, the request API can be used to associate specific controls to be applied by the driver for the OUTPUT buffer, allowing user-space to queue many such buffers in advance. It can also take advantage of requests’ ability to capture the state of controls when the request completes to read back information that may be subject to change.

Put into code, after obtaining a request, user-space can assign controls and one OUTPUT buffer to it:

```c
struct v4l2_buffer buf;
struct v4l2_ext_controls ctrls;
int req_fd;
...
if (ioctl(media_fd, MEDIA_IOC_REQUEST_ALLOC, &req_fd))
    return errno;
...
ctrls.which = V4L2_CTRL_WHICH_REQUEST_VAL;
ctrls.request_fd = req_fd;
if (ioctl(codec_fd, VIDIOC_S_EXT_CTRLS, &ctrls))
    return errno;
...
buf.type = V4L2_BUF_TYPE_VIDEO_OUTPUT;
buf.flags |= V4L2_BUF_FLAG_REQUEST_FD;
buf.request_fd = req_fd;
```
if (ioctl(codec_fd, VIDIOC_QBUF, &buf))
    return errno;

Note that it is not allowed to use the Request API for CAPTURE buffers since there are no per-frame settings to report there.

Once the request is fully prepared, it can be queued to the driver:

if (ioctl(req_fd, MEDIA_REQUEST_IOC_QUEUE))
    return errno;

User-space can then either wait for the request to complete by calling poll() on its file descriptor, or start dequeuing CAPTURE buffers. Most likely, it will want to get CAPTURE buffers as soon as possible and this can be done using a regular VIDIOC_DQBUF:

struct v4l2_buffer buf;
memset(&buf, 0, sizeof(buf));
buf.type = V4L2_BUF_TYPE_VIDEO_CAPTURE;
if (ioctl(codec_fd, VIDIOC_DQBUF, &buf))
    return errno;

Note that this example assumes for simplicity that for every OUTPUT buffer there will be one CAPTURE buffer, but this does not have to be the case.

We can then, after ensuring that the request is completed via polling the request file descriptor, query control values at the time of its completion via a call to VIDIOC_G_EXT_CTRLS. This is particularly useful for volatile controls for which we want to query values as soon as the capture buffer is produced.

struct pollfd pfd = {.events = POLLPRI, .fd = req_fd ;}
poll(&pfd, 1, -1);
...
ctrls.which = V4L2_CTRL_WHICH_REQUEST_VAL;
ctrls.request_fd = req_fd;
if (ioctl(codec_fd, VIDIOC_G_EXT_CTRLS, &ctrls))
    return errno;

Once we don't need the request anymore, we can either recycle it for reuse with ioctl MEDIA_REQUEST_IOC_REINIT...

if (ioctl(req_fd, MEDIA_REQUEST_IOC_REINIT))
    return errno;

... or close its file descriptor to completely dispose of it.

close(req_fd);
### 3.5.4.7 Example for a Simple Capture Device

With a simple capture device, requests can be used to specify controls to apply for a given CAPTURE buffer.

```c
struct v4l2_buffer buf;
struct v4l2_ext_controls ctrls;
int req_fd;
...
if (ioctl(media_fd, MEDIA_IOC_REQUEST_ALLOC, &req_fd))
    return errno;
...
ctrls.which = V4L2_CTRL_WHICH_REQUEST_VAL;
ctrls.request_fd = req_fd;
if (ioctl(camera_fd, VIDIOC_S_EXT_CTRLS, &ctrls))
    return errno;
...
buf.type = V4L2_BUF_TYPE_VIDEO_CAPTURE;
buf.flags |= V4L2_BUF_FLAG_REQUEST_FD;
buf.request_fd = req_fd;
if (ioctl(camera_fd, VIDIOC_QBUF, &buf))
    return errno;
```

Once the request is fully prepared, it can be queued to the driver:

```c
if (ioctl(req_fd, MEDIA_REQUEST_IOC_QUEUE))
    return errno;
```

User-space can then dequeue buffers, wait for the request completion, query controls and recycle the request as in the M2M example above.

### 3.5.5 Function Reference

#### 3.5.5.1 media open()

**Name**

media-open - Open a media device

**Synopsis**

```c
#include <fcntl.h>

int open(const char *device_name, int flags)
```
Arguments

device_name Device to be opened.
flags Open flags. Access mode must be either O_RDONLY or O_RDWR. Other flags have no effect.

Description

To open a media device applications call open() with the desired device name. The function has no side effects; the device configuration remain unchanged.

When the device is opened in read-only mode, attempts to modify its configuration will result in an error, and errno will be set to EBADF.

Return Value

open() returns the new file descriptor on success. On error, -1 is returned, and errno is set appropriately. Possible error codes are:

EACCESS The requested access to the file is not allowed.
EMFILE The process already has the maximum number of files open.
ENFILE The system limit on the total number of open files has been reached.
ENOMEM Insufficient kernel memory was available.
ENXIO No device corresponding to this device special file exists.

3.5.5.2 media close()

Name

media-close - Close a media device

Synopsis

```
#include <unistd.h>

int close(int fd)
```
Arguments

fd  File descriptor returned by open().

Description

Closes the media device. Resources associated with the file descriptor are freed. The device configuration remain unchanged.

Return Value

close() returns 0 on success. On error, -1 is returned, and errno is set appropriately. Possible error codes are:

EBADF  fd is not a valid open file descriptor.

3.5.5.3 media ioctl()

Name

media-ioctl - Control a media device

Synopsis

```
#include <sys/ioctl.h>

int ioctl(int fd, int request, void *argp)
```

Arguments

fd  File descriptor returned by open().

request  Media ioctl request code as defined in the media.h header file, for example ME-DIA_IOC_SETUP_LINK.

argp  Pointer to a request-specific structure.

Description

The ioctl() function manipulates media device parameters. The argument fd must be an open file descriptor.

The ioctl request code specifies the media function to be called. It has encoded in it whether the argument is an input, output or read/write parameter, and the size of the argument argp in bytes.
Macros and structures definitions specifying media ioctl requests and their parameters are located in the media.h header file. All media ioctl requests, their respective function and parameters are specified in *Function Reference*.

**Return Value**

On success 0 is returned, on error -1 and the `errno` variable is set appropriately. The generic error codes are described at the *Generic Error Codes* chapter.

Request-specific error codes are listed in the individual requests descriptions.

When an ioctl that takes an output or read/write parameter fails, the parameter remains unmodified.

### 3.5.5.4 ioctl MEDIA_IOC_DEVICE_INFO

**Name**

MEDIA_IOC_DEVICE_INFO - Query device information

**Synopsis**

`MEDIA_IOC_DEVICE_INFO`

```c
int ioctl(int fd, MEDIA_IOC_DEVICE_INFO, struct media_device_info *argp)
```

**Arguments**

- **fd**  File descriptor returned by `open()`.
- **argp**  Pointer to `struct media_device_info`.

**Description**

All media devices must support the `MEDIA_IOC_DEVICE_INFO` ioctl. To query device information, applications call the ioctl with a pointer to a `struct media_device_info`. The driver fills the structure and returns the information to the application. The ioctl never fails.

`media_device_info`
Table 259: struct media_device_info

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>char</td>
<td>driver[16] Name of the driver implementing the media API as a NUL-terminated ASCII string. The driver version is stored in the driver_version field. Driver specific applications can use this information to verify the driver identity. It is also useful to work around known bugs, or to identify drivers in error reports.</td>
</tr>
<tr>
<td>char</td>
<td>model[32] Device model name as a NUL-terminated UTF-8 string. The device version is stored in the device_version field and is not be appended to the model name.</td>
</tr>
<tr>
<td>char</td>
<td>serial[40] Serial number as a NUL-terminated ASCII string.</td>
</tr>
<tr>
<td>char</td>
<td>bus_info[32] Location of the device in the system as a NUL-terminated ASCII string. This includes the bus type name (PCI, USB, ...) and a bus-specific identifier.</td>
</tr>
<tr>
<td>__u32</td>
<td>media_version Media API version, formatted with the KERNEL_VERSION() macro.</td>
</tr>
<tr>
<td>__u32</td>
<td>hw_revision Hardware device revision in a driver-specific format.</td>
</tr>
<tr>
<td>__u32</td>
<td>driver_version Media device driver version, formatted with the KERNEL_VERSION() macro. Together with the driver field this identifies a particular driver.</td>
</tr>
<tr>
<td>__u32</td>
<td>reserved[31] Reserved for future extensions. Drivers and applications must set this array to zero.</td>
</tr>
</tbody>
</table>

The serial and bus_info fields can be used to distinguish between multiple instances of otherwise identical hardware. The serial number takes precedence when provided and can be assumed to be unique. If the serial number is an empty string, the bus_info field can be used instead. The bus_info field is guaranteed to be unique, but can vary across reboots or device unplug/replug.

**Return Value**

On success 0 is returned, on error -1 and the errno variable is set appropriately. The generic error codes are described at the *Generic Error Codes* chapter.
3.5.5.5 ioctl MEDIA_IOC_G_TOPOLOGY

Name

MEDIA_IOC_G_TOPOLOGY - Enumerate the graph topology and graph element properties

Synopsis

MEDIA_IOC_G_TOPOLOGY

int ioctl(int fd, MEDIA_IOC_G_TOPOLOGY, struct media_v2_topology *argp)

Arguments

fd File descriptor returned by open().
argp Pointer to struct media_v2_topology.

Description

The typical usage of this ioctl is to call it twice. On the first call, the structure defined at struct media_v2_topology should be zeroed. At return, if no errors happen, this ioctl will return the topology_version and the total number of entities, interfaces, pads and links.

Before the second call, the userspace should allocate arrays to store the graph elements that are desired, putting the pointers to them at the ptr_entities, ptr_interfaces, ptr_links and/or ptr_pads, keeping the other values untouched.

If the topology_version remains the same, the ioctl should fill the desired arrays with the media graph elements.

<td>Link flags, see Media link flags for more details.</td>
</tr>
<tr>
<td>__u32 reserved[6]</td>
<td>Reserved for future extensions. Drivers and applications must set this array to zero.</td>
</tr>
</tbody>
</table>
Return Value

On success 0 is returned, on error -1 and the errno variable is set appropriately. The generic error codes are described at the *Generic Error Codes* chapter.

**ENOSPC** This is returned when either one or more of the num_entities, num_interfaces, num_links or num_pads are non-zero and are smaller than the actual number of elements inside the graph. This may happen if the topology_version changed when compared to the last time this ioctl was called. Userspace should usually free the area for the pointers, zero the struct elements and call this ioctl again.

### 3.5.5.6 ioctl MEDIA_IOC_ENUM_ENTITIES

**Name**

MEDIA_IOC_ENUM_ENTITIES - Enumerate entities and their properties

**Synopsis**

```c
MEDIA_IOC_ENUM_ENTITIES
int ioctl(int fd, MEDIA_IOC_ENUM_ENTITIES, struct media_entity_desc *argp)
```

**Arguments**

- **fd** File descriptor returned by `open()`.
- **argp** Pointer to `struct media_entity_desc`.

**Description**

To query the attributes of an entity, applications set the id field of a struct `media_entity_desc` structure and call the MEDIA_IOC_ENUM_ENTITIES ioctl with a pointer to this structure. The driver fills the rest of the structure or returns an EINVAL error code when the id is invalid.

Entities can be enumerated by or‘ing the id with the MEDIA_ENT_ID_FLAG_NEXT flag. The driver will return information about the entity with the smallest id strictly larger than the requested one (‘next entity’), or the EINVAL error code if there is none.

Entity IDs can be non-contiguous. Applications must *not* try to enumerate entities by calling MEDIA_IOC_ENUM_ENTITIES with increasing id’s until they get an error.

**media_entity_desc**
Table 266: struct media_entity_desc

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>__u32</td>
<td>id</td>
</tr>
<tr>
<td>Entity</td>
<td>ID, set by the application. When the ID is or'ed with MEDIA_ENTITY_FLAG_NEXT, the driver clears the flag and returns the first entity with a larger ID. Do not expect that the ID will always be the same for each instance of the device. In other words, do not hard-code entity IDs in an application.</td>
</tr>
<tr>
<td>char</td>
<td>name[32]</td>
</tr>
<tr>
<td>Entity</td>
<td>name as an UTF-8 NULL-terminated string. This</td>
</tr>
</tbody>
</table>

Drivers and applications must set the array to zero.
Return Value

On success 0 is returned, on error -1 and the errno variable is set appropriately. The generic error codes are described at the Generic Error Codes chapter.

EINVAL The struct media_entity_desc references a non-existing entity.

3.5.5.7 ioctl MEDIA_IOC_ENUM_LINKS

Name

MEDIA_IOC_ENUM_LINKS - Enumerate all pads and links for a given entity

Synopsis

MEDIA_IOC_ENUM_LINKS

int ioctl(int fd, MEDIA_IOC_ENUM_LINKS, struct media_links_enum *argp)

Arguments

fd File descriptor returned by open().
argp Pointer to struct media_links_enum.

Description

To enumerate pads and/or links for a given entity, applications set the entity field of a struct media_links_enum structure and initialize the struct media_pad_desc and struct media_link_desc structure arrays pointed by the pads and links fields. They then call the MEDIA_IOC_ENUM_LINKS ioctl with a pointer to this structure.

If the pads field is not NULL, the driver fills the pads array with information about the entity’s pads. The array must have enough room to store all the entity’s pads. The number of pads can be retrieved with ioctl MEDIA_IOC_ENUM_ENTITIES.

If the links field is not NULL, the driver fills the links array with information about the entity’s outbound links. The array must have enough room to store all the entity’s outbound links. The number of outbound links can be retrieved with ioctl MEDIA_IOC_ENUM_ENTITIES.

Only forward links that originate at one of the entity’s source pads are returned during the enumeration process.

On success 0 is returned, on error -1 and the errno variable is set appropriately. The generic error codes are described at the Generic Error Codes chapter.

EINVAL The struct media_links_enum id references a non-existing entity.

3.5.5.8 ioctl MEDIA_IOC_SETUP_LINK

Name

MEDIA_IOC_SETUP_LINK - Modify the properties of a link
**Synopsis**

`MEDIA_IOC_SETUP_LINK`

```c
int ioctl(int fd, MEDIA_IOC_SETUP_LINK, struct media_link_desc *argp)
```

**Arguments**

- **fd** File descriptor returned by `open()`
- **argp** Pointer to `struct media_link_desc`

**Description**

To change link properties applications fill a `struct media_link_desc` with link identification information (source and sink pad) and the new requested link flags. They then call the `MEDIA_IOC_SETUP_LINK` ioctl with a pointer to that structure.

The only configurable property is the `ENABLED` link flag to enable/disable a link. Links marked with the `IMMUTABLE` link flag cannot be enabled or disabled.

Link configuration has no side effect on other links. If an enabled link at the sink pad prevents the link from being enabled, the driver returns with an `EBUSY` error code.

Only links marked with the `DYNAMIC` link flag can be enabled/disabled while streaming media data. Attempting to enable or disable a streaming non-dynamic link will return an `EBUSY` error code.

If the specified link can't be found the driver returns with an `EINVAL` error code.

**Return Value**

On success 0 is returned, on error -1 and the `errno` variable is set appropriately. The generic error codes are described at the `Generic Error Codes` chapter.

- **EINVAL** The `struct media_link_desc` references a non-existing link, or the link is immutable and an attempt to modify its configuration was made.

**3.5.5.9 ioctl MEDIA_IOC_REQUEST_ALLOC**

**Name**

`MEDIA_IOC_REQUEST_ALLOC` - Allocate a request
**Synopsis**

```c
int ioctl(int fd, MEDIA_IOC_REQUEST_ALLOC, int *argp)
```

**Arguments**

- **fd** File descriptor returned by `open()`.
- **argp** Pointer to an integer.

**Description**

If the media device supports *requests*, then this ioctl can be used to allocate a request. If it is not supported, then `errno` is set to `ENOTTY`. A request is accessed through a file descriptor that is returned in `*argp`.

If the request was successfully allocated, then the request file descriptor can be passed to the `VIDIOC_QBUF, VIDIOC_G_EXT_CTRLS, VIDIOC_S_EXT_CTRLS` and `VIDIOC_TRY_EXT_CTRLS` ioctls.

In addition, the request can be queued by calling `ioctl MEDIA_REQUEST_IOC_QUEUE` and re-initialized by calling `ioctl MEDIA_REQUEST_IOC_REINIT`.

Finally, the file descriptor can be *polled* to wait for the request to complete.

The request will remain allocated until all the file descriptors associated with it are closed by `close()` and the driver no longer uses the request internally. See also `here` for more information.

**Return Value**

On success 0 is returned, on error -1 and the `errno` variable is set appropriately. The generic error codes are described at the `Generic Error Codes` chapter.

- **ENOTTY** The driver has no support for requests.

### 3.5.5.10 request close()

**Name**

request-close - Close a request file descriptor
Synopsis

```c
#include <unistd.h>

int close(int fd)
```

Arguments

- `fd` File descriptor returned by `ioctl MEDIA_IOC_REQUEST_ALLOC`.

Description

Closes the request file descriptor. Resources associated with the request are freed once all file descriptors associated with the request are closed and the driver has completed the request. See here for more information.

Return Value

close() returns 0 on success. On error, -1 is returned, and `errno` is set appropriately. Possible error codes are:

- **EBADF** `fd` is not a valid open file descriptor.

3.5.5.11 request ioctl()

Name

request_ioctl - Control a request file descriptor

Synopsis

```c
#include <sys/ioctl.h>

int ioctl(int fd, int cmd, void *argp)
```

Arguments

- `fd` File descriptor returned by `ioctl MEDIA_IOC_REQUEST_ALLOC`.

- `cmd` The request ioctl command code as defined in the media.h header file, for example `ioctl MEDIA_REQUEST_IOC_QUEUE`.

- `argp` Pointer to a request-specific structure.
Description

The `ioctl()` function manipulates request parameters. The argument `fd` must be an open file descriptor.

The `ioctl cmd` code specifies the request function to be called. It has encoded in it whether the argument is an input, output or read/write parameter, and the size of the argument `argp` in bytes.

Macros and structures definitions specifying request ioctl commands and their parameters are located in the `media.h` header file. All request ioctl commands, their respective function and parameters are specified in *Function Reference*.

Return Value

On success 0 is returned, on error -1 and the `errno` variable is set appropriately. The generic error codes are described at the *Generic Error Codes* chapter.

Command-specific error codes are listed in the individual command descriptions.

When an ioctl that takes an output or read/write parameter fails, the parameter remains unmodified.

3.5.5.12 request poll()

Name

request-poll - Wait for some event on a file descriptor

Synopsis

```c
#include <sys/poll.h>

int poll(struct pollfd *ufds, unsigned int nfds, int timeout)
```

Arguments

- `ufds` List of file descriptor events to be watched
- `nfds` Number of file descriptor events at the `ufds` array
- `timeout` Timeout to wait for events
Description

With the `poll()` function applications can wait for a request to complete.

On success `poll()` returns the number of file descriptors that have been selected (that is, file descriptors for which the `revents` field of the respective struct `pollfd` is non-zero). Request file descriptor set the `POLLPRI` flag in `revents` when the request was completed. When the function times out it returns a value of zero, on failure it returns -1 and the `errno` variable is set appropriately.

Attempting to poll for a request that is not yet queued will set the `POLLERR` flag in `revents`.

Return Value

On success, `poll()` returns the number of structures which have non-zero `revents` fields, or zero if the call timed out. On error -1 is returned, and the `errno` variable is set appropriately:

- **EBADF** One or more of the `ufds` members specify an invalid file descriptor.
- **EFAULT** `ufds` references an inaccessible memory area.
- **EINVAL** The `nfds` value exceeds the RLIMIT_NOFILE value. Use `getrlimit()` to obtain this value.

3.5.5.13 `ioctl` MEDIA_REQUEST_IOC_QUEUE

Name

MEDIA_REQUEST_IOC_QUEUE - Queue a request

Synopsis

```
MEDIA_REQUEST_IOC_QUEUE
int ioctl(int request_fd, MEDIA_REQUEST_IOC_QUEUE)
```

Arguments

- **request_fd** File descriptor returned by `ioctl MEDIA_IOC_REQUEST_ALLOC`.

3.5. Part IV - Media Controller API 1529
**Description**

If the media device supports requests, then this request ioctl can be used to queue a previously allocated request.

If the request was successfully queued, then the file descriptor can be polled to wait for the request to complete.

If the request was already queued before, then EBUSY is returned. Other errors can be returned if the contents of the request contained invalid or inconsistent data, see the next section for a list of common error codes. On error both the request and driver state are unchanged.

Once a request is queued, then the driver is required to gracefully handle errors that occur when the request is applied to the hardware. The exception is the EIO error which signals a fatal error that requires the application to stop streaming to reset the hardware state.

It is not allowed to mix queuing requests with queuing buffers directly (without a request). EBUSY will be returned if the first buffer was queued directly and you next try to queue a request, or vice versa.

A request must contain at least one buffer, otherwise this ioctl will return an ENOENT error.

**ReturnValue**

On success 0 is returned, on error -1 and the errno variable is set appropriately. The generic error codes are described at the *Generic Error Codes* chapter.

- **EBUSY** The request was already queued or the application queued the first buffer directly, but later attempted to use a request. It is not permitted to mix the two APIs.
- **ENOENT** The request did not contain any buffers. All requests are required to have at least one buffer. This can also be returned if some required configuration is missing in the request.
- **ENOMEM** Out of memory when allocating internal data structures for this request.
- **EINVAL** The request has invalid data.
- **EIO** The hardware is in a bad state. To recover, the application needs to stop streaming to reset the hardware state and then try to restart streaming.

**3.5.5.14 ioctl MEDIA_REQUEST_IOC_REINIT**

**Name**

MEDIA_REQUEST_IOC_REINIT - Re-initialize a request
Synopsis

MEDIA_REQUEST_IOC_REINIT

int ioctl(int request_fd, MEDIA_REQUEST_IOC_REINIT)

Arguments

request_fd  File descriptor returned by ioctl MEDIA_IOC_REQUEST_ALLOC.

Description

If the media device supports requests, then this request ioctl can be used to re-initialize a previously allocated request.

Re-initializing a request will clear any existing data from the request. This avoids having to close() a completed request and allocate a new request. Instead the completed request can just be re-initialized and it is ready to be used again.

A request can only be re-initialized if it either has not been queued yet, or if it was queued and completed. Otherwise it will set errno to EBUSY. No other error codes can be returned.

Return Value

On success 0 is returned, on error -1 and the errno variable is set appropriately.

EBUSY The request is queued but not yet completed.

3.6 Part V - Consumer Electronics Control API

This part describes the CEC: Consumer Electronics Control

3.6.1 Introduction

HDMI connectors provide a single pin for use by the Consumer Electronics Control protocol. This protocol allows different devices connected by an HDMI cable to communicate. The protocol for CEC version 1.4 is defined in supplements 1 (CEC) and 2 (HEAC or HDMI Ethernet and Audio Return Channel) of the HDMI 1.4a (**HDMI**) specification and the extensions added to CEC version 2.0 are defined in chapter 11 of the HDMI 2.0 (**HDMI2**) specification.

The bitrate is very slow (effectively no more than 36 bytes per second) and is based on the ancient AV.link protocol used in old SCART connectors. The protocol closely resembles a crazy Rube Goldberg contraption and is an unholy mix of low and high level messages. Some messages, especially those part of the HEAC protocol layered on top of CEC, need to be handled by the kernel, others can be handled either by the kernel or by userspace.

In addition, CEC can be implemented in HDMI receivers, transmitters and in USB devices that have an HDMI input and an HDMI output and that control just the CEC pin.

Drivers that support CEC will create a CEC device node (/dev/cecX) to give userspace access to the CEC adapter. The *ioctl CEC_ADAP_G_CAPS* ioctl will tell userspace what it is allowed to do.

In order to check the support and test it, it is suggested to download the **v4l-utils** package. It provides three tools to handle CEC:

- cec-ctl: the Swiss army knife of CEC. Allows you to configure, transmit and monitor CEC messages.
- cec-compliance: does a CEC compliance test of a remote CEC device to determine how compliant the CEC implementation is.
- cec-follower: emulates a CEC follower.

3.6.2 Function Reference

3.6.2.1 cec open()

**Name**

`cec-open` - Open a cec device
## Synopsis

```c
#include <fcntl.h>

int open(const char *device_name, int flags)
```

### Arguments

**device_name** Device to be opened.

**flags** Open flags. Access mode must be `O_RDWR`.

When the 0 NONBLOCK flag is given, the `CEC_RECEIVE` and `CEC_DQEVENT` ioctl will return the `EAGAIN` error code when no message or event is available, and ioctl `CEC_TRANSMIT`, `CEC_ADAP_S_PHYS_ADDR` and `CEC_ADAP_S_LOG_ADDR` all return 0. Other flags have no effect.

### Description

To open a cec device applications call `open()` with the desired device name. The function has no side effects; the device configuration remain unchanged.

When the device is opened in read-only mode, attempts to modify its configuration will result in an error, and `errno` will be set to `EBADF`.

### Return Value

`open()` returns the new file descriptor on success. On error, -1 is returned, and `errno` is set appropriately. Possible error codes include:

- **EACCES** The requested access to the file is not allowed.
- **EMFILE** The process already has the maximum number of files open.
- **ENFILE** The system limit on the total number of open files has been reached.
- **ENOMEM** Insufficient kernel memory was available.
- **ENXIO** No device corresponding to this device special file exists.

### 3.6.2.2 cec close()

### Name

cec-close - Close a cec device
Synopsis

#include <unistd.h>

int close(int fd)

Arguments

fd  File descriptor returned by open().

Description

Closes the cec device. Resources associated with the file descriptor are freed. The device configuration remain unchanged.

Return Value

close() returns 0 on success. On error, -1 is returned, and errno is set appropriately. Possible error codes are:

EBADF  fd is not a valid open file descriptor.

3.6.2.3  cec ioctl()

Name

cec_ioctl - Control a cec device

Synopsis

#include <sys/ioctl.h>

int ioctl(int fd, int request, void *argp)

Arguments

fd  File descriptor returned by open().

request  CEC ioctl request code as defined in the cec.h header file, for example CEC_ADAP_G_CAPS.

argp  Pointer to a request-specific structure.
Description

The ioctl() function manipulates cec device parameters. The argument fd must be an open file descriptor.

The ioctl request code specifies the cec function to be called. It has encoded in it whether the argument is an input, output or read/write parameter, and the size of the argument argp in bytes.

Macros and structures definitions specifying cec ioctl requests and their parameters are located in the cec.h header file. All cec ioctl requests, their respective function and parameters are specified in Function Reference.

Return Value

On success 0 is returned, on error -1 and the errno variable is set appropriately. The generic error codes are described at the Generic Error Codes chapter.

Request-specific error codes are listed in the individual requests descriptions.

When an ioctl that takes an output or read/write parameter fails, the parameter remains unmodified.

3.6.2.4 cec poll()

Name

cec-poll - Wait for some event on a file descriptor

Synopsis

```c
#include <sys/poll.h>

int poll(struct pollfd *ufds, unsigned int nfds, int timeout)
```

Arguments

- **ufds** List of FD events to be watched
- **nfds** Number of FD events at the *ufds array
- **timeout** Timeout to wait for events
Description

With the poll() function applications can wait for CEC events. On success poll() returns the number of file descriptors that have been selected (that is, file descriptors for which the revents field of the respective struct pollfd is non-zero). CEC devices set the POLLIN and POLLRDNORM flags in the revents field if there are messages in the receive queue. If the transmit queue has room for new messages, the POLLOUT and POLLWRNORM flags are set. If there are events in the event queue, then the POLLPRI flag is set. When the function times out it returns a value of zero, on failure it returns -1 and the errno variable is set appropriately.

For more details see the poll() manual page.

Return Value

On success, poll() returns the number structures which have non-zero revents fields, or zero if the call timed out. On error -1 is returned, and the errno variable is set appropriately:

EBADF One or more of the ufds members specify an invalid file descriptor.
EFAULT ufds references an inaccessible memory area.
EINVAL The nfds value exceeds the RLIMIT_NOFILE value. Use getrlimit() to obtain this value.

3.6.2.5 ioctl CEC_ADAP_G_CAPS

Name

CEC_ADAP_G_CAPS - Query device capabilities

Synopsis

CEC_ADAP_G_CAPS

int ioctl(int fd, CEC_ADAP_G_CAPS, struct cec_caps *argp)

Arguments

fd File descriptor returned by open().
argp
Description

All cec devices must support `ioctl CEC_ADAP_G_CAPS`. To query device information, applications call the ioctl with a pointer to a struct `cec_caps`. The driver fills the structure and returns the information to the application. The ioctl never fails.

### cec_caps

<table>
<thead>
<tr>
<th>char</th>
<th>driver[32]</th>
<th>The name of the cec adapter driver.</th>
</tr>
</thead>
<tbody>
<tr>
<td>char</td>
<td>name[32]</td>
<td>The name of this CEC adapter. The combination driver and name must be unique.</td>
</tr>
<tr>
<td>u32</td>
<td>available_log_addrs</td>
<td>The maximum number of logical addresses that can be configured.</td>
</tr>
<tr>
<td>u32</td>
<td>capabilities</td>
<td>The capabilities of the CEC adapter, see <code>CEC Capabilities Flags</code>.</td>
</tr>
<tr>
<td>u32</td>
<td>version</td>
<td>CEC Framework API version, formatted with the <code>KERNEL_VERSION()</code> macro.</td>
</tr>
</tbody>
</table>
Userspace has to configure the physical address by calling `ioctl CEC_ADAP_S_PHYS_ADDR`. If this capability isn’t set, then setting the physical address is handled by the kernel whenever the EDID is set (for an HDMI receiver) or read (for an HDMI transmitter).

Userspace has to configure the logical addresses by calling `ioctl CEC_ADAP_S_LOG_ADDRS`. If this capability isn’t set, then the kernel will have configured this.

Userspace can transmit CEC messages by calling `ioctl CEC_TRANSMIT`. This implies that userspace can be a follower as well, since being able to transmit messages is a prerequisite of becoming a follower. If this capability isn’t set, then the kernel will handle all CEC transmits and process all CEC messages it receives.

Userspace can use the passthrough mode by calling `ioctl CEC_S_MODE`.

This adapter supports the remote control protocol.

The CEC hardware can monitor all messages, not just directed and broadcast messages.

The CEC hardware is only active if the HDMI Hotplug Detect pin is high. This makes it impossible to use CEC to wake up displays that set the HPD pin low when in standby mode, but keep the CEC bus alive.

The CEC hardware can monitor CEC pin changes from low to high voltage and vice versa. When in pin monitoring mode the application will receive `CEC_EVENT_PIN_CEC_LOW` and `CEC_EVENT_PIN_CEC_HIGH` events.

If this capability is set, then `ioctl CEC_ADAP_G_CONNECTOR_INFO` can be used.
Return Value

On success 0 is returned, on error -1 and the errno variable is set appropriately. The generic error codes are described at the Generic Error Codes chapter.

3.6.2.6 ioctls CEC_ADAP_G_LOG_ADDRS and CEC_ADAP_S_LOG_ADDRS

Name

CEC_ADAP_G_LOG_ADDRS, CEC_ADAP_S_LOG_ADDRS - Get or set the logical addresses

Synopsis

CEC_ADAP_G_LOG_ADDRS

int ioctl(int fd, CEC_ADAP_G_LOG_ADDRS, struct cec_log_addrs *argp)

CEC_ADAP_S_LOG_ADDRS

int ioctl(int fd, CEC_ADAP_S_LOG_ADDRS, struct cec_log_addrs *argp)

Arguments

fd File descriptor returned by open().

argp Pointer to struct cec_log_addrs.

Description

To query the current CEC logical addresses, applications call ioctl CEC_ADAP_G_LOG_ADDRS with a pointer to a struct cec_log_addrs where the driver stores the logical addresses.

To set new logical addresses, applications fill in struct cec_log_addrs and call ioctl CEC_ADAP_S_LOG_ADDRS with a pointer to this struct. The ioctl CEC_ADAP_S_LOG_ADDRS is only available if CEC_CAP_LOG_ADDRS is set (the ENOTTY error code is returned otherwise). The ioctl CEC_ADAP_S_LOG_ADDRS can only be called by a file descriptor in initiator mode (see ioctls CEC_G_MODE and CEC_S_MODE), if not the EBUSY error code will be returned.

To clear existing logical addresses set num_log_addrs to 0. All other fields will be ignored in that case. The adapter will go to the unconfigured state and the cec_version, vendor_id and osd_name fields are all reset to their default values (CEC version 2.0, no vendor ID and an empty OSD name).

If the physical address is valid (see ioctl CEC_ADAP_S_PHYS_ADDR), then this ioctl will block until all requested logical addresses have been claimed. If the file descriptor is in non-blocking mode then it will not wait for the logical addresses to be claimed, instead it just returns 0.

A CEC_EVENT_STATE_CHANGE event is sent when the logical addresses are claimed or cleared.

Attempting to call ioctl CEC_ADAP_S_LOG_ADDRS when logical address types are already defined will return with error EBUSY.
### cec_log_addr

Table 272: struct cec_log_addr

<table>
<thead>
<tr>
<th>Type</th>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>__u8</td>
<td>log_addr[CEC_MAX_LOG_ADDRS]</td>
<td>The actual logical addresses that were claimed. This is set by the driver. If no logical address could be claimed, then it is set to CEC_LOG_ADDR_INVALID. If this adapter is Unregistered, then log_addr[0] is set to 0xf and all others to CEC_LOG_ADDR_INVALID.</td>
</tr>
<tr>
<td>__u16</td>
<td>log_addr_mask</td>
<td>The bitmask of all logical addresses this adapter has claimed. If this adapter is Unregistered then log_addr_mask sets bit 15 and clears all other bits. If this adapter is not configured at all, then log_addr_mask is set to 0. Set by the driver.</td>
</tr>
<tr>
<td>__u8</td>
<td>cec_version</td>
<td>The CEC version that this adapter shall use. See CEC Versions. Used to implement the CEC_MSG_CEC_VERSION and CEC_MSG_REPORT_FEATURES messages. Note that CEC_OP_CEC_VERSION_1_3A is not allowed by the CEC framework.</td>
</tr>
<tr>
<td>__u8</td>
<td>num_log_addrs</td>
<td>Number of logical addresses to set up. Must be ≤ available_log_addrs as returned by ioctl CEC_ADAP_G_CAPS. All arrays in this structure are only filled up to index available_log_addrs-1. The remaining array elements will be ignored. Note that the CEC 2.0 standard allows for a maximum of 2 logical addresses, although some hardware has support for more. CEC_MAX_LOG_ADDRS is 4. The driver will return the actual number of logical addresses it could claim, which may be less than what was requested. If this field is set to 0, then the CEC adapter shall clear all claimed logical addresses and all other fields will be ignored.</td>
</tr>
<tr>
<td>__u32</td>
<td>vendor_id</td>

</tr>
</tbody>
</table>
Return Value

On success 0 is returned, on error -1 and the `errno` variable is set appropriately. The generic error codes are described at the Generic Error Codes chapter.

The `ioctl CEC_ADAP_S_LOG_ADDRS` can return the following error codes:

**ENOTTY** The `CEC_CAP_LOG_ADDRS` capability wasn’t set, so this ioctl is not supported.

**EBUSY** The CEC adapter is currently configuring itself, or it is already configured and `num_log_addrs` is non-zero, or another filehandle is in exclusive follower or initiator mode, or the filehandle is in mode `CEC_MODE_NO_INITIATOR`.

**EINVAL** The contents of struct `cec_log_addrs` is invalid.

### 3.6.2.7 ioctls CEC_ADAP_G_PHYS_ADDR and CEC_ADAP_S_PHYS_ADDR

**Name**

CEC_ADAP_G_PHYS_ADDR, CEC_ADAP_S_PHYS_ADDR - Get or set the physical address

**Synopsis**

**CEC_ADAP_G_PHYS_ADDR**

```c
int ioctl(int fd, CEC_ADAP_G_PHYS_ADDR, __u16 *argp)
```

**CEC_ADAP_S_PHYS_ADDR**

```c
int ioctl(int fd, CEC_ADAP_S_PHYS_ADDR, __u16 *argp)
```

**Arguments**

- **fd** File descriptor returned by `open()`.
- **argp** Pointer to the CEC address.

**Description**

To query the current physical address applications call `ioctl CEC_ADAP_G_PHYS_ADDR` with a pointer to a __u16 where the driver stores the physical address.

To set a new physical address applications store the physical address in a __u16 and call `ioctl CEC_ADAP_S_PHYS_ADDR` with a pointer to this integer. The `ioctl CEC_ADAP_S_PHYS_ADDR` is only available if `CEC_CAP_PHYS_ADDR` is set (the ENOTTY error code will be returned otherwise). The `ioctl CEC_ADAP_S_PHYS_ADDR` can only be called by a file descriptor in initiator mode (see `ioctls CEC_G_MODE` and `CEC_S_MODE`), if not the EBUSY error code will be returned.

To clear an existing physical address use `CEC_PHYS_ADDR_INVALID`. The adapter will go to the unconfigured state.

If logical address types have been defined (see `ioctl CEC_ADAP_S_LOG_ADDRS`), then this ioctl will block until all requested logical addresses have been claimed. If the file descriptor is in
non-blocking mode then it will not wait for the logical addresses to be claimed, instead it just returns 0.

A **CEC_EVENT_STATE_CHANGE** event is sent when the physical address changes.

The physical address is a 16-bit number where each group of 4 bits represent a digit of the physical address a.b.c.d where the most significant 4 bits represent ‘a’. The CEC root device (usually the TV) has address 0.0.0.0. Every device that is hooked up to an input of the TV has address a.0.0.0 (where ‘a’ is \(\geq 1\)), devices hooked up to those in turn have addresses a.b.0.0, etc. So a topology of up to 5 devices deep is supported. The physical address a device shall use is stored in the EDID of the sink.

For example, the EDID for each HDMI input of the TV will have a different physical address of the form a.0.0.0 that the sources will read out and use as their physical address.

**Return Value**

On success 0 is returned, on error -1 and the **errno** variable is set appropriately. The generic error codes are described at the *Generic Error Codes* chapter.

The **ioctl CEC_ADAP_S_PHYS_ADDR** can return the following error codes:

**ENOTTY** The CEC_CAP_PHYS_ADDR capability wasn’t set, so this ioctl is not supported.

**EBUSY** Another filehandle is in exclusive follower or initiator mode, or the filehandle is in mode CEC_MODE_NO_INITIATOR.

**EINVAL** The physical address is malformed.

### 3.6.2.8 ioctl CEC_ADAP_G_CONNECTOR_INFO

**Name**

CEC_ADAP_G_CONNECTOR_INFO - Query HDMI connector information

**Synopsis**

```c
int ioctl(int fd, CEC_ADAP_G_CONNECTOR_INFO, struct cec_connector_info *argp)
```

**Arguments**

- **fd** File descriptor returned by `open()`.
- **argp**
Description

Using this ioctl an application can learn which HDMI connector this CEC device corresponds to. While calling this ioctl the application should provide a pointer to a cec_connector_info struct which will be populated by the kernel with the info provided by the adapter’s driver. This ioctl is only available if the CEC_CAP_CONNECTOR_INFO capability is set.

cec_connector_info

Table 278: struct cec_connector_info

| __u32 type | The type of connector this adapter is associated with. |
| union (anonymous) | |
| struct cec_drm_connector_info | |

Table 279: Connector types

| CEC_CONNECTOR_TYPE_NO_CONNECTOR | No connector is associated with the adapter/the information is not provided by the driver. |
| CEC_CONNECTOR_TYPE_DRM | Indicates that a DRM connector is associated with this adapter. Information about the connector can be found in struct cec_drm_connector_info. |

cec_drm_connector_info

Table 280: struct cec_drm_connector_info

| __u32 card_no | DRM card number: the number from a card’s path, e.g. 0 in case of /dev/card0. |
| __u32 connector_id | DRM connector ID. |

3.6.2.9 ioctl CEC_DQEVENT

Name

CEC_DQEVENT - Dequeue a CEC event
**Synopsis**

**CEC_DQEVENT**

```c
int ioctl(int fd, CEC_DQEVENT, struct cec_event *argp)
```

**Arguments**

- **fd**: File descriptor returned by `open()`.
- **argp**: Pointer to the structure containing event data.

**Description**

CEC devices can send asynchronous events. These can be retrieved by calling `CEC_DQEVENT()`. If the file descriptor is in non-blocking mode and no event is pending, then it will return -1 and set errno to the `EAGAIN` error code.

The internal event queues are per-file handle and per-event type. If there is no more room in a queue then the last event is overwritten with the new one. This means that intermediate results can be thrown away but that the latest event is always available. This also means that it is possible to read two successive events that have the same value (e.g. two `CEC_EVENT_STATE_CHANGE` events with the same state). In that case the intermediate state changes were lost but it is guaranteed that the state did change in between the two events.

**cec_event_state_change**

| __u16 phys_addr | The current physical address. This is CEC_PHYS_ADDR_INVALID if no valid physical address is set. |
| __u16 log_addr_mask | The current set of claimed logical addresses. This is 0 if no logical addresses are claimed or if phys_addr is CEC_PHYS_ADDR_INVALID. If bit 15 is set (1 << CEC_LOG_ADDR_UNREGISTERED) then this device has the unregistered logical address. In that case all other bits are 0. |
| __u16 have_conn_info | If non-zero, then HDMI connector information is available. This field is only valid if CEC_CAP_CONNECTOR_INFO is set. If that capability is set and have_conn_info is zero, then that indicates that the HDMI connector device is not instantiated, either because the HDMI driver is still configuring the device or because the HDMI device was unbound. |

**cec_event_lost_msgs**
Table 282: struct cec_event_lost_msgs

| __u32 lost_msgs | Set to the number of lost messages since the filehandle was opened or since the last time this event was dequeued for this filehandle. The messages lost are the oldest messages. So when a new message arrives and there is no more room, then the oldest message is discarded to make room for the new one. The internal size of the message queue guarantees that all messages received in the last two seconds will be stored. Since messages should be replied to within a second according to the CEC specification, this is more than enough. |

The cec_event

**Return Value**

On success 0 is returned, on error -1 and the **errno** variable is set appropriately. The generic error codes are described at the *Generic Error Codes* chapter.

The **ioctl CEC_DQEVENT** can return the following error codes:

**EAGAIN** This is returned when the filehandle is in non-blocking mode and there are no pending events.

**ERESTARTSYS** An interrupt (e.g. Ctrl-C) arrived while in blocking mode waiting for events to arrive.

### 3.6.2.10 **ioctl CEC_G_MODE and CEC_S_MODE**

CEC_G_MODE, CEC_S_MODE - Get or set exclusive use of the CEC adapter

**Synopsis**

**CEC_G_MODE**

```c
int ioctl(int fd, CEC_G_MODE, __u32 *argp)
```

**CEC_S_MODE**

```c
int ioctl(int fd, CEC_S_MODE, __u32 *argp)
```

**Arguments**

- **fd** File descriptor returned by `open()`.
- **argp** Pointer to CEC mode.
Description

By default any filehandle can use `ioctl CEC_RECEIVE` and `CEC_TRANSMIT`, but in order to prevent applications from stepping on each others toes it must be possible to obtain exclusive access to the CEC adapter. This ioctl sets the filehandle to initiator and/or follower mode which can be exclusive depending on the chosen mode. The initiator is the filehandle that is used to initiate messages, i.e. it commands other CEC devices. The follower is the filehandle that receives messages sent to the CEC adapter and processes them. The same filehandle can be both initiator and follower, or this role can be taken by two different filehandles.

When a CEC message is received, then the CEC framework will decide how it will be processed. If the message is a reply to an earlier transmitted message, then the reply is sent back to the filehandle that is waiting for it. In addition the CEC framework will process it.

If the message is not a reply, then the CEC framework will process it first. If there is no follower, then the message is just discarded and a feature abort is sent back to the initiator if the framework couldn’t process it. If there is a follower, then the message is passed on to the follower who will use `ioctl CEC_RECEIVE` to dequeue the new message. The framework expects the follower to make the right decisions.

The CEC framework will process core messages unless requested otherwise by the follower. The follower can enable the passthrough mode. In that case, the CEC framework will pass on most core messages without processing them and the follower will have to implement those messages. There are some messages that the core will always process, regardless of the passthrough mode. See Core Message Processing for details.

If there is no initiator, then any CEC filehandle can use `ioctl CEC_TRANSMIT`. If there is an exclusive initiator then only that initiator can call `ioctl CEC_RECEIVE` and `CEC_TRANSMIT`. The follower can of course always call `ioctl CEC_TRANSMIT`.

Available initiator modes are:

<table>
<thead>
<tr>

<th>0x00</th>
<th>This is not a follower (the default when the device is opened).</th>
</tr>
</thead>
<tbody>
<tr>
<td>CEC_MODE_FOLLOWER</td>
<td>0x10</td>
<td>This is a follower and it will receive CEC messages unless there is an exclusive follower. You cannot become a follower if CEC_CAP_TRANSMIT is not set or if CEC_MODE_NO_INITIATOR was specified, the EINVAL error code is returned in that case.</td>
</tr>
<tr>
<td>CEC_MODE_EXCL_FOLLOWER</td>
<td>0x20</td>
<td>This is an exclusive follower and only this file descriptor will receive CEC messages for processing. If someone else is already the exclusive follower then an attempt to become one will return the EBUSY error code. You cannot become a follower if CEC_CAP_TRANSMIT is not set or if CEC_MODE_NO_INITIATOR was specified, the EINVAL error code is returned in that case.</td>
</tr>
<tr>
<td>CEC_MODE_EXCL_FOLLOWER_PASSTHRU</td>
<td>0x30</td>
<td>This is an exclusive follower and only this file descriptor will receive CEC messages for processing. In addition it will put the CEC device into passthrough mode, allowing the exclusive follower to handle most core messages instead of relying on the CEC framework for that. If someone else is already the exclusive follower then an attempt to become one will return the EBUSY error code. You cannot become a follower if CEC_CAP_TRANSMIT is not set or if CEC_MODE_NO_INITIATOR was specified, the EINVAL error code is returned in that case.</td>
</tr>
<tr>
<td>CEC_MODE_MONITOR_PIN</td>
<td>0xd0</td>
<td>Put the file descriptor into pin monitoring mode. Can only be used in combination with CEC_MODE_NO_INITIATOR, otherwise the EINVAL error code will be returned. This mode requires that the CEC_CAP_MONITOR_PIN capability is set, otherwise the EINVAL error code is returned. While in pin monitoring mode this file descriptor can receive the CEC_EVENT_PIN_CEC_LOW and CEC_EVENT_PIN_CEC_HIGH events to see the low-level CEC pin transitions. This is very useful for debugging. This mode is only allowed if the process has the CAP_NET_ADMIN capability. If that is not set, then the EPERM error code is returned.</td>
</tr>
</tbody>
</table>

Continued on next page
Table 287 – continued from previous page

| CEC_MODE_MONITOR | 0xe0 | Put the file descriptor into monitor mode. Can only be used in combination with CEC_MODE_NO_INITIATOR, otherwise the EINVAL error code will be returned. In monitor mode all messages this CEC device transmits and all messages it receives (both broadcast messages and directed messages for one its logical addresses) will be reported. This is very useful for debugging. This is only allowed if the process has the CAP_NET_ADMIN capability. If that is not set, then the EPERM error code is returned. |

| CEC_MODE_MONITOR_ALL | 0xf0 | Put the file descriptor into ‘monitor all’ mode. Can only be used in combination with CEC_MODE_NO_INITIATOR, otherwise the EINVAL error code will be returned. In ‘monitor all’ mode all messages this CEC device transmits and all messages it receives, including directed messages for other CEC devices, will be reported. This is very useful for debugging, but not all devices support this. This mode requires that the CEC_CAP_MONITOR_ALL capability is set, otherwise the EINVAL error code is returned. This is only allowed if the process has the CAP_NET_ADMIN capability. If that is not set, then the EPERM error code is returned. |

<td><strong>CEC_MSG_REPORT_PHYSICAL_ADDR</strong></td>
<td>The CEC framework will make note of the reported physical address and then just pass the message on to the follower(s).</td>
</tr>
</tbody>
</table>
Return Value

On success 0 is returned, on error -1 and the errno variable is set appropriately. The generic error codes are described at the Generic Error Codes chapter.

The ioctl CEC_S_MODE can return the following error codes:

EINVAL  The requested mode is invalid.
EPERM  Monitor mode is requested, but the process does have the CAP_NET_ADMIN capability.
EBUSY  Someone else is already an exclusive follower or initiator.

3.6.2.11 ioctl CEC_RECEIVE and CEC_TRANSMIT

Name

CEC_RECEIVE, CEC_TRANSMIT - Receive or transmit a CEC message

Synopsis

CEC_RECEIVE
int ioctl(int fd, CEC_RECEIVE, struct cec_msg *argp)

CEC_TRANSMIT
int ioctl(int fd, CEC_TRANSMIT, struct cec_msg *argp)

Arguments

fd  File descriptor returned by open().
argp  Pointer to struct cec_msg.

Description

To receive a CEC message the application has to fill in the timeout field of struct cec_msg and pass it to ioctl CEC_RECEIVE. If the file descriptor is in non-blocking mode and there are no received messages pending, then it will return -1 and set errno to the EAGAIN error code. If the file descriptor is in blocking mode and timeout is non-zero and no message arrived within timeout milliseconds, then it will return -1 and set errno to the ETIMEDOUT error code.

A received message can be:

1. a message received from another CEC device (the sequence field will be 0).
2. the result of an earlier non-blocking transmit (the sequence field will be non-zero).

To send a CEC message the application has to fill in the struct cec_msg and pass it to ioctl CEC_TRANSMIT. The ioctl CEC_TRANSMIT is only available if CEC_CAP_TRANSMIT is set. If there is no more room in the transmit queue, then it will return -1 and set errno to the EBUSY error code. The transmit queue has enough room for 18 messages (about 1 second worth of
2-byte messages). Note that the CEC kernel framework will also reply to core messages (see Core Message Processing), so it is not a good idea to fully fill up the transmit queue.

If the file descriptor is in non-blocking mode then the transmit will return 0 and the result of the transmit will be available via ioctl CEC_RECEIVE once the transmit has finished (including waiting for a reply, if requested).

The sequence field is filled in for every transmit and this can be checked against the received messages to find the corresponding transmit result.

Normally calling ioctl CEC_TRANSMIT when the physical address is invalid (due to e.g. a disconnect) will return ENONET.

However, the CEC specification allows sending messages from ‘Unregistered’ to ‘TV’ when the physical address is invalid since some TVs pull the hotplug detect pin of the HDMI connector low when they go into standby, or when switching to another input.

When the hotplug detect pin goes low the EDID disappears, and thus the physical address, but the cable is still connected and CEC still works. In order to detect/wake up the device it is allowed to send poll and ‘Image/TextView On’ messages from initiator 0xf (‘Unregistered’) to destination 0 (‘TV’).

cec_msg

<table>
<thead>
<tr>
<th>Field Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>__u64 tx_ts</td>
<td>Timestamp in ns of when the last byte of the message was transmitted. The timestamp has been taken from the CLOCK_MONOTONIC clock. To access the same clock from userspace use clock_gettime().</td>
</tr>
<tr>
<td>__u64 rx_ts</td>
<td>Timestamp in ns of when the last byte of the message was received. The timestamp has been taken from the CLOCK_MONOTONIC clock. To access the same clock from userspace use clock_gettime().</td>
</tr>
<tr>
<td>__u32 len</td>
<td>The length of the message. For ioctl CEC_TRANSMIT this is filled in by the application. The driver will fill this in for ioctl CEC_RECEIVE. For ioctl CEC_TRANSMIT it will be filled in by the driver with the length of the reply message if reply was set.</td>
</tr>
<tr>
<td>__u32 timeout</td>
<td>The timeout in milliseconds. This is the time the device will wait for a message to be received before timing out. If it is set to 0, then it will wait indefinitely when it is called by ioctl CEC_RECEIVE. If it is 0 and it is called by ioctl CEC_TRANSMIT, then it will be replaced by 1000 if the reply is non-zero or ignored if reply is 0.</td>
</tr>
<tr>
<td>__u32 sequence</td>
<td>A non-zero sequence number is automatically assigned by the CEC framework for all transmitted messages. It is used by the CEC framework when it queues the transmit result (when transmit was called in non-blocking mode). This allows the application to associate the received message with the original transmit.</td>
</tr>
<tr>
<td>__u32 flags</td>
<td>Flags. See Flags for struct cec_msg for a list of available flags.</td>
</tr>
<tr>
<td>__u8 tx_status</td>
<td>The status bits of the transmitted message. See CEC Transmit Status for the possible status values. It is 0 if this message was received, not transmitted.</td>
</tr>
</tbody>
</table>

Continued on next page
| __u8 | msg[16] | The message payload. For `ioctl CEC_TRANSMIT` this is filled in by the application. The driver will fill this in for `ioctl CEC_RECEIVE`. For `ioctl CEC_TRANSMIT` it will be filled in by the driver with the payload of the reply message if timeout was set. |
| __u8 | reply | Wait until this message is replied. If reply is 0 and the timeout is 0, then don’t wait for a reply but return after transmitting the message. Ignored by `ioctl CEC_RECEIVE`. The case where reply is 0 (this is the opcode for the Feature Abort message) and timeout is non-zero is specifically allowed to make it possible to send a message and wait up to timeout milliseconds for a Feature Abort reply. In this case rx_status will either be set to `CEC_RX_STATUS_TIMEOUT` or `CEC_RX_STATUS_FEATURE_ABORT`. If the transmitter message is CEC_MSG_INITIATE_ARC then the reply values CEC_MSG_REPORT_ARC_INITIATED and CEC_MSG_REPORT_ARC_TERMINATED are processed differently: either value will match both possible replies. The reason is that the CEC_MSG_INITIATE_ARC message is the only CEC message that has two possible replies other than Feature Abort. The reply field will be updated with the actual reply so that it is synchronized with the contents of the received message. |
| __u8 | rx_status | The status bits of the received message. See CEC Receive Status for the possible status values. It is 0 if this message was transmitted, not received, unless this is the reply to a transmitted message. In that case both rx_status and tx_status are set. |
| __u8 | tx_status | The status bits of the transmitted message. See CEC Transmit Status for the possible status values. It is 0 if this message was received, not transmitted. |
| __u8 | tx_arb_lost_cnt | A counter of the number of transmit attempts that resulted in the Arbitration Lost error. This is only set if the hardware supports this, otherwise it is always 0. This counter is only valid if the CEC_TX_STATUS_ARB_LOST status bit is set. |
| __u8 | tx_nack_cnt | A counter of the number of transmit attempts that resulted in the Not Acknowledged error. This is only set if the hardware supports this, otherwise it is always 0. This counter is only valid if the CEC_TX_STATUS_NACK status bit is set. |
| __u8 | tx_low_drive_cnt | A counter of the number of transmit attempts that resulted in the Arbitration Lost error. This is only set if the hardware supports this, otherwise it is always 0. This counter is only valid if the CEC_TX_STATUS_LOW_DRIVE status bit is set. |
| __u8 | tx_error_cnt | A counter of the number of transmit errors other than Arbitration Lost or Not Acknowledged. This is only set if the hardware supports this, otherwise it is always 0. This counter is only valid if the CEC_TX_STATUS_ERROR status bit is set. |

</tr>
<tr>
<td>CEC_RX_STATUS_FEATURE_ABORT</td>
<td>0x04</td>
<td>The message was received successfully but the reply was CEC_MSG_FEATURE_ABORT. This status is only set if this message was the reply to an earlier transmitted message.</td>
</tr>
<tr>
<td>CEC_RX_STATUS_ABORTED</td>
<td>0x08</td>
<td>The wait for a reply to an earlier transmitted message was aborted because the HDMI cable was disconnected, the adapter was unconfigured or the CEC_TRANSMIT that waited for a reply was interrupted.</td>
</tr>
</tbody>
</table>

### Return Value

On success 0 is returned, on error -1 and the errno variable is set appropriately. The generic error codes are described at the *Generic Error Codes* chapter.

The `ioctl CEC.Receive` can return the following error codes:

- **EINVAL** No messages are in the receive queue, and the filehandle is in non-blocking mode.
- **ETIMEDOUT** The timeout was reached while waiting for a message.
- **ERESTARTSYS** The wait for a message was interrupted (e.g. by Ctrl-C).

The `ioctl CEC.TRANSMIT` can return the following error codes:

- **ENOTTY** The CEC_CAP.TRANSMIT capability wasn’t set, so this ioctl is not supported.
- **EPERM** The CEC adapter is not configured, i.e. `ioctl CEC_ADAP.S.LOG.ADDR` has never been called, or CEC_MSG_FL_RAW was used from a process that did not have the CAP_SYS_RAWI0 capability.
- **ENONET** The CEC adapter is not configured, i.e. `ioctl CEC_ADAP.S.LOG.ADDR` was called, but the physical address is invalid so no logical address was claimed. An exception is made in this case for transmits from initiator 0xf (‘Unregistered’) to destination 0 (‘TV’). In that case the transmit will proceed as usual.
- **EBUSY** Another filehandle is in exclusive follower or initiator mode, or the filehandle is in mode CEC_MODE_NO_INITIATOR. This is also returned if the transmit queue is full.
- **EINVAL** The contents of struct cec_msg is invalid.
- **ERESTARTSYS** The wait for a successful transmit was interrupted (e.g. by Ctrl-C).
3.6.3 CEC Pin Framework Error Injection

The CEC Pin Framework is a core CEC framework for CEC hardware that only has low-level support for the CEC bus. Most hardware today will have high-level CEC support where the hardware deals with driving the CEC bus, but some older devices aren’t that fancy. However, this framework also allows you to connect the CEC pin to a GPIO on e.g. a Raspberry Pi and you have now made a CEC adapter.

What makes doing this so interesting is that since we have full control over the bus it is easy to support error injection. This is ideal to test how well CEC adapters can handle error conditions.

Currently only the cec-gpio driver (when the CEC line is directly connected to a pull-up GPIO line) and the AllWinner A10/A20 drm driver support this framework.

If CONFIG_CEC_PIN_ERROR_INJ is enabled, then error injection is available through debugfs. Specifically, in /sys/kernel/debug/cec/cecX/ there is now an error-inj file.

Note: The error injection commands are not a stable ABI and may change in the future.

With cat error-inj you can see both the possible commands and the current error injection status:

```
$ cat /sys/kernel/debug/cec/cec0/error-inj
# Clear error injections:
#    clear          clear all rx and tx error injections
#    rx-clear       clear all rx error injections
#    tx-clear       clear all tx error injections
#    <op> clear     clear all rx and tx error injections for <op>
#    <op> rx-clear  clear all rx error injections for <op>
#    <op> tx-clear  clear all tx error injections for <op>
#    RX error injection:
#        [,<mode>] rx-nack        NACK the message instead of sending an ACK
#        [,<mode>] rx-low-drive    force a low-drive condition at this bit position
#        [,<mode>] rx-add-byte     add a spurious byte to the received CEC message
#        [,<mode>] rx-remove-byte  remove the last byte from the received CEC message
#        any[,<mode>] rx-arb-lost   generate a POLL message to trigger an arbitration lost
#    TX error injection settings:
#        tx-ignore-nack-until-eom  ignore early NACKs until EOM
#        tx-custom-low-usecs <usecs> define the 'low' time for the custom pulse
#        tx-custom-high-usecs <usecs> define the 'high' time for the custom pulse
#        tx-custom-pulse            transmit the custom pulse once the bus is idle
#    TX error injection:
#        [,<mode>] tx-no-eom       don't set the EOM bit
#        [,<mode>] tx-early-eom    set the EOM bit one byte too soon
#        [,<mode>] tx-add-bytes <num> append <num> (1-255) spurious bytes to the message
#        [,<mode>] tx-remove-byte  drop the last byte from the message
#        [,<mode>] tx-short-bit <bit> make this bit shorter than allowed
#        [,<mode>] tx-long-bit <bit> make this bit longer than allowed
#        [,<mode>] tx-custom-bit <bit> send the custom pulse instead of this bit
#        [,<mode>] tx-short-start  send a start pulse that's too short
```
### LinuxMediaDocumentation

| #<op>,<mode> | tx-long-start | send a start pulse that's too long |
| #<op>,<mode> | tx-custom-start | send the custom pulse instead of the start pulse |
| #<op>,<mode> | tx-last-bit <bit> | stop sending after this bit |
| #<op>,<mode> | tx-low-drive <bit> | force a low-drive condition at this bit position |
| #<op> | CEC message opcode (0-255) or 'any' |
| #<mode> | 'once' (default), 'always', 'toggle' or 'off' |
| #<bit> | CEC message bit (0-159) |
| #<poll> | 10 bits per 'byte': bits 0-7: data, bit 8: EOM, bit 9: ACK |
| #<usecs> | CEC poll message used to test arbitration lost (0x00-0xff, default 0x0f) |
|         | microseconds (0-10000000, default 1000) |

You can write error injection commands to error-inj using echo 'cmd' >error-inj or cat cmd.txt >error-inj. The cat error-inj output contains the current error commands. You can save the output to a file and use it as an input to error-inj later.

### 3.6.3.1 Basic Syntax

Leading spaces/tabs are ignored. If the next character is a # or the end of the line was reached, then the whole line is ignored. Otherwise a command is expected.

The error injection commands fall in two main groups: those relating to receiving CEC messages and those relating to transmitting CEC messages. In addition, there are commands to clear existing error injection commands and to create custom pulses on the CEC bus.

Most error injection commands can be executed for specific CEC opcodes or for all opcodes (any). Each command also has a ‘mode’ which can be off (can be used to turn off an existing error injection command), once (the default) which will trigger the error injection only once for the next received or transmitted message, always to always trigger the error injection and toggle to toggle the error injection on or off for every transmit or receive.

So ‘any rx-nack’ will NACK the next received CEC message, ‘any,always rx-nack’ will NACK all received CEC messages and ‘0x82,toggle rx-nack’ will only NACK if an Active Source message was received and do that only for every other received message.

After an error was injected with mode once the error injection command is cleared automatically, so once is a one-time deal.

All combinations of <op> and error injection commands can co-exist. So this is fine:

```
0x9e tx-add-bytes 1
0x9e tx-early-eom
0x9f tx-add-bytes 2
any rx-nack
```

All four error injection commands will be active simultaneously.

However, if the same <op> and command combination is specified, but with different arguments:

```
0x9e tx-add-bytes 1
0x9e tx-add-bytes 2
```

Then the second will overwrite the first.
### 3.6.3.2 Clear Error Injections

**clear** Clear all error injections.

**rx-clear** Clear all receive error injections

**tx-clear** Clear all transmit error injections

**<op> clear** Clear all error injections for the given opcode.

**<op> rx-clear** Clear all receive error injections for the given opcode.

**<op> tx-clear** Clear all transmit error injections for the given opcode.

### 3.6.3.3 Receive Messages

**<op>[<mode>] rx-nack** NACK broadcast messages and messages directed to this CEC adapter. Every byte of the message will be NACKed in case the transmitter keeps transmitting after the first byte was NACKed.

**<op>[<mode>] rx-low-drive <bit>** Force a Low Drive condition at this bit position. If **<op>** specifies a specific CEC opcode then the bit position must be at least 18, otherwise the opcode hasn’t been received yet. This tests if the transmitter can handle the Low Drive condition correctly and reports the error correctly. Note that a Low Drive in the first 4 bits can also be interpreted as an Arbitration Lost condition by the transmitter. This is implementation dependent.

**<op>[<mode>] rx-add-byte** Add a spurious 0x55 byte to the received CEC message, provided the message was 15 bytes long or less. This is useful to test the high-level protocol since spurious bytes should be ignored.

**<op>[<mode>] rx-remove-byte** Remove the last byte from the received CEC message, provided it was at least 2 bytes long. This is useful to test the high-level protocol since messages that are too short should be ignored.

**<op>[<mode>] rx-arb-lost <poll>** Generate a POLL message to trigger an Arbitration Lost condition. This command is only allowed for **<op>** values of next or all. As soon as a start bit has been received the CEC adapter will switch to transmit mode and it will transmit a POLL message. By default this is 0x0f, but it can also be specified explicitly via the **<poll>** argument.

This command can be used to test the Arbitration Lost condition in the remote CEC transmitter. Arbitration happens when two CEC adapters start sending a message at the same time. In that case the initiator with the most leading zeroes wins and the other transmitter has to stop transmitting (‘Arbitration Lost’). This is very hard to test, except by using this error injection command.

This does not work if the remote CEC transmitter has logical address 0 (‘TV’) since that will always win.
### 3.6.3.4 Transmit Messages

**tx-ignore-nack-until-eom** This setting changes the behavior of transmitting CEC messages. Normally as soon as the receiver NACKs a byte the transmit will stop, but the specification also allows that the full message is transmitted and only at the end will the transmitter look at the ACK bit. This is not recommended behavior since there is no point in keeping the CEC bus busy for longer than is strictly needed. Especially given how slow the bus is.

This setting can be used to test how well a receiver deals with transmitters that ignore NACKs until the very end of the message.

**<op>[,<mode>]** tx-no-eom Don’t set the EOM bit. Normally the last byte of the message has the EOM (End-Of-Message) bit set. With this command the transmit will just stop without ever sending an EOM. This can be used to test how a receiver handles this case. Normally receivers have a time-out after which they will go back to the Idle state.

**<op>[,<mode>]** tx-early-eom Set the EOM bit one byte too soon. This obviously only works for messages of two bytes or more. The EOM bit will be set for the second-to-last byte and not for the final byte. The receiver should ignore the last byte in this case. Since the resulting message is likely to be too short for this same reason the whole message is typically ignored. The receiver should be in Idle state after the last byte was transmitted.

**<op>[,<mode>]** tx-add-bytes <num> Append <num> (1-255) spurious bytes to the message. The extra bytes have the value of the byte position in the message. So if you transmit a two byte message (e.g. a Get CEC Version message) and add 2 bytes, then the full message received by the remote CEC adapter is 0x40 0x9f 0x02 0x03.

This command can be used to test buffer overflows in the receiver. E.g. what does it do when it receives more than the maximum message size of 16 bytes.

**<op>[,<mode>]** tx-remove-byte Drop the last byte from the message, provided the message is at least two bytes long. The receiver should ignore messages that are too short.

**<op>[,<mode>]** tx-short-bit <bit> Make this bit period shorter than allowed. The bit position cannot be an Ack bit. If <op> specifies a specific CEC opcode then the bit position must be at least 18, otherwise the opcode hasn’t been received yet. Normally the period of a data bit is between 2.05 and 2.75 milliseconds. With this command the period of this bit is 1.8 milliseconds, this is done by reducing the time the CEC bus is high. This bit period is less than is allowed and the receiver should respond with a Low Drive condition.

This command is ignored for 0 bits in bit positions 0 to 3. This is because the receiver also looks for an Arbitration Lost condition in those first four bits and it is undefined what will happen if it sees a too-short 0 bit.

**<op>[,<mode>]** tx-long-bit <bit> Make this bit period longer than is valid. The bit position cannot be an Ack bit. If <op> specifies a specific CEC opcode then the bit position must be at least 18, otherwise the opcode hasn’t been received yet. Normally the period of a data bit is between 2.05 and 2.75 milliseconds. With this command the period of this bit is 2.9 milliseconds, this is done by increasing the time the CEC bus is high.

Even though this bit period is longer than is valid it is undefined what a receiver will do. It might just accept it, or it might time out and return to Idle state. Unfortunately the CEC specification is silent about this.

This command is ignored for 0 bits in bit positions 0 to 3. This is because the receiver also looks for an Arbitration Lost condition in those first four bits and it is undefined what will happen if it sees a too-long 0 bit.
<op>[,<mode>] tx-short-start Make this start bit period shorter than allowed. Normally the period of a start bit is between 4.3 and 4.7 milliseconds. With this command the period of the start bit is 4.1 milliseconds, this is done by reducing the time the CEC bus is high. This start bit period is less than is allowed and the receiver should return to Idle state when this is detected.

<op>[,<mode>] tx-long-start Make this start bit period longer than is valid. Normally the period of a start bit is between 4.3 and 4.7 milliseconds. With this command the period of the start bit is 5 milliseconds, this is done by increasing the time the CEC bus is high. This start bit period is more than is valid and the receiver should return to Idle state when this is detected.

Even though this start bit period is longer than is valid it is undefined what a receiver will do. It might just accept it, or it might time out and return to Idle state. Unfortunately the CEC specification is silent about this.

<op>[,<mode>] tx-last-bit <bit> Just stop transmitting after this bit. If <op> specifies a specific CEC opcode then the bit position must be at least 18, otherwise the opcode hasn’t been received yet. This command can be used to test how the receiver reacts when a message just suddenly stops. It should time out and go back to Idle state.

<op>[,<mode>] tx-low-drive <bit> Force a Low Drive condition at this bit position. If <op> specifies a specific CEC opcode then the bit position must be at least 18, otherwise the opcode hasn’t been received yet. This can be used to test how the receiver handles Low Drive conditions. Note that if this happens at bit positions 0-3 the receiver can interpret this as an Arbitration Lost condition. This is implementation dependent.

3.6.3.5 Custom Pulses

tx-custom-low-usecs <usecs> This defines the duration in microseconds that the custom pulse pulls the CEC line low. The default is 1000 microseconds.

tx-custom-high-usecs <usecs> This defines the duration in microseconds that the custom pulse keeps the CEC line high (unless another CEC adapter pulls it low in that time). The default is 1000 microseconds. The total period of the custom pulse is tx-custom-low-usecs + tx-custom-high-usecs.

<op>[,<mode>] tx-custom-bit <bit> Send the custom bit instead of a regular data bit. The bit position cannot be an Ack bit. If <op> specifies a specific CEC opcode then the bit position must be at least 18, otherwise the opcode hasn’t been received yet.

<op>[,<mode>] tx-custom-start Send the custom bit instead of a regular start bit.

tx-custom-pulse Transmit a single custom pulse as soon as the CEC bus is idle.

#define _CEC_UAPI_H

#include <linux/types.h>
#include <linux/string.h>

#define CEC_MAX_MSG_SIZE 16

/**
 * struct cec_msg - CEC message structure.
 * @tx_ts: Timestamp in nanoseconds using CLOCK_MONOTONIC. Set by the
 *          driver when the message transmission has finished.
 * @rx_ts: Timestamp in nanoseconds using CLOCK_MONOTONIC. Set by the
 *          driver when the message was received.
 * @len: Length in bytes of the message.
 * @timeout: The timeout (in ms) that is used to timeout CEC_RECEIVE.
 *          Set to 0 if you want to wait forever. This timeout can also be
 *          used with CEC_TRANSMIT as the timeout for waiting for a reply.
 *          If 0, then it will use a 1 second timeout instead of waiting
 *          forever as is done with CEC_RECEIVE.
 * @sequence: The framework assigns a sequence number to messages that are
 *           sent. This can be used to track replies to previously sent
 *           messages.
 * @flags: Set to 0.
 * @msg: The message payload.
 * @reply: This field is ignored with CEC_RECEIVE and is only used by
 *         CEC_TRANSMIT. If non-zero, then wait for a reply with this
 *         opcode. Set to CEC_MSG_FEATURE_ABORT if you want to wait for
 *         a possible ABORT reply. If there was an error when sending the
 *         msg or FeatureAbort was returned, then reply is set to 0.
 *         If reply is non-zero upon return, then len/msg are set to
 *         the received message.
 *         If reply is zero upon return and status has the
 *         CEC_TX_STATUS_FEATURE_ABORT bit set, then len/msg are set to
 *         the received feature abort message.
 *         If reply is zero upon return and status has the
 *         CEC_TX_STATUS_MAX_RETRIES bit set, then no reply was seen at
 *         all. If reply is non-zero for CEC_TRANSMIT and the message is a
broadcast, then -EINVAL is returned.
if reply is non-zero, then timeout is set to 1000 (the required
maximum response time).
@rx_status: The message receive status bits. Set by the driver.
@tx_status: The message transmit status bits. Set by the driver.

3.7 Generic Error Codes

Table 293: Generic error codes

<table>
<thead>
<tr>
<th>Error Code</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>EAGAIN (aka EWOULDBLOCK)</td>
<td>The ioctl can’t be handled because the device is in state where it can’t perform it. This could happen for example in case where device is sleeping and ioctl is performed to query statistics. It is also returned when the ioctl would need to wait for an event, but the device was opened in non-blocking mode.</td>
</tr>
<tr>
<td>EBADF</td>
<td>The file descriptor is not a valid.</td>
</tr>
<tr>
<td>EBUSY</td>
<td>The ioctl can’t be handled because the device is busy. This is typically return while device is streaming, and an ioctl tried to change something that would affect the stream, or would require the usage of a hardware resource that was already allocated. The ioctl must not be retried without performing another action to fix the problem first (typically: stop the stream before retrying).</td>
</tr>
<tr>
<td>EFAULT</td>
<td>There was a failure while copying data from/to userspace, probably caused by an invalid pointer reference.</td>
</tr>
<tr>
<td>EINVAL</td>
<td>One or more of the ioctl parameters are invalid or out of the allowed range. This is a widely used error code. See the individual ioctl requests for specific causes.</td>
</tr>
<tr>
<td>ENODEV</td>
<td>Device not found or was removed.</td>
</tr>
<tr>
<td>ENOMEM</td>
<td>There’s not enough memory to handle the desired operation.</td>
</tr>
<tr>
<td>ENOTTY</td>
<td>The ioctl is not supported by the driver, actually meaning that the required functionality is not available, or the file descriptor is not for a media device.</td>
</tr>
<tr>
<td>ENOSPC</td>
<td>On USB devices, the stream ioctl’s can return this error, meaning that this request would overcommit the usb bandwidth reserved for periodic transfers (up to 80% of the USB bandwidth).</td>
</tr>
<tr>
<td>EPERM</td>
<td>Permission denied. Can be returned if the device needs write permission, or some special capabilities is needed (e. g. root)</td>
</tr>
<tr>
<td>E10</td>
<td>I/O error. Typically used when there are problems communicating with a hardware device. This could indicate broken or flaky hardware. It’s a ‘Something is wrong, I give up!’ type of error.</td>
</tr>
<tr>
<td>ENXIO</td>
<td>No device corresponding to this device special file exists.</td>
</tr>
</tbody>
</table>

Note:
1. This list is not exhaustive; ioctl may return other error codes. Since errors may have side effects such as a driver reset, applications should abort on unexpected errors, or otherwise assume that the device is in a bad state.

2. Request-specific error codes are listed in the individual requests descriptions.

### 3.8 Glossary

**Note:** The goal of this section is to standardize the terms used within the media userspace API documentation. This is Work In Progress.

**Bridge Driver** A *Device Driver* that implements the main logic to talk with media hardware.

**CEC API Consumer Electronics Control API**

An API designed to receive and transmit data via an HDMI CEC interface.

See *Part V - Consumer Electronics Control API*.

**Device Driver** Part of the Linux Kernel that implements support for a hardware component.

**Device Node** A character device node in the file system used to control and transfer data in and out of a Kernel driver.

**Digital TV API Previously known as DVB API**

An API designed to control a subset of the *Media Hardware* that implements digital TV (e.g. DVB, ATSC, ISDB, etc).

See *Part II - Digital TV API*.

**DSP Digital Signal Processor**

A specialized *Microprocessor*, with its architecture optimized for the operational needs of digital signal processing.

**FPGA Field-programmable Gate Array**

An *IC* circuit designed to be configured by a customer or a designer after manufacturing.

**Hardware Component** A subset of the *Media Hardware*. For example an $I^2C$ or *SPI* device, or an *IP Block* inside an *SoC* or *FPGA*.

**Hardware Peripheral** A group of *hardware components* that together make a larger user-facing functional peripheral. For instance, the *SoC ISP IP Block* and the external camera sensors together make a camera hardware peripheral.

Also known as *Peripheral*.

**$I^2C$ Inter-Integrated Circuit**

A multi-master, multi-slave, packet switched, single-ended, serial computer bus used to control some hardware components like sub-device hardware components.

IC  Integrated circuit

A set of electronic circuits on one small flat piece of semiconductor material, normally silicon.

Also known as chip.

IP Block  Intellectual property core

In electronic design a semiconductor intellectual property core, is a reusable unit of logic, cell, or integrated circuit layout design that is the intellectual property of one party. IP Blocks may be licensed to another party or can be owned and used by a single party alone.

ISP  Image Signal Processor

A specialized processor that implements a set of algorithms for processing image data. ISPs may implement algorithms for lens shading correction, demosaicing, scaling and pixel format conversion as well as produce statistics for the use of the control algorithms (e.g. automatic exposure, white balance and focus).

Media API  A set of userspace APIs used to control the media hardware. It is composed by:

- CEC API;
- Digital TV API;
- MC API;
- RC API; and
- V4L2 API.

See Documentation/userspace-api/media/index.rst.

MC API  Media Controller API

An API designed to expose and control the relationships between multimedia devices and sub-devices.

See Part IV - Media Controller API.

MC-centric  V4L2 Hardware device driver that requires MC API.

Such drivers have V4L2_CAP_IO_MC device_caps field set (see ioctl VIDIOC_QUERYCAP).

See Controlling a hardware peripheral via V4L2 for more details.

Media Hardware  Subset of the hardware that is supported by the Linux Media API.

This includes audio and video capture and playback hardware, digital and analog TV, camera sensors, ISPs, remote controllers, codecs, HDMI Consumer Electronics Control, HDMI capture, etc.

Microprocessor  Electronic circuitry that carries out the instructions of a computer program by performing the basic arithmetic, logical, control and input/output (I/O) operations specified by the instructions on a single integrated circuit.

Peripheral  The same as Hardware Peripheral.

RC API  Remote Controller API

An API designed to receive and transmit data from remote controllers.
See *Part III - Remote Controller API*.

**SMBus** A subset of I²C, which defines a stricter usage of the bus.

**SPI Serial Peripheral Interface Bus**

Synchronous serial communication interface specification used for short distance communication, primarily in embedded systems.

**SoC System on a Chip**

An integrated circuit that integrates all components of a computer or other electronic systems.

**V4L2 API V4L2 userspace API**

The userspace API defined in *Part I - Video for Linux API*, which is used to control a V4L2 hardware.

**V4L2 Device Node** A *Device Node* that is associated to a V4L driver.

The V4L2 device node naming is specified at *V4L2 Device Node Naming*.

**V4L2 Hardware** Part of the media hardware which is supported by the *V4L2 API*.

**V4L2 Sub-device** V4L2 hardware components that aren’t controlled by a *Bridge Driver*. See *Sub-device Interface*.

**Video-node-centric** V4L2 device driver that doesn’t require a media controller to be used.

Such drivers have the `V4L2_CAP_I0_MC` `device_caps` field unset (see `ioctl VID-IOC_QUERYCAP`).

**V4L2 Sub-device API** Part of the *V4L2 API* which control *V4L2 sub-devices*, like sensors, HDMI receivers, scalers, deinterlacers.

See *Controlling a hardware peripheral via V4L2* for more details.

## 3.9 GNU Free Documentation License

### 3.9.1 0. PREAMBLE

The purpose of this License is to make a manual, textbook, or other written document “free” in the sense of freedom: to assure everyone the effective freedom to copy and redistribute it, with or without modifying it, either commercially or noncommercially. Secondarily, this License preserves for the author and publisher a way to get credit for their work, while not being considered responsible for modifications made by others.

This License is a kind of “copyleft”, which means that derivative works of the document must themselves be free in the same sense. It complements the GNU General Public License, which is a copyleft license designed for free software.

We have designed this License in order to use it for manuals for free software, because free software needs free documentation: a free program should come with manuals providing the same freedoms that the software does. But this License is not limited to software manuals; it can be used for any textual work, regardless of subject matter or whether it is published as a printed book. We recommend this License principally for works whose purpose is instruction or reference.
3.9.2 1. APPLICABILITY AND DEFINITIONS

This License applies to any manual or other work that contains a notice placed by the copyright
holder saying it can be distributed under the terms of this License. The “Document”, below,
refers to any such manual or work. Any member of the public is a licensee, and is addressed as
“you”.

A “Modified Version” of the Document means any work containing the Document or a portion
of it, either copied verbatim, or with modifications and/or translated into another language.

A “Secondary Section” is a named appendix or a front-matter section of the Document that deals
exclusively with the relationship of the publishers or authors of the Document to the Document’s
overall subject (or to related matters) and contains nothing that could fall directly within that
overall subject. (For example, if the Document is in part a textbook of mathematics, a Secondary
Section may not explain any mathematics.) The relationship could be a matter of historical
connection with the subject or with related matters, or of legal, commercial, philosophical,
ethical or political position regarding them.

The “Invariant Sections” are certain Secondary Sections whose titles are designated, as being
those of Invariant Sections, in the notice that says that the Document is released under this
License.

The “Cover Texts” are certain short passages of text that are listed, as Front-Cover Texts or
Back-Cover Texts, in the notice that says that the Document is released under this License.

A “Transparent” copy of the Document means a machine-readable copy, represented in a format
whose specification is available to the general public, whose contents can be viewed and edited
directly and straightforwardly with generic text editors or (for images composed of pixels)
generic paint programs or (for drawings) some widely available drawing editor, and that is
suitable for input to text formatters or for automatic translation to a variety of formats suitable
for input to text formatters. A copy made in an otherwise Transparent file format whose
markup has been designed to thwart or discourage subsequent modification by readers is not
Transparent. A copy that is not “Transparent” is called “Opaque”.

Examples of suitable formats for Transparent copies include plain ASCII without markup, Tex-
info input format, LaTeX input format, SGML or XML using a publicly available DTD, and
standard-conforming simple HTML designed for human modification. Opaque formats include
PostScript, PDF, proprietary formats that can be read and edited only by proprietary word pro-
cessors, SGML or XML for which the DTD and/or processing tools are not generally available,
and the machine-generated HTML produced by some word processors for output purposes only.

The “Title Page” means, for a printed book, the title page itself, plus such following pages as
are needed to hold, legibly, the material this License requires to appear in the title page. For
works in formats which do not have any title page as such, “Title Page” means the text near the
most prominent appearance of the work’s title, preceding the beginning of the body of the text.
3.9.3 2. VERBATIM COPYING

You may copy and distribute the Document in any medium, either commercially or noncommercially, provided that this License, the copyright notices, and the license notice saying this License applies to the Document are reproduced in all copies, and that you add no other conditions whatsoever to those of this License. You may not use technical measures to obstruct or control the reading or further copying of the copies you make or distribute. However, you may accept compensation in exchange for copies. If you distribute a large enough number of copies you must also follow the conditions in section 3.

You may also lend copies, under the same conditions stated above, and you may publicly display copies.

3.9.4 3. COPYING IN QUANTITY

If you publish printed copies of the Document numbering more than 100, and the Document's license notice requires Cover Texts, you must enclose the copies in covers that carry, clearly and legibly, all these Cover Texts: Front-Cover Texts on the front cover, and Back-Cover Texts on the back cover. Both covers must also clearly and legibly identify you as the publisher of these copies. The front cover must present the full title with all words of the title equally prominent and visible. You may add other material on the covers in addition. Copying with changes limited to the covers, as long as they preserve the title of the Document and satisfy these conditions, can be treated as verbatim copying in other respects.

If the required texts for either cover are too voluminous to fit legibly, you should put the first ones listed (as many as fit reasonably) on the actual cover, and continue the rest onto adjacent pages.

If you publish or distribute Opaque copies of the Document numbering more than 100, you must either include a machine-readable Transparent copy along with each Opaque copy, or state in or with each Opaque copy a publicly-accessible computer-network location containing a complete Transparent copy of the Document, free of added material, which the general network-using public has access to download anonymously at no charge using public-standard network protocols. If you use the latter option, you must make reasonably prudent steps, when you begin distribution of Opaque copies in quantity, to ensure that this Transparent copy will remain thus accessible at the stated location until at least one year after the last time you distribute an Opaque copy (directly or through your agents or retailers) of that edition to the public.

It is requested, but not required, that you contact the authors of the Document well before redistributing any large number of copies, to give them a chance to provide you with an updated version of the Document.

3.9.5 4. MODIFICATIONS

You may copy and distribute a Modified Version of the Document under the conditions of sections 2 and 3 above, provided that you release the Modified Version under precisely this License, with the Modified Version filling the role of the Document, thus licensing distribution and modification of the Modified Version to whoever possesses a copy of it. In addition, you must do these things in the Modified Version:

• A. Use in the Title Page (and on the covers, if any) a title distinct from that of the Document, and from those of previous versions (which should, if there were any, be listed in the History
section of the Document). You may use the same title as a previous version if the original publisher of that version gives permission.

• B. List on the Title Page, as authors, one or more persons or entities responsible for authorship of the modifications in the Modified Version, together with at least five of the principal authors of the Document (all of its principal authors, if it has less than five).

• C. State on the Title Page the name of the publisher of the Modified Version, as the publisher.

• D. Preserve all the copyright notices of the Document.

• E. Add an appropriate copyright notice for your modifications adjacent to the other copyright notices.

• F. Include, immediately after the copyright notices, a license notice giving the public permission to use the Modified Version under the terms of this License, in the form shown in the Addendum below.

• G. Preserve in that license notice the full lists of Invariant Sections and required Cover Texts given in the Document's license notice.

• H. Include an unaltered copy of this License.

• I. Preserve the section entitled “History”, and its title, and add to it an item stating at least the title, year, new authors, and publisher of the Modified Version as given on the Title Page. If there is no section entitled “History” in the Document, create one stating the title, year, authors, and publisher of the Document as given on its Title Page, then add an item describing the Modified Version as stated in the previous sentence.

• J. Preserve the network location, if any, given in the Document for public access to a Transparent copy of the Document, and likewise the network locations given in the Document for previous versions it was based on. These may be placed in the “History” section. You may omit a network location for a work that was published at least four years before the Document itself, or if the original publisher of the version it refers to gives permission.

• K. In any section entitled “Acknowledgements” or “Dedications”, preserve the section’s title, and preserve in the section all the substance and tone of each of the contributor acknowledgements and/or dedications given therein.

• L. Preserve all the Invariant Sections of the Document, unaltered in their text and in their titles. Section numbers or the equivalent are not considered part of the section titles.

• M. Delete any section entitled “Endorsements”. Such a section may not be included in the Modified Version.

• N. Do not retitle any existing section as “Endorsements” or to conflict in title with any Invariant Section.

If the Modified Version includes new front-matter sections or appendices that qualify as Secondary Sections and contain no material copied from the Document, you may at your option designate some or all of these sections as invariant. To do this, add their titles to the list of Invariant Sections in the Modified Version’s license notice. These titles must be distinct from any other section titles.

You may add a section entitled “Endorsements”, provided it contains nothing but endorsements of your Modified Version by various parties—for example, statements of peer review or that the text has been approved by an organization as the authoritative definition of a standard.
You may add a passage of up to five words as a *Front-Cover Text*, and a passage of up to 25 words as a *Back-Cover Text*, to the end of the list of *Cover Texts* in the *Modified Version*. Only one passage of Front-Cover Text and one of Back-Cover Text may be added by (or through arrangements made by) any one entity. If the *Document* already includes a cover text for the same cover, previously added by you or by arrangement made by the same entity you are acting on behalf of, you may not add another; but you may replace the old one, on explicit permission from the previous publisher that added the old one.

The author(s) and publisher(s) of the *Document* do not by this License give permission to use their names for publicity for or to assert or imply endorsement of any *Modified Version*.

### 3.9.6 5. COMBINING DOCUMENTS

You may combine the *Document* with other documents released under this License, under the terms defined in section 4 above for modified versions, provided that you include in the combination all of the *Invariant Sections* of all of the original documents, unmodified, and list them all as Invariant Sections of your combined work in its license notice.

The combined work need only contain one copy of this License, and multiple identical *Invariant Sections* may be replaced with a single copy. If there are multiple Invariant Sections with the same name but different contents, make the title of each such section unique by adding at the end of it, in parentheses, the name of the original author or publisher of that section if known, or else a unique number. Make the same adjustment to the section titles in the list of Invariant Sections in the license notice of the combined work.

In the combination, you must combine any sections entitled “History” in the various original documents, forming one section entitled “History”; likewise combine any sections entitled “Acknowledgements”, and any sections entitled “Dedications”. You must delete all sections entitled “Endorsements.”

### 3.9.7 6. COLLECTIONS OF DOCUMENTS

You may make a collection consisting of the *Document* and other documents released under this License, and replace the individual copies of this License in the various documents with a single copy that is included in the collection, provided that you follow the rules of this License for verbatim copying of each of the documents in all other respects.

You may extract a single document from such a collection, and distribute it individually under this License, provided you insert a copy of this License into the extracted document, and follow this License in all other respects regarding verbatim copying of that document.

### 3.9.8 7. AGGREGATION WITH INDEPENDENT WORKS

A compilation of the *Document* or its derivatives with other separate and independent documents or works, in or on a volume of a storage or distribution medium, does not as a whole count as a *Modified Version* of the Document, provided no compilation copyright is claimed for the compilation. Such a compilation is called an “aggregate”, and this License does not apply to the other self-contained works thus compiled with the Document, on account of their being thus compiled, if they are not themselves derivative works of the Document. If the *Cover Text* requirement of section 3 is applicable to these copies of the Document, then if the Document is less than one quarter of the entire aggregate, the Document’s Cover Texts may be placed on
covers that surround only the Document within the aggregate. Otherwise they must appear on covers around the whole aggregate.

3.9.9 8. TRANSLATION

Translation is considered a kind of modification, so you may distribute translations of the Document under the terms of section 4. Replacing Invariant Sections with translations requires special permission from their copyright holders, but you may include translations of some or all Invariant Sections in addition to the original versions of these Invariant Sections. You may include a translation of this License provided that you also include the original English version of this License. In case of a disagreement between the translation and the original English version of this License, the original English version will prevail.

3.9.10 9. TERMINATION

You may not copy, modify, sublicense, or distribute the Document except as expressly provided for under this License. Any other attempt to copy, modify, sublicense or distribute the Document is void, and will automatically terminate your rights under this License. However, parties who have received copies, or rights, from you under this License will not have their licenses terminated so long as such parties remain in full compliance.

3.9.11 10. FUTURE REVISIONS OF THIS LICENSE

The Free Software Foundation may publish new, revised versions of the GNU Free Documentation License from time to time. Such new versions will be similar in spirit to the present version, but may differ in detail to address new problems or concerns. See http://www.gnu.org/copyleft/.

Each version of the License is given a distinguishing version number. If the Document specifies that a particular numbered version of this License “or any later version” applies to it, you have the option of following the terms and conditions either of that specified version or of any later version that has been published (not as a draft) by the Free Software Foundation. If the Document does not specify a version number of this License, you may choose any version ever published (not as a draft) by the Free Software Foundation.

3.9.12 Addendum

To use this License in a document you have written, include a copy of the License in the document and put the following copyright and license notices just after the title page:

Copyright © YEAR YOUR NAME.

Permission is granted to copy, distribute and/or modify this document under the terms of the GNU Free Documentation License, Version 1.1 or any later version published by the Free Software Foundation; with the Invariant Sections being LIST THEIR TITLES, with the Front-Cover Texts being LIST, and with the Back-Cover Texts being LIST.

A copy of the license is included in the section entitled “GNU Free Documentation License”.

If you have no Invariant Sections, write “with no Invariant Sections” instead of saying which ones are invariant. If you have no Front-Cover Texts, write “no Front-Cover Texts” instead of “Front-Cover Texts being LIST”; likewise for Back-Cover Texts.
If your document contains nontrivial examples of program code, we recommend releasing these examples in parallel under your choice of free software license, such as the GNU General Public License, to permit their use in free software.

#### 3.10.1 MIPI CCS camera sensor driver

The MIPI CCS camera sensor driver is a generic driver for MIPI CCS compliant camera sensors. It exposes three sub-devices representing the pixel array, the binner and the scaler.

As the capabilities of individual devices vary, the driver exposes interfaces based on the capabilities that exist in hardware.

##### 3.10.1.1 Pixel Array sub-device

The pixel array sub-device represents the camera sensor’s pixel matrix, as well as analogue crop functionality present in many compliant devices. The analogue crop is configured using the \texttt{V4L2\_SEL\_TGT\_CROP} on the source pad (0) of the entity. The size of the pixel matrix can be obtained by getting the \texttt{V4L2\_SEL\_TGT\_NATIVE\_SIZE} target.

##### 3.10.1.2 Binner

The binner sub-device represents the binning functionality on the sensor. For that purpose, selection target \texttt{V4L2\_SEL\_TGT\_COMPOSE} is supported on the sink pad (0).

Additionally, if a device has no scaler or digital crop functionality, the source pad (1) exposes another digital crop selection rectangle that can only crop at the end of the lines and frames.
3.10.1.3 Scaler

The scaler sub-device represents the digital crop and scaling functionality of the sensor. The V4L2 selection target V4L2_SEL_TGT_CROP is used to configure the digital crop on the sink pad (0) when digital crop is supported. Scaling is configured using selection target V4L2_SEL_TGT_COMPOSE on the sink pad (0) as well.

Additionally, if the scaler sub-device exists, its source pad (1) exposes another digital crop selection rectangle that can only crop at the end of the lines and frames.

3.10.1.4 Digital and analogue crop

Digital crop functionality is referred to as cropping that effectively works by dropping some data on the floor. Analogue crop, on the other hand, means that the cropped information is never retrieved. In case of camera sensors, the analogue data is never read from the pixel matrix that are outside the configured selection rectangle that designates crop. The difference has an effect in device timing and likely also in power consumption.

3.10.1.5 Private controls

The MIPI CCS driver implements a number of private controls under V4L2_CID_USER_BASE_CCS to control the MIPI CCS compliant camera sensors.

Analogue gain model

The CCS defines an analogue gain model where the gain can be calculated using the following formula:

\[ \text{gain} = \frac{m_0 \times x + c_0}{m_1 \times x + c_1} \]

Either \( m_0 \) or \( c_0 \) will be zero. The constants that are device specific, can be obtained from the following controls:

- V4L2_CID_CCS_ANALOGUE_GAIN_M0
- V4L2_CID_CCS_ANALOGUE_GAIN_M1
- V4L2_CID_CCS_ANALOGUE_GAIN_C0
- V4L2_CID_CCS_ANALOGUE_GAIN_C1

The analogue gain (\( x \) in the formula) is controlled through V4L2_CID_ANALOGUE_GAIN in this case.

Alternate analogue gain model

The CCS defines another analogue gain model called alternate analogue gain. In this case, the formula to calculate actual gain consists of linear and exponential parts:

\[ \text{gain} = \text{linear} \times 2^\text{exponent} \]

The linear and exponent factors can be set using the V4L2_CID_CCS_ANALOGUE_LINEAR_GAIN and V4L2_CID_CCS_ANALOGUE_EXPONENTIAL_GAIN controls, respectively.
Shading correction

The CCS standard supports lens shading correction. The feature can be controlled using `V4L2_CID_CCS_SHADING_CORRECTION`. Additionally, the luminance correction level may be changed using `V4L2_CID_CCS_LUMINANCE_CORRECTION_LEVEL`, where value 0 indicates no correction and 128 indicates correcting the luminance in corners to 10% less than in the centre.

Shading correction needs to be enabled for luminance correction level to have an effect.

3.10.2 The cx2341x driver

3.10.2.1 Non-compressed file format

The cx23416 can produce (and the cx23415 can also read) raw YUV output. The format of a YUV frame is specific to this chip and is called HM12. ‘HM’ stands for ‘Hauppauge Macroblock’, which is a misnomer as ‘Conexant Macroblock’ would be more accurate.

The format is YUV 4:2:0 which uses 1 Y byte per pixel and 1 U and V byte per four pixels.

The data is encoded as two macroblock planes, the first containing the Y values, the second containing UV macroblocks.

The Y plane is divided into blocks of 16x16 pixels from left to right and from top to bottom. Each block is transmitted in turn, line-by-line.

So the first 16 bytes are the first line of the top-left block, the second 16 bytes are the second line of the top-left block, etc. After transmitting this block the first line of the block on the right to the first block is transmitted, etc.

The UV plane is divided into blocks of 16x8 UV values going from left to right, top to bottom. Each block is transmitted in turn, line-by-line.

So the first 16 bytes are the first line of the top-left block and contain 8 UV value pairs (16 bytes in total). The second 16 bytes are the second line of 8 UV pairs of the top-left block, etc. After transmitting this block the first line of the block on the right to the first block is transmitted, etc.

The code below is given as an example on how to convert HM12 to separate Y, U and V planes. This code assumes frames of 720x576 (PAL) pixels.

The width of a frame is always 720 pixels, regardless of the actual specified width.

If the height is not a multiple of 32 lines, then the captured video is missing macroblocks at the end and is unusable. So the height must be a multiple of 32.
Raw format c example

```c
#include <stdio.h>
#include <stdlib.h>
#include <string.h>

static unsigned char frame[576*720*3/2];
static unsigned char framey[576*720];
static unsigned char frameu[576*720 / 4];
static unsigned char framev[576*720 / 4];

static void de_macro_y(unsigned char* dst, unsigned char *src, int dstride, int w, int h)
{
    unsigned int y, x, i;

    // descramble Y plane
    // dstride = 720 = w
    // The Y plane is divided into blocks of 16x16 pixels
    // Each block in transmitted in turn, line-by-line.
    for (y = 0; y < h; y += 16) {
        for (x = 0; x < w; x += 16) {
            for (i = 0; i < 16; i++) {
                memcpy(dst + x + (y + i) * dstride, src, 16);
                src += 16;
            }
        }
    }
}

static void de_macro_uv(unsigned char *dstu, unsigned char *dstv, unsigned char *src, int dstride, int w, int h)
{
    unsigned int y, x, i;

    // descramble U/V plane
    // dstride = 720 / 2 = w
    // The U/V values are interlaced (UVUV...).
    // Again, the UV plane is divided into blocks of 16x16 UV values.
    // Each block in transmitted in turn, line-by-line.
    for (y = 0; y < h; y += 16) {
        for (x = 0; x < w; x += 8) {
            for (i = 0; i < 16; i++) {
                int idx = x + (y + i) * dstride;
                dstu[idx+0] = src[0];
                dstv[idx+0] = src[1];
                dstu[idx+1] = src[2];
                dstv[idx+1] = src[3];
                dstu[idx+2] = src[4];
                dstv[idx+2] = src[5];
                dstu[idx+3] = src[6];
                dstv[idx+3] = src[7];
                dstu[idx+4] = src[8];
                dstv[idx+4] = src[9];
                dstu[idx+5] = src[10];
                dstv[idx+5] = src[11];
                dstu[idx+6] = src[12];
                dstv[idx+6] = src[13];
                dstu[idx+7] = src[14];
                dstv[idx+7] = src[15];
                src += 16;
            }
        }
    }

```

3.10. Video4Linux (V4L) driver-specific documentation
3.10.2.2 Format of embedded V4L2_MPEG_STREAM_VBI_FMT_IVTV VBI data

Author: Hans Verkuil <hverkuil@xs4all.nl>

This section describes the V4L2_MPEG_STREAM_VBI_FMT_IVTV format of the VBI data embedded in an MPEG-2 program stream. This format is in part dictated by some hardware limitations of the ivtv driver (the driver for the Conexant cx23415/6 chips), in particular a maximum size for the VBI data. Anything longer is cut off when the MPEG stream is played back through the cx23415.

The advantage of this format is it is very compact and that all VBI data for all lines can be stored while still fitting within the maximum allowed size.

The stream ID of the VBI data is 0xBD. The maximum size of the embedded data is 4 + 43 * 36, which is 4 bytes for a header and 2 * 18 VBI lines with a 1 byte header and a 42 bytes payload each. Anything beyond this limit is cut off by the cx23415/6 firmware. Besides the data for the VBI lines we also need 36 bits for a bitmask determining which lines are captured and 4 bytes for a magic cookie, signifying that this data package contains V4L2_MPEG_STREAM_VBI_FMT_IVTV VBI data. If all lines are used, then there is no longer room for the bitmask. To solve this two different magic numbers were introduced:

‘itv0’: After this magic number two unsigned longs follow. Bits 0-17 of the first unsigned long denote which lines of the first field are captured. Bits 18-31 of the first unsigned long and bits 0-3 of the second unsigned long are used for the second field.

‘ITV0’: This magic number assumes all VBI lines are captured, i.e. it implicitly implies that the bitmasks are 0xffffffff and 0xf.

After these magic cookies (and the 8 byte bitmask in case of cookie ‘itv0’) the captured VBI lines start:
For each line the least significant 4 bits of the first byte contain the data type. Possible values are shown in the table below. The payload is in the following 42 bytes.

Here is the list of possible data types:

```
#define IVTV_SLICED_TYPE_TELETEXT 0x1  // Teletext (uses lines 6-22 for PAL)
#define IVTV_SLICED_TYPE_CC 0x4        // Closed Captions (line 21 NTSC)
#define IVTV_SLICED_TYPE_WSS 0x5       // Wide Screen Signal (line 23 PAL)
#define IVTV_SLICED_TYPE_VPS 0x7       // Video Programming System (PAL)
```

### 3.10.3 Hantro video decoder driver

The Hantro video decoder driver implements the following driver-specific controls:

**V4L2_CID_HANTRO_HEVC_SLICE_HEADER_SKIP (integer)** Specifies to Hantro HEVC video decoder driver the number of data (in bits) to skip in the slice segment header. If non-IDR, the bits to be skipped go from syntax element “pic_output_flag” to before syntax element “slice_temporal_mvp_enabled_flag”. If IDR, the skipped bits are just “pic_output_flag” (separate_colour_plane_flag is not supported).

**Note:** This control is not yet part of the public kernel API and it is expected to change.

### 3.10.4 i.MX Video Capture Driver

#### 3.10.4.1 Events

**ipuX_csiY**

This subdev can generate the following event when enabling the second IDMAC source pad:

- **V4L2_EVENT_IMX_FRAME_INTERVAL_ERROR**

The user application can subscribe to this event from the ipuX_csiY subdev node. This event is generated by the Frame Interval Monitor (see below for more on the FIM).

#### 3.10.4.2 Controls

**Frame Interval Monitor in ipuX_csiY**

The adv718x decoders can occasionally send corrupt fields during NTSC/PAL signal re-sync (too little or too many video lines). When this happens, the IPU triggers a mechanism to re-establish vertical sync by adding 1 dummy line every frame, which causes a rolling effect from image to image, and can last a long time before a stable image is recovered. Or sometimes the mechanism doesn’t work at all, causing a permanent split image (one frame contains lines from two consecutive captured images).

From experiment it was found that during image rolling, the frame intervals (elapsed time between two EOF’s) drop below the nominal value for the current standard, by about one frame time (60 usec), and remain at that value until rolling stops.
While the reason for this observation isn’t known (the IPU dummy line mechanism should show an increase in the intervals by 1 line time every frame, not a fixed value), we can use it to detect the corrupt fields using a frame interval monitor. If the FIM detects a bad frame interval, the ipuX_csiY subdev will send the event V4L2_EVENT_IMX_FRAME_INTERVAL_ERROR. Userland can register with the FIM event notification on the ipuX_csiY subdev device node. Userland can issue a streaming restart when this event is received to correct the rolling/split image.

The ipuX_csiY subdev includes custom controls to tweak some dials for FIM. If one of these controls is changed during streaming, the FIM will be reset and will continue at the new settings.

- V4L2_CID_IMX_FIM_ENABLE
  Enable/disable the FIM.

- V4L2_CID_IMX_FIM_NUM
  How many frame interval measurements to average before comparing against the nominal frame interval reported by the sensor. This can reduce noise caused by interrupt latency.

- V4L2_CID_IMX_FIM_TOLERANCE_MIN
  If the averaged intervals fall outside nominal by this amount, in microseconds, the V4L2_EVENT_IMX_FRAME_INTERVAL_ERROR event is sent.

- V4L2_CID_IMX_FIM_TOLERANCE_MAX
  If any intervals are higher than this value, those samples are discarded and do not enter into the average. This can be used to discard really high interval errors that might be due to interrupt latency from high system load.

- V4L2_CID_IMX_FIM_NUM_SKIP
  How many frames to skip after a FIM reset or stream restart before FIM begins to average intervals.

- V4L2_CID_IMX_FIM_ICAP_CHANNEL / V4L2_CID_IMX_FIM_ICAP_EDGE
  These controls will configure an input capture channel as the method for measuring frame intervals. This is superior to the default method of measuring frame intervals via EOF interrupt, since it is not subject to uncertainty errors introduced by interrupt latency.

  Input capture requires hardware support. A VSYNC signal must be routed to one of the i.MX6 input capture channel pads.

  V4L2_CID_IMX_FIM_ICAP_CHANNEL configures which i.MX6 input capture channel to use. This must be 0 or 1.

  V4L2_CID_IMX_FIM_ICAP_EDGE configures which signal edge will trigger input capture events. By default the input capture method is disabled with a value of IRQ_TYPE_NONE. Set this control to IRQ_TYPE_EDGE_RISING, IRQ_TYPE_EDGE_FALLING, or IRQ_TYPE_EDGE_BOTH to enable input capture, triggered on the given signal edge(s).

  When input capture is disabled, frame intervals will be measured via EOF interrupt.

3.10.5 Maxim Integrated MAX2175 RF to bits tuner driver

The MAX2175 driver implements the following driver-specific controls:

3.10.5.1 V4L2_CID_MAX2175_I2S_ENABLE

Enable/Disable I2S output of the tuner. This is a private control that can be accessed only using the subdev interface. Refer to Documentation/driver-api/media/v4l2-controls.rst for more details.

<table>
<thead>
<tr>
<th>0</th>
<th>I2S output is disabled.</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>I2S output is enabled.</td>
</tr>
</tbody>
</table>

3.10.5.2 V4L2_CID_MAX2175_HSLS

The high-side/low-side (HSLS) control of the tuner for a given band.

<table>
<thead>
<tr>
<th>0</th>
<th>The LO frequency position is below the desired frequency.</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>The LO frequency position is above the desired frequency.</td>
</tr>
</tbody>
</table>

3.10.5.3 V4L2_CID_MAX2175_RX_MODE (menu)

The Rx mode controls a number of preset parameters of the tuner like sample clock (sck), sampling rate etc. These multiple settings are provided under one single label called Rx mode in the datasheet. The list below shows the supported modes with a brief description.
### Europe modes

<table>
<thead>
<tr>
<th>Mode</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>FM 1.2&quot; (0)</td>
<td>This configures FM band with a sample rate of 0.512 million samples/sec with a 10.24 MHz sck.</td>
</tr>
<tr>
<td>DAB 1.2&quot; (1)</td>
<td>This configures VHF band with a sample rate of 2.048 million samples/sec with a 32.768 MHz sck.</td>
</tr>
</tbody>
</table>

### North America modes

<table>

### 3.10.6.1 Private API

The driver supports frame grabbing with the video4linux API, so all video4linux tools (like xawtv) should work with this driver.

Besides the video4linux interface, the driver has a private interface for accessing the Motion Eye extended parameters (camera sharpness, agc, video framerate), the snapshot and the MJPEG capture facilities.

This interface consists of several ioctls (prototypes and structures can be found in include/linux/meye.h):

- **MEYEIOC_G_PARAMS** and **MEYEIOC_S_PARAMS** Get and set the extended parameters of the motion eye camera. The user should always query the current parameters with MEYEIOC_G_PARAMS, change what he likes and then issue the MEYEIOC_S_PARAMS call (checking for -EINVAL). The extended parameters are described by the meye_params structure.

- **MEYEIOC_QBUF_CAPT** Queue a buffer for capture (the buffers must have been obtained with a VIDIOCGBUF call and mmap’ed by the application). The argument to MEYEIOC_QBUF_CAPT is the buffer number to queue (or -1 to end capture). The first call to MEYEIOC_QBUF_CAPT starts the streaming capture.

- **MEYEIOC_SYNC** Takes as an argument the buffer number you want to sync. This ioctl blocks until the buffer is filled and ready for the application to use. It returns the buffer size.

- **MEYEIOC_STILLCAPT** and **MEYEIOC_STILLJCAPT** Takes a snapshot in an uncompressed or compressed jpeg format. This ioctl blocks until the snapshot is done and returns (for jpeg snapshot) the size of the image. The image data is available from the first mmap’ed buffer.

Look at the ‘motioneye’ application code for an actual example.
3.10.7 OMAP 3 Image Signal Processor (ISP) driver

The OMAP 3 ISP driver does support the V4L2 event interface on CCDC and statistics (AEWB, AF and histogram) subdevs.

The CCDC subdev produces V4L2_EVENT_FRAME_SYNC type event on HS_VS interrupt which is used to signal frame start. Earlier version of this driver used V4L2_EVENT_OMAP3ISP_HS_VS for this purpose. The event is triggered exactly when the reception of the first line of the frame starts in the CCDC module. The event can be subscribed on the CCDC subdev.

(When using parallel interface one must pay account to correct configuration of the VS signal polarity. This is automatically correct when using the serial receivers.)

Each of the statistics subdevs is able to produce events. An event is generated whenever a statistics buffer can be dequeued by a user space application using the VIDIOC_OMAP3ISP_STAT_REQ_IOCTL. The events available are:

- V4L2_EVENT_OMAP3ISP_AEWB
- V4L2_EVENT_OMAP3ISP_AF
- V4L2_EVENT_OMAP3ISP_HIST

The type of the event data is struct omap3isp_stat_event_status for these ioctlls. If there is an error calculating the statistics, there will be an event as usual, but no related statistics buffer. In this case omap3isp_stat_event_status.buf_err is set to non-zero.

3.10.7.2 Private IOCTLs

The OMAP 3 ISP driver supports standard V4L2 IOCTLs and controls where possible and practical. Much of the functions provided by the ISP, however, does not fall under the standard IOCTLs — gamma tables and configuration of statistics collection are examples of such.

In general, there is a private ioctl for configuring each of the blocks containing hardware-dependent functions.

The following private IOCTLs are supported:

- VIDIOC_OMAP3ISP_CCDC_CFG
- VIDIOC_OMAP3ISP_PRV_CFG
- VIDIOC_OMAP3ISP_AEWB_CFG
- VIDIOC_OMAP3ISP_HIST_CFG
- VIDIOC_OMAP3ISP_AF_CFG
3.10.7.3 CCDC and preview block IOCTLs

The VIDIOC_OMAP3ISP_CCDC_CFG and VIDIOC_OMAP3ISP_PRV_CFG IOCTLs are used to configure, enable and disable functions in the CCDC and preview blocks, respectively. Both IOCTLs control several functions in the blocks they control. VIDIOC_OMAP3ISP_CCDC_CFG IOCTL accepts a pointer to struct omap3isp_ccdc_update_config as its argument. Similarly VIDIOC_OMAP3ISP_PRV_CFG accepts a pointer to struct omap3isp_prev_update_config. The definition of both structures is available in include/linux/omap3isp.h.

The update field in the structures tells whether to update the configuration for the specific function and the flag tells whether to enable or disable the function.

The update and flag bit masks accept the following values. Each separate functions in the CCDC and preview blocks is associated with a flag (either disable or enable; part of the flag field in the structure) and a pointer to configuration data for the function.

Valid values for the update and flag fields are listed here for VIDIOC_OMAP3ISP_CCDC_CFG. Values may be or'ed to configure more than one function in the same IOCTL call.

- OMAP3ISP_CCDC_ALAW
- OMAP3ISP_CCDC_LPF
- OMAP3ISP_CCDC_BLCLAMP
- OMAP3ISP_CCDC_BCOMP
- OMAP3ISP_CCDC_FPC
- OMAP3ISP_CCDC_CULL
- OMAP3ISP_CCDC_CONFIG_LSC
- OMAP3ISP_CCDC_TBL_LSC

The corresponding values for the VIDIOC_OMAP3ISP_PRV_CFG are here:

- OMAP3ISP_PREV_LUMAENH
- OMAP3ISP_PREV_INVALAW
- OMAP3ISP_PREV_HRZ_MED
- OMAP3ISP_PREV_CFA
- OMAP3ISP_PREV_CHROMA_SUPP
- OMAP3ISP_PREV_WB

1 include/linux/omap3isp.h
• OMAP3ISP_PREV_BLKADJ
• OMAP3ISP_PREV_RGB2RGB
• OMAP3ISP_PREV_COLOR_CONV
• OMAP3ISP_PREV_YC_LIMIT
• OMAP3ISP_PREV_DEFECT_COR
• OMAP3ISP_PREV_GAMMABYPASS
• OMAP3ISP_PREV_DRK_FRM_CAPTURE
• OMAP3ISP_PREV_DRK_FRM_SUBTRACT
• OMAP3ISP_PREV_LENS_SHADING
• OMAP3ISP_PREV_NF
• OMAP3ISP_PREV_GAMMA

The associated configuration pointer for the function may not be NULL when enabling the function. When disabling a function the configuration pointer is ignored.

3.10.7.4 Statistic blocks IOCTLs

The statistics subdevs do offer more dynamic configuration options than the other subdevs. They can be enabled, disabled and reconfigured when the pipeline is in streaming state.

The statistics blocks always get the input image data from the CCDC (as the histogram memory read isn’t implemented). The statistics are dequeueable by the user from the statistics subdev nodes using private IOCTLs.

The private IOCTLs offered by the AEWB, AF and histogram subdevs are heavily reflected by the register level interface offered by the ISP hardware. There are aspects that are purely related to the driver implementation and these are discussed next.

3.10.7.5 VIDIOC_OMAP3ISP_STAT_EN

This private IOCTL enables/disables a statistic module. If this request is done before streaming, it will take effect as soon as the pipeline starts to stream. If the pipeline is already streaming, it will take effect as soon as the CCDC becomes idle.

3.10.7.6 VIDIOC_OMAP3ISP_AEWB_CFG, VIDIOC_OMAP3ISP_HIST_CFG and VIDIOC_OMAP3ISP_AF_CFG

Those IOCTLs are used to configure the modules. They require user applications to have an in-depth knowledge of the hardware. Most of the fields explanation can be found on OMAP’s TRMs. The two following fields common to all the above configure private IOCTLs require explanation for better understanding as they are not part of the TRM.

omap3isp_[h3a_af/h3a_aewb/hist]_config.buf_size:

The modules handle their buffers internally. The necessary buffer size for the module’s data output depends on the requested configuration. Although the driver supports reconfiguration while streaming, it does not support a reconfiguration which requires bigger buffer size than
what is already internally allocated if the module is enabled. It will return -EBUSY on this case. In order to avoid such condition, either disable/reconfigure/enable the module or request the necessary buffer size during the first configuration while the module is disabled.

The internal buffer size allocation considers the requested configuration's minimum buffer size and the value set on buf_size field. If buf_size field is out of [minimum, maximum] buffer size range, it’s clamped to fit in there. The driver then selects the biggest value. The corrected buf_size value is written back to user application.

omap3isp_[h3a_af/h3a_aewb/hist]_config.config_counter:

As the configuration doesn’t take effect synchronously to the request, the driver must provide a way to track this information to provide more accurate data. After a configuration is requested, the config_counter returned to user space application will be an unique value associated to that request. When user application receives an event for buffer availability or when a new buffer is requested, this config_counter is used to match a buffer data and a configuration.

3.10.7.7 VIDIOC_OMAP3ISP_STAT_REQ

Send to user space the oldest data available in the internal buffer queue and discards such buffer afterwards. The field omap3isp_stat_data.frame_number matches with the video buffer’s field_count.

3.10.7.8 References

3.10.8 The Linux USB Video Class (UVC) driver

This file documents some driver-specific aspects of the UVC driver, such as driver-specific ioctls and implementation notes.

Questions and remarks can be sent to the Linux UVC development mailing list at linux-uvc-devel@lists.berlios.de.

3.10.8.1 Extension Unit (XU) support

Introduction

The UVC specification allows for vendor-specific extensions through extension units (XUs). The Linux UVC driver supports extension unit controls (XU controls) through two separate mechanisms:

- through mappings of XU controls to V4L2 controls
- through a driver-specific ioctl interface

The first one allows generic V4L2 applications to use XU controls by mapping certain XU controls onto V4L2 controls, which then show up during ordinary control enumeration.

The second mechanism requires uvcvideo-specific knowledge for the application to access XU controls but exposes the entire UVC XU concept to user space for maximum flexibility.

Both mechanisms complement each other and are described in more detail below.
Control mappings

The UVC driver provides an API for user space applications to define so-called control mappings at runtime. These allow for individual XU controls or byte ranges thereof to be mapped to new V4L2 controls. Such controls appear and function exactly like normal V4L2 controls (i.e. the stock controls, such as brightness, contrast, etc.). However, reading or writing of such a V4L2 controls triggers a read or write of the associated XU control.

The ioctl used to create these control mappings is called UVCIOC_CTRL_MAP. Previous driver versions (before 0.2.0) required another ioctl to be used beforehand (UVCIOC_CTRL_ADD) to pass XU control information to the UVC driver. This is no longer necessary as newer uvcvideo versions query the information directly from the device.

For details on the UVCIOC_CTRL_MAP ioctl please refer to the section titled “IOCTL reference” below.

3. Driver specific XU control interface

For applications that need to access XU controls directly, e.g. for testing purposes, firmware upload, or accessing binary controls, a second mechanism to access XU controls is provided in the form of a driver-specific ioctl, namely UVCIOC_CTRL_QUERY.

A call to this ioctl allows applications to send queries to the UVC driver that directly map to the low-level UVC control requests.

In order to make such a request the UVC unit ID of the control’s extension unit and the control selector need to be known. This information either needs to be hardcoded in the application or queried using other ways such as by parsing the UVC descriptor or, if available, using the media controller API to enumerate a device’s entities.

Unless the control size is already known it is necessary to first make a UVC_GET_LEN requests in order to be able to allocate a sufficiently large buffer and set the buffer size to the correct value. Similarly, to find out whether UVC_GET_CUR or UVC_SET_CUR are valid requests for a given control, a UVC_GET_INFO request should be made. The bits 0 (GET supported) and 1 (SET supported) of the resulting byte indicate which requests are valid.

With the addition of the UVCIOC_CTRL_QUERY ioctl the UVCIOC_CTRL_GET and UVCIOC_CTRL_SET ioctlts have become obsolete since their functionality is a subset of the former ioctl. For the time being they are still supported but application developers are encouraged to use UVCIOC_CTRL_QUERY instead.

For details on the UVCIOC_CTRL_QUERY ioctl please refer to the section titled “IOCTL reference” below.

Security

The API doesn’t currently provide a fine-grained access control facility. The UVCIOC_CTRL_ADD and UVCIOC_CTRL_MAP ioctlts require super user permissions.

Suggestions on how to improve this are welcome.
Debugging

In order to debug problems related to XU controls or controls in general it is recommended to enable the UVC TRACE CONTROL bit in the module parameter ‘trace’. This causes extra output to be written into the system log.

ioctl reference

UVCIOC_CTRL_MAP - Map a UVC control to a V4L2 control

Argument: struct uvc_xu_control_mapping

Description:

This ioctl creates a mapping between a UVC control or part of a UVC control and a V4L2 control. Once mappings are defined, userspace applications can access vendor-defined UVC control through the V4L2 control API.

To create a mapping, applications fill the uvc_xu_control_mapping structure with information about an existing UVC control defined with UVCIOC_CTRL_ADD and a new V4L2 control.

A UVC control can be mapped to several V4L2 controls. For instance, a UVC pan/tilt control could be mapped to separate pan and tilt V4L2 controls. The UVC control is divided into non overlapping fields using the ‘size’ and ‘offset’ fields and are then independently mapped to V4L2 control.

For signed integer V4L2 controls the data_type field should be set to UVC_CTRL_DATA_TYPE_SIGNED. Other values are currently ignored.

Return value:

On success 0 is returned. On error -1 is returned and errno is set appropriately.

ENOMEM Not enough memory to perform the operation.
EPERM Insufficient privileges (super user privileges are required).
EINVAL No such UVC control.
EOVERFLOW The requested offset and size would overflow the UVC control.
EEXIST Mapping already exists.

Data types:

```c
* struct uvc_xu_control_mapping
  __u32 id V4L2 control identifier
  __u8 name[32] V4L2 control name
  __u8 entity[16] UVC extension unit GUID
  __u8 selector UVC control selector
  __u8 size V4L2 control size (in bits)
  __u8 offset V4L2 control offset (in bits)
  enum v4l2_ctrl_type
    v4l2_type V4L2 control type
  enum uvc_control_data_type
    data_type UVC control data type
```

Chapter 3. Linux Media Infrastructure userspace API
struct uvc_menu_info
  *menu_info Array of menu entries (for menu controls only)
__u32 menu_count Number of menu entries (for menu controls only)

* struct uvc_menu_info
__u32 value Menu entry value used by the device
__u8 name[32] Menu entry name

* enum uvc_control_data_type
  UVC_CTRL_DATA_TYPE_RAW Raw control (byte array)
  UVC_CTRL_DATA_TYPE_SIGNED Signed integer
  UVC_CTRL_DATA_TYPE_UNSIGNED Unsigned integer
  UVC_CTRL_DATA_TYPE_BOOLEAN Boolean
  UVC_CTRL_DATA_TYPE_ENUM Enumeration
  UVC_CTRL_DATA_TYPE_BITMASK Bitmask

**UVCIOC_CTRL_QUERY** - Query a UVC XU control

Argument: struct uvc_xu_control_query

**Description:**

This ioctl queries a UVC XU control identified by its extension unit ID and control selector.

There are a number of different queries available that closely correspond to the low-level control requests described in the UVC specification. These requests are:

**UVC_GET_CUR** Obtain the current value of the control.

**UVC_GET_MIN** Obtain the minimum value of the control.

**UVC_GET_MAX** Obtain the maximum value of the control.

**UVC_GET_DEF** Obtain the default value of the control.

**UVC_GET_RES** Query the resolution of the control, i.e. the step size of the allowed control values.

**UVC_GET_LEN** Query the size of the control in bytes.

**UVC_GET_INFO** Query the control information bitmap, which indicates whether get/set requests are supported.

**UVC_SET_CUR** Update the value of the control.

Applications must set the ‘size’ field to the correct length for the control. Exceptions are the UVC_GET_LEN and UVC_GET_INFO queries, for which the size must be set to 2 and 1, respectively. The ‘data’ field must point to a valid writable buffer big enough to hold the indicated number of data bytes.

Data is copied directly from the device without any driver-side processing. Applications are responsible for data buffer formatting, including little-endian/big-endian conversion. This is particularly important for the result of the UVC_GET_LEN requests, which is always returned as a little-endian 16-bit integer by the device.
Return value:

On success 0 is returned. On error -1 is returned and errno is set appropriately.

ENOENT The device does not support the given control or the specified extension unit could not be found.

ENOBUS The specified buffer size is incorrect (too big or too small).

EINVAL An invalid request code was passed.

EBADRQC The given request is not supported by the given control.

EFAULT The data pointer references an inaccessible memory area.

Data types:

```c
* struct uvc_xu_control_query
  __u8 unit    Extension unit ID
  __u8 selector Control selector
  __u8 query   Request code to send to the device
  __u16 size   Control data size (in bytes)
  __u8 *data   Control value
```
